64. *L. magnificus* Jones. Subulate and long-villous, erect, 6 to 12 dm. tall, acaulescent; leaves crowded at the base, petioles 15 to 20 cm. long, leaflets about 7, 30 to 40 mm. long by 6 to 10 mm. wide, hairy both sides; racemes 30 to 45 cm. long; flowers 16 to 18 mm. long, more or less verticillate, bracts deciduous, pedicels stout, 4 mm. long, spreading-pubescent; petals pinkish-purple, banner glabrous, the yellow center changing to dark purple, keel arcuate, yellow, ciliate on the upper edges of the short acumen; ovules 10, pods and seeds not seen.—Gravelly washes, Panamint Range. Var. *GLARÉCOLA* Jones. Flowers only 10 to 12 mm. long; pedicels slender, about 8 mm. long; racemes 20 to 30 cm. long.—Gravelly soil, Lone Pine, Inyo Co. Var. *HESPERIUS* C. P. Sm. About 2 dm. tall; flowers 13 to 15 mm. long; pedicels stout, about 4 mm. long; racemes about 10 cm. long; upper calyx-lip bifid, lower tridentate; keel straight.—Coarse sand, w. of Bishop, Inyo Co. (*L. hesperius* Hel.)

65. *L. saxosus* Howell. Densely villous, low, stems abbreviated, plants 1 to 3 dm. tall; leaves largely basal, long-petioled, glabrous or sparsely sub-villous above, appressed-silky below, leaflets 8 to 12, 12 to 30 mm. long; racemes 5 to 10 cm. long, densely flowered; flowers 14 to 18 mm. long, bracts deciduous, pedicels 4 to 6 mm. long, spreading-pubescent; petals blue, banner with yellow center, almost as wide as long, keel ciliate on upper edges; pods villous, ovules 4 or 5.—Stony fields and hilltops, Modoc Co.; n. to eastern Wash.

## 12. *CYTISUS* L.

Shrubs. Leaves 3-foliolate. Flowers yellow or white. Calyx-tube campanulate, its limb (in ours) 2-lipped. Petals broad; keel obtuse. Stamens monadelphous. Pod flattened, several-seeded. (Greek Kutisus, a kind of clover.)

1. *C. scoparius* Link. SCOTCH BROOM. Shrub 3 to 6 ft. high, with angular broom-like leafless branches or sparingly leafy; leaves palmate, the leaflets 2 to 4 lines long; flowers bright yellow, solitary or in pairs in the axils, forming leafy racemes; pods pilose along the margins.—Native of Eur., sparingly spontaneous: w. Sonoma Co.; Millbrae, San Mateo Co.

## 13. *ULEX* L.

Densely spiny shrubs with dark green almost leafless branches. Leaves reduced to spines or small scales. Flowers yellow, showy, axillary and often crowded at the ends of the branches. Calyx yellow, deeply 2-lipped. Stamens monadelphous. (Old Latin name of some similar plant.)

1. *U. europæus* L. FURZE. GORSE. Two to 4 ft. high; pods villous, ½ in. long.—Near the coast, Marin Co. to Mendocino Co.; sparingly nat. from Eur.

## 14. *MEDICAGO* L. MEDICK

Herbs, the leaves and flowers essentially as in *Melilotus*. Flowers in short spikes or loose heads. Stamens diadelphous, the upper one entirely free. Pod small, 1 to several-seeded, incurved or coiled or spirally twisted, indehiscent. (Greek Medike, name given by Dioscorides to a plant from Media, perhaps Lucern.)

Perennial; flowers blue. . . . . 1. *M. sativa*.  
Annuals; flowers yellow.

Pod 1-seeded, reniform, unarmed but strongly nerved. . . . . 2. *M. lupulina*.

Pod several-seeded, spirally coiled,

Margined with prickles.

Edge of the pod keeled, not grooved between the prickles; leaflets not  
spotted. . . . . 3. *M. hispida*.

Edge of the pod furrowed between the prickles; leaflets with a large inky  
spot on the upper face. . . . . 4. *M. arabica*.

Unarmed. . . . . 5. *M. apiculata*.

1. *M. sativa* L. ALFALFA. Perennial from an elongated taproot, erect and smooth; leaflets oblong-obovate or linear-oblong, 8 to 10 lines long; flowers

Co. to L. Cal., reaching the coast southw. (*L. eminens*, tricolor and *jucundus* Greene. *L. brittoni* Abrams. *L. acutilobus* Hel.)

59. *L. sericatus* Kell. Densely appressed-silky, usually unbranched, decumbent, 15 to 30 cm. tall; leaves long-petioled, silvery-silky both sides, rather scattered, leaflets 6 or 7, spatulate, rounded or retuse, 3 to 4 cm. long, mostly over 12 mm. wide; flowers 14 to 16 mm. long, scattered or subverticillate, bracts early deciduous, pedicels 4 to 5 mm. long, appressed-pubescent; petals purplish-blue, banner somewhat pubescent on the back, wings very broad, keel arcuate, ciliate on the upper edges and on the lower free margins near the claws; ovules 5 to 7, seeds light brown, more or less mottled.—Dry slopes of the higher mountains of the St. Helena and Mayacamas ranges.

60. *L. cervinus* Kell. Densely velvety-pubescent or subsilky, unbranched, subacaulescent, erect, 15 to 30 cm. tall; leaves long-petioled, crowded near the base, leaflets 5 to 8, appressed-silky both sides, ovate to lanceolate, obtuse or rounded at apex, 2 to 6 cm. long, 10 to 30 mm. wide; flowers 14 to 16 mm. long, more or less whorled, bracts early deciduous, pedicels 3 to 5 mm. long, spreading-pubescent; petals broad, banner more or less pubescent on the back, keel curved, ciliate above and near the claws below; pods appressed-silky, about 30 by 8 mm., ovules 6 to 8, seeds somewhat spotted and with a dark lateral line.—Dry pine lands, Santa Lucia Mts. (*L. latissimus* Greene.)

61. *L. excubitus* Jones. Densely appressed-silky, 3 to 15 dm. tall, with persistent woody stems, more or less branched; leaves all long-petioled, lower internodes short, leaflets 7 or 8, oblong-oblancoate to spatulate, 2 to 4 cm. long, densely silky on both sides; flowers in whorls which are well-separated below, 10 to 14 mm. long, bracts deciduous, pedicels 4 to 6 mm. long, appressed-pubescent; petals blue, more or less mixed with violet, yellow center of banner commonly changing to rich violet, glabrous or somewhat pubescent dorsally, wings broad, keel arcuate, ciliate above and sometimes near claws below; pods 3 to 5 cm. long, 8 to 10 mm. wide, ovules 6 to 8, seeds pale, obscurely marked except for a yellowish-brown lateral line on each side.—Gravelly washes and rocky slopes, Inyo and Ventura Cos. to L. Cal., rarely near the coast. Var. *HALLII* C. P. Sm. Usually larger and coarser, the flowers 14 to 18 mm. long.—Cañons and hillsides, Ventura and San Bernardino Cos. and s. to L. Cal. (*L. hallii* Abrams. *L. paynei* Dav.) Var. *JOHNSTONI* C. P. Sm. A low subalpine congested shrub with the persistent woody branches seldom over 15 cm. long; racemes 6 to 12 cm. long; flowers 14 to 18 mm. long.—Dry mountain tops, Ventura and San Bernardino Cos. and s. Var. *AUSTROMONTANUS* C. P. Sm. Stems short, mostly herbaceous, the long-petioled leaves crowded at the base, with 1 to 3 reduced upper leaves; otherwise as in var. *hallii*.—Open fields or grassy desert slopes, Kern Co. to San Diego Co. (*L. austromontanus* Hel.)

62. *L. gráyi* Wats. Densely short-villous, usually unbranched, 20 to 35 cm. tall; cauline leaves short-petioled, scattered along stem, leaflets 5 to 9, oblanceolate, 25 to 35 mm. long, about 6 mm. wide, hairy on both sides; flowers 12 to 14 mm. long, more or less whorled, bracts early deciduous, pedicels 2 to 4 mm. long, spreading-pubescent; petals broad, banner with a yellow center, glabrous or somewhat pubescent dorsally, keel slightly arcuate, densely ciliate on the upper margins and often also on the lower edges near claws; pods appressed-pubescent, 25 to 30 mm. long by 6 to 8 mm. wide, dull yellow, ovules 4 to 6, seeds grayish-yellow, obscurely marked except for the dark lateral lines.—Cañons and valleys, Sierra Nevada from Plumas Co. to Fresno Co.

63. *L. obtusilobus* Hel. Appressed-silvery-silky, 2 to 3.5 dm. tall, more or less decumbent to ascending; leaves silvery-silky both sides, petioles 3 to 4 cm. long, leaflets 5 to 7, 2 to 4 cm. long by 5 to 10 mm. wide; verticils 4 to 7, approximate; flowers 12 to 14 mm. long, spreading, bracts deciduous, pedicels 3 mm. long, loosely appressed-pubescent; petals blue or lilac, banner suborbicular, pubescent dorsally, with yellow center, keel more or less curved,

522. *Medicago hispida* Gaertn.; a, fl. branchlet x  $\frac{1}{2}$ ; b, fl. x  $2\frac{1}{2}$ ; c, pod x 2.

blue (5 lines long), in racemes; pod spirally twisted so as to form 2 or 3 complete rings or coils.—Borders of fields and in low valleys. Native of western Asia, cultivated for more than 20 centuries. Brought into California in 1854, it is our "King of Forage Plants," often producing ten tons of hay per acre per annum. It is also valued as a bee plant, sometimes yielding 60 lbs. of honey to the acre.

2. *M. lupulina* L. NONESUCH. BLACK MEDICK. Branching from the base into spreading procumbent stems 9 to 18 in. long; leaflets orbicular and more or less deltoid to cuneate-obovate, 4 to 6 lines long; peduncles longer than the leaves (1 to  $1\frac{1}{2}$  in. long), bearing a short dense spike of bright yellow flowers; pod reniform, 1-seeded, black when ripe.—Nat. from Eur., uncommon, but widely distributed. Apr.-June.

3. *M. hispida* Gaertn. BUR CLOVER. Fig. 522. Branches spreading or procumbent, from a few in. to 2 ft. long;

herbage nearly glabrous; leaflets obovate or obcordate; stipules finely toothed; peduncles 3 to 5-flowered, rather longer than the leaves; pod twisted into a spiral of 2 or 3 turns, compressed, reticulated, the thin keeled edge bordered by a double row of more or less hooked or curved prickles.—Nat. from Eur.; very common throughout Cal. on the plains, low hills and in the valleys. Mar.-June, but flowering in moist places at nearly all seasons. By cattlemen it is prized as a dry season stock feed, since the burs are produced in great quantity and are highly nutritious; the plant also furnishes a green forage in spring. This is a rare instance of an aggressive immigrant having forage value.

4. *M. arábica* All. SPOTTED MEDICK. Very similar to no. 3, but the petioles with spreading hairs, the leaflets usually much larger (1 in. long); pod compactly spiral, the margin thicker.—Nat. from Eur.; San Francisco Bay region, uncommon.

5. *M. apiculata* Willd. Stems spreading, 1 to 2 ft. long; leaflets deltoid, denticulate, except at the base, usually retuse and mucronate at apex, 5 to 6 lines long; pod unarmed or the spines very short, the sides strongly reticulated, the reticulations running to the edge and appearing as a row of tubercles on either side of the margin.—Nat. from Eur., widely distributed but rare.

# 15. MELILOTUS Juss. SWEET CLOVER

Annual or biennial herbs with pinnately 3-foliolate leaves and toothed leaflets. Herbage fragrant in drying. Flowers small, yellow or white, in spike-like racemes on axillary peduncles, in bud erect, soon deflexed and not again becoming erect. Calyx 5-toothed. Petals falling after flowering, free from the stamen tube. Stamens diadelphous, the upper one entirely free. Pod ovoid, straight, longer than the calyx, scarcely dehiscent, 1 or 2-seeded. (Greek meli, honey, and lotos, the ancient name of some plant belonging to this family.)

Flowers white; plants 3 to 6 ft. high. . . . . 1. *M. alba*.  
Flowers yellow; plants  $1\frac{1}{2}$  to 3 ft. high. . . . . 2. *M. indica*.

1. *M. alba* Desr. WHITE MELILOT. Erect, simple below, branching above; leaflets broadly or narrowly oblong, tapering to both ends, or widest above the middle, serrate except at the very base,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long; flowers 2 lines

long, in racemes 1 to 4 in. long; pod somewhat wrinkled. — Nat. from Eur.; stream bottoms throughout Cal., mostly toward the interior, or in moist valleys northw. It is cultivated for forage but cattle do not take kindly to it at first. July-Oct.

2. *M. indica* All. YELLOW MELILOT. Fig. 523. Main stem erect, with many rather spreading branches from above the base; leaflets broadly or narrowly cuneate-obovate, dentate or serrate but entire below the middle, truncate or retuse at apex,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long; racemes 1 to 2 in. long, longer than the peduncles; flowers  $1\frac{1}{2}$  lines long; pod with thinish strongly wrinkled coat. — Nat. from Eur., common throughout Cal. Apr.-May. It is cultivated as a green manure plant.

523. *Melilotus indica* All.; a, fl. branchlet x 1; b, fl. x 5.

#### 16. TRIFOLIUM L. CLOVER

Herbs with palmate (or rarely short-pinnate) leaves; leaflets generally 3, sometimes 4 to 7; stipules foliaceous, united at the base and clasping the petiole. Flowers white, yellow, pink, red or purple, in heads. Heads capitate, sometimes loose (umbellate) or short-spicate. Calyx 5-toothed, the lobes equal or nearly so, entire or sometimes bifid or trifid. Petals withering and persistent. Stamens diadelphous. Pod globose to elongated, 1 to 8 (mostly 1 or 2)-seeded, included within the persistent calyx. (Latin tres, three, and folium, leaf.)

#### A. Heads with an involucre.

##### 1. COROLLA CONSPICUOUSLY INFLATED; ANNUALS.

Involucre present.

Involucral lobes 3 to 9 (commonly about 6 lines long); heads large; flowers cream-color or yellowish.....1. *T. fucatum*.

Involucral lobes 2 lines long or less; heads small; flowers purple, reddish or white... 2. *T. amplexans*.

Involucre reduced to a ring, or subobsolete.....3. *T. depauperatum*.

##### 2. COROLLA NOT INFLATED (SOMEWHAT INFLATED IN NO. 13); ANNUALS EXCEPT NOS. 7 AND 11.

a. Involucre a flat or spreading disc with variously shaped margin (sometimes of separate segments).

Calyx-teeth dilated and either tridentate or simple.

Plants strictly glabrous; stems commonly not fistulous.

Stipules erect.....4. *T. tridentatum*.

Stipules with the tips reflexed.....5. *T. polyodon*.

Plants pubescent and clammy; stems fistulous.....6. *T. obtusiflorum*.

Calyx-teeth not dilated but subulate, entire.

Heads large; stems commonly thick.

Flowers large, 6 to 7 lines long, purple to pinkish, lighter at the top; heads very densely flowered; perennial.....7. *T. involucreatum*.

Flowers smaller (mostly 3 to 5 lines long), dark purple, cream-tipped; heads less densely flowered; annual.....8. *T. appendiculatum*.

Heads small and stems slender (except in *T. variegatum* var. *melananthum*).

Stipules with margin laciniately toothed or divided.

Corolla much longer than calyx; involucre with laciniately toothed lobes....

9. *T. variegatum*.

Corolla little longer than calyx; involucre cleft nearly to base into deeply laciniate divisions.....10. *T. oliganthum*.

Stipules with margin entire or nearly so; corolla 2 to 3 times as long as calyx; involucre cleft to base or nearly so.....11. *T. monanthum*.

*b. Involucre campanulate to bowl-shaped.*

Lobes of involucre toothed.

Calyx-teeth many-forked, glabrous.....12. *T. cyathiferum*.

Calyx-teeth all or all but one simple, hairy or ciliate.

Calyx-teeth awn-like, plumose, the upper one forked.....13. *T. barbigerum*.

Calyx-teeth subulate, ciliate, all simple.....14. *T. microdon*.

Lobes of involucre entire; calyx-teeth broadly subulate with scarious margins.....15. *T. microcephalum*.

**B. Heads naked or with involucre reduced to a vestigial ring or bract.****1. FLOWERS PEDICELLATE.***a. Annuals; flowers in age reflexed.*

Plants more or less pubescent.

Petioles shorter than the leaflets; terminal leaflet on a rachis 1 to 2 lines long, the lateral subsessile (leaves pinnate); flowers yellow.

Heads 3 lines broad; banner not dilated.....16. *T. dubium*.

Heads 4½ to 5 lines broad; banner dilated.....17. *T. procumbens*.

Petioles as long as or longer than leaflets; leaflets all subsessile at the same point (leaves palmate); flowers white to rose-pink; pubescence confined to peduncles and calyces.....18. *T. bifidum*.

Plants strictly glabrous.

Calyx-teeth with bristled or ciliated margins; flowers light pink.....19. *T. ciliatum*.

Calyx-teeth with entire margins; flowers rose-red to cream-color...20. *T. gracilentum*.

*b. Perennials (or rarely biennials).*

Leaflets 3; flowers in age reflexed.

Plants sparsely pubescent above.

Peduncles becoming recurved at apex; flowers cream-white.....21. *T. breweri*.

Peduncles remaining erect; flowers tinged with pink.

Calyx-teeth twice as long as the tube; upper stipules toothed.....22. *T. oreoganum*.

Calyx-teeth little longer than the tube; stipules entire.....23. *T. hybridum*.

Plants glabrous throughout.

Rachis commonly produced above the heads; leaflets mostly lanceolate to oblong-lanceolate, acuminate, spinulose-serrate.....24. *T. kingii*.

Rachis not produced above the heads; leaflets broader, not acuminate, less deeply toothed.

Leaflets ¾ to 2½ in. long; stems erect or ascending, simple or nearly so, more or less leafy.

Plants ½ to 1 ft. high; leaflets ¾ to 1½ in. long; flowers red.....25. *T. beckwithii*.

Plants 2 to 2¾ ft. high; leaflets 1½ to 2½ in. long; flowers white...26. *T. howellii*.

Leaflets not over ¾ in. long; leaves all or mostly basal.

Stems creeping, bearing erect or ascending leaves and petioles; flowers white or pink.....27. *T. repens*.

Stems caespitose from the branching crown of a thick root; flowers lavender.....28. *T. bolanderi*.

Leaflets 5 to 7 (rarely 3); flowers not reflexed (rarely so in no. 32).

Calyx densely silky-villous, the filiform segments plumose.

Heads exceeding the leaves; stipules ovate-oblong.

Stipules sparsely toothed; heads somewhat spicate; stem simple.....29. *T. macrocephalum*.

Stipules entire; heads capitate-umbellate; caespitose, the stems and leaves matted, the naked peduncles erect.....30. *T. monoense*.

Heads not exceeding the leaves; heads somewhat umbellate; stipules lanceolate, entire; stems matted.....31. *T. andersonii*.

Calyx pubescent, the lanceolate or subulate-lanceolate segments not plumose.

Heads few-flowered; plant 1 to 3 in. high.....32. *T. gymnocarpon*.

Heads many-flowered; plant 6 to 8 in. high.....33. *T. lemmonii*.

**2. FLOWERS SESSILE.***a. Annuals; flowers not reflexed.*

Heads sessile in pairs, subtended by the stipules of the sessile upper leaves..34. *T. macraei*.

Heads not sessile.

Corolla exceeding or about equaling the calyx.

Heads 7 to 12 lines wide, globose-ovate; corollas well-exserted; stem one from the base.....35. *T. amoenum*.

Heads mostly 4 to 6 lines wide, cylindric or hemispheric to narrowly ovate; stems 1 to several from the base.

Corollas well-exserted.....36. *T. dichotomum*.

Corollas barely or not at all exserted.....37. *T. albobipureum*.

Corolla much exceeded by the calyx, entirely obscured by the long-plumose calyx-teeth.....38. *T. olivaceum*.

*b. Perennials.*

Heads sessile, subtended by the stipules of the sessile upper leaves; stipules scarious; flowers not reflexed.....39. *T. pratense*.

Heads long-pedunculate; stipules foliaceous.

Peduncles strongly recurved in age; flowers reflexed.....40. *T. eriocephalum*.

Peduncles remaining erect; flowers not at all reflexed, or only tardily...41. *T. longipes*.

1. *T. fucatum* Lindl. SOUR CLOVER.

Fig. 524. Stems stout, fistulous, succulent, diffuse, 1 to 2¾ ft. long; stipules large, broadly subulate, acuminate, the margins membranous; leaflets rhombic-ovate, 5 to 12 lines broad, broadly dentate, sometimes dentate-setate; heads large, 1 to 2 in. in diameter; involucre 5 to 9-lobed, its margins scarious, entire; flowers pedicellate; corolla cream-colored tinged with light green, in age inflating and turning a deep pink; keel dark purple; calyx very small, scarious, the teeth short, unequal; pods stipitate, 3 to 8-seeded.—Low alkaline or brackish places, often on blue adobe, throughout cismon-tane Cal.: n. to Ore. It acts much like an alien weed, since abundant along railroad tracks and country roads. Possibly introd. from S. Am.

Apr.-June. Var. *VIRESCENS* Jepson. Smaller; leaflets spatulate, pectinate to pectinate-dentate; calyx-teeth reduced to 3, longer than the calyx-tube; pod 3-seeded.—Dry hills, Napa Co. to Humboldt Co. Var. *GAMBELLII* Jepson. Procumbent and very succulent; leaflets rhombic, thick, glaucous; calyx-teeth very long, 2 to 3-cleft.—E. Contra Costa Co. Var. *FLAVULUM* Jepson. Procumbent as in var. *gambellii*; leaflets small, rotund-obovate; calyx-teeth simple, equaling or exceeding the calyx-tube.—Widely distributed and abundant in marshy places near the sea-coast, San Mateo Co. to Napa Co.

2. *T. ampléctens* T. & G. Stems commonly several or many from the base, rather stout, decumbent or ascending, 6 to 15 in. high; herbage glabrous; leaflets obovate to oblanceolate, emarginate to truncate, cuneate at base, serrate, ¼ to ¾ in. long; heads 4 to 11-flowered; involucre 6 or 7-lobed, the lobes rounded to oblong, scarious-margined, entire or occasionally toothed, equaling or exceeding the calyx-teeth; corolla white or purple, inflated. — Rich soil, low plains and foothills: Great

Valley; Coast Ranges. It inter-grades to the varieties. Var. *STENOPHYLLUM* Jepson n. comb. Stems more slender; leaflets linear to oblanceolate; involucre lobes oblong, entire.—Valley fields: Sacramento Valley and Napa and Sonoma Cos. to San Diego Co. (*T. stenophyllum* Nutt.) Var. *DIVERSIFOLIUM* Jepson n. comb. Heads many (8 to 15)-flowered; involucre very small, 6 to 9-lobed, the lobes ½ line long.—Salt marshes and alkaline soil, Contra Costa Co. to San Luis Obispo Co. (*T. diversifolium* Nutt.) Var. *TRUNCATUM* Jepson n. comb. Leaflets ¾ to 1 in. long; heads with the flowers in 2 whorls (rarely 1), the inner whorl subtended by a very small involucre ring.—Plains and mesas, coastal S. Cal. and n. to Marin Co. and the Sacramento Valley. (*T. truncatum* Greene.)

525 *Trifolium depauperatum* Desv.; a, fl. branchlet x 1; b, fl. with inflated corolla x 2.

524. *Trifolium fucatum* Lindl.; head. x 1.

3. *T. depauperatum* Desv. Fig. 525. Stems slender, ascending, 4 to 8

526. *Trifolium tridentatum* Lindl.: a, fl. branchlet  $\times \frac{1}{2}$ ; b, involucre  $\times 1\frac{1}{2}$ ; c, calyx spread open  $\times 2$ ; d, variations of calyx lobes  $\times 2$ .

in. high; herbage glabrous; leaflets cuneate-emarginate, denticulate, 3 to 5 lines long; peduncles slender, wiry; heads loose, 2 to 7-flowered, subtended by an exceedingly small or reduced involucral ring; corolla whitish to purple, becoming inflated, the banner enclosing the small wings and keel; pods stipitate, 2 to 6-ovuled, commonly 2-seeded.—Alkaline areas of valleys or flats in the hills, 25 to 2500 ft.: Great Valley, Sierra Nevada foothills; Coast Ranges from Humboldt Co. to S. Cal.; n. to Ore.; Chile. Var. *LACINIATUM* Jepson. Leaflets laciniately toothed or lobed.—Subsaline flats: e. Contra Costa Co.; Marin, Napa and Colusa Cos. Var. *ANGUSTATUM* Jepson. Leaves narrowly linear, entire or dentate, 5 to 6 lines long.—E. Contra Costa Co.; Sonoma and Napa Cos.

4. *T. tridentatum* Lindl. TOMCAT CLOVER. Fig. 526. Stems several from the base, erect or ascending, 4 to 20 in. high; stipules laciniate-toothed, erect; leaflets linear-oblong to lanceolate, serrate-setate to entire,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; heads hemispherical, broader than long,

$\frac{3}{4}$  to  $1\frac{1}{2}$  in. broad, the flowers standing out conspicuously, the wings protruding at right angles from the tube-like fold of the banner; involucre more or less deeply cleft into narrow lanceolate lobes; calyx-teeth usually tridentate, shorter than the calyx-tube; corolla bright to light purple, often white-tipped.—Valleys, hill slopes and cañon sides, 50 to 4000 ft., throughout cismontane Cal.; also Modoc and Siskiyou Cos.; n. to B. C. Our most abundant and widely distributed clover, exhibiting many ecological variations. Var. *SEGETUM* McDer. Stems hollow, 4 to 5 lines thick, often 2 ft. high; leaflets  $2\frac{1}{2}$  in. long, 9 lines wide; heads broadly conical; flowers large, the tridentate calyx-teeth long, acicular.—San Francisco Bay region, abundant; the largest and most luxuriant variety. Var. *ACICULARE* McDer. Erect; peduncles short (1 to 4 in. long); divisions of involucre unequal, long-acicular, or the involucre reduced; calyx-teeth dilated, simple, becoming abruptly acicular.—Cismontane Cal., widely distributed.

5. *T. polyodon* Greene. Stems flaccid, 1 to  $1\frac{1}{2}$  ft. high; stipules lacinate, the margins reflexed; leaflets obovate, serrulate, 3 to 11 lines long; involucre not deeply lobed, each lobe many-toothed; heads 4 to 7 lines broad; flowers dull purple, fading to white at the top; calyx turbinate, 10-nerved, reticulate, the teeth tridentate or multifid; pod 2-seeded; seeds brown-speckled.—Local at Pacific Grove and Monterey.

6. *T. obtusiflorum* Hook. CREEK CLOVER. Stems stout, erect, fistulous, 12 to 17 in. high; herbage clammy-hispidulous throughout; leaflets obovate-oblancheolate or oblanceolate, obtuse or acute, fringed-serrate,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long; peduncles 1 to 3 in. long; heads large; involucre small; calyx-teeth entire, dilated near base; corolla white with a bright purple spot at the center.—Moist swales or creek bottoms, widely distributed throughout cismontane Cal., 300 to 3700 ft., but rare as compared with its relative *T. tridentatum*; n. to southwestern Ore. The clamminess of the entire plant, even on dry summer days, makes it easily recognizable.

7. *T. involucratum* Ort. COW CLOVER.

Fig. 527. Stems thick but flaccid, low-caespitose or tall (4 to 24 in. high); herbage strictly glabrous; petioles long; small leaflets obovate or obtuse-oblong, about 2 to 3 lines long; large leaflets oblong, ovate, obovate or rhombic-oblong, serrulate-setate, mostly obtuse, about 5 to 14 lines long; heads large, showy,  $\frac{3}{4}$  to  $1\frac{1}{8}$  in. broad, each whorl often subtended by a secondary involucre; involucre deeply or slightly lobed, each lobe 3 to 5-toothed; calyx 10-nerved; corolla purple, rose-red or pinkish, lighter at the top; pod 2 to 6-seeded.—Frequent along streams, by springs or in salt-marshes, 10 to 8000 ft., throughout Cal. from the coasts to the deserts and in the mountains. Apr.-June. Var. *FIMBRIATUM* McDer. Leaflets spinulose-margined, acute, recurved at tip (in extreme form), 1 to  $1\frac{1}{4}$  in. long; involucre divided into entire subulate divisions.—Wet meadows and margins of streams, 4000 to 7500 ft.: Sierra Nevada from Tulare Co. to Lassen and Siskiyou Cos.; n. to B. C. (T. spinulosum Dougl.) Var. *FENDLERI* McDer. Leaflets oblong, rounded at apex; calyx with one tooth slightly longer.—East side Sierra Nevada in Mono Co.; e. to Col. and N. Mex. Var. *KENNEDIANUM* McDer. Involucre extremely small (1 to 2 lines broad), scarious.—Sand-dunes, Del Norte Co.

527. *Trifolium involucratum* Ort.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, involucre  $\times 1$ ; c, fl.  $\times 1\frac{1}{2}$ .

8. *T. appendiculatum* Loja. Stems erect or diffuse, thick and fistulous or sometimes slender, 3 to 17 in. long; glabrous; stipules reflexed or spreading, irregularly laciniate; leaflets broadly obovate, obtuse or retuse, 2 to 8 (or 14) lines long; involucre 7 to 9-lobed, the lobes 3 to 5-toothed; heads mostly large and showy (5 to 12 lines broad); corolla dark-purple, cream-tipped; beak of keel long-apiculate.—Grassy slopes, Mendocino and Humboldt Cos.; Pacific Grove. Rare. May-June. Var. *ROSTRATUM* Jepson n. comb. Dwarf, 3 to 4 in. high; leaflets small, obovate, on long filiform petioles; involucre 4-lobed, each lobe 3 or 4-toothed; heads small, few-flowered; keel rostrate.—Marin and Alameda Cos. (T. rostratum Greene.)

9. *T. variegatum* Nutt. WHITE-TIP CLOVER. Stems slender, often several from the base and freely branching, decumbent or ascending,  $\frac{1}{2}$  to 2 ft. high; herbage strictly glabrous; stipules ovate, laciniately toothed; leaflets commonly obovate, sometimes oblong-oblong, very small to large (2 to 7 lines long); peduncles slender; heads irregularly subglobose, 3 to 6 lines broad, few to many-flowered; involucre much smaller, 4 to 12-lobed, the lobes 3 to 7-toothed; flowers small; corolla purple, white-tipped or purple throughout; calyx 5 to 20-nerved, its teeth subulate-setaceous, often purple, simple or one tooth bifid.—Low or moist places, 20 to 4000 ft., widely distributed and common throughout cismontane Cal.; n. to B. C. Var. *PAUCIFLORUM* McDer. Dwarf, caespitose or the stems short and slender (1 to 6 in. long); leaflets very small; heads small (2 to 3 lines long), of 1 to 7 small purplish flowers; involucre 1 to 4-lobed, the lobes 3 to 5-toothed.—Montane, 2000 to 9000 ft.: Coast Ranges; Sierra Nevada. The smallest clover of western N. Am. Var. *TRILOBATUM* Jepson. Slender, 4 to 8 in. high, sparsely branched at the base; margin of stipules laciniate; petioles slender,  $1\frac{1}{2}$  to 2 in. long; leaflets lanceolate, acute at each end or often remarkably trilobate at apex; heads on long slender peduncles; lobes of involucre deeply and

laciniately toothed; flowers long; corolla dark purple, cream-color at the tips; calyx-teeth slender, acute, generally purple-tinted; pods 2-seeded.—Marysville Buttes. Var. *MELANANTHUM* Greene. Leaflets large, oblanceolate to oblong or obovate, obtuse,  $\frac{1}{2}$  to 1 in. long; heads  $\frac{3}{4}$  to  $1\frac{1}{8}$  in. broad, large-flowered, showy; involucre small; calyx-teeth pungent and purple-tipped.—Common in low moist places, attaining a luxuriant growth: Coast Ranges and Great Valley.

10. *T. oliganthum* Steud. Stems slender, sparsely leafy, with long internodes and long peduncles, 4 to 16 in. high; herbage light green, glabrous, or the stipules and involucres sparsely pubescent; leaflets linear to cuneate-oblong, serrate-setate to entire, 3 to 9 lines long; peduncles 1 to  $3\frac{3}{4}$  in. long; heads very small ( $2\frac{1}{2}$  to 3 lines high), 3 to 15-flowered; involucre small, divisions deeply lacinate and unequal; flowers small; corolla lavender, white-tipped; keel purple; calyx-teeth broadly subulate, dark green; pod 2 or 3-seeded.—Wooded cañons and brush-covered slopes, 25 to 3500 ft.: Coast Ranges from San Luis Obispo Co. to Lake and Humboldt Cos.; Calaveras Co. to Butte Co.; n. to B. C.; not common. Mar.-June. Var. *TRICHOCALYX* McDer. Peduncles and heads covered with a white pubescence; leaflets obcordate or rhombic,  $1\frac{1}{2}$  to 5 lines wide, 2 to 8 lines long.—Pacific Grove.

528. *Trifolium monanthum* Gray; a, habit x  $\frac{1}{2}$ ; b, fl. x  $1\frac{1}{4}$ ; c, leaf x  $1\frac{1}{4}$ .

11. *T. monanthum* Gray. CARPET CLOVER. Fig. 528. Stems slender, erect or decumbent, 1 to 4 in. high; herbage sparingly villous with long scattered hairs or glabrous; stipules lanceolate, entire or nearly so; leaflets ovate to oblanceolate, 1 to 4 lines long, mostly retuse, sparingly toothed; heads 1 to 4-flowered; involucre very small, 2 to 3-parted and often unilateral, the lobes bifid; corolla 4 to 6 lines long, white or sometimes purplish, about 3 times as long as the short calyx; calyx-teeth

subulate, shortly acuminate, thin.—Moist meadows and springy places, 5000 to 10,000 ft.: San Jacinto and San Bernardino mountains; Sierra Nevada from Tulare Co. to Amador Co.; w. Nev. June-Aug. Var. *PARVUM* McDer. Stems many from the base, diffuse or decumbent, 4 to 12 in. high, herbage conspicuously pubescent; involucre very small but extending to the base of the calyx-teeth.—Sierra Nevada from Fresno Co. to Placer Co., 3500 to 9000 ft. Var. *TENERUM* Parish. Stems 4 to 6 in. high, rather conspicuously villous; leaflets oblanceolate, acute; heads mostly 3 to 6-flowered; involucre divisions lacinate almost to the base.—Montane, sandy banks of streams, 6500 to 7000 ft., Fresno Co. to Tulare Co. Var. *GRANTIANUM* (Hel.) Parish. Glabrous, bright green; petioles 3 to 4 times longer than the leaflets; leaflets 4 to 8 lines long; flowers 5 to 6 lines long.—Montane, 5200 to 10,000 ft., San Jacinto and San Bernardino mountains. (*T. grantianum* Hel.)

12. *T. cyathiferum* Lindl. MOUNTAIN CLOVER. Stems erect or decumbent, 3 to 12 in. long; herbage strictly glabrous; leaflets narrowly obovate to elliptic-oblong, 5 to 12 lines long; involucre membranous, bowl-shaped, 5 to 10 lines broad, the lobed margin unequally toothed; corolla white or light pink, soon turning brown; calyx-teeth 1 to 3 times trichotomously forked.—Valleys or hillsides, 50 to 6000 ft.: North Coast Ranges from Lake Co. to Humboldt Co.; Sierra Nevada from Placer Co. n. to Modoc Co.; e. to Nev., n. to Ida. and B. C.

13. *T. barbigerum* Torr. Stems several from the base, procumbent, spreading in a circle, 3 to 8 in. long; peduncles erect, slender, wiry, pubescent to glabrous; stipules ovate-lanceolate, scarious, the upper portion green; leaflets rhombic or deltoid to ovate-oblong, setate-serrulate, 3 to 4 lines long; in-

volucre large, almost enclosing the flowers; calyx surpassing the corolla, its teeth plumose, setaceous, the lower tooth once or twice forked; corolla rose-red, the banner inflated; pods 2-seeded.—Low hills: near the coast from Monterey Co. to Del Norte Co.; Calaveras Co. Apr.-June. Var. *ANDRÉWSII* Gray. Villous-pubescent throughout, less procumbent and larger than the species; heads large; involucre villous-pubescent on both surfaces, 10 to 16-lobed, the lobes flabellate; flowers large, purple or lilac, the showy corollas much longer than the calyx.—Near the coast, Mendocino to San Luis Obispo. Rare.

14. *T. microdon* H. & A. Fig. 529. Stems stout, erect,  $\frac{1}{2}$  to 2 ft. high; herbage pilose; leaflets broadly obcordate or oblanceolate, serrate-setate, 5 to 9 lines long; stipules ovate-lanceolate; involucre deeply campanulate, becoming flattened at anthesis, 5 to 15-lobed; lobes prominent, green, 3 to 7-toothed; flowers small; corolla white or turning light pink; calyx-teeth short, abruptly subulate, scarious and ciliate-margined; pods 1-seeded.—Hillsides and valleys, Coast Ranges from San Luis Obispo Co. to Solano and Mendocino Cos.; n. to B. C.; S. Am. Var. *PILDSUM* Eastw. Smaller; more or less woolly pubescent.—San Nicholas Isl.

529. *Trifolium microdon* H. & A.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, involucre  $\times 1\frac{1}{2}$ ; c, fl.  $\times 3\frac{1}{2}$ .

15. *T. microcéphalum* Pursh. Stems slender, ascending,  $\frac{1}{2}$  to 2 ft. high; herbage soft-pubescent to nearly glabrous; stipules ovate, acuminate; leaflets obcordate to oblanceolate, retuse, serrate, 3 to 6 lines long; involucre 7 to 10-lobed, the lobes lanceolate, entire with scarious web-like margins; heads small, compact, 3 to 5 lines high; flowers small; corolla light pink or white; calyx shorter to slightly longer than corolla, the teeth entire, pungent, the margin below with a broad scarious border; pods 1 or 2-seeded.—Hillsides and valleys, common throughout cismontane Cal.; n. to B. C. Mar.-May.

16. *T. dubium* Sibth. SHAMROCK. Stems slender, 1 to many from base, erect or ascending,  $\frac{1}{2}$  to  $1\frac{1}{2}$  ft. long, pubescent above; leaflets obovate or cuneate, denticulate, often emarginate, 3 to 4 lines long, on very short petioles; heads small (3 lines broad), the rachis elongated; flowers very small, in age reflexed; corolla yellow; pods 1-seeded.—Nat. from Eur.: Humboldt Co. (frequent); Crescent City; Nevada City. May-June.

17. *T. procumbens* L. HOP CLOVER. Stems slender, decumbent or ascending, 6 to 13 in. long, finely appressed-pubescent; leaflets elliptic-obovate, often emarginate, 3 to 9 lines long, longer than the petioles; heads globose or a little elongate, 4 to 5 lines long; flowers in age reflexed; corolla bright yellow, standard very broad.—Introd. from Eur., sparingly established: Potato Cañon, San Bernardino Mts.; Humboldt Co. (Eureka; Korbel). June.

18. *T. bifidum* Gray. PINOLE CLOVER. Stems erect, very slender, 7 to 17 in. high; stipules ovate-lanceolate, setaceously acuminate, entire; leaflets remarkably bifid, that is  $\frac{1}{2}$  to  $\frac{1}{2}$  their length, often with a prominent mucro in the notch, the lobes coarsely toothed at apex; leaflets of upper leaves 5 to 11 lines long; peduncles pubescent at base of heads; heads small, the flowers

in age reflexed; calyx pubescent; corolla purple or pale pink, banner characteristically patterned by the peculiar venation.—Open hills and valleys, 100 to 1500 ft.: coastal S. Cal.; Coast Range hills from Santa Clara Co. to Humboldt Co.; Sacramento Valley; Sierra Nevada foothills from Mariposa Co. to Shasta Co.; infrequent in the typical form. May-June. Var. *DECIPIENS* Greene. Leaflets linear-cuneate to obcordate, entire or slightly emarginate at apex.—More common than the species; Santa Barbara Co. to Humboldt Co., thence e. to the Great Valley and n. Sierra Nevada foothills.

19. *T. ciliatum* Nutt. TREE CLOVER. Fig. 530. Stem stout, erect, fistulous, 1 to 2 ft. high; herbage glabrous throughout; stipules large, ovate-lanceolate, the margins scarious; leaflets oblong or oblong-ovate, obtuse, entire to serrulate,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; heads conical, the flowers reflexed in age; rachis often projecting through the head as a sterile point 1 to 5 lines long; corolla pinkish-purple; calyx-teeth remarkably ciliate; banner inflated at base, tapering toward the apex; pods 1 or 2-seeded.—

Plains, valleys and foothills, 50 to 5000 ft., throughout cismontane Cal.; n. to Wash. (*T. ciliolatum* Benth.)

530. *Trifolium ciliatum* Nutt.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, calyx spread open  $\times 3\frac{1}{2}$ ; c, fl.  $\times 2$ .

531. *Trifolium gracilentum* T. & G.; a, habit  $\times \frac{1}{2}$ ; b, fl.  $\times 2$ .

20. *T. gracilentum* T. & G. PIN-POINT CLOVER. Fig. 531. Stems slender, erect, spreading or procumbent, 5 to 20 in. long; herbage glabrous; stipules ovate-lanceolate; leaflets obovate, retuse at apex, 3 to 6 (or 9) lines long; heads numerous, small, 3 to 5 lines long, with the flowers reflexed in age, the rachis projecting; calyx-teeth subulate, entire, shorter than the reddish purple to light pink corolla; pod 1 to 2-seeded.—Valleys and foothills, 50 to 2500 ft.: coastal S. Cal.; Coast Ranges; Great Valley; Sierra Nevada foothills; n. to Wash. Common throughout the coast counties. Mar.-May. Var. *INCONSPICUUM* Fer. Smaller but like the species in habit; stems 4 in. high or less; flowers light purple to white; banner broader.—Common throughout coastal S. Cal. and w. Cal. The leaves exhibit a variety of beautiful markings from tiny white spots to red, brown and purple. Var. *PALMERI* McDer. Leaflets large, lanceolate, abruptly acute at tip, the margins serrate-setate; corolla purple to pink.—Santa Barbara Is. Apr.

21. *T. bréweri* Wats. FOREST CLOVER. Fig. 532. Stems slender, erect or diffuse, 6 to 14 in. high; herbage pubes-

cent. glaucous; leaflets obovate, notched or obtuse at apex, coarsely dentate, 3 to 7 lines long; heads small, loose, peduncles curved at apex in age and pedicels retro-curved so that the flowers at last stand almost horizontally (i. e. at right angles to the straight portion of the peduncle); corolla cream-white to deep pink.—Open forest, 3000 to 6500 ft.: Sierra Nevada from Mariposa Co. to Plumas and Butte Cos., thence westerly to Trinity Co.; n. to southwestern Ore. June-Aug.

22. *T. oréganum* Howell. Stems slender, 3 to 8 in. high, these and the chiefly basal leaves in a dense tuft on the root-crown; herbage glabrous to glabrate; stipules ovate, acuminate, the upper ones toothed, the lower entire; leaflets oblanceolate to obovate, serrulate, mucronate, 3 to 11 (or 15) lines long; peduncles  $1\frac{1}{4}$  to  $3\frac{1}{2}$  in. long; heads a little spicate,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long; flowers 6 to 7 lines long, the short pedicels reflexed in age; corolla pinkish or light red; calyx-segments subulate, twice as long as the tube.—Moist gravelly open slopes, 5000 ft., Buck Mt., Humboldt Co.; n. to Ore. June-July.

23. *T. hybridum* L. ALSIKE CLOVER. Stems short (4 to 12 in. high); herbage sparsely pubescent, or subglabrous; leaflets large, ovate to orbicular,  $\frac{3}{4}$  to  $1\frac{1}{8}$  in. long; pedicels pubescent; calyx

532. *Trifolium breweri* Wats.; a, fl. branchlet  $\times \frac{3}{4}$ ; b, calyx spread open  $\times 2$ ; c, banner  $\times 2$ ; d, pistil  $\times 3$ .

or glabrous, or a little hairy in the sinuses; corolla light pink.—Nat. from Eur. in mountain meadows: Sierra Nevada; Humboldt and Siskiyou Cos. Closely related to *T. repens* but a much stouter plant.

24. *T. kingii* Wats. Fig. 533. Stems rather slender, ascending, 4 to 15 in. high; leaflets lanceolate to oblong-lanceolate, acuminate, the lower rounded or obovate, spinulose-serrate,  $\frac{1}{2}$  to  $1\frac{1}{4}$  (or 2) in. long; stipules broadly lanceolate, entire,  $\frac{1}{4}$  to  $\frac{1}{2}$  as long as the leaflets; heads slightly elongate, 5 to 7 lines long; flowers 5 to 6 lines long, early deflexed, the end of the rachis produced as a sterile point; corolla rose-color or purple; calyx-segments subulate, longer than the tube.—Moist cañon bottoms, 5500 to 6500 ft., Nevada Co. to Siskiyou and Lassen Cos.; e. to Utah, n. to Mont. June.

25. *T. beckwithii* Brew. Stems stout, erect or ascending, 4 to 12 in. high; stipules lanceolate to ovate, entire; leaflets narrowly to broadly oblong, mostly obtuse, serrate,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long; heads

533. *Trifolium kingii* Wats.; a, leaf  $\times \frac{1}{2}$ ; b, fl. branchlet  $\times \frac{1}{2}$ ; c, calyx spread out  $\times 3\frac{1}{2}$ .

globose, 1 to 1½ in. long; flowers 6 to 8 lines long, reflexed in age; corolla red; calyx-teeth linear-subulate, straight, equaling the tube; ovary smooth, 2 to 6-ovuled.—Mountain valleys and meadows, 4000 to 6000 ft., n. Sierra Nevada from Nevada Co. to Modoc Co.; n. to eastern Ore. and southern Ida., e. to Nev. June-July.

26. *T. howellii* Wats. Stems stout, erect, nearly simple, 2 to 2¾ ft. high; stipules large, foliaceous, ovate; leaflets elliptic to elliptic-ovate, 1½ to 2½ in. long; heads ovate or oblong, ½ to ¾ in. long, the flowers on reflexed pedicels; corolla white.—Cañon creeks, 4000 to 5000 ft., Humboldt Co. to Siskiyou Co.; n. to Ore. July-Aug.

27. *T. repens* L. WHITE CLOVER. Stems creeping, bearing erect or ascending leaves and petioles; peduncles 2 to 9 in. high, much exceeding the leaves; herbage glabrous; leaflets broadly obcordate, 4 to 9 lines long; stipules ovate-lanceolate, acute; heads globose, 8 to 14 lines broad, the flowers completely reflexed in age; corolla white; calyx-teeth short, subulate, entire.—Nat. from Eur.; moist meadows, Sierra Nevada and Humboldt Co.

28. *T. bolanderi* Gray. Plants 4 to 9 in. high, the numerous stems decumbent or ascending, caespitose on the branched root-crown, sparsely leafy, the leaves mostly basal; leaflets obovate or somewhat rhomboidal, slightly serrulate, 3 to 8 lines long; peduncles slender, elongated, occasionally axillary, 2 to 5 in. long; heads small (5 to 6 lines long), the flowers relatively few, reflexed; corolla lavender; calyx-teeth lanceolate, scarcely equaling the tube; ovary smooth, 2-ovuled.—Mountain meadows, 7000 to 7100 ft., Sierra Nevada from Mariposa Co. (Westfalls Mdw.) to Fresno Co. (North Fork Kings River); very rare. June-July.

534. *Trifolium macrocephalum* Poir.; a. habit  $\times \frac{1}{2}$ ; b, fl.  $\times 1$ .

29. *T. macrocephalum* Poir. BIG-HEAD CLOVER. Fig. 534. Stem stout, simple, 4 to 9 in. high; herbage somewhat villous; stipules large, ovate-oblong, sparsely serrate; leaflets cuneate-oblong to obovate, obtuse, serrulate, mucronate, 3 to 8 lines long; heads mostly terminal, globose-ovate, 1¼ to 1½ in. broad; corolla ⅞ to 1¼ in. long, purplish; calyx half as long, the teeth subulate, plumose, 3 to 4 times as long as the tube; pod stipitate, 6-ovuled, smooth.—Shasta, Siskiyou and Modoc Cos.; e. to Nev., n. to B. C. Rather rare. Apr.-June.

30. *T. monoense* Greene. Caespitose dwarf 2 to 3½ in. high, the leaves and peduncles matted on the branching root-crown; herbage thinly pubescent; leaflets narrow-obovate, abruptly acute, entire, 3 to 5 lines long; stipules membranous, conspicuously crowded on the ends of the root-crown branches; peduncles 1½ to 2¾ in. long; heads 8 to 9 lines broad, a little broader than high; calyx-teeth densely hairy.—High montane, 10,000 to 12,000 ft., White Mts., Inyo Co.

31. *T. andersónii* Gray. Caespitose dwarf 2 to 4 in. high, forming dense leafy tufts or mats on the stout root-crown; herbage densely silky- or rusty-villous; leaflets oblanceolate to cuneate-oblong, 4 to 11 lines long, abruptly short-acute or mucronate, entire or nearly so; peduncles mostly axillary, shorter than the leaves; heads subglobose, ¾ to 1¼ in. broad, subtended by a scarious vestige of an involucre; flowers 6 to 8 lines

long; corolla purplish; calyx-teeth filiform, plumose, a little shorter than the petals; pods tomentose, about 5-ovuled, 1 or 2-seeded.—Mountain slopes, 3500 to 8000 ft., n. Sierra Nevada from Sierra Co. to Shasta and Modoc Cos.; e. to Nev. June-July.

32. *T. gymnocárcpon* Nutt. Dwarf, caespitose, 1 to 3 in. high, the leaves and peduncles arising from the shortly branched root-crown; herbage white-pubescent; stipules thin and scarious, forming conspicuous persistent sheaths to the branches of the root-crown; leaflets 3 to 5, obovate to elliptic, markedly serrate, 4 to 6 lines long; heads loosely few-flowered, surpassed by the leaves; calyx pubescent, its teeth lanceolate, about equaling the tube; corolla yellowish-white or reddish,  $3\frac{1}{2}$  to 4 lines long,  $1\frac{1}{2}$  to 2 times as long as the calyx; pods very short and thick, 1 or 2-seeded.—Plains and valleys, 5300 to 5500 ft., Plumas Co. to Modoc Co.; e. to Col. June.

33. *T. lemmónii* Wats. Stems rather slender, 6 to 8 in. high, from a thick root; stipules ovate, acuminate, coarsely toothed; leaflets obovate, obtuse, mucronate, coarsely toothed, 3 to 6 lines long; peduncles mostly terminal, far exceeding the leaves; heads 10 to 13 lines broad; flowers numerous, 4 to 7 lines long; calyx-tube pubescent, 2 lines long, the teeth subulate, nearly equal; corolla bright yellow; banner strongly hooded; ovary slightly pubescent, 2-ovuled.—Eastern crests and slopes of the n. Sierra Nevada, 5000 to 7000 ft., from Sierra Co. to Lassen Peak. June-July.

34. *T. macràei* H. & A. Stems several from the base, spreading or stout, often wiry, 4 to 12 in. long; herbage softly pubescent throughout; leaflets obovate, 4 to 6 lines long; heads sessile in pairs, subtended by the stipules and sessile leaves, 4 to 6 lines high; corolla purple, as long or longer than the plumose calyx.—Along the coast, Del Norte Co. to S. Cal.

35. *T. amoënum* Greene. Stem stout, erect, commonly one from the base, dichotomously branched only above,  $\frac{1}{2}$  to 2 ft. high, few-headed; herbage more or less densely pubescent; leaflets broadly obovate, about 1 in. long; leaves subsessile; heads globose-ovate, densely-flowered, 1 to  $1\frac{1}{2}$  in. long, on peduncles  $1\frac{1}{2}$  to  $4\frac{1}{2}$  in. long; peduncles straight; corolla purplish, tipped with white.—Valley fields, Marin and Sonoma Cos. to Solano Co.; rare. May-June.

36. *T. dichotomum* H. & A. INDIAN CLOVER. Fig. 535. Stems erect or ascending, 6 to 16 in. high; herbage sparsely to densely pubescent; stipules small, ovate-acuminate; petioles slender; leaflets ovate to elliptical or cuneate-obovate, 4 to 11 lines long; heads cylindric to ovate-cylindric, most commonly a little spike-like, truncate at top, turbinate at base, 6 to 12 lines long; peduncles 2 to 6 in. long, curved or retrocurved at apex; corolla cream-tipped, longer than the calyx; pods 1-seeded.—Locally gregarious, covering patches a rod square or so, low hills, Santa Cruz Co. to Contra Costa, Solano and Napa Cos.; rather uncommon. (*T. californicum* Jepson.) Var. *TURBINATUM* Jepson. Three to 6 in. high; heads narrowly or broadly turbinate, sometimes broadly ovate, 4 to 8 lines high; corollas longer than the calices.—Mountain slopes: Humboldt Co.; Mt. St. Helena; Mt. Tamalpais; Mt. Hamilton; Hepsedam Peak. (*T. petrophilum* Hel.)

535. *Trifolium dichotomum* H. & A.; a, habit  $\times \frac{1}{2}$ ; b, fl.  $\times 2$ ; c, pod  $\times 3$ .

37. *T. álhopurpúreum* T. & G. RANCH-  
ERIA CLOVER. Stems slender, ascending or  
slightly decumbent, 8 to 16 in. high;  
heads hemispherical, or somewhat elon-  
gated, 4 to 7 lines long, the terminal  
single, on long peduncles, the lateral on  
short peduncles; leaflets obovate to cune-  
ate-oblong, obtuse, 3 to 7 (or 12) lines  
long; corolla dark purple, barely or not at  
all longer than the calyx-teeth; pods 1 or  
2-seeded. — Valleys and hillsides, 20 to  
3000 ft.: Coast Ranges from Siskiyou Co.  
to San Luis Obispo Co. and s. to San  
Diego Co.; less common in the Sierra  
Nevada foothills from Butte Co. to Kern  
Co.; n. to Wash. Apr.-May. Var. *NEOLA-*  
*GÓPUS* McDer. Stems rigid, 12 to 16 in.  
high; corolla as long as or slightly longer  
than the calyx. — Coast Ranges from Hum-  
boldt Co. to w. Kern Co.

38. *T. oliváceum* Greene. Fig. 536. Stems erect or ascending, 8 to 12 in. high;  
herbage pubescent and glaucous through-  
out; leaflets cuneate-obovate, serrulate, 4  
to 12 (or 15) lines long; peduncles stout;  
heads broadly ovate to hemispherical,  
subtruncate to turbinate at base, bright  
olive-green, 6 to 10 lines high; flowers  
completely hidden by the long and pubes-  
cent calyx-teeth; calyx-tube 1 to  $1\frac{1}{2}$  lines long, conspicuous at the base of  
the heads; corolla whitish and purplish; pods glabrous, 1-seeded. — Low hills  
and valley fields, Butte and Colusa Cos. to Marin Co. Apr.-May. Var.

*COLUMBINUM* Jepson n. comb. Heads  
dove-color, longer than broad, 6 to 12  
lines high; pods pubescent, 1-seeded.  
— Low hills, North Coast Ranges  
from Solano Co. to Mendocino and  
Colusa Cos. Var. *GRÍSEUM* Jepson n.  
var. Heads gray, broadly ovate, 6 to  
8 lines high; flowers less completely  
concealed. — Hills bordering the w.  
side of the San Joaquin Valley (New  
Idria, Jepson 2708, type).

39. *T. praténse* L. RED CLOVER. Stems branching from the base,  $\frac{1}{2}$   
to 2 ft. high; herbage pubescent;  
petioles short, the leaves subtending,  
the head sessile; leaflets large, ovate  
to elliptic, entire to crenulate, often  
with a whitish blotch near the  
middle, 1 to  $1\frac{3}{4}$  in. long; stipules  
membranous, conspicuously veined;  
heads round-ovate to conical,  $\frac{3}{4}$  to  
1 in. high; corolla deep pink or red;  
calyx-tube characteristically nerved  
near the base of teeth; pod 2-seeded.  
— Nat. from Eur.; low moist valleys  
or meadows in the mts.

40. *T. ériocéphalum* Nutt. Fig.  
537. Stems erect or at base decum-  
bent,  $\frac{1}{2}$  to 1 ft. high; herbage vil-

536. *Trifolium olivaceum* Greene; a, fl.  
branchlet  $\times \frac{1}{2}$ ; b, fl.  $\times 2$ .

537. *Trifolium eriocephalum* Nutt.; a, fl.  
branchlet  $\times \frac{1}{2}$ ; b, fl.  $\times 2$ .

lous with spreading hairs, or rarely glabrous; stipules long, nearly entire; leaflets narrowly oblong or sometimes broader, serrulate,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; peduncles becoming recurved; heads dense, globose, slightly spicate,  $\frac{1}{2}$  to  $\frac{3}{4}$  in. broad; flowers early reflexed, 4 to 6 lines long; calyx-teeth plumose, filiform, lax,  $\frac{2}{3}$  the length of the petals; corolla dull yellow; ovary hairy, 2 to 4-ovuled.—Humboldt Co. to Siskiyou Co.; n. to Wash. and Ida. June. Var. *HARNEYENSE* McDer. Leaves long and narrow ( $\frac{3}{4}$  to  $2\frac{1}{2}$  in. long, 1 to  $2\frac{1}{2}$  lines broad); heads 5 to 6 lines broad.—Siskiyou Co.; n. to Ida.

41. *T. longipes* Nutt. Stems slender, erect or ascending, 2 to 12 in. high, arising from a branched woody rootstock; stems usually glabrous, the leaflets and calyx sparingly villous; stipules ovate-lanceolate, entire or toothed; leaflets narrowly oblong or obovate to oblanceolate, serrulate,  $\frac{1}{3}$  to  $1\frac{1}{2}$  in. long; peduncles (1 or)  $2\frac{1}{2}$  to  $4\frac{1}{2}$  in. long, remaining erect; heads broadly ovate, rather dense, 7 to 10 lines high; corolla 5 to 6 lines long, yellowish-white or tinged with purple; calyx-teeth lanceolate-subulate, straight, more or less hairy, shorter than the corolla; ovules 2 to 4.—Montane, 6000 to 8500 ft.: San Jacinto and San Bernardino mountains; Sierra Nevada from Tulare Co. to Shasta and Modoc Cos.; Mt. Sanhedrin to Yollo Bolly Mts.; e. to Rocky Mts., n. to Canada. June-July. Var. *ELMERI* McDer. Stoutier,  $1\frac{1}{2}$  to 2 ft. high; leaflets linear-oblong,  $1\frac{1}{2}$  to  $2\frac{3}{4}$  in. long.—E. Humboldt Co. July-Aug.

# 17. LOTUS L. BIRD'S-FOOT TREFOIL

By ALICE M. OTTLEY

Herbs or suffrutescent plants. Leaves alternate, pinnately compound, with 3 to many leaflets; stipules foliaceous, membranous, scarious, or gland-like. Flowers solitary or umbellate, mostly leafy-bracteate. Calyx-teeth subequal. Corolla yellow to nearly white, often marked with rose, red or purple; petals of keel with more or less prominent lobe at base of blade, which is closely associated with pocket on wings. Stamens diadelphous. Legumes straight to strongly arcuate, one to many-seeded. (Ancient Greek plant-name.)

Corolla white or cream-colored, veined or suffused with rose or red.

Stipules broadly ovate to lanceolate; flowers umbellate, 1 to 1.2 cm. long; perennials. . . . . 3. *L. stipularis*.

Stipules gland-like; flowers solitary, 4 to 9 mm. long; annuals.

Calyx-teeth longer than the tube. . . . . 18. *L. americanus*.

Calyx-teeth not longer than the tube.

Flowers peduncled; bract 3 (1 or 2)-foliolate. . . . . 14. *L. micranthus*.

Flowers nearly sessile, ebracteate. . . . . 17. *L. denticulatus*.

Corolla greenish yellow to yellow, variously marked with rose, red or purple.

Stipules foliaceous, membranous or scarious; perennials.

Bract usually distant from the umbel and of several leaflets, stipulate; pedicels 1 to 10 mm. long.

Herbage gray-woolly, somewhat silky. . . . . 2. *L. incanus*

Herbage bright-green to glaucous, glabrate, the young tips pubescent. . . . . 1. *L. crassifolius*.

Bract when present borne at the base of the umbel and of 1 to 3 leaflets; pedicels rarely more than 1 mm. long.

Stems arising from a thickened root; claws of the petals distinctly exerted beyond the calyx-tube.

Bract mostly absent; corolla yellow and white or cream-colored. . . . . 5. *L. pinnatus*.

Bract present; banner yellow, wings pale rose or lilac, tip of keel purple. . . . . 4. *L. formosissimus*.

Stems arising from a slender rhizome; banner yellow, more or less veined with purple, wings whitish; claws of petals obscurely exerted beyond the calyx-tube. . . . . 6. *L. oblongifolius*.

Stipules gland-like.

Annuals.

Flowers in pedunculate umbels.

Legumes straight-beaked; seeds granulose, sometimes rugose; umbels 1 to 3-flowered.

Seeds quadrate, notched at the hilum. . . . . 11. *L. strigosus*.

Seeds subglobose. . . . . 12. *L. tomentellus*.

Legumes not straight-beaked; seeds smooth.

Beak of legume recurved, short; umbels 1 to 5-flowered. . . . . 13. *L. salsuginosus*.

Beak of legume involute, long; umbels several-flowered.

Style glabrous. . . . . 28. *L. nuttallianus*.

Style pubescent. . . . . 29. *L. hamatus*.

Flowers solitary, sessile or short-pedicel.

Calyx-teeth equaling or shorter than the tube. . . . . 16. *L. subpinnatus*.

- Calyx-teeth mostly twice as long as the tube.....15. *L. humistratus*.  
 Perennials.  
 Flowers 1.3 to 2.5 cm. long; umbels long-peduncled.  
 Leaflets 7 to 9.....7. *L. grandiflorus*.  
 Leaflets 3 to 5.....8. *L. rigidus*.  
 Flowers 1.2 cm. or less long.  
 Legumes straight or nearly so.  
 Umbels long-peduncled; fruits dehiscent.  
 Legumes mostly reddish brown, appressed-pubescent; var.  
 multicaulis of.....9. *L. wrightii*.  
 Legumes mostly straw-colored, thinly silky-pubescent.....  
 10. *L. argyraeus*.  
 Umbels sessile to short-peduncled; fruit indehiscent.  
 Herbage silky-canescens.....23. *L. leucophyllus*.  
 Herbage glabrous to glabrate, growing tips often pubescent.  
 Calyx-teeth subulate, lax, often recurved.....26. *L. benthamii*.  
 Calyx-teeth subulate, stiff, always erect.....24. *L. scoparius*.  
 Legumes slightly curved to strongly arcuate.  
 Calyx-teeth short-triangular with midvein broad and conspicuous.....  
 27. *L. junceus*.  
 Calyx-teeth linear to filiform, often subulate.  
 Herbage nearly glabrous.....25. *L. haydonii*.  
 Herbage pubescent.  
 Pubescence somewhat woolly, hairs of young stems loose  
 and spreading, making with the stem, at point  
 of insertion, a right or an obtuse angle.....  
 19. *L. eriophorus*.  
 Pubescence mostly appressed, hairs of young stems, mak-  
 ing with the stem, at point of insertion, an  
 acute angle.  
 Banner blade oblong to short-oblong, making an  
 acute angle with the wings.  
 Pubescence usually silky, hairs on leaves and  
 calyces soft, straight, mostly long...  
 21. *L. argophyllus*.  
 Pubescence not silky, hairs on leaves and  
 calyces somewhat arched.....  
 20. *L. douglasii*.  
 Banner blade short-obovate, either reflexed or erect  
 and making a right angle with the wings...  
 22. *L. davidsonii*.

I. Subgenus *HOSACKIA*.—Stipules foliaceous, membranous or scarious; umbels few to many-flowered, long-peduncled; flowers 7 to 20 mm. long; legumes straight, abruptly short-beaked, dehiscent, not reflexed; perennials.

A. LEGUMES LINEAR-OBLONG; FLOWERS 1 TO 1.5 CM. LONG; CLAWS OF PETALS EXsertED BEYOND THE CALYX-TUBE; LEAFLETS 5 TO 15.

538. *Lotus crassifolius* Greene; a, fl. branchlet x 1; b, pod x ½.

1. *L. crassifolius* (Benth.) Greene. Fig. 538. Stems erect, fistulose, 4 to 12 dm. high, with long internodes; leaflets oval, rhombic or obovate; umbels one-sided; flowers greenish yellow marked with dark red; calyx-teeth usually very short and subulate-triangular; legumes 3.5 to 7 cm. long, 3 mm. or more wide, several to many-seeded.—Foothills and mountains, 2300 to 8000 ft.: San Jacinto Mts. of S. Cal.; Sierra Nevada; Coast Ranges; n. to the Columbia River. May-July. (*Hosackia crassifolia* Benth. *H. stolonifera* Lindl.)

2. *L. incanus* (Torr.) Greene. Fig. 539. Stems erect, 1.5 to 3 dm. high; leaflets oval to elliptical; calyx-teeth linear-subulate, less than half the length of the tube; legumes 1.5 to 4 cm. long, 2 to 7 mm. wide, glabrous.—Open places in pine woods: Butte, Placer and Nevada Cos., 2500 to 3400 ft. May-July. (*Hosackia incana* Torr.)

3. *L. stipularis* (Benth.) Greene. Stems erect, 3 to 5 dm. high, woody; herbage

539. *Lotus incanus* Greene; a, fr. branchlet  $\times 1$ ; b, fl.  $\times 2$ .

loosely villous; hairs long and somewhat wavy, often viscid-glandular; leaflets oval to nearly oblong, the first pair often at the base of the leaf, covering the stipules; pedicels 2 to 4 mm. long; calyx long-campanulate, teeth short-triangular or subulate, 1 (or 2) mm. or less long; wings of corolla spreading; legumes 3 cm. or less long, 2 to 3 mm. wide, often glandular.—Dry hillsides and mountain slopes, 10 to 3800 ft.: Coast Ranges from Monterey Co. to Mendocino Co.; Sierra Nevada from Shasta Co. to Tulare Co.; infrequent. Apr.-July. (*Hosackia stipularis* Benth. *H. macrophylla* Kell. *H. balsamifera* Kell.) Var. *SUBGLABER* Ottley. Prostrate to erect; herbage nearly glabrous, underside of leaflets glaucous; pedicels 1 to 2 mm. long; calyx-tube turbinate-campanulate, teeth triangular, ciliate; legumes 1.5 to 4 cm. long, 3 to 4.5 mm. wide.—Border of woods of the plains, hills or mountains; Sonoma, Mendocino, Humboldt, and Del Norte Cos.; n. to Wash. Not abundant. Apr.-July. (*Hosackia rosea* Eastw.)

#### B. LEGUMES LINEAR.

4. *L. formosissimus* Greene. WITCH'S TEETH. Fig. 540. Stems herbaceous, weak; herbage glabrous; basal leaves with 3 to 5 obovate retuse leaflets, upper leaves with 5 or 7 (or 9) oblanceolate to elliptical acute leaflets; bract of 1 to 3 (or to 7) leaflets; flowers 1.3 to 2 cm. long; calyx slightly 2-lipped; banner blade oblong, reflexed; wings of corolla spreading; claws of the keel longer than the acutely beaked blades.—Damp or springy ground, 10 to 1500 ft., mostly along the coast from Monterey and San Benito Cos. to Del Norte Co.; n. to Wash. Mar.-June. (*Hosackia gracilis* Benth.)

5. *L. pinnatus* Hook. Stems flexuous, 2 to 4 dm. high; herbage glabrous; leaflets 5 to 9, oval or obovate, obtuse or acute, somewhat mucronulate; umbels not leafy-bracteate as a rule, but with an involucre of short, scarious bractlets; flowers 1.2 to 1.5 cm. long; calyx 2-lipped, with tube transparent and lighter than the dark conic hypanthium; claws of the keel petals and blade of the banner as in no. 4.—Occasional in moist ground, 3000 to 6000 ft.: Trinity and Shasta Cos.; Sierra Nevada from Calaveras Co. to Plumas Co.; n. to Wash., where more abundant. Apr.-July. (*Hosackia bicolor* Dougl.)

6. *L. oblongifolius* (Benth.) Greene. Stems erect, 1.5 to 3 dm. high, bright green; herbage pubescent with short-appressed hairs; leaves 7 to 11-foliate; leaflets linear-lanceolate or ellip-

540. *Lotus formosissimus* Greene; a, fl. branchlet  $\times \frac{1}{2}$ ; b, fl.  $\times 1\frac{1}{2}$ ; c, pods  $\times \frac{1}{2}$ .

tical, acute at both ends; umbels 1 to 5-flowered; flowers 8 to 15 mm. long; calyx-tube turbinate-campanulate, somewhat villous; banner blade ovate, erect, claws of the keel shorter than the broad, rounded blade.—Along streams in the foothills and mts. of S. Cal., 1000 to 6000 ft., from San Diego Co. to Santa Barbara Co. and the Tehachapi Mts. Frequent. May-Oct. (*Hosackia oblongifolia* Benth. *H. lathyroides* D. & H.) Var. *TORREYI* (Gray) Ottley. Hirsute-pubescent, becoming glabrate; leaflets oblanceolate or obovate, mostly obtuse, those of the uppermost leaves often elliptical or oval and acute at both ends; flowers 10 to 15 mm. long.—Meadows and along streams: Sierra Nevada; North Coast Ranges; frequent. May-Sept. (*L. torreyi* Greene. *Hosackia torreyi* Gray.) Var. *CUPREUS* (Greene) Ottley. Stems low, much-branched and flaccid, arising from a closely branched woody rhizome, glabrous; leaflets oblanceolate, mucronate, those of the lower leaves mostly cuneate-obovate; umbels 1 to 3-flowered; flowers 7 to 8 mm. long.—Meadows: s. Sierra Nevada, 8000 ft. or higher. Local. June-Aug. (*L. cupreus* Greene. *Hosackia cuprea* Smiley.)

II. Subgenus *ANISLOTUS*.—Stipules gland-like; flowers solitary or umbellate, 4 to 25 mm. long; legumes straight or nearly so, abruptly short-beaked, dehiscent, not reflexed.

A. WINGS TURNED OBLIQUELY IN RELATION TO THE SHORT KEEL; BANNER BLADE OBLONG, ATTENUATE INTO THE CLAW, ROLLING BACK.

### 1. Perennials.

a. Stems erect from a branched woody rhizome; legumes linear, many-seeded.

7. *L. grandiflorus* (Benth.) Greene. Fig. 541. Stems 4 to 7 dm. high; young stems and leaves slightly puberulent; leaves 3 to 9 cm. long; leaflets

541. *Lotus grandiflorus* Greene; a, fl. branchlet  $\times \frac{1}{2}$ ; b, pod  $\times \frac{1}{4}$ .

obovate, obtuse, mucronate; umbels several-flowered; bract of 1 to 3 large leaflets; calyx with soft, short, white hairs between its teeth, teeth long-subulate with a broad base to nearly linear, half to nearly as long as the tube; corolla lemon-yellow, turning deep rose with age.—Dry slopes, 2000 to 3500 ft.: Sierra Nevada from Mariposa Co. to Shasta Co., thence s. in the Coast Ranges to Santa Barbara Co. and mts. of S. Cal. Mar.-July. Infrequent. (*Hosackia grandiflora* Benth. The form of the Sierra Nevada is larger than that of the Coast Ranges and represents *Hosackia macrantha* Greene.) Var. *MUTABILIS* Ottley. Shorter; herbage velvety-pubescent; leaves mostly less than 4 cm. long; peduncles shorter or slightly longer

than the leaves; flowers 1.5 to 1.8 cm. long.—Ridges: Coast Ranges from Mendocino and Lake Cos. to San Luis Obispo Co.; s. to mts. of S. Cal.; Calaveras Co., Sierra Nevada. More frequent than the species. Apr.-June. (*Hosackia grandiflora* var. *anthylloides* Gray. *L. leucophaeus* Greene. *L. confinis* Greene.)

8. *L. rigidus* (Benth.) Greene. Suffrutescent with stems coarse and rigid; internodes long; herbage pubescent with scanty, short, appressed white hairs, becoming glabrate; leaves short (1 to 2 cm. long); leaf-rachis clearly evident when bearing 5 leaflets; leaflets linear-oblong, obtuse or truncate at apex, cuneate at base, markedly variable in length; umbels 2 or 3-flowered; bracts when present commonly of 1 small leaflet; calyx-teeth broadly subulate,  $\frac{1}{2}$  to  $\frac{1}{4}$  the length of the tube (rarely almost equaling it in length); legumes straw-color, shining, terete; seeds globose, granulose.—Ranges in

and bordering the deserts: Inyo Co.; e. Mohave Desert; Colorado Desert (where it reaches its best development); e. to Utah and Ariz., s. to L. Cal. Mar.-June. (*Hosackia rigida* Benth. *L. argensis* Cov.)

b. Stems many from the root-crown; leaves short; umbels bractless.

9. *L. wrightii* (Gray) Greene var. *multicaulis* Ottley. Decumbent or ascending. stems 2.5 dm. or less long, slender; herbage appressed-pubescent; leaflets mostly 3 or 4, oblong or oblanceolate; peduncles 2 to 4 cm. long; umbels commonly 2-flowered; flowers 1 cm. long; calyx  $\frac{1}{2}$  as long, teeth narrowly lanceolate to linear,  $\frac{1}{2}$  as long as the tube; legumes linear, 2 to 3 cm. long, 2 to 3 mm. wide; seeds subglobose.—New York Mts., e. Mohave Desert; e. to Nev. Apr.-May.

10. *L. argyraeus* Greene. Stems prostrate with short internodes; herbage, calyces and legumes covered with a white, silky, appressed pubescence; leaves often broader than long, petiole and rachis short; leaflets 3 to 5, cuneate-oblanceolate or cuneate-obovate, mostly obtuse to truncate; umbels 1 or 2 (or 3)-flowered; flowers 8 to 10 mm. long; calyx-teeth subulate, slightly more than one-half as long as the tube; legumes linear to linear-oblong, 1 to 2.2 cm. long; seeds oblong-spherical, smooth.—Mountain valleys: San Bernardino Mts. to San Diego Co.; s. to L. Cal. Occasional. May-Sept. (*Hosackia argyrea* Greene.)

2. *Annuals; stems several from the root-crown.*

11. *L. strigosus* (Nutt.) Greene. Stems slender, decumbent to ascending; herbage and legumes thinly appressed-hirsutulous; leaves 1.5 to 2.5 cm. long; leaflets linear-oblong, acute, scattered along the flattened rachis, the basal one nearly at juncture of petiole with stem, about half the length of the terminal one; flowers 5 to 10 mm. long; legumes straight or slightly curved at apex, 2 to 3 cm. long, 2 to 2.5 mm. wide; seeds not more than 1 mm. in diameter.—Sandy soil along the coast from San Francisco to San Diego Co. Jan.-Nov. (*Hosackia strigosa* Nutt. *H. rubella* Nutt. *H. nudiflora* Nutt.) Var. *hirtellus* (Greene) Ottley. Canescently hirsutulous, hairs not appressed; leaves 1 to 2 cm. long; leaflets cuneate-oblanceolate, obovate or oblong, obtuse, thickish; flowers 8 to 11 mm. long; legumes mostly 3 mm. wide, usually somewhat constricted between the seeds; seeds larger than for the species.—Arid situations, mainly in the pine belt on ridges, Tuolumne Co. to S. Cal.; s. to L. Cal. Apr.-Oct. Intergrades with the type represent Nuttall's *Hosackia nudiflora*. (*L. hirtellus* Greene.)

542. *Lotus tomentellus* Greene; fl. and fr. branchlet  $\times 1$ .

12. *L. tomentellus* Greene. Fig. 542. Small prostrate plant with leaves and flowers resembling those of *L. strigosus* var. *hirtellus*; pubescence thin, canescently hirsutulous; legumes less than 3 mm. wide.—Deserts: Panamint Mts. to Colorado Desert; e. to Ariz., s. to L. Cal. Mar.-May.

B. WINGS PARALLEL TO THE KEEL; BANNER BLADE ABRUPTLY CLAWED.

1. Lobe or process of keel shallow; legumes linear; seeds globose to short-oblong.

13. *L. salsuginosus* Greene. Decumbent or procumbent; stems many from the crown of the root; pubescence of few, short, appressed hairs; leaves slightly succulent, 2 to 4 cm. long, the rachis flattened; leaflets mostly 5 or 6, obovate to orbicular; umbel with a bract of 1 to 3 ovate or orbicular leaflets; flowers 8 to 10 mm. long; keel obtuse.—Coastal counties from Santa Clara to San Diego; Reché Cañon, San Bernardino Co.; Santa Barbara Is.; s. to L. Cal. Mar.-July. (*Hosackia maritima* Nutt.) Var. *brévivexillus* Ottley. Small and prostrate; peduncles shorter than the leaves; flowers 3 to 5 mm. long; banner and wings shorter than the keel; legumes 1 to 2 cm. long, con-

stricted between the seeds. — Panamint Mts.; Colorado Desert; San Diego Co.; Ariz. to Mex. and L. Cal.; islands w. of L. Cal. Mar.-May. (*L. humilis* Greene.)

14. *L. micranthus* Benth. Fig. 543. Low, diffusely branched; stems slender and wiry; rachis of leaf terete; leaflets 3 to 5, somewhat glaucous, oblong, oblanceolate or elliptical, obtuse; flowers 4 to 5 mm. long; calyx turbinate-campanulate; banner blade short-oblong to nearly orbicular; keel acute; legumes constricted between the seeds; seeds 5 to 9, suborbicular to short-oblong. — Fairly common in grassy situations in the foothills, 100 to 4000 ft.: Coast Ranges; Sierra Nevada; s. to Los Angeles Co.; n. to Wash. Jan.-Aug. (*Hosackia parviflora* Benth.)

543. *Lotus micranthus* Benth.; a, habit  $\times \frac{1}{2}$ ; b, fl.  $\times 4$ .

2. Lobe or process of keel deep; keel attenuately beaked, its upper margin covered, except at the tip, by the wings; legumes linear to oblong; seeds umbilicate; rachis of leaf flattened; leaflets 3 to 5; flowers 5 to 8 mm. long.

15. *L. humistratus* Greene. HILL LOTUS. Stems prostrate to ascending, diffusely branched; herbage densely villous or sometimes only slightly so; leaflets oblanceolate to obovate, 2 or 3 at apex of the rachis, the others scattered; banner short-clawed, blade nearly orbicular; legumes oblong, commonly straw-color, 7 to 10 mm. long; seeds 2 to 5, mostly 3. — Largely confined to dry hillsides 100 to 2500 ft.: Siskiyou Co.; Coast Ranges; Sierra Nevada foothills; Inyo Co.; Mohave Desert; thence e. to N. Mex. Apr.-July. (*Hosackia brachycarpa* Benth. *Lotus trispermus* Greene.)

544. *Lotus subpinnatus* Lag.; a, habit  $\times \frac{1}{2}$ ; b, fl.  $\times 1$ ; c, fl.  $\times 1$ .

16. *L. subpinnatus* Lag. Fig. 544. Closely allied to no. 15, pubescence less marked, varying from pilose to nearly glabrous; legumes oblong to linear, 10 to 25 mm. long, 3 to 7-seeded. — Hillsides and plains 20 to 2500 ft., throughout cismontane Cal., often growing with *L. humistratus*. Mar.-Oct. (*Hosackia subpinnata* T. & G. *H. wrangeliana* T. & G.)

17. *L. denticulatus* (Drew) Greene. Stems erect, 2 to 5 dm. high; branches few and coarse; stems glabrous or with scanty, appressed pubescence, sometimes glaucous; leaves and calyces pilose, often denticulate; legumes 1 to 2 cm. long, 3 to 4 mm. wide. — Butte Co. to Siskiyou Co., thence s. to Mendocino Co.; n. to B. C. May-Aug. (*Hosackia denticulata* Drew.)

you Co., thence s. to Mendocino Co.; n. to B. C. May-Aug. (*Hosackia denticulata* Drew.)

III. Subgenus *ACMISPON*. — Stipules gland-like; leaves with 3 leaflets, terminal leaflet petiolulate, oblong or elliptical, acute, the 2 lateral ones asymmetrically ovate, nearly sessile, borne near or at the base of

the leaf; flowers solitary, peduncled, bracteate; keel acutely beaked; legumes linear, abruptly short-beaked, dehiscent, not reflexed; annuals.

18. *L. americanus* (Nutt.) Bisch. SPANISH CLOVER. Stems erect or ascending, 1.5 to 4.5 dm. high, well-branched; herbage silky-villous or pilose to nearly glabrous; vigorous branches sometimes bearing leaves with 4 or 5 leaflets and tips of branches occasionally with leaves of but 1 leaflet; peduncles exceeding the leaves or shorter; calyx-teeth subulate-lanceolate; legumes 3 to 7-seeded.—Throughout Cal. but mostly in the cismontane region; ne. to Minn., se. to Tex. and Mex. May-Oct. (*L. sericeus* Pursh. *Hosackia purshiana* Benth.) Var. *MINUTIFLORUS* Ottley. Decumbent, less robust than the type, pilose to nearly glabrous; peduncles longer or shorter than the leaves; flowers 4 to 5 mm. long.—Apparently a reduced form of the species growing at high altitudes or under other unfavorable conditions. June-July. (*Hosackia elata* var. *glabra* Nutt. *H. pilosa* Nutt.)

IV. Subgenus *SYRMATIUM*.—Stipules gland-like; flowers yellow, often marked with red, 3 to 12 mm. long, umbellate (umbels sometimes reduced to a single flower); legumes less than 2 cm. long, straight to arcuate, mostly attenuate into a long, incurved beak, indehiscent, reflexed; fruit deciduous at base of pedicel.

#### A. PERENNIALS.

##### 1. *Herbage conspicuously pubescent; many branches arising from the root-crown.*

a. Umbels several to many-flowered, short-peduncled to sessile, bracteate; prostrate to decumbent (*L. argophyllus* var. *ornithopus* erect).

19. *L. eriophorus* Greene. Plants forming dense mats several dm. in diameter, covered with a gray or rusty-villous pubescence; leaves on the main branches often conspicuously larger than those on the secondary branches; leaflets 4 to 6, scattered, oblanceolate or obovate, acute and apiculate; flowers 5 to 7 mm. long; calyx slightly more than one-half the length of the flower, its teeth approaching the length of the tube; legumes terete, arcuate, not keeled or only slightly so, abruptly beaked, usually 2-seeded.—Near the coast from Sonoma Co. to San Diego. Apr-Oct. (*Hosackia tomentosa* H. & A.) Var. *HEERMANNII* (D. & H.) Ottley. Pubescence thinner, stems often glabrate; flowers smaller, 3 to 5 mm. long; legumes mostly 1-seeded.—Santa Cruz Co. to San Diego Co.; San Bernardino and Riverside Cos. The typical condition of the variety appears in sandy washes at low altitudes. In the San Jacinto Mts. it closely resembles *L. douglasii* var. *nevadensis* but may be distinguished from it by the character of the pubescence. (*Hosackia heermannii* D. & H.)

20. *L. douglasii* Greene. Pubescence of stems of short, appressed hairs, of leaves and calyces somewhat villous; stems with long internodes; leaflets 4 or 5, oblanceolate or obovate, mostly acute; flowers 10 to 12 mm. long; calyx-teeth equal in length to the tube; wings oblong, noticeably surpassing the keel; legumes canescent, arcuate, attenuately beaked, mostly clearly keeled, extending well beyond the calyx-teeth.—Hills and mountains, Sierra Co. to Siskiyou Co.; n. to Wash. and Ida. Reaches its typical condition north of the state. May-July. (*Hosackia decumbens* Benth.) Var. *NEVADENSIS* (Wats.) Ottley. Often flowering the first season; pubescence always appressed; branches wiry; flowers 4 to 7 mm. long; calyx-teeth not more than half the length of the tube; wings equaling or exceeding the keel in length.—Mountains, 3500 to 6500 ft.: Sierra Nevada, n. to Siskiyou Co. s. to mts. of S. Cal.; e. to Nev. (*Hosackia decumbens* var. *nevadensis* Wats.) Var. *CONGESTUS* Ottley. Villous character of the pubescence more marked; branches shorter than for the type, 15 to 25 cm. long; internodes short; umbels dense, confined to the tips of the branches; leaflets elliptical, acute at both ends.—Hill country of Lake, Humboldt, Trinity and Siskiyou Cos. May-July. (*L. incanus* Dougl.)

21. *L. argophyllus* (Gray) Greene. Silvery-tomentose, tomentum close, extending from apex to base of the long, slender, decumbent branches, longer, denser and more silky on the leaves and calyces; leaves 8 to 15 mm. long; leaflets 3 to 5, roundish obovate; umbels nearly sessile, dense, extending back from the apex of the stem for some distance; bract of 1 leaflet, commonly present; flowers 8 to 10 mm. long; pedicels short, hidden by the pubescence; calyx-teeth obscured by the pubescence, about half the length of the tube; ovary with 2 to 4 ovules; legumes silky, slightly longer than the calyx, nearly straight, attenuately beaked, mostly clearly keeled, 1 (or 2)-seeded; seeds curved-oblong.—Foothills and plains, Monterey and Fresno Cos. to S. Cal. Mar.-July. (*Hosackia argophylla* Gray.) Var. *FREMONTII* (Gray) Ottley. Leaves slightly longer than those of the type; leaflets broadly oblanceolate or obovate to elliptical, acute; umbels confined to the ends of the branches; calyx-teeth as long as the tube; blade of banner shorter than its claw.—Sierra Nevada from Placer Co. to Mariposa Co. Occasional. May-July. (*Hosackia argophylla* var. *fremontii* Gray.) Var. *DECORUS* (Jtn.) Ottley. Herbage glistening satiny-canescens throughout or only at tips of the branches; umbels peduncled; pedicels more evident than in the type.—Foothills and mts. of S. Cal. Apr.-July. (*Hosackia argophylla* var. *decora* Jtn.) Var. *NIVEUS* (Greene) Ottley. Stems woody and stocky, characterized by short internodes; leaflets acute; calyx-teeth as long as the tube, extending beyond the corolla.—Santa Cruz and San Clemente Isls. (*Syrmatium niveum* Greene.) Var. *ORNITHOPUS* (Greene) Ottley. Less pubescent than the species or the varieties, herbage somewhat silky, stems becoming glabrate; leaflets 3 to 7, mostly 4 or 5, 6 to 12 mm. long, acute; umbels long-peduncled; legumes conspicuously exceeding the calyx, 2-seeded.—Santa Barbara Isls. Apr.-June. (*Hosackia ornithopus* Greene. *H. venusta* Eastw.)

22. *L. davidsōnii* Greene. Closely resembling *L. douglasii* var. *nevadensis* and *L. argophyllus* var. *decorus* in habit and general appearance; herbage bluish-green or silvery; flowers 5 to 8 mm. long; calyx-teeth half as long as the tube or approaching it in length.—Pine belt of the mts. of S. Cal.; frequent. May-Aug. (*L. sulphureus* Greene.)

545. *Lotus scoparius* Ottley; a, fl. branchlet  $\times \frac{1}{2}$ ; b, fl.  $\times 2$ ; c, pod  $\times 2$ .

b. Umbels 1 to 3 (or 5)-flowered, sessile, bractless; prostrate to erect.

23. *L. leucophyllus* Greene. Suffrutescent to slightly woody at base; leaflets 3, approximate, elliptical (or oblanceolate), acute; flowers 6 to 9 mm. long; calyx nearly half as long, teeth narrowly linear, about half as long as the tube; claws of the petals exserted; legumes silky-canescens, slender, much exceeding the calyx; seeds 2 to several.—Foothills and mountains, 1000 to 6000 ft.: San Benito and Monterey Cos. to Inyo Co.; s. to Cajon Pass and San Geronio Pass. Apr.-July. (*Hosackia sericea* Benth. *H. procumbens* Greene.) Var. *JEPSONII* Ottley. Flowers 1 to 2 in an umbel, 9 to 12 mm. long; calyx-teeth between 2 and 3 mm. long and more than half the length of the tube; claws of the petals scarcely exserted.—S. Sierra Nevada in Tulare and Kern Cos., 6000 to 6300 ft. July.

2. Herbage not conspicuously pubescent, growing tips often appressed-pubescent; suffrutescent (*L. junceus* var. *biolettii* somewhat herbaceous).

24. *L. scoparius* (Nutt.) Ottley. DEER-WEED. Fig. 545. Suberect, bushy, 4 to 12 dm. high, with long virgate greenish

branches; stipular ridge prominent; leaflets 3 (4 or 5), oblong or oblanceolate (or oval), acute; umbels sessile or nearly so, extending back from apex of branches for many cm.; flowers 8 to 10 mm. long; legumes much surpassing the calyx, 1 or 2-seeded.—Hill country, 10 to 2500 ft.: Sierra Nevada foothills from Amador Co. to Kern Co.; Coast Ranges from Humboldt Co. to San Luis Obispo Co.; s. to coastal S. Cal.; abundant. Feb.-Oct. Plants having calyx-teeth triangular, with a prominent midvein ending in a subulate point, occur in San Diego Co. (*Hosackia scoparia* Nutt. *L. glaber* Greene. *Syrmatium glabrum* Vog.) Var. *VEATCHII* (Greene) Ottley. Decumbent, more pubescent than the type; leaflets oblanceolate, obtuse; umbels nearly sessile; flowers 10 to 12 mm. long; calyx-teeth subulate-triangular; legumes 2-seeded.—San Miguel Isl.; s. to L. Cal. (*Hosackia veatchii* Greene. *Syrmatium patens* Greene.) Var. *DENDROIDEUS* (Greene) Ottley. Erect, more woody than the species, 12 to 21 dm. high; umbels short-peduncled; flowers 10 to 12 mm. long; legumes 2 or 3-seeded, longer than in the species.—Santa Cruz, Santa Rosa and Santa Catalina Isls. Jan.-Aug. (*Syrmatium dendroideum* Greene.) Var. *TRASKIAE* (Eastw.) Ottley. Erect; leaflets oblanceolate, obtuse; umbels pedunculate, with or without a 1-foliate bract; calyx-teeth short, subulate-triangular; claws conspicuously exerted.—Santa Catalina Isl. (*Syrmatium traskiae* Eastw.) Var. *BREVIALATUS* Ottley. Flowers 8 to 10 mm. long; banner short, keel extending noticeably beyond the upward curving wings.—S. Cal.; less abundant than the species.

25. *L. haydonii* (Orcutt) Greene. Low, erect, thickly branched, with inconspicuous leaves and flowers, the plant appearing little more than a mass of slender stiff greenish branches; leaves ternate; leaflets elliptical, obtuse, 2.5 mm. or less long; flowers solitary or rarely in pairs, short-pedunculate, 5 mm. or less long; legumes incurved, 1-seeded.—Stony slopes, w. border of the Colorado Desert; s. to L. Cal.; local. Apr. (*Hosackia haydoni* Orcutt. *L. spenceriae* Mcbr.)

26. *L. benthāmii* Greene. Stems brownish, abundantly branched, occasionally forming masses 7.5 dm. high and 12 dm. in diameter; stipules prominent; leaflets 3 to 5, oblong or cuneate-oblanceolate; peduncles exceeding the leaves; bract of 1 or 2 leaflets, sometimes lacking; legumes falcate, the subulate beak nearly as long as the body, 2-seeded.—Coastal: Sonoma Co.; San Mateo Co. to Santa Barbara Co. Apr.-Oct. (*Hosackia cytisoides* Benth.)

27. *L. júnceus* (Benth.) Greene. Stems brownish, low, erect to decumbent, much-branched, often two or three branches from a node; leaflets 3 to 5, rounded-oblanceolate; peduncles shorter or longer than the leaves; umbels mostly ebracteate; legumes short, terete and arcuate, 1-seeded.—Infrequent on dry hills and ridges, Mt. Tamalpais to San Luis Obispo. Apr.-July. (*Hosackia juncea* Benth.) Var. *BIOLETTII* (Greene) Ottley. Prostrate to decumbent, with many branches arising from the crown of the root; stems more delicate and wiry than for the species; pubescence more abundant, of short appressed hairs; leaflets oblanceolate or obovate, obtuse or acute; peduncles 5 to 20 mm. long; bract of 1 leaflet.—Dry ridges and burned-over areas: Fort Bragg; Mt. Tamalpais. May-Oct. (*L. biolettii* Greene.)

B. ANNUALS; PROSTRATE WITH MANY BRANCHES ARISING FROM THE CROWN OF THE ROOT.

28. *L. núttalliānus* Greene. Branches long and slender; young stems, leaves and calyces thinly hirsutulous, older stems glabrate; leaves 5 to 7-foliate; leaflets cuneate-oblanceolate, acute or obtuse; peduncles exceeding the leaves; bract when present mostly of 1 leaflet; flowers 5 to 7 mm. long, the calyx less than half as long; calyx-teeth triangular, about  $\frac{1}{2}$  as long as the tube; legumes several times as long as the calyx, slender, arcuate, constricted between the two seeds.—Coastal: San Diego Co. to L. Cal.; local. Apr.-June. (*Hosackia prostrata* Nutt.)

29. *L. hamātus* Greene. Fig. 546. Young stems, leaves and calyces appressed-pubescent; leaflets 4 to 6, oblanceolate, often mucronate and cuneate; umbels sessile or nearly so, ebracteate; flowers 3 to 4.5 mm. long, the calyx half as long; shape of fruit as in the preceding species; pericarp with wavy

v-shaped markings.—Occasional in sandy soils: Los Angeles, San Diego, San Bernardino, and Riverside Cos.; Santa Catalina Isl.; L. Cal. Mar.-June. (*Hosackia micrantha* Nutt. in part.)

### 18. AMÓRPHA L.

Deciduous shrubs with heavy-scented herbage. Leaves odd-pinnate, with caducous stipules and stipels, the leaflets dotted with translucent glands. Flowers small, violet or purple, in long and narrow terminal spikes. Calyx obconic, 5-toothed, persistent. Petals wanting except the banner, this erect, clawed, folded around the stamens and style. Stamens monadelphous at the very base, otherwise distinct, longer than the banner. Pod short, but exceeding the calyx, 1 or 2-seeded, tardily deliscent. (Greek amorphos, deformed, alluding to the corolla.)

Branchlets and leaves without prickly-like glands; calyx-teeth very short, low-triangular.....1. *A. fruticosa*.  
Branchlets and leaf-rachis with prickly-like glands; calyx-teeth acute-triangular or lanceolate,  $\frac{1}{2}$  to  $\frac{3}{4}$  as long as the tube.....2. *A. californica*.

1. *A. fruticosa* L. FALSE INDIGO. Shrub 3 to 6 ft. high; herbage minutely pubescent; leaflets 11 to 15, ovate to oblong,  $\frac{3}{4}$  to  $1\frac{1}{8}$  in. long, shortly petioled; stipules and bracts (as also in no. 2) linear-lanceolate, caducous; racemes 3 to 9 in. long; flowers 3 lines long; calyx canescent, especially on the teeth, with many glands; banner dark purple, truncatish or notched; pod with conspicuous blister-like glands, 4 lines long.—Along streams in the foothills and

mts.: s. slope San Gabriel and San Bernardino mountains to San Diego Co., w. side Colorado Desert; e. to Mississippi Valley and Fla. (*A. occidentalis* Abrams.)

2. *A. californica* Nutt. MOCK LOCUST. Fig. 547. Shrub 4 to 7 ft. high; herbage minutely pubescent; leaflets 11 to 27, oblong-elliptical, mucronulate at the retuse apex, shortly petioled, 7 to 12 lines long; rachis with prickly-like glands scattered among the sessile ones, the prickles often more or less deciduous late in the season; racemes 2 to  $5\frac{1}{2}$  in. long; flowers as in no. 1 except that the calyx has longer teeth; pod  $2\frac{1}{2}$  lines long, with many low circular glands which are depressed or somewhat excavated in the center.—Wooded cañons, 500 to 3000 ft.; Marin Co. to San Luis Obispo and Mt. Pinos; s. to the San Bernardino and Santa Ana mountains. (*A. hispidula* Greene.) Var. *NAPÉNSIS* Jepson n. var. Subglabrous; glands on the rachis none; racemes 1 to  $1\frac{1}{4}$  in. long; calyx nearly glabrous and glandless, its teeth minute.—Howell Mt., Napa Range (Jepson, type).

### 19. PAROSÈLA Cav. DALEA

Herbs, small shrubs or small trees. Herbage glandular-punctate. Leaves unequally pinnate or simple; stipules small, subulate; leaflets small, entire. Flowers in terminal spikes or racemes. Calyx with 5 nearly equal teeth or lobes, persistent. Banner cordate or auriculate, inserted opposite the cleft stamens. Stamens monadelphous. Pod ovate, compressed, usually indehiscent, more

546. *Lotus hamatus* Greene; a, fl. branchlet x 1; b, pod x 2.

547. *Amorpha californica* Nutt.; a, fl. branchlet x  $\frac{1}{4}$ ; b, fl. x  $3\frac{1}{2}$ ; c, pod x  $3\frac{1}{2}$ .

or less included in the calyx, 1 to 2-seeded. Seeds reniform. (Anagram of Psoralea.)

Shrubs, often very low; calyx-tube with a short turbinate base, the petals and stamens inserted at the summit of the turbinate portion; wing and keel petals with free claws or at least adnate only to very base of stamen-tube.

Leaves simple.

Stems white-pubescent, very spinose; calyx white-pubescent; ovules 4 to 6. . . . . 1. *P. spinosa*.

Stems bright green, somewhat spinose; calyx yellowish, nearly glabrous; ovules 2. . . . . 2. *P. schottii*.

Leaves pinnate, the terminal leaflet often longer than the lateral.

Corolla large, glabrous, exceeding calyx; leaflets more or less decurrent on rachis; petioles rather long (often as long as rachis and terminal leaflet); flowers in racemes.

Leaflets more or less decurrent on rachis, mostly ovate or oblong.

Banner rounded at summit or scarcely emarginate. . . . . 3. *P. arborescens*.

Banner obcordate. . . . . 4. *P. californica*.

Leaflets mostly distinct from rachis, narrowly linear or oblong. . . . . 5. *P. fremontii*.

Corolla small, more or less pubescent, little exceeding calyx; leaflets distinct from rachis; petioles very short; flowers in very dense spikes.

Leaflets 3 to 7, rather large, the terminal conspicuously longer; calyx densely hairy. . . . . 6. *P. emoryi*.

Leaflets 7 to 13, minute, subequal. . . . . 7. *P. polyadenia*.

Herbs, sometimes a little woody at base; petals and stamens inserted at base of calyx-tube, the claws of the wing and keel petals adnate to stamen-tube for about half their length.

Flowers in loose spike-like racemes; calyx less than half length of corolla. . . . . 8. *P. parryi*.

Flowers in heads; calyx exceeding corolla. . . . . 9. *P. mollis*.

1. *P. spinosa* (Gray) Hel. SMOKE TREE. Fig. 548. Very spinose and nearly leafless ash-gray low shrub or small tree, 4 to 25 ft. high; branchlets numerous, reduced to slender spines 1 to  $1\frac{1}{2}$  (or 3) in. long; leaves few, simple, cuneate-or linear-oblong, nearly sessile,  $\frac{1}{4}$  to 1 in. long, marked with a few large glands and persisting only a few weeks; spike  $\frac{1}{2}$  to 1 in. long; calyx-tube marked by a row of glands; corolla violet-purple, 4 to 5 lines long; ovules 4 to 6.—Common in washes, Colorado Desert; Ariz. to L. Cal. and Sonora. (*Dalea spinosa* Gray.)

2. *P. schottii* (Torr.) Hel. Shrubby slender somewhat spinose bush 3 to 8 ft. high; herbage bright green and nearly glabrous, or the young parts canescent; glandular dots dark, but the branches nearly glandless; leaves simple, linear,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long; flowers blue in loose racemes 1 to 4 in. long; calyx yellowish,  $2\frac{1}{2}$  to 3 lines long, obscurely glandular, its teeth low-triangular or shortly acute, ciliate-margined; corolla 4 to 5 lines long; banner obcordate; wings broadly oblong; keel-petals semi-orbicular with a strong auricular lobe at base; ovary and style pubescent; ovules 2, collateral; pods obliquely elliptic, 4 to 6 lines long, conspicuously marked with red glands, containing a single large seed.—Dry gravelly mesas, Colorado Desert; s. to L. Cal. (*Dalea schottii* Torr.)

3. *P. arborescens* (Torr.) Hel. MOHAVE DALEA. Rather spiny shrub with somewhat slender branches, 2 to 3 ft. high; herbage white-tomentose (eventually quite glabrous), the upper portion of the branches with scattered short bristle-like yellow glands; leaves  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long, pinnately divided into 5 (3 or 7) obovate mostly subequal leaflets 3 to 4 (or 6) lines long; racemes  $1\frac{1}{2}$  to 2 in. long; calyx 3 lines long, its lower teeth recurving, oblong-lance-

548. *Parosela spinosa* Hel.; a, fl. branchlet  $\times \frac{3}{4}$ ; b, fl.  $\times 2$ ; c, banner  $\times 2$ ; d, pod  $\times 2$ .

olate or lanceolate-subulate, nearly as long as tube; fruiting calyx 5 lines long; corolla blue, 4 to 5 lines long; banner obovate; ovary and lower part of style densely white-hairy with ascending hairs; ovules 2, superposed.—Mohave Desert. (*Dalea arborescens* Torr. *P. neglecta* Parish.)

4. *P. californica* (Wats.) Vail. CALIFORNIA DALEA. Rough bush 1 to 2 (or 6) ft. high; young parts canescent, sparingly glandular, eventually more or less glabrous; branchlets eventually rigid, spinose; leaves 7 to 10 lines long, pinnately divided into 5 (rarely 3 or 7) oblong entire leaflets decurrent on rachis, 1 to 5 lines long, or the terminal leaflet sometimes notched or unequally 2-cleft or sometimes excessively developed and the 2 lateral leaflets reduced or none; racemes 2 to 3 in. long; calyx canescent,  $2\frac{1}{2}$  to 3 lines long, its lower teeth subulate, rather shorter than tube; corolla purple, 4 to 5 lines long; banner with a v-shaped notch; upper part of ovary and style (except tip) white-hispidulose.—San Jacinto Valley; desert slopes of the San Bernardino and San Jacinto mountains; e. to southern Utah. Very near *P. fremontii*. (*Dalea californica* Wats.)

5. *P. fremontii* (Torr.) Vail. FREMONT DALEA. Shrub 1 to 3 ft. high; nearly glabrous or the leaves thinly canescent; leaves pinnate; leaflets 3 to 5, narrowly oblong, 3 lines long, mostly distinct from rachis; racemes loose, 3 to 5 in. long; calyx 3 lines long, finely pubescent outside and inside, its lower teeth subulate, as long as tube; corolla purple, 5 lines long; banner orbicular, notched at apex; lower portion of style and margins of ovary white-hairy with close ascending hairs; ovules 2, sub-collateral.—S. Nev. (*Dalea fremontii* Torr. *P. wheeleri* Vail.) Var. *SAUNDERSII* Mcbr. Leaves soon bright green, glandular-dotted; leaflets 3 to 7 (or 9), ovate-oblong, 3 to 4 (or 6) lines long; calyx brownish, nearly or quite glabrous outside, hairy inside.—Desert slopes and mesas, 2000 to 6000 ft.: Mohave Desert; Mono Co. (*Dalea saundersii* Parish.) Var. *JOHNSONII* Jepson n. comb. More leafy; sparingly glandular; leaflets narrowly linear or linear-lanceolate, 3 to 10 lines long, the terminal commonly longer than the lateral; calyx often glabrous or less

pubescent outside, hairy inside or with a tuft of hairs at the sinuses.—Desert slopes and mesas, Cottonwood Mts. and Ord Mt.; e. through southern Nev. to n. Ariz. and sw. Utah. (*Dalea johnsonii* Wats.)

6. *P. emoryi* (Gray.) Hel. Densely and divaricately branched shrub 1 to 4 ft. high, white with a close felt-like tomentum, commonly sprinkled with red glands; leaves  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long, pinnate with 5 to 7 obovate leaflets, sometimes 3 or reduced to 1; leaflets 2 to 6 lines long, or the terminal leaflet much longer, commonly longer than the lateral; spikes very dense, capitate to oblong,  $\frac{1}{4}$  to  $\frac{3}{4}$  in. long; calyx  $2\frac{1}{2}$  to 3 lines long, 10-ribbed, rusty-pubescent, with subulate teeth as long as tube; corolla purple, 3 lines long; banner orbicular, cordate at base, the midrib very hairy on back; keel hairy on under side; style (except tip) and ovary (except base) densely short-hairy when young; ovules 2, collateral.—Colorado Desert; Ariz. to Sonora and L. Cal. (*Dalea emoryi* Gray.)

7. *P. polyadenia* (Torr.) Hel. Fig. 549. Stout somewhat spinose very

549. *Parosela polyadenia* Hel.; a, fl. branchlet  $\times \frac{3}{4}$ ; b, fl.  $\times 2\frac{1}{2}$ ; c, pod  $\times 2\frac{1}{2}$ .

divaricately branched shrub 1 to 2 (or 5) ft. high; branches and leaves densely canescent, thickly sprinkled with yellowish saucer-shaped glands; leaves pinnate, 3 to 8 lines long, the petioles short or almost none; leaflets 7 to 9 (or 13), obovate, notched at apex, 1 line long; racemes dense, 4 to 7 lines long; calyx 2 lines long, hairy (especially on the teeth) and with prominent red glands between the strong callus-ribs of the tube, the teeth lanceolate or subulate, almost equaling or longer than the tube; corolla pinkish or violet, 3 lines long; banner roundish to oblong-elliptic; ovary glabrous except the hairy summit; ovules 2, collateral; style hairy with spreading hairs; seed 1.—Desert region from Owens Valley n. to Nev. (*Dalea polyadenia* Torr.) Var. *SUBNUDA* Parish. Calyx-tube nearly or quite glabrous.—Inyo and Mono Cos. (*Dalea polyadenia* var. *subnuda* Wats.)

8. *P. parryi* (T. & G.) Hel. *PARRY DALEA*. Stems slender, diffusely spreading, 1 to 2 ft. long; herbage puberulent or glabrate; leaflets 6 to 10 pairs, obovate or oblong, emarginate or obtuse,  $\frac{1}{2}$  to  $2\frac{1}{2}$  lines long, with distinct petiolules; flowers 3 to 4 lines long, purple, in loose spikes; calyx turbinate, strongly ribbed, somewhat silky-canescens, its teeth ovate, acute, equaling or shorter than tube; banner  $\frac{1}{3}$  and wings  $\frac{2}{3}$  as long as keel; banner cordately reniform and with a short sharp point at apex, the center whitish and with translucent gland-dots, the purple sides turned in so as almost to make a sac; ovules 2; "pod smooth."—Mts. between the Mohave and Colorado deserts; Ariz. to L. Cal. (*Dalea parryi* T. & G.)

9. *P. mollis* (Benth.) Hel. Stems many from the base, 6 to 10 in. long; herbage hairy-pubescent, dotted with black saucer-shaped glands, the leaves under a lens sometimes suggesting domino pieces; leaves  $\frac{3}{4}$  to 1 in. long, with 4 to 6 pairs of leaflets; leaflets obcordate to obovate or oblong,  $1\frac{1}{2}$  to 3 lines long; spikes very dense, 1 to  $1\frac{1}{2}$  in. long; calyx concealed by the dense clothing of hairs, 3 to 4 lines long; corolla pinkish, shorter than or little exceeding the subulate plumose calyx-teeth; banner reniform, hardly half length of the keel; keel very broad and blunt at tip; wings shorter than keel, notched at apex.—Colorado and Mohave deserts; Panamint Range; e. to Nev. (*Dalea mollis* Benth.)

## 20. PSORALEA L.

Ours perennial herbs. Herbage heavy-scented, punctate with dark dots. Leaves 3 or 5-foliate; stipules free from the petiole. Flowers purple or whitish in spikes or racemes. Calyx 5-cleft. Keel broad, obtuse, joined to the wings. Stamens monadelphous or diadelphous; anthers uniform. Pod seldom exceeding the calyx, 1-seeded, indehiscent. (Greek *psoraleos*, scurfy or rough, the glands wart-like in some species.)

A. Plants from rootstocks; leaves pinnate with 3 leaflets; pod indehiscent, the beak short or none.

Stems prostrate; leaves and peduncles erect; flowers spicate; stamens diadelphous.....

1. *P. orbicularis*.

Stems erect.

Flowers in spikes, purple.

Stamens monadelphous; peduncles shorter than the leaves..... 2. *P. strobilina*

Tenth stamen nearly free; peduncles exceeding the leaves; bracts soon deciduous

Bracts shorter than the flowers; calyx-teeth a little longer than the corolla..

3. *P. macrostachya*

Bracts as long as or longer than the flowers; calyx-teeth a little shorter than the corolla..... 4. *P. douglasii*.

Flowers in racemes, whitish; stamens monadelphous.

Leaflets broadly ovate; calyx-teeth  $\frac{1}{2}$  to 1 line long..... 5. *P. physodes*.

Leaflets lanceolate-ovate; calyx-teeth 1 to 2 lines long..... 6. *P. rigida*.

B. Plants from stout thick roots; leaves palmate with 5 or 6 leaflets; pod circumscissile or bursting irregularly, the beak long.

Pedicels slender, 2 lines long; calyx-lobes nearly regular..... 7. *P. californica*.

Pedicels less than 1 line long or none; calyx-lobes markedly irregular..... 8. *P. castorea*.

1. *P. orbicularis* Lindl. Stems creeping and rooting, the long-petioled leaves and peduncles erect; peduncles 10 to 24 in. long; herbage finely pubescent, the inflorescence densely whitish-villous; leaflets  $2\frac{1}{2}$  to  $3\frac{1}{2}$  in. long, the lateral pair broadly obovate, the terminal one more nearly orbicular; petioles 6 to 21 in. long; spikes 3 to 10 in. long; flowers 6 to 8 lines long;

calyx with stipitate glands scattered among the hairs, cleft almost to the base, the lowest tooth as long as the purplish corolla; pods ovate, acute, 3 lines long.—Grassy vales, meadows or creek bottoms, 500 to 4000 ft.: coastal S. Cal. and n. in the Coast Ranges to Siskiyou Co., thence s. in the Sierra Nevada to Mariposa Co.

2. *P. strobilina* H. & A. Stems erect, 2 to 3 ft. high; herbage villous or pubescent throughout, the upper surface of the leaves subglabrous; stems, peduncles and petioles rather densely sprinkled with tack-shaped glands; inflorescence villous; leaflets orbicular to rhombic-ovate,  $1\frac{3}{4}$  to  $2\frac{3}{4}$  in. long; stipules membranous, narrowly ovate, acuminate, about 5 lines long; peduncles shorter than the leaves; spikes short-oblong, 1 to 2 in. long; bracts membranous, broadly ovate, abruptly acuminate, 7 to 9 lines long, deciduous; calyx 6 to 9 lines long, the lower tooth much the longest and equaling the purple corolla; ovary pubescent.—Hill country from Contra Costa Co. to Santa Cruz Co.: Saratoga; Los Gatos; Little Arthur Creek, Gilroy.

3. *P. macrostachya* DC. LEATHER ROOT. Stems erect, 4 to 10 ft. high; herbage variable, nearly glabrous, villous-pubescent or tomentose; leaflets rhombic-ovate, sometimes ovate-lanceolate, 1 to 3 in. long; peduncles commonly much exceeding the leaves; spikes broadly cylindrical, silky-villous with white hairs, mostly 9 to 10 lines broad; calyx 3 to 5 lines long, the lower tooth a little the longest, exceeding or equaling the petals, the 4 upper teeth short, broadly lanceolate; corolla purple, the lower portion of banner dull greenish; pods hairy, ovate-oblong, acute, flattened, 3 to 4 lines long.—Along rivers and larger streams in the valleys, following the cañon bottoms in the mountains, and common in the salt marshes, always in the richest soils, 5 to 3000 ft., cismontane Cal. Our most common and widely distributed species of the genus. The roots furnished to the Pomos and other native tribes a very tough fibre.

4. *P. douglásii* Greene. Habit of no. 3, but more slender; subglabrous, the petioles and sometimes the stems with elevated dot-like glands; leaflets rhombic-ovate,  $1\frac{1}{4}$  to  $2\frac{1}{2}$  in. long; spikes mostly narrower (7 to 8 lines broad) than in no. 3, 2 to 3 in. long, on slender peduncles 3 to  $5\frac{1}{2}$  in. long; bracts deltoid and long-acuminate, caducous; rachis and calyces densely short-villous, the hairs commonly blackish, the segments of the latter just shorter than the violet corolla.—San Luis Obispo Co. to the Santa Cruz Mts. and Marin Co.; uncommon. Aug.-Sept.

550. *Psoralea physodes* Dougl.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, fl.  $\times 1$ ; c, pod  $\times 2$ .

5. *P. physodes* Dougl. CALIFORNIA TEA. Fig. 550. Stems erect, 10 to 23 in. high; herbage nearly glabrous; leaflets ovate, varying to orbicular, mostly acute, 1 to  $1\frac{1}{4}$  in. long; peduncles mostly shorter than the leaves; racemes dense,  $\frac{1}{2}$  to 1 in. long, about as broad, the bracts small; calyx cup-shaped, covered with glands which suggest low volcanic craters, and slightly villous with usually dark hairs, about  $\frac{1}{2}$  as long as the corolla, at length much enlarged and inflated; calyx-teeth very short and subequal; corolla 5 to 6 lines long; petals greenish-white, the keel purple-tipped; pods suborbicular, compressed, 3 lines long.—Common in open spots on bushy or wooded slopes of the higher hills or mountains: San Gabriel and Santa

Monica mountains to Monterey, Mt. Diablo, Marin Co., Napa Range, Vaca Mts. and Siskiyou Co.; n. to B. C. Apr.-June. The herbage when dried makes a pleasant tea and was used as such by early Californians.

6. *P. rigida* Parish. Similar to no. 5; stems erect, 2 to 2½ ft. high; herbage and inflorescence with a minute scattered pubescence; leaflets mostly ovate-lanceolate, 1¼ to 3 in. long; racemes 1 to 1¾ in. long; calyx at first black-pubescent, less conspicuously glandular than in no. 5; calyx-teeth 1 to 2 lines long.—San Diego Co.: Oak Grove; Cuyamaca Mts.

7. *P. californica* Wats. Stems 5 to 8 in. high, tufted on the often branched root-crown; pubescence silky and appressed; leaves palmately compound; leaflets 5 or 6, orbicular-obovate, cuneate at base, ½ to 1 (or 1½) in. long; stipules scarious, lanceolate; racemes very much shorter than the leaves, dense, ¾ to 1 in. long, on short peduncles; calyx silky-villous, 6 lines long, the linear-acuminate lobes a little shorter than the petals; pods oblong, narrowed to a lanceolate beak, thin-walled, villous; seed dark brown, 2 lines long or more.—Mountain slopes and summits, 1500 to 5300 ft.: inner Coast Ranges from Glenn Co. to Mt. Diablo and Mt. Pinos; s. Sierra Nevada (Bodfish; Kernville); Santa Barbara Co.; San Bernardino Mts.; L. Cal.; widely distributed but a rare plant. May-July.

8. *P. castorea* Wats. Stems ascending, 3 to 8 in. high; herbage white-pubescent; leaflets obovate-rhomboid, obtuse, ¾ to 1¼ in. long; racemes oblong, 1 to 1¼ in. long; bracts palmately 3-lobed; flowers 4 lines long; lower calyx-lobes elliptic, the others subulate, a little shorter than the corolla.—Sandy places, Daggett, Mohave Desert.

## 21. GLYCYRRHIZA L. LIQUORICE

Perennial herbs with glandular-viscid herbage. Leaves odd-pinnate, glandular-dotted. Flowers yellowish-white, in axillary peduncled spikes. Calyx 5-cleft, with the 2 upper lobes shorter or partly united. Stamens mainly diadelphous, the alternate anthers smaller. Ovary 2 to many-ovuled; style short and rigid, curved at the tip. Pod bur-like, densely beset with hooked prickles, in ours oblong, few-seeded, indehiscent. (Greek glukus, sweet, and rhiza, root.)

1. *G. lepidota* (Nutt.) Pursh. Fig. 551. Stems erect, 2 ft. high; herbage viscid-puberulent and sometimes with minute scales; leaflets 11 to 15, oblong-ovate-lanceolate, 1 to 1½ in. long; stipules linear-subulate, spikes broadly oblong, 1 to 1½ in. long; peduncles shorter than the leaves, ¾ to 3 in. long, with spreading glandular hairs; calyx very glandular; pod ½ to ¾ in. long, reddish brown, 2 to 6-seeded.—Rich soil of low or moist lands in the valleys or on the plains, 20 to 4000 ft., throughout Cal.; n. to B. C. June.

## 22. KENTROPHYTA Nutt.

Low tufted perennials with fine silky appressed pubescence and persistent odd-pinnate leaves. Lower stipules scarious, united on the side of stem opposite the leaf; upper stipules and leaflets rigid and awn-pointed. Peduncles axillary, bearing 1 to 3 small flowers. Calyx 5-cleft. Pod 1-celled, 1 to 2-seeded, included in the calyx. Sta-

551. *Glycyrrhiza lepidota* Pursh; a, fl. branchlet  $\times \frac{1}{2}$ ; b, cluster of pods  $\times \frac{1}{2}$ ; c, pod  $\times 1$

552. *Kentrophyta montana* Nutt.; *a*, habit  $\times \frac{1}{2}$ ; *b*, leaf with stipules  $\times 1\frac{1}{2}$ ; *c*, fl.  $\times 3$ ; *d*, pod  $\times 3$ .

Corolla usually long and narrow; keel mostly obtuse. Stamens diadelphous (9 and 1). Pod turgid, or inflated and bladder-like, sometimes not inflated, 1-celled or partly or completely 2-celled by the intrusion of one or both sutures, tardily dehiscent, 2 to many-seeded. Seeds small, usually reniform on slender funiculi. (Ancient Greek name for some leguminous plant.)

mens diadelphous (9 and 1). Seeds large for the size of the pod. (Greek kentron, spur or prickle, and phytum, plant.)

1. *K. montana* Nutt. Fig. 552. Stem rigid, 2 to 3 in. high; leaves crowded, the 5 to 7 leaflets subulate, spine-tipped, 2 to 5 lines long, divaricate in age; peduncles hardly over 1 line long; calyx-teeth subulate-setaceous, much longer than the campanulate tube; corolla whitish or purplish-tinged, 2 lines long; pods ovate, acuminate, 3 lines long.—Alpine crests on either side of the Owens Valley trough, 11,300 to 13,000 ft. (Mt. Dana; Mt. Warren; White Mts.). July.

### 23. *ASTRÁGALUS* L. RATTLE-WEED. LOCO-WEED

Herbs with odd-pinnate leaves and persistent stipules. Flowers purple, pale yellow or white, in spikes, racemes or heads. Racemes mostly spike-like, either the pedicels very short or the flowers crowded. Calyx 5-toothed.

#### I. Pods strongly inflated.

##### A. PODS 1-CELLED (SEED-BEARING SUTURE SOMETIMES SLIGHTLY INTRUDED).

###### 1. *Pods stipitate*.

Stipe not more than twice as long as calyx.

Stems low and tufted.

Perennials.

Pods obovate, balloon-shaped, much rounded or obtuse at apex; leaves commonly grayish-puberulent; n. Sierra Nevada; Yollo Bolly Mts.; White Mts. .... 1. *A. hookerianus*.

Pods broadly spindle-shaped; leaves essentially glabrous; White Mts. .... 2. *A. oophorus*.

Annual; pods broadly ovate, acute; Providence Mts. .... 3. *A. deserticola*.  
Stems 1 to 3 ft. high, not tufted; perennials; inner South Coast Ranges.

Pod acuminate at base and at apex; calyx-tube cylindric. .... 4. *A. oxyphissus*.

Pod acute at base and at apex; calyx-tube campanulate. .... 5. *A. curtipes*.

Stipe more than twice as long as calyx; perennial. .... 6. *A. leucophyllus*.

###### 2. *Pods not stipitate*.

Perennials.

Pods glabrous or sparsely pubescent.

Seed-bearing suture somewhat intruded; stipules distinct.

Pods 5 to 8 lines long; w. side Colorado Desert. .... 7. *A. vaseyi*.

Pods 1 to 1½ in. long.

Pods oblong-ovate, abruptly acute at apex, 1 to 1½ in. long; mostly

South Coast Ranges and S. Cal. .... 8. *A. douglasii*.

Pods ovoid, gradually acute at apex, barely 1 in. long; S. Cal. .... 9. *A. oocarpus*.

Seed-bearing suture not intruded.

Stipules meeting or united on opposite side of stem from leaf; leaflets

crowded; coastal from San Francisco s. .... 10. *A. menziesii*.

Stipules distinct; leaflets not crowded; Colorado Desert. .... 11. *A. prussii*.

Pods rather densely pubescent.

Stems 1 to 4 ft. long; leaves 8 to 5 in. long.

Pods oblong, 1 in. long; Monterey and San Luis Obispo Cos. .... 12. *A. macrodon*.

Pods ovate, ½ in. long; in or near Mohave Desert. .... 13. *A. hornii*.

Stems 3 to 8 in. long; leaves ½ to 1 in. long; ne. Cal. .... 14. *A. pulvisferae*

- Annuals; pods densely hoary-pubescent; Colorado Desert.  
 Pods narrowly ovate,  $2\frac{1}{4}$  lines wide; branches ascending.....15. *A. aridus*.  
 Pods broadly ovate,  $4\frac{1}{4}$  lines wide; branches spreading from base...16. *A. sabulonum*.
- B. PODS WHOLLY OR INCOMPLETELY 2-CELLED.
- Flowers racemose; plants 4 in. high or more.  
 Pods not stout-beaked, ovate.  
 Pods stipitate, glabrous; Sierra Nevada.....17. *A. bolanderi*.  
 Pods not stipitate.  
 Pods hoary with soft dense pubescence; annual or biennial; deserts and desert ranges.....18. *A. coulteri*.  
 Pods not hoary, rather sparsely pubescent; perennial; Lassen Co. and n...  
 19. *A. lentiginosus*.  
 Pods stout-beaked, globose, sessile; perennial; mts. of Tulare Co.....20. *A. kernensis*.  
 Flowers in small heads; plants 2 to 3 in. high; pod incompletely 2-celled, sessile; perennial; high Sierra Nevada.....21. *A. platytropis*.

## II. Pods not strongly inflated.

### A. PERENNIALS (EXCEPT NO. 22 A BIENNIAL).

1. *Dorsal and ventral sutures both externally prominent, forming a thick cord-like ridge; pods coriaceous, strongly rugulose.*  
 Pods hoary-pubescent, thin-walled, non-stipitate; biennials.....22. *A. mohavensis*.  
 Pods glabrous, fleshy-coriaceous; perennials.  
 Pods not stipitate; leaflets 5 or 7, linear, remote.....23. *A. shockleyi*.  
 Pods stipitate; leaflets mostly 11 to 21.  
 Stipe not longer than calyx; pod linear-oblong, curved; leaflets narrowly linear; Kern Co. region.....24. *A. pachyypus*.  
 Stipe mostly longer than calyx; pod elliptic, straight, very turgid; leaflets oblong; Siskiyou Co.....25. *A. pacificus*.
2. *Dorsal suture not prominent and not cord-like externally (except in A. bicristatus), in 2-celled pods often inturned and forming a groove; pods not strongly rugulose.*  
 Pods 1-celled.  
 Pods glabrous, subglabrate or at least not long hairy.  
 Pods strongly obcompressed.  
 Pods stipitate, strongly cristate fore and aft by the prominent sutures.....  
 26. *A. bicristatus*.  
 Pods not stipitate, not cristate fore and aft.  
 Leaflets obovate,  $1\frac{1}{4}$  to 5 lines long; pods  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long.....  
 27. *A. todanthus*.  
 Leaflets linear, 6 to 11 lines long; pods 1 to  $1\frac{1}{4}$  in. long...28. *A. casei*.  
 Pods not obcompressed.  
 Pods stipitate.  
 Pods subcylindric.  
 Pods more or less curved,  $\frac{3}{4}$  to 1 in. long; Alpine Co. to Plumas Co.....29. *A. gibbsii*.  
 Pods straight, 1 to  $1\frac{1}{4}$  in. long; Siskiyou Co...30. *A. californicus*.  
 Pods strongly flattened laterally (except one form in *A. trichopodus*).  
 Leaflets narrowly linear; pods linear-oblong; Siskiyou Co. to Lassen Co.; inner ranges, S. Cal.....31. *A. filipes*.  
 Leaflets oblong; pods narrowly elliptic or linear-oblong, or mostly narrowed from above the middle toward the base (ob-lanceolate); coastal S. Cal.....32. *A. trichopodus*.  
 Pods not stipitate, ovate; coastal.....33. *A. pycnostachyus*.  
 Pods densely covered with long hairs, sessile.  
 Flowers white or blue and white, not over 1 in. long; pods curved-oblong or -ovate; peduncles shorter than the leaves.....34. *A. purshii*.  
 Flowers crimson,  $1\frac{1}{4}$  to  $1\frac{1}{2}$  in. long; pods curved-broad-oblong; peduncles equaling or surpassing the leaves.....35. *A. coccineus*.
- Pods wholly or incompletely 2-celled.  
 Pods over  $\frac{1}{2}$  in. long (sometimes less in no. 42).  
 Mature pods strongly obcompressed, sessile.  
 Plant tufted; pods densely woolly, moderately curved,  $\frac{2}{3}$  to 1 in. long; mts. of S. Cal.....36. *A. inflexus*.  
 Plant not tufted; pods pubescent, strongly curved, 1 to  $2\frac{1}{2}$  in. long; Mohave and Inyo Co. deserts.....37. *A. layneae*.
- Mature pods not obcompressed.  
 Pods not stipitate.  
 Pods 3-angled or triquetrous; deserts.....38. *A. tricarınatus*.  
 Pods compressed or cylindric.  
 Herbage and pods strongly villous; pods reflexed or spreading; e. side Sierra Nevada.....39. *A. malacus*.  
 Herbage and pods not villous.  
 Stems not caespitose,  $\frac{3}{4}$  to 1 ft. high; pods reflexed or spreading; leaflets 17 to 25; cent. Sierra Nevada foothills...  
 40. *A. congdonii*.  
 Stems caespitose, not over 6 in. high; pods erect or ascending; leaflets not over 13.  
 Peduncles equaling or shorter than the leaves; flowers yellowish; Modoc Co.....41. *A. obscurus*.

- Peduncles longer than the leaves; flowers purple-tipped;  
Inyo Range.....42. *A. calycosus*.
- Pods stipitate.  
Herbage glabrous or nearly so; stipe of pod scarcely longer than calyx-tube; Humboldt Co.....43. *A. sylvaticus*.  
Herbage appressed-pubescent; stipe of pod equaling or exceeding calyx-teeth; Santa Barbara Isls.....44. *A. nevini*.
- Pods not more than  $\frac{1}{2}$  in. long (sometimes longer in *A. andersonii*), non-stipitate.  
Flowers in capitate clusters or in racemes not 1 in. long.  
Pod not over 2 to 3 lines long; flowers commonly many; Sierra Co. to Placer Co.  
Stems slender,  $\frac{1}{2}$  to 2 ft. long; herbage green, thinly strigulose, the calyces not white-woolly.....45. *A. lemmonii*.  
Stems stout, 2 to 4 in. long; herbage white with dense silky pubescence, the calyces white-woolly.....46. *A. austinae*.  
Pod 5 to 6 lines long; flowers few; stems slender, not over  $\frac{1}{2}$  ft. long; Death Valley region.....47. *A. atratus*.
- Flowers in racemes or spikes  $1\frac{1}{2}$  in. long or more.  
Pods erect, very finely pubescent; calyx-teeth short and broad; Mono Co. to Modoc Co.....48. *A. mortonii*.
- Pods spreading or reflexed.  
Pods densely tomentose; calyx-teeth setaceous, at least as long as the tube.  
Stems  $\frac{1}{2}$  to 1 ft. high; pods incurved; Sierra Nevada.....49. *A. andersonii*.  
Stems 3 to 4 ft. high; pods nearly straight; Los Angeles Co.....50. *A. brauntonii*.  
Pods glabrous; calyx-teeth subulate, about as long as the tube; Lake and Napa Cos.....51. *A. clevelandii*.
- B. ANNUALS; PODS NOT STIPITATE.**
1. *Pods elliptic-ovate or ovate, 2-seeded, strongly wrinkled or ridged transversely; flowers in short racemes or spikes.*  
Pod erect, little exerted from the calyx.  
Pod deeply 2-lobed lengthwise; mostly cismontane species.....52. *A. didymocarpus*.  
Pod creased dorsally but not 2-lobed; mostly desert species.....53. *A. dispermus*.  
Pod deflexed, well-exserted from the calyx.....54. *A. nigrescens*.
2. *Pods linear or nearly so (oblong-ovate in no. 57), several to many-seeded, not wrinkled transversely.*  
Flowers in racemes; pods curved, grooved dorsally; plants silvery or hoary-pubescent; deserts.  
Pods linear, compressed, 2-celled.....55. *A. albens*.  
Pods lanceolate, strongly thickened and somewhat obcompressed, incompletely 2-celled.....56. *A. agninus*.
- Flowers commonly in small head-like clusters at the ends of the peduncles; plants green or at least not strongly hoary-pubescent.  
Pods not laterally compressed, completely or almost completely 2-celled.  
Pods oblong-ovate, straight, silvery-pubescent; style in fruit stout, straight, as long as body of pod.....57. *A. breweri*.  
Pods cylindric or teretish, curved, green; style in fruit short, curved or hooked,  $\frac{1}{4}$  to  $\frac{1}{2}$  as long as body of pod.  
Pods grooved on back, not stipe-like at base.....58. *A. tener*.  
Pods not grooved on back, drawn down to a stipe-like base, attenuate at apex.....59. *A. clarianus*.
- Pods laterally compressed, incompletely 2-celled, grooved dorsally.  
Pods linear-attenuate, straight or nearly so, 2 in. long; North Coast Ranges....60. *A. rattanii*.  
Pods linear,  $\frac{3}{4}$  in. long, curved; desert.  
Keel obtuse or acute, not prolonged at apex.....61. *A. nuttallianus*.  
Keel prolonged at apex into an acute beak.....62. *A. acutirostris*.

1. *A. hookerianus* Gray. BALLOON PLANT. Stems tufted, 3 to 9 (or 12) in. high, from a woody base; leaves  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long, puberulent, often grayish; leaflets 13 to 19, discrete, often crowded, linear to linear-oblong, 3 to 5 (or 7) lines long; flowers whitish or violet, 4 lines long, very short-pedicled in a capitate moderately dense raceme which elongates somewhat in fruit; calyx-teeth subulate,  $\frac{1}{2}$  as long as the campanulate tube; pods strongly inflated, obovate, rounded at apex or very obtuse (balloon-shaped), 1-celled, 1 to 2 in. long, glabrous or scantily puberulent, about 10-seeded, the stipe longer than the calyx.—Montane: e. side of the Sierra Nevada from Mono Co. to Modoc Co.; White Mts.; Yollo Bolly Mts.; w. Nev. to Ore. Var. *WHITNEYI* Jones. Herbage green or greenish, scantily strigose.—Sierra Nevada in Mono Co., 8000 to 12,000 ft. Var. *pinosus* Jepson n. comb. Herbage glabrous, bright green; leaflets distant.—Mt. Pinos, Ventura Co. (*A. whitneyi* var. *pinosus* Elmer.)

2. *A. oóphorus* Wats. Fig. 553. Stems many from the branched crown of a stout taproot, ascending, forming a rounded clump 8 or 9 in. high; herbage glabrous or essentially so; leaflets 6 to 9 pairs, obovate, obtuse,  $2\frac{1}{2}$  to 6 lines long; racemes short,  $\frac{3}{4}$  to 2 in. long; flowers purplish, 6 lines long; calyx-tube deeply bowl-shaped, its subulate teeth almost as long; banner light purple, the wings white; pod strongly inflated, very broadly spindle-shaped, 1-celled,  $1\frac{1}{2}$  to  $1\frac{3}{4}$  in. long, stiped, the stipe little exceeding the calyx-tube.—High montane, desert ranges, 7200 to 10,000 ft.: Panamint Range; White Mts.; n. into Nev. Fr. July-Aug.

3. *A. deserticola* Jepson n. sp. Annual, branched from base, 3 to 7 in. high; herbage strigose, gray, in age becoming green; leaves 2 to 3 in. long; leaflets 9 to 13, oblong, 4 to 7 lines long; racemes short, rather dense, on peduncles shorter than the leaves; calyx-teeth narrow, about  $\frac{3}{4}$  as long as the campanulate tube; corolla dark blue, 3 to  $3\frac{1}{2}$  lines long; pod broadly ovate, strongly inflated, membranaceous, 1-celled, 10 lines long, on a stipe barely equaling the calyx-tube.—Providence Mts. (T. Brandege, type). May (fr.).

4. *A. oxýphys* Gray. Stem rigid, erect, 2 to 3 ft. high; herbage white-villous when young, soon becoming subglabrate and green; leaves  $3\frac{1}{2}$  to  $4\frac{1}{2}$  in. long; leaflets 15 to 23, oblong to linear-oblong,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long; racemes elongate, on peduncles longer than the leaves; calyx-teeth triangular-subulate,  $\frac{1}{2}$  as long as the cylindric tube; corolla white or greenish-white, 7 to 8 lines long; pods semi-obovate (i. e. the ventral suture nearly straight), inflated, 1-celled,  $1\frac{1}{2}$  to 2 in. long, with sharply pointed apex, at base attenuate into a recurved stipe 3 to 4 lines long; seeds numerous.—Inner South Coast Range from Stanislaus Co. to Fresno Co., thence s. to the upper San Joaquin Valley. Mar.-Apr. (fl. and fr.).

5. *A. cúrtipes* Gray. Stem erect,  $1\frac{1}{2}$  to  $2\frac{3}{4}$  ft. high; herbage finely pubescent, grayish when young, the upper surface of the leaves glabrous or nearly so; leaves 3 to  $4\frac{1}{2}$  in. long; leaflets 19 to 33, linear, rarely oblong, cuneate at base, sometimes retuse, 5 to 8 lines long; racemes short-cylindric (1 to 2 in.), rather densely many-flowered, the peduncles longer than the leaves; calyx-teeth subulate, about half as long as the campanulate short-oblong tube; corolla whitish, 5 to 6 lines long; pods strongly inflated, ovate or obovate, acute, 1-celled, puberulent,  $1\frac{1}{4}$  to  $1\frac{1}{2}$  in. long, pendulous on a rigid recurved stipe, little exceeding the calyx-tube; seeds many.—San Luis Obispo Co. Jan.-Apr.

6. *A. leucophýllus* T. & G. Stems erect, 1 to 3 ft. high; herbage silvery-pubescent, in age becoming green; leaves  $2\frac{1}{2}$  to 5 in. long; leaflets 17 to 29, linear to oblong, 5 to 13 lines long; racemes 2 to 4 in. long, rather dense, the flowers yellowish-white, 5 to 7 lines long; calyx-teeth subulate,  $\frac{1}{2}$  as long as the tube; pods much-inflated, oblong or ovate, abruptly short-acute, 1-celled,  $1\frac{1}{8}$  to  $1\frac{1}{4}$  in. long, the valves unequal; stipe densely pubescent,  $\frac{1}{2}$  to 1 in. long.—Low open dry hills: inner Coast Ranges from Solano Co. to Monterey Co.; Madera Co. Apr.-June. Said to be poisonous to horses and sheep.

553. *Astragalus oophorus* Wats.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, pods  $\times \frac{1}{2}$ ; c, cross sect. of pod  $\times 1$ .

7. *A. vâseyi* Wats. Stems ascending or at length procumbent,  $1\frac{1}{2}$  to 3 ft. long; herbage somewhat canescent or the upper surface of the leaves glabrous; leaves  $2\frac{1}{2}$  to 3 in. long; leaflets oblong, 5 to 7 lines long; flowers purple, 4 lines long; calyx-teeth subulate, little longer than the tube; pods inflated, narrowly ovate, tapering to an acute apex, 1-celled, canescent, 5 to 8 lines long.—Desert slopes of the San Jacinto and Cuyamaca ranges. Apr. (fl. and fr.).

8. *A. douglâsii* Gray. Stems many, ascending,  $1\frac{1}{4}$  to 3 ft. high; herbage appressed-pubescent or in age glabrate; leaves  $3\frac{1}{2}$  to 5 in. long; leaflets 15 to 25, linear to oblong-linear, obtuse or retuse,  $4\frac{1}{2}$  to 9 lines long; racemes many-flowered, the flowers whitish or yellow, spreading; corolla 3 to 4 lines long, the calyx about  $\frac{1}{2}$  as long; calyx-teeth subulate,  $\frac{1}{2}$  to  $\frac{3}{4}$  as long as the campanulate tube; pods remarkably inflated, oblong to ovate, abruptly very short acute, 1-celled, 1 to  $1\frac{1}{4}$  in. long, the ventral suture slightly intruded; seeds numerous.—Foothills, 180 to 4000 ft.: w. Yolo Co.; South Coast Ranges to the mts. of S. Cal. May.

9. *A. oocârpus* Gray. Stems stout, erect or nearly so, 4 to 6 ft. high; herbage glabrous or slightly pubescent, the calyces somewhat villous-pubescent; leaves  $3\frac{1}{2}$  to 7 in. long; leaflets 19 to 23, narrowly oblong to ovate-oblong,  $\frac{1}{2}$  to 1 (or  $1\frac{1}{2}$ ) in. long; peduncles shorter than the leaves, bearing dense or rather loosely flowered racemes; flowers tawny-yellow, 4 to 5 lines long; calyx-teeth triangular-subulate, nearly half as long as the campanulate tube; pods of rather parchment-like texture, turgid and much inflated, ovoid, gradually acute at apex, nearly 1 in. long, 1-celled, the ventral suture projecting slightly inward.—Cuyamaca Mts. n. to the Conchilla Range.

554. *Astragalus menziesii* Gray; a, fl. branchlet  $\times \frac{1}{2}$ ; b, fl.  $\times 1$ ; c, pods  $\times \frac{1}{2}$ .

strongly inflated, the walls membranous.—Sandy slopes near the coast, San Francisco Co. to Monterey Co. May-July.

11. *A. præussii* Gray var. *limatus* Jepson n. comb. Fig. 555. Robust bushy plant 1 to 2 ft. high; herbage subglabrous or sparsely strigose, the upper surface of the leaves glabrous or glabrate; leaves  $2\frac{1}{2}$  to 5 in. long; leaflets 11 to 15, obovate or oblong, obtuse or obcordate,  $\frac{1}{3}$  to  $1\frac{1}{3}$  in. long; racemes rather loose, on peduncles shorter or longer (in fruit) than the leaves; calyx-teeth triangular-lanceolate, about  $\frac{1}{3}$  or  $\frac{1}{4}$  as long as the tube; corolla purple, 9 to 10 lines long; pods oblong-cylindric or oblong-ovate, chartaceous-inflated, obscurely puberulent or glabrate, reticulate-veined, 1-celled, many-seeded, subsessile or barely stipitate,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long, 5 to 6 lines broad.—Colorado Desert. Apr. (fl. and fr.). (*A. limatus* Sheld.)

10. *A. menzièsii* Gray. Fig. 554. Stems erect or decumbent, 1 to 4 ft. high; herbage grayish with appressed pubescence, often becoming green and glabrate; leaves  $2\frac{1}{2}$  to 5 in. long; leaflets usually many, oblong or oblong-obovate, retuse or obtuse, 6 to 10 lines long, more closely borne than in *A. douglasii*; racemes dense, mostly 2 to 4 in. long, the stout peduncles nearly equaling the leaves; flowers whitish, 5 to 6 lines long, early reflexed; pods ovoid, 1-celled,  $1\frac{1}{2}$  to 2 in. long,

12. *A. macrodon* Gray. Stems much branched at base, 1 to 2 ft. high; herbage densely villous-pubescent, somewhat glabrate in age; leaves 3 to 4 in. long; leaflets 19 to 23, linear or linear-oblong, 4 to 8 lines long; racemes rather loosely few-flowered; calyx-teeth nearly as long as the narrow-campanulate tube; corolla yellowish, 3 to 4 lines long; pods 1-celled, strongly inflated, short-oblong or ovate, abruptly short-pointed at apex, densely puberulent, in age subglabrate.—Upper Salinas River valley; very local species. June-July (fl. and fr.).

13. *A. hornii* Gray. SHEEP LOCO. Fig. 556. Stems slender, widely spreading, 3 to 4 ft. long; herbage rather sparsely appressed-pubescent on the stems and upper sur-

555. *Astragalus preussii* var. *limatus* Jepson; a, fl. branchlet  $\times \frac{1}{2}$ ; b, fl.  $\times 1$ ; c, fl.  $\times 1$ ; d, wings & keel  $\times 1$ ; e, pods  $\times \frac{1}{2}$ .

556. *Astragalus hornii* Gray; a, fl. branchlet  $\times \frac{1}{2}$ ; b, pods  $\times \frac{1}{2}$ ; c, cross sect. of pod  $\times 2$ .

face of the leaves glabrate; leaves 3 to 5 in. long; leaflets about 21, narrowly oblong, obtuse, 4 to 8 lines long; flowers numerous in a dense short or capitate spike which is equally dense in fruit ( $\frac{3}{4}$  to  $1\frac{3}{4}$  in. long) and is borne on a peduncle surpassing the leaves; calyx-teeth subulate, about as long as the campanulate tube; corolla yellowish-white; pods broadly ovate, acuminate, straight, 1-celled, pilose, 6 to 15-seeded.—Infrequent; San Bernardino Valley and n. through the Mohave Desert to the upper San Joaquin Valley (Tulare and Kern Cos.) and Inyo Co.; e. to Utah. Aug.-Oct. It is reported as poisonous to sheep.

14. *A. pulsiferae* Gray. Stems slender, prostrate, branching, 3 to 8 in. long, arising from the branched crown of a slender taproot; herbage (including mature pods) whitish-villous; leaves  $\frac{1}{2}$  to 1 in. long, the 9

to 11 leaflets crowded; leaflets narrow-obovate, mostly retuse,  $1\frac{1}{2}$  to 4 lines long; pedicels in fruit often 2 to 4 lines long; calyx-teeth linear-filiform, longer than the tube; corolla white, purplish-tinged, 2 lines long; pods ovate-inflated, 1-celled, 4 to 6 lines long, 3 to 8-seeded.—N. Sierra Nevada from Plumas Co. to Shasta and Modoc Cos., about 4000 ft. July.

15. *A. áridus* Gray. Profusely branched from base, 6 to 9 in. high; herbage and pods silvery-pubescent, often glabrate; leaves  $1\frac{1}{2}$  to 2 in. long; leaflets 9 to 15, oblong to obovate, 3 to 5 lines long; flowers few, yellowish-white,  $2\frac{1}{2}$  lines long, in loose racemes on peduncles shorter than the leaves; calyx about half as long as corolla, the slender teeth about as long as the tube; pods sessile, narrowly ovate, somewhat incurved, inflated, 5 to 6 lines long, 1-celled, several-seeded.—Colorado Desert. Apr.

16. *A. sabulònum* Gray. Diffusely branched from base, 3 to 10 in. high, gray with close strigose pubescence; leaves 2 to 3 in. long; leaflets 9 to 15, linear-oblong, 3 to 5 lines long; racemes short, loose, rather few-flowered, the flowers  $2\frac{1}{2}$  to 3 lines long; calyx-teeth lanceolate-subulate, a little longer than the tube; pods incurved-ovate, short-acuminate,  $\frac{1}{2}$  to  $\frac{3}{4}$  in. long, 1-celled, pubescent; seeds several.—Colorado Desert, 300 to 500 ft.; e. to Nev. Apr. (fr.).

557. *Astragalus bolanderi* Gray; a, fl. branchlet  $\times \frac{1}{2}$ ; b, fl.  $\times 1$ ; c, pods  $\times \frac{1}{2}$ ; d, cross sect. of pod  $\times 1$ .

17. *A. bolánderi* Gray. Fig. 557. Stems many, erect, from the branched crown of a heavy woody root, 9 to 12 in. high; herbage pubescent; stipules scarious, the lower united on the side of the stem opposite the leaf; leaves 3 to 6 in. long; leaflets 9 to 23, linear to narrowly oblong; peduncles not exceeding the leaves, bearing a short crowded 6 to 12-flowered raceme; calyx-teeth slender-subulate, a little shorter than the tube; corolla white or purplish-tinged, 5 to 6 lines long; pod narrowly ovate-inflated, incurved, coriaceous, glabrous, veiny, 7 to 10 lines long, on a stipe equaling or slightly exceeding the calyx, more or less grooved along both sutures, incompletely 2-celled, the apical  $\frac{1}{3}$  partitionless; seeds 12 or 14.—Sierra Nevada from Tulare Co. to Placer Co., 5200 to 9000 ft. June-July.

18. *A. còulteri* Benth. Annual or biennial; stems usually several from a tough or almost woody base, widely branched,  $\frac{1}{3}$  to 1 ft. high; whole herbage hoary with a dense covering of short silky appressed hairs; leaves 2 to  $3\frac{1}{2}$  in. long; leaflets 11 to 15, oblong to obovate, obtuse or retuse, 3 to 7 lines long; racemes cylindric, loose, 10 to 20-flowered, the peduncles mostly shorter than the leaves; calyx-teeth slender, about half as long as the tube; corolla purple, 4 to 5 lines long; pods ovate-inflated, sharp-pointed, 8 to 9 lines long, chartaceous, purplish-mottled, densely pubescent with soft short hairs, conspicuously grooved dorsally, 2-celled except at the apex; seeds numerous.—Colorado and Mohave deserts, n. to Inyo Co. May (fl. and fr.).

19. *A. léntiginòsus* Dougl. SPOTTED LOCO. Branched from base, 5 to 9 (or 12) in. high; herbage sparsely strigose-pubescent or glabrate; leaves 1 to  $2\frac{1}{2}$  in. long; leaflets 11 to 21, oblong to obovate,  $\frac{1}{4}$  to  $\frac{1}{2}$  in. long; peduncles shorter than the leaves, bearing short-oblong racemes of crowded flowers; flowers white or purplish, 3 to 4 lines long; calyx-teeth lanceolate-

subulate,  $\frac{1}{2}$  to nearly as long as the tube; pods broadly ovate, rather abruptly pointed, membranous-inflated, straw-color (almost as if shining), incurved, often purplish-mottled, 5 to 7 lines long, more or less grooved along both ventral and dorsal sutures, 2-celled except at apex; seeds many.—E. side of the Sierra Nevada in Lassen Co.; n. to Wash. Apr.-May.

20. **A. kernensis** Jepson n. sp. KERN LOCO. Perennial with many slender stems, 3 to 4 in. high, from the woody crown of a stout root; herbage strigose-pubescent with stiffish hairs, the upper surface of the leaflets merely bordered by strigose hairs; stipules scarious, distinct; leaves 1 to 2 in. long; leaflets about 13, obovate, obtuse or retuse,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  lines long; racemes short, rather closely 4 to 6-flowered, the whitish flowers  $4\frac{1}{2}$  lines long; calyx-teeth subulate, about half the length of the narrow-campanulate tube; banner notched, its sides turned abruptly back; wings involute-tubular, shorter than banner, turning bluish; keel shorter than wings; pods globose, membranous-inflated, abruptly beaked, 3 lines long, more or less grooved along both sutures, 2-celled; seeds about 4.—High Sierra Nevada of Tulare Co., Volcano Creek, 8200 ft. (Jepson 4930, type). July (fl. and fr.).

21. **A. platytropis** Gray. Peduncles and leaves tufted on the crown of a taproot, 2 to 3 in. high; herbage silvery-pubescent; leaves  $2\frac{1}{2}$  to  $3\frac{1}{2}$  in. long; leaflets 7 to 13, obovate or oblong,  $1\frac{1}{2}$  to 3 lines long; flowers (5 or 6) in capitate racemes on slender scape-like peduncles, the peduncles about equaling the leaves; calyx-teeth subulate, nearly as long as the tube; corolla yellowish-white with purplish keel,  $3\frac{1}{2}$  to  $4\frac{1}{2}$  lines long; pods turgid-ovate, very short-pointed, scantily strigulose, sometimes purplish-mottled, 2-celled except at the apex, 1 in. long.—Mts. near Sonora Pass, Sierra Nevada, 10,000 ft.; e. to Nev. Rare. July (fl. and fr.). The large inflated pod is in size out of proportion to this diminutive alpine plant.

22. **A. mohavensis** Wats. Fig. 558. Biennial, much-branched from a somewhat woody base,  $\frac{1}{4}$  to 1 ft. high; herbage appressed, silky-villose, or the stems glabrate; stipules triangular, distinct; leaves  $1\frac{1}{2}$  to  $2\frac{1}{2}$  in. long; leaflets about 11, roundish-obovate to oblong-obovate, 3 to 6 lines long; racemes loosely few-flowered, the peduncles shorter than the leaves; calyx-teeth narrow, about equaling the turbinate tube; corolla blue,  $4\frac{1}{2}$  to 5 lines long; pods oblong, somewhat compressed, coriaceous, rugulose, incompletely 2-celled, hoary-pubescent, 6 to 9 (or 12) lines long, both sutures prominent and cord-like externally; seeds many.—Desert ranges, e. Mohave Desert to the Death Valley region. May.

23. **A. shöckleyi** Jones. Stems  $1\frac{1}{2}$  to 2 ft. high, freely branching; herbage hoary-pubescent or in age (especially the stems) glabrate; leaves  $3\frac{1}{2}$  to  $4\frac{1}{2}$  in. long, the rachis thick and stem-like, the 2 or 3 pairs of leaflets very remote; leaflets linear,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long; pods oblong, 7 to 9 lines long, subsessile, partially or in age completely 2-celled.—White Mts.

24. **A. pachypus** Greene. Fig. 559. Stems branching,  $1\frac{1}{2}$  to 4 ft. high; herbage densely silvery-puberulent, the leaves soon glabrate, especially

558. *Astragalus mohavensis* Wats.; a, fr. branchlet  $\times \frac{1}{2}$ ; b, infl.  $\times \frac{1}{2}$ ; c, cross sect. of pod  $\times 2$ .

559. *Astragalus pachypus* Greene; *a.* leaf  $\times \frac{1}{2}$ ; *b.* infl.  $\times \frac{1}{2}$ ; *c.* pods  $\times \frac{1}{2}$ ; *d.* cross sect. of pods  $\times 2$ .

above; leaves 3 to 5 in. long; leaflets 15 to 21, narrowly linear, retuse or obtuse, 4 to 12 lines long; racemes loosely few-flowered, equaling the leaves; calyx-teeth subulate, equaling the campanulate tube; corolla yellowish or white, 8 lines long; pods narrowly oblong, slightly incurved when mature, incompletely 2-celled,  $\frac{3}{4}$  to 1 in. long, shortly thick-stiped, fleshy when young, in age coriaceous and rather strongly rugulose, both sutures extremely prominent and cord-like; seeds about 12.—Foothills, 2000 to 5300 ft.: Tehachapi Range, w. to the Cuyama Valley, s. to Cajon Pass. May-June (fl. and fr.).

25. *A. pacificus* Sheld. Stems erect or ascending from a stout root-stock, 1 to 2 ft. high; herbage thinly pubescent with soft woolly hairs; leaves  $2\frac{1}{2}$  to  $3\frac{1}{2}$  in. long; leaflets 9 to 19, oblong, usually cuneate at base, sometimes obovate, retuse, 3 to 6 lines long; racemes short ( $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long), loosely flowered, the peduncles equaling or exceeding the leaves; calyx-teeth slender, nearly equaling the tube; corolla yellowish, 5 to 7 lines long; pods elliptic, 2-celled, very turgid, about as thick as broad, abruptly mucronate,  $\frac{1}{2}$  to  $\frac{3}{4}$  in. long,

glabrous, fleshy-coriaceous, strongly rugulose, reflexed or ascending, upon a stipe nearly twice as long as the calyx-tube, the ventral suture externally prominent and cord-like, the dorsal suture less so; seeds 8 or 10.—Siskiyou Co.; n. to Ore. July (fr.).

26. *A. bicristatus* Gray. Stems diffusely branched from a suffrutescent base; herbage strigulose, the hairs of the inflorescence commonly black; leaflets 13 to 19, not crowded, linear, obtuse, 5 to 11 lines long; flowers yellowish-white, 6 to 7 lines long, rather numerous in loose racemes; calyx-teeth triangular-subulate, about  $\frac{1}{2}$  as long as the campanulate tube; corolla twice as long as calyx, the blunt keel strongly upcurved at tip, the banner conspicuously longer; pods oblong, strongly obcompressed, prominently 2-keeled, somewhat curved, conspicuously wrinkled or veined, 1-celled, glabrous, 1 to  $1\frac{1}{4}$  in. long; seeds numerous.—Open desert slopes or cañon floors, 5500 to 7000 ft., San Gabriel Mts. and San Bernardino Mts. June-July.

27. *A. iodanthus* Wats. Stems many from the branched crown of a tap-root, ascending or procumbent, 6 to 12 in. long; herbage glabrous or essentially so; leaves  $1\frac{1}{2}$  to  $2\frac{1}{2}$  in. long; leaflets 11 to 15, obovate, obtuse or retuse,  $1\frac{3}{4}$  to 5 lines long; raceme  $\frac{1}{2}$  to  $\frac{3}{4}$  in. long; flowers 4 to 5 lines long, pale blue; calyx-teeth setaceous,  $\frac{3}{4}$  as long as tube; pods narrowly oblong, strongly flattened contrary to the partition, curved or moon-shaped, dorsally grooved, acuminate beaked, 1-celled, glabrous or scantily puberulent,  $\frac{3}{4}$  to  $1\frac{1}{8}$  in. long.—Montane valleys or slopes, 5000 to 6000 ft.: along the e. side of the Sierra Nevada from Washoe Co., Nev., to Esmeralda Co., Nev., rarely in valleys on its eastern crests (Sierra Co., Cal.).

28. *A. casei* Gray. Fig. 560. Similar to no. 26, especially in flowers and foliage; diffusely branching, 9 to 10 in. high, seemingly glabrous but sparingly strigulose; leaves 2 to 3 in. long; leaflets 11 to 13, distant, linear, 6 to 11 lines long; pods oblong in outline, strongly flattened contrary to the sutures, conspicuously beaked, 1-celled, scantily strigulose, 1 to  $1\frac{1}{4}$  in.

long; beak stout, acuminate, inflexed but straight.—Death Valley region; n. through western Nev.

29. *A. gibbsii* Kell. Stems rather stout, branching, 1 ft. high; herbage with a short spreading pubescence, often grayish; leaves  $2\frac{1}{2}$  to  $3\frac{1}{2}$  in. long; leaflets 15 to 21, obovate, retuse or obcordate, 3 to 7 lines long; flowers yellowish-white, 6 to 9 lines long, numerous in dense racemes, borne on peduncles exceeding the leaves; calyx-teeth triangular,  $\frac{1}{2}$  to  $\frac{1}{4}$  the length of the oblong-campanulate tube; pod sub-cylindric, more or less curved, 1-celled, pubescent or subglabrate,  $\frac{3}{4}$  to 1 in. long, on a stipe 6 to 7 lines long.—N. Sierra Nevada, towards crest or eastern slope, from Plumas Co. to Alpine Co.; w. Nev. to Ore. and Ida. May-June.

30. *A. californicus* Greene. Stems commonly several from a stout woody base,  $\frac{3}{4}$  to 2 ft. high; herbage pubescent, becoming glabrate; leaves 1 to  $2\frac{1}{2}$  in. long; leaflets 13 to 19, oblong, emarginate, sometimes merely obtuse, acute at base, 3 to 7 lines long; racemes short, the peduncles surpassing the leaves; flowers yellowish, 5 to 6 lines long; calyx-teeth triangular-subulate,  $\frac{1}{4}$  to  $\frac{1}{2}$  as long as the tube; pods linear, sub-cylindric, straight, 1 to  $1\frac{3}{4}$  in. long, 1-celled, glabrous or puberulent, often purplish-mottled, spreading horizontally, tapering to a stipe 3 to 7 lines long.—Siskiyou Co. May-June. Very near *A. collinus* Dougl., which has pendulous pods 6 to 8 lines long (Ore. to Wash.).

31. *A. filipes* Torr. Stems slender, many from base, closely erect, 1 to 2 ft. high; herbage glabrous or sparingly strigose-pubescent; leaves 2 to  $3\frac{1}{2}$  in. long; leaflets 9 to 17, rather distant, narrowly linear,  $\frac{1}{4}$  to  $\frac{3}{4}$  in. long; racemes long-peduncled, loosely flowered; calyx-teeth broad, about  $\frac{1}{4}$  as long as the campanulate tube; corolla yellowish-white, 4 to 5 lines long; pods spreading or pendulous, linear-oblong, acute, compressed, 1-celled, glabrous,  $\frac{1}{2}$  to 1 in. long, rather shortly tapering at base into a stipe 3 to 4 lines long.—Siskiyou Co. to Lassen and Modoc Cos.; n. to Wash. June. Var. *INVERSUS* Jepson n. comb. Stems flexuous, straggling; herbage very sparsely pubescent with strigose hairs; leaflets 7 to 11, linear to filiform; calyx-teeth triangular; flowers  $4\frac{1}{2}$  lines long; pods straight or slightly recurved.—Lava beds, Plumas Co. to Shasta and Modoc Cos. (*A. inversus* Jones.) Var. *RESIDUUS* Jepson n. var. Ventral margin of pods straight or straightish, the dorsal margin slightly curved.—Valleys and mountain slopes near the desert from the Santa Rosa Mts. (Cahuilla Valley, Jepson 1469, type) to Mt. Pinos.

32. *A. trichopodus* Gray. Stout, rigid, erect, 1 to 3 ft. high; herbage rather thinly strigose-puberulent or the upper surface of the leaves glabrous; leaves 3 to  $5\frac{1}{2}$  in. long; leaflets numerous, narrowly oblong or cuneate-oblong, obtuse to retuse, 4 to 9 lines long; racemes short, commonly dense, the peduncles commonly shorter than the leaves; pedicels recurved in fruit; calyx-teeth triangular-subulate,  $\frac{1}{2}$  as long as the campanulate tube; corolla yellowish-white, 4 to 6 lines long; pods compressed or somewhat inflated, narrowly elliptic, acute at apex and base, 1-celled, glabrous, 6 to 11 lines long, 3 lines broad, pendulous on a filiform minutely pubescent stipe 3 to 6 lines long.—Santa Barbara Co. to Los Angeles Co. Mar-May. Var. *GAVIDTUS*

560. *Astragalus casei* Gray; a, fr. branchlet  $\times \frac{1}{2}$ ; b, infl.  $\times \frac{1}{2}$ ; c, cross sect. of pod  $\times 1\frac{1}{2}$ .

561. *Astragalus trichopodus* var. *antisellii* Jepson; a, leaf  $\times \frac{1}{2}$ ; b, pods  $\times \frac{1}{2}$ ; c, fl.  $\times 1$ ; d, cross sect. of pod  $\times 2$ .

34. *A. purshii* Dougl. Stems from a long taproot, 2 to 4 (or 8) in. long, forming densely matted tufts; herbage densely white-woolly; leaves  $1\frac{1}{4}$  to  $2\frac{1}{2}$  in. long; leaflets 9 to 19, cuneate-oblong, 3 to 5 lines long; peduncles shorter than the leaves, bearing at the tip (3 to) 5 or 6 flowers; calyx-teeth slender-subulate,  $\frac{1}{4}$  to  $\frac{1}{2}$  as long as the narrow tube; corolla white or white and blue, 7 to 11 lines long; pods oblong, 1-celled, densely clothed with long white or yellowish hairs so as to appear like pellets of wool, 5 to 8 (or 10) lines long; beak none or the pod apex short-acute.—Mendocino Co. to Siskiyou and Modoc Cos.; ranging south in a color form on the east side of the Sierra Nevada to Inyo Co. and recurring in the inner South Coast Range; n. to B. C., e. to Rocky Mts. Var. *TINCTUS* Jones. Flowers purple.—Siskiyou and Modoc Cos. s. to Inyo Co. Var. *LONGILOBUS* Jones. Pod more or less obcompressed, rather strongly beaked, 7 to 9 lines long; beak straightish, inflexed,  $\frac{1}{6}$  to  $\frac{1}{2}$  as long as the body.—Desert side of the Sierra Nevada from Siskiyou Co. to New York Mts. and Tehachapi Range, thence n. to San Carlos Range. Var. *LECTULUS* Jones. Leaflets fewer; pe-

Jepson n. comb. Pods flat, semi-obovate, very densely clustered, 8 to 12 lines long,  $3\frac{1}{2}$  to 4 lines wide, the ventral suture straight or nearly so.—Coastal Santa Barbara Co.; Santa Catalina Isl. (*A. gaviotus* Elmer.) Var. *ANTISELLII* Jepson n. comb. Fig. 561. Leaflets oblong; pods flat, oblanceolate to oblong-oblanceolate, abruptly acute, 10 to 13 lines long,  $2\frac{1}{2}$  to 3 lines wide.—Common in the mts., San Luis Obispo Co. to Los Angeles Co. (*A. antisellii* Gray.)

33. *A. pycnostachyus* Gray. Fig. 562. Stems rather stout, 1 to 3 ft. high; herbage grayish with a soft pubescence; leaves 2 to 3 in. long; leaflets 23 to 31, narrowly oblong, crowded,  $\frac{1}{2}$  to  $\frac{3}{4}$  in. long; peduncles a little shorter than the leaves; flowers whitish or the wings yellowish, 4 to 5 lines long, closely sessile in dense oblong or cylindric spikes; calyx-teeth subulate, about  $\frac{1}{2}$  as long as the broadly campanulate tube; pods ovate, acute, beaked with the persistent style, 1-celled, glabrous, veined, retrorsely imbricated, 4 to  $4\frac{1}{2}$  lines long; seeds few.—Along the coast from Los Angeles to Humboldt Co. July-Aug.

562. *Astragalus pycnostachyus* Gray; a, fl. branchlet  $\times \frac{1}{2}$ ; b, pods  $\times \frac{1}{2}$ ; c, cross sect. of pod  $\times 2\frac{1}{2}$ .

563. *Astragalus coccineus* Bdg.; a, habit x  $\frac{1}{2}$ ; b, pod x  $\frac{1}{2}$ ; c, cross sect. of pod x 1.

duncles shorter; flowers smaller ( $4\frac{1}{2}$  lines long); pods smaller (3 lines long). — High montane, 6000 to 10,000 ft., San Bernardino Mts. to the southern Sierra Nevada in Tulare Co.

35. *A. coccineus* Bdg. Fig. 563. Densely tufted from a stout taproot,  $3\frac{1}{2}$  to 6 in. high; herbage densely white-silky; leaves 2 to 4 in. long; leaflets 11 to 15, obovate to broadly ovate, obtuse, 3 to 6 (or 7) lines long; spikes numerous, rather few-flowered, the flowers short-pedicellate, crowded near the top; calyx about half as long as the corolla, the linear-subulate teeth about  $\frac{1}{3}$  the length of the cylindrical tube; corolla scarlet, straight,  $1\frac{1}{4}$  to  $1\frac{1}{2}$  in. long; pods oblong, 1-celled, 1 to  $1\frac{1}{2}$  in. long. — Desert ranges, 3000 to 8000 ft.: w. Colorado Desert; Inyo Co. Apr.-May.

36. *A. inflexus* Dougl. var. *leucolobus* Jepson n. comb. Caespitose from a somewhat woody base, 2 to 5 in. high, hoary throughout with

dense soft pubescence; stipules triangular, 2 to 3 lines long; leaves 2 to 3 in. long; leaflets 11 to 19, obovate to oblong,  $2\frac{1}{2}$  to 6 lines long; racemes rather loosely few-flowered, the peduncles equaling or surpassing the leaves; calyx-teeth triangular-subulate,  $\frac{1}{4}$  as long as the cylindric tube; corolla purple and white, 8 lines long; pods narrowly oblong, markedly obcompressed, incurved, broadly grooved dorsally, 8 to 12 lines long, densely but rather closely tomentose, nearly or quite 2-celled except at apex; seeds about 12. — Mts. of S. Cal., 6000 to 8000 ft., from the Santa Rosa Mts. to the San Bernardino Mts. and San Gabriel Mts. May-June. (*A. leucolobus* Jones.) Var. *ORDENSIS* Jepson n. var. White-woolly throughout with long loose hairs or the calyx black-hairy; stipules lanceolate, 6 lines long; leaves  $2\frac{1}{2}$  to  $3\frac{1}{2}$  in. long; leaflets oblong or obovate, 4 to 6 lines long; pods oblong, incurved, somewhat obcompressed, incompletely 2-celled, densely shaggy tomentose, like pellets of wool. — Ord Mt., Mohave Desert (Jepson 5877, type). Var. *FLOCCULATUS* Jepson n. var. Fig. 564. Like var. *ordensis* but the leaves  $1\frac{1}{2}$  to 2 (or 3) in. long, exceeding the peduncles a little; leaflets  $2\frac{1}{2}$  to 3 lines long; stipules triangular, 3 lines long. — Panamint Mts., Hanaupah Cañon (Jepson 6999, type).

37. *A. layneae* Greene. Fig. 565. Diffusely spreading,  $\frac{1}{2}$  to  $1\frac{1}{2}$  ft. high, the stems commonly very short, the leaves mostly basal or sub-basal; herbage densely appressed-villous, gray or at length subglabrate and greenish; the calyces often black-

564. *Astragalus inflexus* var. *flocculatus* Jepson; a, habit x  $\frac{1}{2}$ ; b, infl. x  $\frac{1}{2}$ ; c, cross sect. of pod x  $1\frac{1}{2}$ .

565. *Astragalus layneae* Greene; a, fr. branchlet  $\times \frac{1}{2}$ ; b, infl.  $\times \frac{1}{2}$ ; c, pod  $\times 1$ ; d, cross sect. of pod  $\times 2$ .

7 to 12 lines long, incompletely 2-celled; seeds 8 or 10.—Mohave and Colorado deserts. May.

39. *A. málacus* Gray. Erect,  $\frac{1}{2}$  to 1 ft. high, the stems and basal leaves forming a dense tuft on the branched crown of the taproot; herbage villous with spreading hairs; leaves  $2\frac{1}{2}$  to  $3\frac{1}{4}$  in. long; leaflets 11 to 17, obovate, obtuse or truncatish, 4 to 9 lines long; peduncles surpassing the cauline leaves; spikes closely many-flowered,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long, elongating in fruit; calyx dark-hairy, the slender teeth much shorter than the cylindric tube; corolla deep purple, 6 to 7 lines long; pods rigid, linear-oblong, slightly curved, shallowly grooved dorsally, incompletely 2-celled, 1 in. long, widely spreading on recurved pedicels; seeds many.—E. side of the Sierra Nevada from Modoc Co. to Inyo Co.; w. Nev. to Ore. May.

40. *A. congdonii* Wats. Stems more or less branched, commonly decumbent at base,  $\frac{3}{4}$  to 1 ft. high; herbage loosely whitish-pilose; leaves  $1\frac{1}{2}$  to  $2\frac{1}{2}$  in. long; leaflets 17 to 25, obovate to oblong, retuse or obtuse, 2 to 3 lines long; racemes very loose, elongate, on peduncles longer than the leaves; calyx-teeth triangular-subulate, nearly as long as the tube; corolla yellowish-white, 5 to 6 lines long; pods linear, curved, somewhat compressed, puberulent, pendulous, grooved on the back, incompletely 2-celled, 1 in. long; seeds numerous.—Sierra foothills from Amador Co. to Mariposa Co. May (fl. and fr.).

41. *A. obscurus* Wats. Stems wiry or slender, numerous in a broom-like tuft on a branched root-crown, 3 to 5 in. high; herbage appressed-pubescent; leaves 2 to 3 in. long; leaflets 5 to 13, linear to oblong, 2 to 5 lines long; peduncles equaling or shorter than the leaves; racemes loosely few-flowered, the yellowish flowers 4 lines long; calyx-teeth subulate, more than half as long as the campanulate tube; pods linear, straight, not flattened, coriaceous, lightly strigose-pubescent, 6 to 9 lines long, incompletely 2-celled, the dorsal suture intruded; seeds 6 to 8.—Modoc Co.; Nev. to Ore. June (fl. and fr.).

hairy; leaves 3 to 6 in. long; leaflets 13 to 23, roundish-obovate, obtuse, 3 to 9 lines long; racemes loose, elongate, many-flowered, the peduncles longer or shorter than the leaves; calyx-teeth triangular,  $\frac{1}{4}$  to  $\frac{1}{3}$  as long as the tube; corolla white, purple-tipped, 6 to  $8\frac{1}{2}$  lines long; free filament very short; pods linear, acute or acuminate, obcompressed, strongly incurved, hairy-pubescent or glabrate, often purplish-mottled, 1 to 2 in. (or  $2\frac{1}{2}$ ) in. long, incompletely 2-celled, the inturning of the dorsal suture forming a broadly V-shaped groove; seeds 10 to 20.—Sandy washes, Mohave Desert to Inyo Co. Apr.-May (fl. and fr.).

38. *A. tricarínatus* Gray. Stems  $\frac{1}{2}$  to 1 ft. high, branching from base; herbage canescent; leaves  $1\frac{1}{2}$  to  $2\frac{1}{2}$  in. long; leaflets 11 to 17, linear to narrowly oblong, mostly truncatish or notched at apex, 3 to 8 lines long; peduncles longer than the leaves, bearing a loose raceme of whitish or yellowish flowers; flowers  $\frac{1}{2}$  in. long; calyx-teeth subulate, about as long as the campanulate tube; pods glabrous, triquetrous, straight or slightly curved,

42. *A. calycosus* Torr. Densely tufted on a branched root-crown, 1 to 3 (or 6) in. high, the leaves and peduncles basal; herbage densely silvery-silky; leaves 1 to 3 in. long; leaflets 1 to 2 (rarely 5) pairs, obovate to oblong, 2 to 5 lines long; racemes 2 to 6 (or 8)-flowered, on peduncles exceeding the leaves; calyx-teeth subulate,  $\frac{1}{2}$  as long as the campanulate tube; corolla 4 to 5 lines long, purple-tipped; pods oblong, straight or slightly curved, finely but densely strigose, 5 to 7 lines long, deeply grooved dorsally and thus incompletely 2-celled; seeds about 10.—High montane, 8000 to 11,000 ft., Inyo Range; n. and e. through the ranges of Nev. and Ariz. June (fl. and fr.).

43. *A. sylvaticus* Wats. Stems clustered, ascending,  $\frac{3}{4}$  to  $1\frac{1}{4}$  ft. high; herbage glabrous or nearly so; leaves  $2\frac{1}{2}$  to 4 in. long; leaflets 13 to 23, elliptic to oblong, retuse, 4 to 8 lines long; racemes short, densely flowered, the flowers and fruit reflexed, the peduncles equaling or exceeding the leaves; calyx slightly pubescent, its teeth slender-acuminate, about equaling the tube; corolla yellowish-white,  $3\frac{1}{2}$  lines long; pods glabrous, linear, compressed, curved, grooved dorsally, incompletely 2-celled,  $\frac{3}{4}$  to 1 in. long, shortly stipitate; seeds 6 or 8.—Humboldt Co.; n. to Ore. June.

44. *A. nevii* Gray. Low, the herbage gray with appressed pubescence; leaves 2 to 3 in. long; leaflets cuneate-obovate, notched at apex, 3 to  $4\frac{1}{2}$  lines long; racemes many-flowered, subcapitate; calyx-teeth lanceolate, at least half the length of the tube; corolla white; pod 2-celled, rather broadly linear-lunate, reticulate, glabrous or nearly so, stipitate, strongly grooved dorsally, 8 lines long.—Santa Barbara Isls. Aug. (fl. and fr.).

45. *A. lemmönii* Gray. Stems slender, several to many from the root-crown,  $\frac{1}{2}$  to 2 ft. long, soon procumbent; herbage strigulose; leaves  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long; leaflets 9 to 13, linear to linear-oblong, 3 to 5 lines long; peduncles filiform, shorter than the leaves; flowers whitish, tinged with purple,  $1\frac{1}{2}$  to 2 lines long, few to many, crowded in a capitate raceme; calyx-teeth setaceous-subulate, equaling or longer than the short-campanulate tube; pod puberulent, ovate-oblong, 2 to  $2\frac{1}{2}$  lines long, grooved dorsally, incompletely 2-celled; seeds few.—Sierra Valley. May-June.

46. *A. austinae* Gray. Stems densely tufted, 2 to 4 in. long, from a woody root-crown; herbage silvery-pubescent; stipules scarious, mostly united into one ovate body opposite the leaf; leaves 1 to  $1\frac{1}{4}$  in. long; leaflets 9 to 17, oblong or ovate-lanceolate, 2 to 4 lines long; peduncles equaling or exceeding the leaves, bearing 10 to 12 nearly sessile flowers in a dense head; calyx-teeth filiform, longer than the campanulate tube; corolla whitish, 3 to 4 lines long, persistent, with villous wings and banner; pods sessile, densely pubescent, somewhat obcompressed, grooved dorsally, incompletely 2-celled,  $2\frac{1}{2}$  to 3 lines long (not equaling the calyx and corolla); seeds few.—Dry exposed ridges, alpine at 8000 to 11,000 ft. on the eastern crests of the n. Sierra Nevada from Placer Co. to Nevada Co.; e. to Nev. July.

47. *A. atratus* Wats. var *panamintensis* Jepson n. comb. Slender, 4 to 6 in. high, branched from a somewhat woody base; herbage strigulose; leaves  $2\frac{1}{2}$  to  $3\frac{1}{2}$  in. long; leaflets 9 to 11, narrowly linear, acute, 2 to 3 lines long; stipules distinct, triangular; racemes 2 or 3-flowered, on slender peduncles shorter than the leaves; calyx-teeth subulate, about as long as the tube; corolla yellowish tipped with purple,  $5\frac{1}{2}$  lines long; pods linear, straight, 5 to 6 lines long, chartaceous, nearly glabrous, deeply grooved dorsally, incompletely 2-celled.—Panamint Range. Apr. (*A. panamintensis* Sheld.) Var. *MENSANUS* Jones. Plant ashy; leaflets elliptic to oblong; pods flattened, 1 in. long, 2 lines wide, short-stipitate.—Darwin Mesa.

48. *A. mortonii* Nutt. Stout, often widely branched from base,  $\frac{1}{2}$  to 2 ft. high; herbage strigulose; leaves 3 to 5 in. long; leaflets 13 to 21, oblong to obovate, obtuse or acute, 6 to 9 lines long; peduncles shorter or longer than the leaves; racemes densely flowered, spike-like, in fruit very crowded and  $1\frac{1}{2}$  to  $2\frac{1}{4}$  in. long; flowers greenish-white or cream color, 6 to 7 lines long, reflexed as they open, the fruit erect; calyx-teeth triangular, not half as long as the broadly oblong tube; pods subcylindric or narrowly oblong, straight,

grooved dorsally, incompletely 2-celled, 5 to 6 lines long, the ventral suture externally prominent; seeds numerous.—E. side of the Sierra Nevada from Mono Co. to Modoc Co.; e. to Utah, n. to Ore. Aug.

49. *A. andersøni* Gray. Stems several, somewhat tufted, from a woody root-crown,  $\frac{1}{2}$  to 1 ft. high; herbage grayish with silky-villous pubescence; leaves 1 to  $3\frac{1}{2}$  in. long; leaflets 13 to 25, oblong or obovate, 3 to 5 lines long; peduncles surpassing the leaves; racemes closely flowered, 1 to  $1\frac{3}{4}$  in. long; calyx-teeth subulate-setaceous, about as long as the campanulate tube; corolla yellowish-white or pinkish, 6 lines long; pods sessile, linear-oblong, compressed, curved, grooved dorsally, incompletely 2-celled, 6 to 8 lines long; seeds 16 to 20.—E. side of the Sierra Nevada from Inyo Co. to Lassen Co.; e. to western Nev. May.

50. *A. brauntōni* Parish. Stems erect or reclining, 3 to 4 ft. high; herbage gray-tomentulose; leaves 4 to 6 in. long; leaflets numerous, oblong, truncate or obtuse, 3 to 6 lines long; racemes cylindric, densely flowered, the flowers and fruit reflexed, the peduncles shorter than the leaves; calyx-teeth very narrow, longer than the tube; corolla light purple, 4 lines long, the banner prominent; pods sessile, oblong, slightly curved, beaked, tomentose, grooved dorsally, incompletely 2-celled (the apical portion without partitions), 3 to 4 lines long; seeds 2 or 3 on each side of the partition-fold.—Santa Monica Mts., Los Angeles coast. May.

566. *Astragalus clevelandii* Greene; a, fl. branchlet  $\times \frac{1}{2}$ ; b, fl.  $\times 2\frac{1}{2}$ ; c, pod  $\times 2\frac{1}{2}$ ; d, cross sect. of pod  $\times 4$ .

51. *A. clevelandii* Greene. Fig. 566. Stems stoutish, erect, branching, 1 to  $2\frac{1}{2}$  ft. high; herbage puberulent, becoming glabrate; leaves 2 to 3 in. long; leaflets 15 to 23, narrowly oblong to lanceolate,  $2\frac{1}{2}$  to 7 lines long; racemes narrow, 3 to 6 in. long, on peduncles longer than the leaves; calyx-teeth subulate, about equaling the tube; corolla white or cream-color, hardly over 2 lines long; pods curved, ovate-lanceolate, strongly grooved on the back, reticulate, glabrous, incompletely 2-celled, 2 to  $2\frac{1}{2}$  lines long, on recurved pedicels.—Mountain valleys and cañons, Lake and Napa Cos. July-Aug. (fr.).

52. *A. didymocarpus* H. & A. Stems slender, commonly diffusely branched from base, 3 to 12 in. high; herbage strigulose, the calyx hairs mostly blackish; leaflets 9 to 15, oblong to linear, cuneate, deeply notched at apex,  $2\frac{1}{2}$  to 5 lines long; spikes oblong-elliptic to capitate, very densely flowered,  $3\frac{1}{2}$  to 7 (or 12) lines long, the peduncles commonly exceeding the leaves; flowers remaining erect; corolla white and violet,  $1\frac{1}{2}$  to 2 lines long, scarcely exceeding the calyx; pods short-ovate, deeply 2-lobed lengthwise by the intrusion of the dorsal suture, incompletely 2-celled, corrugated by strong transverse ridges, 1 to  $1\frac{1}{2}$  lines long; seeds 2.—Interior valleys and foothills, 50 to 3100 ft.: South Coast Ranges and San Joaquin Valley, s. through the Mohave Desert to San Diego Co. (reaching the coast southward); L. Cal. Mar.-Apr.

53. *A. dispérmus* Gray. Similar to no. 52; herbage grayish, strigulose; calyx conspicuously white-villous; pods mostly narrow-ovate, less wrinkled, creased by the dorsal suture but not deeply 2-lobed, 1 to  $1\frac{1}{4}$  lines long.—Mohave and Colorado deserts; e. to Ariz., s. to L. Cal.

567. *Astragalus nigrescens* Nutt.; a, fl. and fr. branchlet  $\times \frac{1}{2}$ ; b, fl.  $\times 3\frac{1}{2}$ ; c, pod  $\times 5$ ; d, cross sect. of pod  $\times 3$ .

flowered, the peduncles shorter than the leaves; calyx-teeth lanceolate-subulate, nearly as long as the turbinate tube; corolla purple, 3 lines long; pods sessile, linear, compressed, curved, strongly grooved dorsally, 2-celled, pubescent, 6 lines long.—Desert side of the San Bernardino Mts.; local species. May.

56. *A. agninus* Jepson n. sp. Annual with slender taproot; stems several from the base, often zigzag,  $\frac{1}{2}$  to  $1\frac{1}{2}$  ft. high, hoary-canescens throughout; stipules distinct, triangular, scarious; leaves 2 to 3 in. long; leaflets 7 to 13, obovate to oblong, obtuse or retuse, 3 to 5 lines long; raceme somewhat loose,  $1\frac{1}{2}$  to 2 in. long, the purplish flower 4 lines long; calyx-teeth subulate, about  $\frac{1}{2}$  as long as the narrow-campanulate tube; pods lanceolate, somewhat curved, somewhat obcompressed, membranous, densely hoary-pubescent, grooved dorsally, very slightly if at all inflated, 7 to 9 lines long, the fold in-growing from the dorsal suture, extending half way or nearly to the ventral suture; seeds 8 or 10; style slender, persistent in fruit and curved or hooked.—Borrego Sprs., w. Colorado Desert (Jepson 8883, type). Apr. (fl. and fr.).

57. *A. breweri* Gray. Fig. 568. Stems filiform or nearly, branching, 1 to several from base, 3 to 9 (or 12) in. high; herbage sparsely strigulose or subglabrous, the calyces often black-

54. *A. nigrescens* Nutt. Fig. 567. Slender, many-branched from base, 4 to 12 in. high; herbage rather sparsely appressed-pubescent, the calyces and often the stems with black hairs; leaves  $\frac{3}{4}$  to 1 in. long; leaflets 7 or 9 to 13, narrowly cuneate-oblong, emarginate, 2 to 4 lines long; racemes 4 to 8 lines long, several-flowered, on slender peduncles, exceeding the leaves; flowers soon curving downward; calyx-teeth narrow, about equaling the tube; corolla 1 line long, violet or violet-tipped; pods deflexed,  $1\frac{1}{2}$  lines long, well-exserted from the calyx, hirsute-pubescent, strongly obcompressed, deeply grooved on the back, incompletely 2-celled, with slender wavy transverse ridges which are more prominent at the margins; seeds 2.—Foothills, Coast Ranges from Humboldt Co. to San Luis Obispo Co., frequent; s. to the San Bernardino Valley; also Sierra Nevada foothills, but rare. Mar.-May.

55. *A. albens* Greene. Stems many from base, diffuse, 5 to 6 in. high; herbage silvery-pubescent; leaves 1 to 2 in. long; leaflets 5 to 11, obovate, obtuse,  $2\frac{1}{2}$  to 4 lines long; racemes loose, few-

568. *Astragalus breweri* Gray; a, habit  $\times \frac{1}{2}$ ; b, pod  $\times 1\frac{1}{2}$ ; c, cross sect. of pod  $\times 6$ .

569. *Astragalus tener* Gray; a, habit  $\times \frac{2}{3}$ ; b, pods  $\times \frac{2}{3}$ ; c, fl.  $\times 1$ ; d, cross sect. of ovary  $\times 2\frac{1}{2}$ .

campanulate tube; pods linear, sub-cylindric, 5 to 7 lines long, lightly appressed-pubescent, strongly grooved on the back by the inturning of the dorsal suture, completely 2-celled; style persistent in fruit, short, hooked; seeds 6 to 10.—Mostly alkaline flats or plains: Sacramento Valley, s. to Monterey Co. May (fr.).

59. *A. clarianus* Jepson n. sp. Fig. 570. Branching from or near the base, 3 to 6 in. high; herbage green, lightly strigulose; leaves 6 to 9 lines long, nearly twice as long as the petioles; leaflets 7 to 9, oblong, emarginate, acutish at base, 2 to 3 lines long; flowers 2 to 6, in a subcapitate cluster; calyx dark-pubescent, its acute teeth less than  $\frac{1}{2}$  as long as the tube; corolla white, the banner and keel with purple spot at apex, 5 to 6 lines long; pods subterete, curved, drawn down to a stipe-like base, attenuate at apex, minutely pubescent, almost completely 2-celled, 1 to  $1\frac{1}{4}$  in. long; style persistent, curved.—Rocky hillslopes, Napa Range: near St. Helena (Clara A. Hunt, type); Conn Valley.

60. *A. rattanii* Gray. Fig. 571. Stems several to many from base, 4 to 14 in. high; herbage sparsely strigose-pubescent, the upper surface of the leaves glabrous; leaves  $1\frac{1}{4}$  to 2 in. long; leaflets 11 to 15, narrowly cuneate-obovate or -oblong, emarginate, 2 to 5 lines long; flowers in capitate clusters terminating peduncles longer than the leaves; calyx-teeth lanceolate-subulate, more than half as long as the campanulate tube; corolla violet or white, 4 to 5 lines long; pods 3 to 7 in a capitate cluster, narrowly linear, atten-

hairy; leaves  $1\frac{1}{4}$  to  $1\frac{1}{2}$  in. long; leaflets 7 to 11, obovate to narrowly oblong-cuneate, obtuse to obcordate, 2 to 4 lines long; heads closely (3 or) 5 to 9-flowered, the flowers violet-purple tinged, 4 to  $4\frac{1}{2}$  lines long; calyx-teeth lanceolate-subulate, about equaling the tube; pods ovate or oblong-ovate, whitish-pubescent, 2-celled, grooved on the back, 3 to 4 lines long, beaked with the now elongated very stout straight style; seeds 6.—North Coast Ranges from Mendocino Co. to Marin Co. Apr.

58. *A. tener* Gray. Fig. 569. Slender, branched from base, 3 to 9 in. high, minutely appressed-pubescent; leaves 1 to  $1\frac{1}{4}$  in. long; leaflets 9 to 15, linear or cuneate, acute or emarginate, 3 to 5 lines long; flowers purplish, 5 lines long, in heads or short racemes, the slender peduncles longer than the leaves; calyx-teeth subulate, more than half as long as the narrow-

570. *Astragalus clarianus* Jepson; a, habit  $\times \frac{1}{2}$ ; b, fl.  $\times 1\frac{1}{2}$ ; c, cross sect. of pod  $\times 3$

571. *Astragalus rattanii* Gray; a, fl. branchlet  $\times \frac{1}{2}$ ; b, pods  $\times \frac{1}{2}$ ; c, cross sect. of pod  $\times 6$ .

keel prolonged into a beak.—W. Colorado Desert; Mohave Desert; n. to Inyo Co. Apr.-May (fl. and fr.).

#### 24. OXYTROPIS DC.

Differing from *Astragalus* only in the keel which is prolonged at the apex into a slender beak. (Greek oxus, sharp, and tropis, keel.)

Herbage silky-villous; leaves 3 to 6 lines long. . . . . 1. *O. oreophila*.  
Herbage viscid-pubescent; leaves  $2\frac{1}{2}$  to 3 in. long. . . . . 2. *O. viscida*.

1. *O. oreophila* Gray. Leaves and peduncles densely tufted or matted on the root-crown, 1 to  $2\frac{1}{2}$  in. high; herbage silvery-pubescent; leaflets 5 to 11, oblong to ovate,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  lines long; peduncles scapose, longer than the leaves, bearing at the summit a capitate cluster of purplish flowers 4 to 5 lines long; pods strongly ovate-inflated, densely grayish-pubescent, 5 lines long, grooved ventrally and the ventral suture bearing a narrow intruded fold, the dorsal suture plane.—Mt. San Geronio, San Bernardino Mts., 9000 to 11,000 ft.; e. to Utah. Aug. (fl. and fr.).

2. *O. viscida* Nutt. Stems caespitose from a stout branching root-crown, 4 to 6 in. high; herbage viscid-pubescent, strongly scented; leaves  $2\frac{1}{2}$  to  $3\frac{1}{2}$  in. long; leaflets 25 to 33,

uate, compressed, grooved dorsally, almost 2-celled, 2 to  $2\frac{1}{4}$  in. long; seeds many.—North Coast Ranges from Lake Co. to Humboldt Co. May (fl.)-June (fl. and fr.).

61. *A. nuttallianus* DC. Stems several from the base, diffuse or prostrate, 3 to 10 in. long; herbage pubescent with stiffish white appressed hairs; leaves in a basal tuft and scattered along the branches,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long; leaflets 9 to 13, linear to oblong, acute at base and apex,  $2\frac{1}{2}$  to 3 lines long; flowers capitate, the peduncles slender, exceeding the leaves; calyx-teeth narrow, about as long as the tube; corolla whitish or purplish, 2 to  $2\frac{1}{2}$  lines long, the keel with obtuse or acute inflexed or up-turned tip; pods nearly or quite 2-celled, linear, somewhat curved, compressed, deeply grooved dorsally, 7 to 9 lines long; seeds 14 to 16.—Inyo Co. s. through the e. Mohave Desert to the Colorado Desert, thence w. to San Jacinto Valley; far e. to Ark. May.

62. *A. acutirostris* Wats. Fig. 572. Like *A. nuttallianus*; apex of corolla

572. *Astragalus acutirostris* Wats.; a, habit  $\times \frac{1}{4}$ ; b, fl.  $\times 1\frac{1}{2}$ ; c, pod  $\times 1\frac{1}{2}$ ; d, cross sect. of pod  $\times 3$ .

573. *Olneya tesota* Gray; *a*, leaf with stipular spines  $\times \frac{1}{2}$ ; *b*, fl. branchlet  $\times \frac{1}{2}$ ; *c*, calyx spread open  $\times 1\frac{1}{2}$ ; *d*, pod  $\times \frac{1}{2}$ .

pubescent and often provided with tack-shaped glands,  $\frac{1}{2}$  to 3 in. long, 1 to 8-seeded, more or less constricted between the seeds; seeds ovoid-globose, 4 to 6 lines long.—Desert valleys, Colorado Desert; Ariz. to Sonora and L. Cal. The wood is remarkably hard and heavy and is used by desert Indians for arrow parts and tool-handles.

#### 26. *SESBANIA* Pers.

Herbs or shrubs with pinnate leaves and numerous entire leaflets. Flowers commonly yellow, 1 to several on slender axillary peduncles. Calyx broadly campanulate with 2 deciduous bractlets at base. Banner circular or oval; wings oblong; keel blunt. Stamens diadelphous (9 and 1). Ovary mostly stipitate, many-ovuled. Fruit elongated-linear, partitioned between the seeds. (*Sesban*, Arabic name of one of the species.)

1. *S. macrocarpa* Muhl. COLORADO RIVER HEMP. Fig. 574. Annual, 3 to 10 ft. high; leaves exceeding the flowers; leaflets 13 to 41 pairs, narrowly oblong to linear, mucronulate, 5 to 14 lines long; calyx-teeth short, acute, salient; corolla yellowish, brownish-mottled, 6 to  $7\frac{1}{2}$  lines long; pods 4 to 9 in. long, 1 to  $2\frac{1}{2}$  lines wide.—Very abundant on overflow lands along the

oblong, revolute, acute, 2 to 3 lines long; peduncles equaling or exceeding the leaves, bearing rather dense subcylindric spikes of whitish flowers  $5\frac{1}{2}$  lines long; corolla with strongly beaked keel; pods terete, incompletely 2-celled by intrusion of the seed-bearing suture.—White Mts., 12,200 ft.; n. to Ore. July (fl. and fr.).

#### 25. *ÓLNEYA* Gray

Tree with thin scaly bark, the branches armed with stout spines in pairs below the leaves. Leaves pinnate, with entire leaflets. Flowers few, in axillary racemes. Banner orbicular, deeply emarginate. Stamens diadelphous (9 and 1). Style bearded above. Pod thick, 1 to 5-seeded, tardily dehiscent. (S. T. Olney, 1812-1878, Rhode Island botanist.)

1. *O. tesota* Gray. DESERT IRONWOOD. Fig. 573. Broad-crowned tree 15 to 25 ft. high; leaves  $1\frac{1}{2}$  to 3 in. long; leaflets 5 to 8 pairs, cuneate-oblong or -obovate, 3 to 10 lines long; spines 1 to 4 lines long; racemes loose,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long; flowers violet-purple, 4 to 5 lines long; pods oblong, more or less

574. *Sesbania macrocarpa* Muhl.; *a*, fl. branchlet  $\times \frac{3}{4}$ ; *b*, pod  $\times \frac{1}{2}$ .

lower Colorado River, e. to the Atlantic, s. to Cent. Am. It is a fiber plant producing white lustrous smooth and very strong filaments which are used by the Yuma Indians for nets and fish-lines.

### 27. *VÍCIA* L. VETCH. TARE

Annual or perennial herbs with weak angular stems, often slightly climbing. Leaves pinnate, with several to many leaflets and semi-sagittate stipules, the rachis ending in a simple or branched tendril. Flowers solitary or racemose, axillary, the racemes one-sided. Calyx 5-toothed, the three lower teeth often longer. Banner oblong, or appearing so by the turning back of the edges; wings united to the middle of the keel. Stamens diadelphous (9 and 1) or monadelphous below. Style filiform with a tuft of hairs below the stigma all around or sometimes only on the back. Pod flat, 2 to several-seeded. Seeds globose, the funiculus expanded above to cover the hilum, thus arillate. Cotyledons remaining under ground in germination. (Classical Latin name.)

Annuals; flowers few, 1 or 2 in the axils.

Flowers subsessile.....1. *V. sativa*.

Flowers on elongated peduncles.....2. *V. exigua*.

Perennials; flowers several to many, in a raceme on an elongated peduncle.

Leaflets 8 to 12; peduncles 3 to 8-flowered.

Herbage glabrous or nearly so; stems straightish.....3. *V. americana*.

Herbage finely pilose-pubescent; stems zig-zag.....4. *V. californica*.

Leaflets 16 to 30.

Flowers reddish-purple; peduncles 7 to 18-flowered; pods blackening in drying..

5. *V. gigantea*.

Flowers bright blue-purple; peduncles 16 to 30-flowered; pods not blackening in

drying.....6. *V. semicincta*.

1. *V. sativa* L. COMMON VETCH. TARE. Stems slender,  $1\frac{1}{2}$  to  $2\frac{3}{4}$  ft. high; leaflets 6 to 12, glabrous, or the margins slightly ciliate, oblong or narrower, often cuneate, truncate or retuse, mucronate,  $\frac{2}{3}$  to 1 in. long; stipules small, toothed; flowers solitary or geminate, nearly sessile, the pedicels 1 line long at most; corolla 8 to 10 lines long; banner purple, wings red; calyx-teeth subulate-setaceous, longer than the tube; pods  $1\frac{1}{2}$  in. long; seeds  $1\frac{1}{2}$  lines in diameter.—Nat. from Eur.; occasional throughout cismontane Cal.

2. *V. exigua* Nutt. CALIFORNIA VETCH. Very slender, 1 to 2 ft. high; leaflets 4 to 12, oblong to narrowly linear, acute or obtusish, apiculate; peduncles filiform, shorter than the leaves,  $\frac{1}{2}$  to 2 in. long, 1 or 2-flowered; flowers 2 to 3 lines long, white or purplish; pods glabrous, 4 or 5-seeded, 1 in. long.—Stony or sandy soil: Napa Co. and San Joaquin Co. to S. Cal. Apr. Var. *HÁSSEI* Jepson. Stouter; leaflets of at least the lower leaves deeply notched at apex, the notch mucronate; pod 5 to 8 or sometimes only 3-seeded.—Benicia; Livermore; S. Cal.

3. *V. americana* Muhl. AMERICAN VETCH. Fig. 575. Stems 2 to 3 ft. long, trailing or climbing by branched tendrils, sharply 4-sided or winged at the angles; herbage nearly glabrous; leaflets broadly oblong, usually widest above the middle, obtuse, mucronulate,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long; peduncles shorter than the leaves, 4 to 7 or 8-flowered; flowers at first purplish, changing to bluish, 9 lines long; calyx-tube 2 lines long, the lower teeth the longer (1 line long), the upper approximate, incurved; pods

575. *Vicia americana* Muhl.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, pistil  $\times 2$ ; c, pod  $\times \frac{1}{2}$ .

576. *Vicia americana* var. *linearis* Wats.; leaf  $\times \frac{1}{2}$ .

$1\frac{1}{4}$  to 2 in. long; seeds globose, dull black, 2 lines in diameter.—Foothills, 50 to 4700 ft.: coastal S. Cal.; Coast Ranges; Sierra Nevada. Feb.-May. There are intergrades to the varieties. Var. *LINEARIS* Wats. Fig. 576. Leaflets 1 to  $1\frac{1}{2}$  in. long,  $\frac{1}{2}$  to  $1\frac{1}{2}$  lines wide; pods 1 in. long.—Range of the species. Var. *TRUNCATA* Brew. Fig. 577. Leaflets truncate at apex and 3 to 5-denticulate; pods  $\frac{3}{4}$  to 1 in. long.—Range of the species.

577. *Vicia americana* var. *truncata* Brew.; leaf  $\times \frac{1}{2}$ .

4. *V. californica* Greene. Stems zigzag, erect or decumbent, 5 to 11 in. long; herbage finely villous-pubescent; leaflets 8 to 12, elliptic to cuneate-obovate, truncate with the apex 3 to 5-denticulate, 3 to 8 lines long; racemes 3 to 6-flowered.—Mountain slopes, 4000 to 6000 ft.; mts. of S. Cal.; Sierra Nevada from Tulare Co. to Siskiyou Co., thence s. to Humboldt Co. It intergrades to no. 3 and seems insufficiently distinct.

5. *V. gigantea* Hook. GIANT VETCH. Fig 578. Stems stout, somewhat pubescent, climbing several feet high, often forming extensive tangles and draperies over shrubs; leaflets narrowly oblong or tapering somewhat from the base to the obtuse mucronulate apex; calyx short, lower teeth about equaling the tube; corolla red-purple or pale saffron, 6 to 7 lines long; pod oblong,  $1\frac{1}{2}$  in. long, glabrous, glaucous, 3 or 4-seeded; seeds globose, velvety black, 2 lines in diameter.—Along streams near the coast from Monterey Co. to Humboldt Co.; n. to Alas. Mar.-June. The herbage blackens in drying.

6. *V. semicincta* Greene. Stems 3 to 4 ft. high, striate-angled; herbage puberulent; leaflets 16 to 24, linear, approximate,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long; racemes equaling or surpassing the leaves, densely flowered,  $1\frac{1}{4}$  to  $1\frac{3}{4}$  in. long; corolla bright blue-purple, 5 lines long; pods  $\frac{3}{4}$  in. long, glaucous, few-seeded; seeds dull black.—Fields, Goose Lake Valley, n. Modoc Co.; also se. Ore.

578. *Vicia gigantea* Hook.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, fl.  $\times 1$ ; c, pod  $\times \frac{1}{2}$ .

## 28. LATHYRUS L. PEA

Herbs, ours perennial. In technical character and in habit very similar to *Vicia*. Raceme commonly one-sided. Banner roundish or very broad. Upper teeth of calyx commonly shorter than the lower. Leaflets usually larger, in ours 3 to 5 pairs, mostly mucronate; rachis in some species not prolonged into a tendril. Style flattish, hairy along the upper side only, that is, next the free stamen. (Old Greek name of the pea.)

## Stems angled.

Tendrils short and unbranched or none.

Herbage villous.

Plants decumbent; stipules larger than the leaflets; tendrils none; peduncles longer than the leaves, 2 to 6-flowered. .... 1. *L. littoralis*.Plants erect; stipules smaller than the leaflets; tendrils none or reduced to a point; peduncles much shorter than the leaves, 1 or 2-flowered. . . 2. *L. torreyi*.

Herbage glabrous or pubescent.

Leaflets thin, the mucro minute; tendrils simple; herbage puberulent. .... 3. *L. nevadensis*.Leaflets thick, coriaceous, glaucous, the mucro stout and twisted; tendrils none or reduced to a point; herbage glabrous. .... 4. *L. rigidus*.

Tendrils long, branched or simple.

Leaflets linear, equaling or exceeding the rachis. .... 5. *L. graminifolius*.

Leaflets shorter than the rachis.

Herbage more or less pubescent; stipules  $\frac{1}{4}$  to  $\frac{3}{4}$  in. long.Flowers deep red; w. Riverside and San Diego Cos. .... 6. *L. splendens*.

Flowers not deep red.

Flowers dull white, the banner purple-veined or purplish; Santa Cruz Co. to Humboldt Co. .... 7. *L. vestitus*.Flowers rose-pink or flesh-color, the banner with purple veinlets; coastal S. Cal. and n. to Monterey Co. .... 8. *L. strictus*.Herbage glabrous; stipules  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long.Ovary pubescent; tendrils mostly unbranched; stipules as large as and simulating the leaflets. .... 9. *L. maritimus*.

Ovary glabrous; tendrils branched; stipules small or large, not resembling the leaflets.

Racemes slender; flowers turning sordid. .... 10. *L. sulphureus*.Racemes stout; flowers fading blue or yellowish. .... 11. *L. polyphyllus*.

## Stems winged; tendrils long, branched.

Herbage puberulent; stipules  $\frac{1}{4}$  to  $\frac{3}{4}$  in. long. .... 12. *L. californicus*.Herbage glabrous or nearly so; stipules  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long. .... 13. *L. jepsonii*.

1. *L. littoralis* (Nutt.) Endl. BEACH PEA. Fig. 579. Stems many from creeping rootstocks, stout, decumbent; herbage densely silky-villous, suggestive of a hairy Lupine; leaflets 1 to 3 pairs with a usually smaller or imperfect terminal one, cuncate-oblong, 4 to 6 lines long; stipules ovate or somewhat hastate, 2 to 3 times as large as the leaflets; peduncles exceeding the leaves; calyx-teeth nearly equal, as long as the tube; corolla 6 to 8 lines long; banner purple, the keel and wings white or nearly so; pod oblong, 1 in. long, villous, 3 to 5-seeded.—Seashore, Santa Cruz Co. to Del Norte Co.; n. to Wash.

2. *L. torreyi* Gray. Stems erect, very slender, 4 to 9 in. high; herbage light green, sparingly villous; leaflets thin, elliptic to ovate or oblong, 5 to 7 lines long; leaves with a terminal leaflet or the rachis merely ending in a point; stipules small, semi-sagittate, lanceolate, the lower lobe very short; flowers solitary or in 2s, the peduncles 4 to 12 lines long; calyx-teeth subulate, exceeding the tube, or the upper shorter and broader; corolla 6 lines long; banner pale lilac, keel and wings white; pod linear-oblong, pubescent, 1 in. long, 3 to 5-seeded.—Shady woods: Santa Clara Co. to Humboldt Co.; n. to Wash. The herbage is possessed of a lasting fragrance.

3. *L. nevadensis* Wats. Stems loosely soft-pubescent or sparsely puberulent, 5 to 18 in. high; leaves sparsely pubescent; stipules 3 to 8 lines long; leaflets 3 to 6 pairs, narrowly or broadly elliptic, acute or obtuse at both ends, apiculate or mucronulate, usually rather thin, sometimes small and thick,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long; tendrils

579. *Lathyrus littoralis* Endl.; a, fl branchlet  $\times \frac{1}{2}$ ; b, fl.  $\times 1$ ; c, pod  $\times \frac{1}{2}$ .

commonly short and unbranched; peduncles usually shorter than the leaves, few-flowered; calyx-teeth triangular-acuminate, the lower somewhat the larger; corolla reddish-purple fading to blue, sometimes yellowish-white,  $\frac{1}{2}$  to  $\frac{3}{4}$  in. long; keel abruptly upward-turned or right-angled.—Foothills and mts., 2000 to 7000 ft.: Napa Co. to Siskiyou Co., thence to Plumas Co. and s. in the Sierra Nevada to Mariposa Co. (*L. nuttallii* Wats.)

4. *L. rigidus* White. Stems slender, angled, ascending, 6 to 10 in. high; herbage glabrous and somewhat glaucous; stipules narrow; leaves coriaceous, 1 to  $2\frac{1}{2}$  in. long; leaflets 4 to 10, oblong-ob lanceolate, 7 to 11 lines long; tendrils reduced or none; peduncles exceeding the leaves; racemes 2 to 5-flowered; corolla 8 to 11 lines long, white.—Plains and low hills, n. Modoc Co.; n. to Ore.

5. *L. graminifolius* White. Stems 6 to 14 in. high; herbage glabrous, or sometimes loosely pubescent; stipules narrow-lanceolate; rachis of leaves 1 to 2 in. long, the leaflets linear, pointed, 1 to 3 in. long; tendrils simple or branched; peduncles  $\frac{1}{2}$  to  $2\frac{1}{2}$  in. long, 2 to 4-flowered; corolla white, often pink or purple-tinged, 4 lines long.—Open forest, 4400 to 6000 ft., Siskiyou Co. to Lassen Co., thence s. in the Sierra Nevada; e. to N. Mex., s. to Mex.

6. *L. splendens* Kell. CAMPO PEA. Stems climbing 2 to 4 ft. high, angled; herbage minutely pubescent or subglabrous; leaflets about 8, linear to elliptic-ovate, very variable (even on one individual), 10 to 14 lines long; stipules variable; racemes 4 to many-flowered; corolla deep red, 1 to  $1\frac{1}{4}$  in. long.—Mts. of Riverside and San Diego Cos.; s. to L. Cal. A remarkably showy species.

7. *L. vestitus* Nutt. Stems angled, low and herbaceous, or climbing 3 to 7 ft. high on shrubs and woody below; stipules broadly or narrowly semi-sagittate; leaflets finely puberulent, dark green, lighter on the under surface, 8 to 12 lines long, 2 to  $4\frac{1}{2}$  lines wide, tapering to both ends from the middle, usually more acute at apex than at base, mucronulate; racemes many-flowered; lowest calyx-teeth lanceolate, nearly equaling or exceeding tube; corolla dull white, turning sordid in age, 7 to 8 or 9 lines long, the banner violet-veined, sometimes pink-tinged; seed with a small aril.—Foothills, open or wooded slopes, 100 to 2500 ft.: Santa Cruz Co. to Alameda Co. and n. to Tehama and Humboldt Cos.; n. to Ore.

8. *L. strictus* Nutt. Similar to *L. vestitus* and most likely distinct from it only varietally; stouter; leaflets elliptic to linear, acute, commonly pubescent, 8 to 15 lines long; stipules 2 to 5 lines long; flowers rose-pink or flesh color or whitish with red or purple or lavender veinlets.—Foothills and mountains, 2000 to 5500 ft.: Monterey Co. and Tehachapi Mts. to the San Jacinto Mts. and San Diego Co.; s. to L. Cal. (*L. violaceus* and *L. lactiflorus* Greene.) Var. *ALFELDII* Jepson n. comb. Stipules nearly half as large as the leaflets.—Palomar to San Diego. (*L. alfeldii* White.) Var. *BARBARAE* Jepson n. comb. Leaflets elongated-linear,  $\frac{3}{4}$  to 2 in. long, mostly 1 to 2 lines wide.—Santa Barbara; Palomar Mt. (*L. violaceus* var. *barbarae* White.) Var. *THACHERAE* Jepson n. var. Subglabrous; leaves 1 to  $1\frac{1}{2}$  in. long; basal lobes of stipules narrow (lanceolate to subulate).—Ojai Valley, Ventura Co. (Olive Thacher 22, type).

9. *L. maritimus* Bigelow. Stems stout, 1 to 2 ft. high, at length decumbent; herbage glabrous; leaflets elliptic, obtuse at apex, mucronulate,  $\frac{3}{4}$  to  $1\frac{3}{4}$  in. long; stipules broadly ovate, acute, as large as the leaflets; upper calyx-teeth  $\frac{1}{2}$  to  $\frac{3}{4}$  as long as the lower; corolla purple,  $\frac{3}{4}$  in. long; ovary heavily glandular-pubescent.—Sandy seashore, Humboldt Co. to Del Norte Co.; n. to Alas., e. to Lab.; Eur.

10. *L. sulphureus* Brew. Stems rather stout, 1 to 2 ft. high; herbage glabrous; leaflets 6 to 12, not closely paired or commonly distinctly alternate on the rachis, oblong-ovate to elliptic, cuspidate at apex,  $\frac{3}{4}$  to 2 in. long; stipules small or large, mostly broad; peduncles 2 to 4 in. long; racemes 6 to 25-flowered; pedicels recurved; corolla dull white or the banner slightly pinkish, turning yellowish-brown, 5 to 7 lines long; upper calyx-teeth much

shorter than the lower; banner short, pink- or purple-veined in the middle.—Foothills, 2200 to 5500 ft.: Lake Co. to Trinity Co.; Sierra Nevada from Plumas Co. to Tulare Co.

11. *L. polyphyllus* Nutt. Stem erect, angled,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  ft. high; herbage rather light-colored, perfectly glabrous; leaflets narrowly ovate to elliptic-ovate, obtuse at base and apex, mucronulate,  $\frac{3}{4}$  to  $2\frac{1}{2}$  in. long; stipules half to as large as the leaflets, ovate, acuminate or ovate-lanceolate, dilated below into a rounded toothed lobe, 3 to 9 lines broad; racemes 5 to many-flowered; lower calyx-teeth distinctly longer than tube; corolla rose-purple, fading blue or yellowish, 7 to 8 lines long.—Vicinity of the ocean: Mendocino Co. to Del Norte Co.; n. to B. C., s. in a slightly modified form to the Oakland Hills and San Francisco. Var. *INSECUNDUS* Jepson n. var. Raceme not one-sided, the subulate calyx-lobes very prominent in bud.—Olema, Marin Co. (Jepson, type).

12. *L. californicus* Wats. Stems erect, stoutish, strongly winged, or at least evidently winged,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  ft. high, or climbing 4 to 6 ft.; herbage light green, glaucous, finely pubescent or subglabrous; leaflets 1 to 3 in. long, 3 to 11 lines wide, tapering from the middle to each end, acute, mucronate, strongly several-nerved from or near the base, the nerves branching little and almost parallel; stipules semi-sagittate, narrow, the upper lobe lanceolate, the lower lobe little dilated, commonly entire; racemes 4 to 18-flowered, on peduncles 3 to 7 in. long; calyx sparingly to densely pubescent; lower calyx-teeth lanceolate, subequal, longer than tube; pod 2 in. long, 4 lines broad; corolla white, the banner pink-veined and soon pink-flushed, all the petals sordid in age, 8 to 10 lines long; seed with a small aril.—Sandy places in valleys or along streams, 50 to 4000 ft.: Sierra Nevada foothills from Tuolumne Co. to Shasta Co.; Sacramento Valley; inner North Coast Ranges from Siskiyou Co. to Solano Co.; Oakland Hills; Mt. Hamilton Range. (*L. watsonii* White.)

580. *Lathyrus jepsonii* Greene; a, fl. branch-  
let  $\times \frac{1}{2}$ ; b, wing  $\times 1$ ; c, pistil  $\times 1\frac{1}{2}$ ;  
d, pod  $\times \frac{1}{2}$ .

13. *L. jepsonii* Greene. Fig. 580. Stems 4 to 8 ft. high, climbing, strongly winged along the angles; herbage glabrous; leaflets 8 to 12, linear-lanceolate, 1 to  $1\frac{1}{2}$  in. long; stipules semi-sagittate, both the apical and basal lobes lanceolate or oblong; peduncles mostly shorter than the leaves; corolla rose-purple, 8 to 9 lines long; lower calyx-teeth unequal, the middle one equaling the tube; pods  $1\frac{3}{4}$  to  $2\frac{1}{4}$  in. long, 3 to 4 lines wide.—Deltas or marshes: Suisun Marshes; lower Sacramento isls. Aug.-Oct.

## 29. *ALHÁGI* Desv.

Spiny shrub. Leaves simple, entire, deciduous. Flowers few in racemes. Calyx short-campanulate, subequally toothed. Stamens diadelphous. Banner with incurved margin. Pods linear, incompletely 2-celled, constricted between the seeds. (The Mauretanian name.)

1. *A. camelórum* Fisch. CAMEL THORN. One to 2 ft. high; spines numerous, slender,  $\frac{1}{2}$  to 1 in. long; flowers lavender-red, 4 to 5 lines long.—Nat. from Asia Minor; Mecca, Colorado Desert.

## LINACEAE. FLAX FAMILY

Herbs. Leaves alternate, or sometimes opposite, small, entire, without stipules or these sometimes replaced by a gland. Flowers mostly in cymose panicles, perfect, regular, in ours 5-merous. Petals distinct, very quickly falling. Stamens 5, slightly united at base. Styles 2 to 5, distinct. Cells of the superior ovary as many as the styles, or twice as many by the formation of a false division wall from the back of each cell, these false partitions frequently not complete. Fruit a capsule, splitting through the false partitions and frequently also septicidal.

## 1. LINUM L. FLAX

Our only genus. (Ancient Latin name of these plants.)

Perennial; styles 5; flowers blue; petals without ventral appendages.....1. *L. lewisii*.  
Annuals; styles 2 or 3.

Styles 2; petals without ventral appendages; flowers yellow; sepals irregularly serrate or lacerate; upper leaves serrate.....2. *L. digynum*.

Styles 3; petals commonly with ventral appendages at base; sepals entire, or sometimes minutely ciliate-glandular.

Leaves closely margined with stipitate glands; pedicels 1 to 5 lines long, discrete. Flowers yellow; leaves linear.....3. *L. adenophyllum*.

Flowers pink; leaves ovate.....4. *L. drymarioides*.

Leaves entire, not ciliate-glandular.

Pedicels more or less elongated and flowers thus distinctly separate from one another; stem much branched and repeatedly dichotomous above the simple base.

Flowers yellow, the petals 1 to 1½ lines long.....5. *L. cleveandii*.

Flowers pinkish or white.

Petals about 3 lines long; pedicels straight.....6. *L. spergulinum*.

Petals about 2 lines long; pedicels curved at apex.....7. *L. micranthum*.

Pedicels short, the flowers in rather close clusters.

Flowers white, pink or rose-purple.....8. *L. californicum*.

Flowers bright yellow.....9. *L. breweri*.

1. *L. lewisii* Pursh. BLUE FLAX. Stems several from a woody root-crown, erect, thickly clothed with leaves, simple below the corymbosely branched summit, 1½ to 3 ft. high; herbage glabrous; leaves linear-lanceolate or linear, acute, 5 to 11 lines long; flowers in terminal loose and somewhat corymbose clusters, or racemose on the branches; corolla blue, 6 to 8 lines long; pedicels 6 to 7 lines long, becoming elongated in fruit; sepals ovate, 3 to 5-nerved; capsule globose, acute, 3 to 5 lines long, eventually dehiscent by 10 valves, the valves often with a brown midnerve.—Sierra Nevada, 4000 to 9000 ft., s. to San Diego Co.; rare in the Coast Ranges; n. to Brit. Am., e. to Texas.

2. *L. digynum* Gray. Stem slender, simple below, corymbosely forked above, 4 to 9 in. high; leaves usually opposite, elliptic or oblong to spatulate-oblong, 3 to 10 lines long, the lower entire, the upper sharply serrate; flowers short-pedicelled; sepals irregularly serrate or lacerate; petals yellow, not appendaged, 2 lines long; carpels 2, the false septa complete.—Meadows, 3500 to 4700 ft., Sierra Nevada from Mariposa Co. to Plumas Co. and n. to Siskiyou Co.; n. to Wash. June-July.

3. *L. adenophyllum* Gray. Stem simple below, repeatedly forked above and forming a widely branched panicle, 4 to 14 in. high; leaves alternate or the lowest opposite, lanceolate, 3 to 6 lines long, the margin conspicuously glandular-ciliate; flowers yellow or yellowish white, about 2 to 2½ lines long; sepals entire and naked, or slightly glandular-ciliate; appendages of the petals broad and confluent, somewhat pubescent; filaments abruptly dilated and 2-toothed at base; capsule as long as the lanceolate sepals.—Open hills, 3000 to 5000 ft., Lake and Mendocino Cos.

4. *L. drymarioides* Curran. Similar to no. 3; herbage sparingly villous; leaves broadly ovate; flowers pink, scattered; petals minute, 2-toothed and appendaged at base.—Foothills, w. Colusa Co.

5. *L. cleveandii* Greene. Stem branched above the base, repeatedly dichotomous, 8 to 12 in. high; herbage glabrate, leaves oblong to linear, 3 to 5 lines long; flowers on filiform pedicels (1 or) 2 to 7 lines long; petals

yellow, ( $\frac{3}{4}$  or) 1 to  $1\frac{1}{2}$  lines long, 2-toothed, 3-appendaged; capsule somewhat longer than the sepals.—Opens on chaparral slopes, 1000 to 2500 ft., Napa, Lake and Mendocino Cos., in the geographic gap of *L. micranthum*, between Mt. Tamalpais and Mt. Diablo on the south, and Hy-am-pum on the north. June.

6. *L. spergulinum* Gray. Fig. 581. Stems simple below, above more or less dichotomously paniculate, slightly hairy in the forks, 11 to 18 in. high; leaves linear, 3 to 6 lines long; pedicels filiform, rigid, straight, 3 to 10 lines long; flowers pinkish-white, 3 to  $3\frac{1}{2}$  lines long; sepals ovate, naked or with one edge weakly glandular-ciliate; petals 2-toothed, with 3 appendages, the middle one ligulate and hairy, the lateral horn-like, twined outward and downward, or often reduced; capsule ovoid, acute, nearly twice as long as the sepals.—Open or brushy slopes, 1000 to 2000 ft., Contra Costa and Sonoma Cos. to Mendocino Co. June-July.

7. *L. micranthum* Gray. Stems freely branched above the base, the branches commonly rather closely ascending, 5 to 10 in. high; leaves narrowly linear, 3 to 6 lines long; flowers white or pinkish, commonly 2 lines long, somewhat nodding on the curved ends of straight or nearly straight pedicels; pedicels 2 to 9 lines long; sepals oblong-lanceolate, the inner sparingly or microscopically glandular-ciliate; petals 1 to  $1\frac{1}{2}$  (rarely  $2\frac{1}{2}$ ) lines long, 2-toothed, with or mostly without appendages; capsule ovoid, equal to the sepals.—Open hills, often in rocky soil, 1900 to 4500 ft., San Diego Co. to Siskiyou Co. in both the Coast Ranges and Sierra Nevada; n. to Ore. May-July.

8. *L. californicum* Benth. Stem paniculately branched, with angled or striate branches, 4 to 24 in. high; herbage glaucous; leaves linear, 5 to 12 lines long, with prominent stipular glands; sepals lanceolate, glabrous but the 3 inner sparingly glandular-ciliate; petals white or pinkish, 2 to  $3\frac{1}{2}$  lines long, 3-appendaged, the median appendage rounded, not hairy; capsule ovoid, acute, a little shorter than the sepals.—Open hills, 1000 to 2000 ft.: San Carlos Range; Mt. Diablo; Napa Co.; Lake Co.; Butte Co. Var. *congestum* Jepson n. comb. Sepals puberulent.—Coastal: San Mateo Co.; San Francisco; Marin Co. (*L. congestum* Gray.)

9. *L. brèweri* Gray. Stems rather shortly branched at summit, or at least not diffusely branched, 9 to 14 in. high; herbage glaucous; leaves narrowly linear, 5 to 8 lines long; flowers bright yellow, 3 lines long; sepals ovate, some slightly glandular on the margin; petals obovate, 3 to 4 lines long, the short claw with a tooth on each side and a central gland.—Dry hill or cañon sides in grassy opens: Mt. Diablo; Vaca Mts. June.

581. *Linum spergulinum* Gray; a, fl. branchlet  $\times \frac{1}{2}$ ; b, stamens  $\times 5$ ; c, pistil  $\times 5$ ; d, median gland or appendage at base of petal and two lateral horns  $\times 7\frac{1}{2}$ .

#### OXALIDACEAE. OXALIS FAMILY

Ours low herbs with sour juice and palmately 3-foliolate leaves. Flowers complete, regular, symmetrical, 5-merous. Ovary superior, 5-celled; styles 5, distinct. Fruit a loculicidal capsule.

1. *OXALIS* L. WOOD SORREL

Leaflets obcordate, closing and drooping at night. Peduncles axillary, 1 to several-flowered. Sepals imbricated. Stamens 10, the filaments somewhat dilated and united at base. Glands none. Capsule membranous, 5-celled, more or less 5-lobed, the cells opening on the dorsal sutures through which the seeds are ejected, the valves remaining attached to the axis by the partitions. Seeds 2 to several in each cell. (Greek oxus, sour, the juice containing oxalic acid.)

Leaves alternate on the stem; flowers yellow.

Stems from a running rootstock; pedicels in fruit divergent or umbellate, bearing the capsules erect.....1. *O. corniculata*.

Stems from a stout caudex; pedicels deflexed or refracted in fruit, curved at tip and bearing the capsules erect.....2. *O. wrightii*.

Leaves all basal; flowers pink, white or rose-color.

Scapes commonly 1-flowered; petals 9 to 12 lines long.....3. *O. oregana*.

Scapes commonly 3 to 6-flowered; petals 3 to 6 lines long.....4. *O. trillifolia*.

1. *O. corniculata* L. YELLOW SORREL. Stems slender, decumbent or ascending, from running rootstocks, 3 to 6 in. long; herbage villous, sometimes very scantily so; leaflets  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long, on slender petioles with small villous stipules; peduncles axillary, elongated, bearing 2 or 3 flowers; petals yellow; capsules linear,  $\frac{1}{2}$  in. long, many-seeded.—Weed introd. from Eur., mostly along the coast. Apr.-Oct. Var. *ATROPURPUREA* Planch. Stems and foliage deep red-purple.—Native of Eur., garden escape.

2. *O. wrightii* Gray. Stems caespitose from a stout root-crown or short caudex, 3 to 7 (or 13) in. long; stems villous, the leaves pubescent; leaflets 3 to 5 lines long; peduncles axillary, elongated, 1 to 3-flowered; flowers 4 to 6 lines long; petals yellow, obovate, truncatish or usually emarginate; capsules oblong,  $\frac{1}{2}$  to  $\frac{3}{4}$  in. long.—Monterey to San Diego, thence e. to Tex. Apr.-May. (*Xanthoxalis californica* Abrams.)

3. *O. oregana* Nutt. REDWOOD SORREL. Fig. 582. Scapes and leaves from a creeping rootstock; herbage more or less rusty-villous; scapes 2-bracted near the top, commonly 1-flowered; leaflets broadly obcordate, broader than long, 1 to  $1\frac{1}{2}$  in. long; petals oblong-obovate, slightly retuse or obtuse, pink, white, or rose-color, often veined with purple, 9 to 12 lines long; capsules obovoid, 9 lines long.—Shady woods in the Redwood belt from the Santa Lucia Mts. to Del Norte Co.; n. to Wash. Mar.-Apr. Var. *TRACYI* Jepson n. var. Flowers small, 4 lines long; petals white, obtuse.—Humboldt Co. and n. to Curry Co., Ore. (Tamba Ranch, Chetco River, Jepson 9366, type).

4. *O. trillifolia* Hook. Scapes and leaves all basal from a fleshy-scaly rootstock; scapes as long as the leaves, 5 to 10 in. high, umbellately 3 to 6-flowered; leaflets thin, 1 to  $1\frac{1}{2}$  in. long; petals nearly white, deeply notched, 3 to 6 lines long; capsules linear, 10 to 15 lines long.—Montane, 5000 to 6000 ft.: Trinity Summit, n. Humboldt Co.; n. to Wash.

582. *Oxalis oregana* Nutt.; a, habit  $\times \frac{1}{2}$ ; b, petal  $\times 1$ ; c, pistil  $\times 2$ .

## GERANIACEAE. GERANIUM FAMILY

Ours herbs with lobed and divided leaves and scarious stipules. Flowers complete, regular, symmetrical, 5-merous. Sepals persistent. Petals deciduous. Stamens as many or twice as many as the petals. Ovary superior, 5-celled, deeply lobed, the 5 styles united around the elongated axis (prolongation of the receptacle) and free only at tip. Fruit of 5 one-seeded carpels separating elastically when ripe from the central persistent axis and bearing the twisted or spirally coiled styles as tails.

Stamens with anthers 10; leaves palmately parted; styles in fruit nearly glabrous inside.

1. GERANIUM.

Stamens with anthers 5; leaves pinnatifid or pinnate, or roundish-cordate; styles in fruit bearded inside. . . . . 2. ERODIUM.

## 1. GERANIUM L. CRANESBILL

Herbs with forking stems, swollen nodes and stipulate palmately parted leaves. Peduncles axillary, umbellately 2 or 3-flowered, or 1-flowered. Flowers regular, 5-merous, the sepals imbricate in the bud. Stamens 10, sometimes slightly connate at base, all with perfect anthers, the 5 longer alternate with the petals and with glands at their base. Styles in fruit nearly glabrous inside. Cotyledons plicate, incumbent on the caulicle. (Greek geranos, a crane, from the elongated fruit-bearing beak.)

Petals 1 to 2½ (or 3) lines long, little or not at all exceeding the calyx; stems leafy.

Carpels hairy; stems (especially the lower part) usually retrorsely pubescent.

Perennial; seeds superficially reticulate; pubescence glandless. . . . 1. *G. pilosum*.

Annuals.

Inflorescence usually glandless; flowers light pink; leaf divisions broad; seeds reticulated. . . . . 2. *G. carolinianum*.

Inflorescence more or less glandular; flowers purple; leaf divisions narrow; seeds regularly pitted. . . . . 3. *G. dissectum*.

Carpels glabrous, transversely wrinkled; seeds smooth; stems and petioles pilose-spreading, the hairs sometimes glandular; annual. . . . . 4. *G. molle*.

Petals 4½ to 8 lines long, much exceeding the calyx; carpels and beaks glandular-pubescent; seeds very minutely roughened; perennials.

Leaves all basal; San Bernardino Mts. . . . . 5. *G. caespitosum*.

Stems leafy; widespread in the higher mts.

Petals pink; hairs of pedicels sometimes tipped with yellowish glands. . . . . 6. *G. incisum*.

Petals white; hairs of pedicels tipped with purple glands. . . . 7. *G. richardsonii*.

1. *G. pilosum* Forst. Stems slender, leafy, branching, arising from a thick root-crown, 1 to 1¾ ft. high; stems and petioles retrorsely hispidulose, the leaves hispidulose; leaves ¾ to 1 in. wide, incisely 3 or 5-parted, the cuneate segments more or less deeply toothed or cleft; peduncles 2-flowered; petals deep purple, 1 to 2 lines long; carpels dark brown or black, somewhat sparsely hairy.—Introduced from Eur.: Inverness, Marin Co.; Trinidad, Humboldt Co. May-June. Var. *RETORSUM* Jepson n. comb. Pubescence of stem retrorsely strigose.—Presidio, San Francisco; Blue Lake, Humboldt Co. June. (*G. retrorsum* L'Her.)

*G. sibiricum* L. Annual; peduncles 1-flowered; sepals strongly awned; petals white, 3 lines long.—Native of Siberia; adv. at Olema, Marin Co.

2. *G. carolinianum* L. CAROLINA GERANIUM. Stems branching, erect or ascending, 7 to 14 in. high; herbage pubescent; leaves palmately 5 to 7-parted, the cuneate segments more or less incisely dissected or toothed, the ultimate segments rather broad; peduncles commonly shorter than the petioles; inflorescence usually not glandular; flowers about 3 lines long; petals light pink; beak of fruit loosely villous, sometimes glandular; carpels hairy, usually black; seed reticulately ridged or pitted.—Nat. from eastern U. S.; widely distributed but mostly infrequent. Mar-May. Var. *LONGIPES* Wats. Branching from base, looser and more spreading; leaves cleft into 3 to 5 broader nearly equal primary lobes which are toothed or cleft; peduncles longer than the petioles, spreading.—Humboldt and Siskiyou Cos., 2500 to 3500 ft.; n. to B. C., e. to Col. July-Aug.

3. *G. dissectum* L. COMMON GERANIUM. Fig. 583. Differing little from no. 2, but the primary lobes of the leaves typically very narrow, with the ultimate divisions mostly slender, somewhat falcate and acute; petals rose-purple; inflorescence and fruit glandular.—Nat. from Eur.: Coast Ranges,

583. *Geranium dissectum* L.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, fl.  $\times 1\frac{1}{2}$ ; c, carpel  $\times 1$ ; d, seed  $\times 5$ .

dino Mts., 7000 to 8000 ft.; e. to N. Mex. June.

6. *G. incisum* Nutt. Stems 1 to 2 ft. high, from a stout often branched caudex; herbage pubescent, the stems and pedicels pilose, the hairs sometimes tipped with yellow glands; basal leaves or petioles 6 to 11 in. long, deeply parted into usually 5 segments which are again cleft or deeply toothed; cauline leaves short-petioled, parted into usually 3 segments; petals pink or purple, hairy inside, 5 to 7 lines long.—Mountain valleys and cañon flats, 4000 to 7000 ft.: mts. of S. Cal.; Sierra Nevada from Tulare Co. to Siskiyou Co.; n. to B. C. June-Aug.

7. *G. richardsonii* F. & T. Fig. 584. Stems rather slender, from a stout caudex,  $1\frac{1}{2}$  to  $2\frac{1}{4}$  ft. high; herbage appressed-pubescent, the stems and petioles pilose or hirsute, sometimes retrorsely so; basal leaves deeply 5-parted into toothed or cleft segments, the petioles 3 to 12 in. long; hairs of the pedicels tipped with purple glands; petals white, mostly roseate-veined, hairy within, 5 to 6 lines long.—Mountain valleys or along cañon bottoms, 5500 to 9000 ft.: mts. of S. Cal.; Sierra Nevada from Tulare Co. to Siskiyou Co., thence s. to Humboldt Co. (800 ft); e. to Rocky Mts., n. to Saskat. July.

frequent in the San Francisco Bay region. Feb.-June.

4. *G. mólle* L. Stems slender, several from the base, 12 to 20 in. high; leaves pubescent, deeply cleft into 5 to 7 broad cuneate segments, the segments toothed or cleft, the basal leaves with petioles 3 to 5 in. long; pedicels widely divergent after flowering; petals rose-pink, cleft at apex,  $1\frac{1}{2}$  lines long, with a tuft of hairs at base; carpels glabrous, finely wrinkled transversely, the beak glandular-pubescent.—Introduced from Eur., infrequent: San Francisco; Hydesville, Humboldt Co.; Eureka; Gilbert Creek, Del Norte Co. May.

5. *G. caespitosum* James. Peduncles scape-like, these and the leaves in a basal tuft from a thick caudex, 5 to 6 in. long; herbage puberulent, the peduncles and petioles retrorsely hairy; leaves 5-parted or -divided, the segments cuneate, deeply toothed or cleft; peduncles 1 or 2-flowered; petals pale, purple-veined, villous within,  $4\frac{1}{2}$  to 5 lines long.—San Bernar-

584. *Geranium richardsonii* F. & T.; a, basal leaf  $\times \frac{2}{9}$ ; b, fl. branchlet  $\times \frac{1}{2}$ ; c, stamen circle and pistil  $\times 1\frac{1}{2}$ ; d, fruit  $\times \frac{3}{2}$ .

2. *ERODIUM* L'Her. STORKSBILL

Annual herbs. Leaves opposite, often unequal, either simple or pinnate, with one interpetiolar stipule on one side and two on the other. In vegetative characters very similar to *Geranium*; the flower and fruit nearly the same, but the stamens with anthers 5 only, the alternate filaments sterile and scale-like. Styles bearded inside. Pedicels after anthesis commonly retrocurved. (Greek *erodios*, a heron.)

Sepals not bristle-tipped; leaves mostly cordate or subcordate at base.

Leaves round-ovate to oblong-ovate, sub-palmately cleft or parted....1. *E. texanum*.

Leaves cordate-reniform, crenately toothed or shallowly lobed....2. *E. macrophyllum*.

Sepals bristle-tipped or setose-tipped; leaves oblong or oblong-ovate, not cordate at base, pinnatifid or pinnately divided into toothed or cleft lobes.

Leaves pinnately cleft into broad crenate lobes; beak of fruit 3 to 5 in. long; sepals bristle-tipped; glands of the flowers greenish.....3. *E. botrys*.

Leaves pinnate; beak of fruit  $1\frac{1}{2}$  to  $1\frac{3}{4}$  in. long; glands of the flowers reddish or brownish.

Leaflets serrate or merely incised; petals with naked claws; sepals without bristles or sometimes tipped with 1 or 2 short setose hairs; stipules large, obtuse.....4. *E. moschatum*.

Leaflets pinnatifid; petals with ciliate claws; sepals tipped with 1 or 2 long bristle-like hairs; stipules commonly small and acute...5. *E. cicutarium*.

1. *E. texanum* Gray. Stems caespitose, several from the base, leafy,  $1\frac{1}{2}$  to 11 in. long; herbage canescently appressed-pubescent, without glandular hairs; leaves round-ovate to oblong-ovate, cordate to subcordate at base, subpalmately lobed or divided, dentate, 4 to 11 lines long; flowers in clusters of about 3; sepals oblong, abruptly mucronate, silvery with appressed pubescence, purple-veined; petals purple, 7 to 9 lines long on the earliest flowers, the late ones greatly reduced or suppressed; carpels rather sparsely hairy, the beak scabrous, appressed-pubescent.—Sandy soils, Mohave and Colorado deserts; e. to Tex. Apr.-May.

585. *E. botrys* Bertol.; Los Angeles Co.  
leaf  $\times \frac{1}{4}$ .

2. *E. macrophyllum* H. & A. Peduncles and leaves basal or sub-basal, 3 to 12 in. high; herbage puberulent; leaves reniform-cordate, crenate and often shallowly lobed, 1 to 2 in. broad; umbels mostly 2 or 3-flowered; petals white, 5 to 8 lines long, little exceeding the broad sepals; filaments conspicuously orbicular-dilated at base; mature carpels densely silky-hairy, truncate at top, 4 lines long.—Great Valley; South Coast Ranges; coastal S. Cal.; rare. Var. *CALIFORNICUM* Jepson. Taller, branching, 12 to 16 in. high; herbage puberulent and also beset with gland-tipped hairs; leaves 2 to  $3\frac{1}{2}$  in. broad; umbels frequently 5 or 6-flowered; petals deep rose-red or purple.—Alameda Co. to

3. *E. botrys* Bertol. Fig. 585. Stems leafy, branching from

the base, commonly prostrate, but sometimes erect,  $\frac{1}{2}$  to  $2\frac{1}{2}$  ft. long; herbage coarsely white-pubescent; leaves 1 to 4 in. long on petioles as long or twice as long, oblong-ovate, pinnatifid, the lobes serrate, acute; sepals short-pointed and tipped with 1 or 2 short bristles; petals deep violet; glands greenish; filaments dilated nearly to apex and toothed.—Mediterranean plant widely naturalized. On low pastured hills and rolling gravelly plains its rosettes of leaves are formed in winter or early spring, lie flat on the ground, kill out other seedlings and effectively protect the plant from close competition.

4. *E. moschatum* L'Her. WHITE-STEM FILAREE. MUSK CLOVER. Fig. 586. Leaves at first forming a close rosette on the ground, later with stout fleshy ascending leafy stems  $\frac{1}{2}$  to  $1\frac{1}{2}$  ft. high; herbage hirsute with scattered spreading hairs; leaves 2 or 3 in. to  $1\frac{1}{2}$  ft. long; leaflets ovate to elliptical, serrate and sparsely incised, short-petiololate,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long, the terminal cuneately 3 to 5-parted; peduncles much elongated in fruit, 4 to 11 in. long; petals rose-purple, 3 lines long, with short claws; filaments membranously winged at base, with upwardly pointing

586. *E. moschatum* L'Her.;  
leaf  $\times \frac{1}{4}$ .

587. *E. cicutarium*  
L'Her.;  
leaf  $\times \frac{1}{4}$ .

teeth; beak of the fruit  $1\frac{1}{2}$  to  $1\frac{3}{4}$  in. long.—Nat. from Eur.; abundant in rich lands of valley orchards and vineyards, in the North Coast Ranges often forming extensive pure growths and in such places far more common than *E. cicutarium*. Mar.-Apr. The term Filaree, a contraction of the Spanish Alfilerilla, is, like the names Pin Clover or Pin Grass, indifferently applied to either this species or to no. 5.

5. *E. cicutarium* L'Her. RED-STEM FILAREE. Fig. 587. Leaves at first forming a close rosette on the ground, later with more or less ascending leafy stems 3 to 12 in. long; leaflets subsessile, nearly oblong, incisely pinnatifid with acute often toothed lobes; petals rose-purple; sepals terminated by 1 or 2 bristle-like hairs; filaments little dilated at base, not toothed; beak of the fruit 1 to  $1\frac{1}{4}$  in. long.—Introduced from the Mediterranean region; barren hillsides or dry plains everywhere; in all interior or semi arid regions far more common than no. 4. Beginning to flower in Feb. or Mar. and in many places continuing through the summer. It is an esteemed forage plant. The stems are commonly reddish, in no. 4 commonly with white stems.

### LIMNANTHACEAE. MEADOW FOAM FAMILY

Annual herbs with dissected alternate leaves without stipules. Flowers complete, regular, symmetrical, 3 to 6-merous. Calyx of distinct sepals, persistent, free from the ovary. Petals withering-persistent. Stamens twice as many as the petals. Carpels 5, their bodies distinct but with a common style arising from among them near the base, at length separating from a very short axis as 1-seeded nutlets.

Flowers commonly 5-merous, never 3-merous; petals notched at apex, longer than the sepals; cismontane. . . . . 1. *LIMNANTHES*.  
Flowers 3-merous; petals entire, shorter than the sepals; northern Sierra Nevada, mostly transmontane. . . . . 2. *FLOERKEA*.

#### 1. *LIMNANTHES* R. Br.

Flowers solitary on axillary peduncles, ours 5-merous (exceptionally 4 or 6-merous). Sepals valvate in the bud. Stamens 10, distinct, the filaments alternate the petals with a gland-like swelling at base. Petals with a U-shaped band of hairs on the claw. Stigmas 5, capitate. (Greek limne, marsh, and anthos, flower, in reference to the habitat.)

Nutlets smooth or with only a few tubercles at apex; corolla white, usually with a yellow eye; herbage glabrous. . . . . 1. *L. douglasii*.  
Nutlets densely set with scale-like tubercles, the ridges or plates of the tubercles densely covered on the margins with very minute roundish granules, these granules microscopically scaly on the surface.  
Herbage glabrous; corolla white, commonly aging or fading pinkish. . . . 2. *L. rosea*.  
Herbage (especially the young parts) pilose; corolla white, sometimes rose-tinted at apex. . . . . 3. *L. alba*.

1. *L. douglasii* R. Br. MEADOW FOAM. Stems several from the base, ascending, 6 to 14 in. long; herbage yellowish green, succulent, glabrous; leaves pinnately divided, the divisions 3 to 9 and incisely toothed or parted; peduncles at length 2 to 4 in. long; sepals lanceolate, 3 to 4 lines long,  $\frac{1}{2}$  the length of the petals; petals white (or occasionally roseate), yellowish at base or sometimes wholly white, obovate-cuneate, a U-shaped band of hairs on the claw; nutlets smooth to strongly tuberculate, about 2 lines in diameter.—Low ground in or near shallow water, forming large patches which color in Apr. the valley levels in the Coast Ranges from Trinity Co. to San Luis Obispo Co.; less common in the Sierra foothills from Butte Co. to Tulare Co.; rare in S. Cal. (San Diego Co.). Its white and yellow is nearly as pleasing as that of blue in *Nemophila menziesii*. (*Floerkea douglasii* Baill.)

2. *L. rosea* Hartw. VALLEY FOAM. Fig. 588. Stems more or less fleshy, many from the base, ascending or erect, 4 to 12 in. high; petals white, the nerves rose-color, commonly aging or fading rosy or with a tinge of rose, 6 to 7 lines long; nutlets grayish or light brown, densely set all over with rather thin spreading scale-like tubercles or crests, the ridges or plates of

the tubercles covered with very minute or microscopic roundish granules furnished with microscopic scales.—Sacramento Valley and lower San Joaquin Valley. Perhaps this passes into *L. alba*. (*Floerkea rosea* Greene.)

3. *L. alba* Hartw. Commonly erect, 5 to 8 in. high; young parts and buds more or less pilose, the calyx densely white-woolly with long hairs on the inside; sepals rather broad; petals white, often rose-tinted at apex; nutlets reddish brown, prominently tuberculate, the tubercles composed of plates or strands and thus more or less hollow or lattice-like.—Northern Sierra foothills (Tuolumne Co. to Shasta Co.) and adjacent rolling plains. (*Floerkea alba* Greene.)

## 2. FLOERKEA Willd.

Similar to *Limnanthes* but the flowers 3-merous. Petals small, entire, shorter than the sepals, alternate with as many glands. Stamens 6. Stigmas 3, not capitate. (H. G. Floerke, a German botanist.)

1. *F. proserpinacoides* Willd. Stems slender, (1½ or) 6 to 12 in. high; herbage glabrous; petals white, 1 line long; nutlets with somewhat slender tubercles at summit.—Mountain valleys, 5000 to 7500 ft., n. Sierra Nevada from Nevada Co. to Modoc Co.; n. to Ore., e. to Del.

588. *Limnanthes rosea* Hartw.; a, habit x ½; b, fr. x ½; c, petal base x 1.

## POLYGALACEAE. POLYGALA FAMILY

Perennial herbs or bushes with alternate simple leaves and no stipules. Flowers in terminal racemes, irregular and resembling the papilionaceous flowers of Leguminosae, but not like them in structure. Stamens (in ours) monadelphous. Ovary simple, superior.

### 1. POLYGALA L. MILKWORT

Stems often with milky juice. Sepals 5, thin, the two lower and the upper keeled one of about the same size, the two lateral much larger, colored, and projecting like the wings of a pea-flower. Petals 3, united at base, 2 forming a dorsal pair, the third anterior, hooded above and often beaked or crested, enclosing the stamens and style. Stamens 8, monadelphous, the tube open on one side and adnate to the base of the petals. Ovary 2-celled with one ovule in each cell; style long, curved. Capsule with thin walls, flattened contrary to the partition, rounded and often notched above, dehiscing loculicidally at the margin. Seeds with a conspicuous caruncle. (Polus, much, and gala, milk, an ancient Greek name for some shrub used as a stimulant.) Spineless plants.

Beak of the keel broad, strongly curved; flowers purple; sepals glabrous or essentially so; caruncle often wrinkled and bladdery, its lobes concealing the upper part of the seed like a cap; herbaceous; Coast Ranges.....

1. *P. californica*.

Beak of the keel slender, straight or nearly so; flowers greenish-white; sepals pubescent; caruncle almost as long as the seed, not cap-like, but with a short lobe projecting downward a little on each side of the seed; woody at base; Sierra Nevada mostly.....

2. *P. cornuta*.

Spiny bush; desert region.....3. *P. acanthoclada*.

1. *P. californica* Nutt. Fig. 589. Stems many from the crown of a perennial root, mostly simple, 3 to 8 in. high; leaves oblong- or elliptic-ovate, ½ to 1½ in. long, distinctly petioled; flowers of two sorts: those near the root apetalous and developing most of the fruit; those of the terminal racemes with rose-purple corollas 5 to 6 lines long; capsules broadly elliptical, 3 lines long.—Wooded or brush-covered slopes: San Luis Obispo Co. to Marin Co.

589. *Polygala californica* Nutt.;  
a, fl. and fr. branchlets  $\times \frac{1}{2}$ ;  
b, fl.  $\times 2$ .

wings notched at apex; capsules broadly elliptic, emarginate,  $2\frac{1}{2}$  lines long.—Providence Mts.; e. to Ariz. and Col.

and the Napa Range; n. to Ore. Not reported from the inner Coast Range. May-June.

2. *P. cornuta* Kell. Stems several from the base, branching, woody below, 1 to 3 ft. high; leaves ovate to oblong or linear,  $\frac{3}{4}$  to  $1\frac{1}{4}$  (or  $1\frac{3}{4}$ ) in. long, shortly petioled; flowers greenish-white, 4 lines long, borne in a short dense terminal raceme; outer sepals densely tomentulose; petals scarcely equaling the keel; capsule orbicular. — Sierra Nevada, 1500 to 3500 ft., from Fresno Co. to Siskiyou Co., thence s. to Humboldt Co. June-July. Var. *FISHIAE* Jepson n. comb. Bush 2 to 4 ft. high; outer sepals puberulent; wings purple; keel yellow.—Foothills and mts., coastal S. Cal.: Matilija Cañon, Ventura Co.; Mt. Wilson; Dulzura; s. to L. Cal. (*P. fishiae* Parry.)

3. *P. acanthoclada* Gray. DESERT POLYGALA. Spiny shrub 1 to  $2\frac{1}{2}$  ft. high; herbage ashy-pubescent; leaves oblanceolate to linear, 3 to 6 lines long; flowers white, 2 lines long; petals purplish-tinged at apex;

### EUPHORBIACEAE. SPURGE FAMILY

Herbs or shrubs. Leaves simple. Flowers monoecious or dioecious, in ours small or minute ( $1\frac{1}{2}$  to 2 lines long), always apetalous in ours (except *Argythamnia*), often naked, i. e., destitute of calyx as well, sometimes exceedingly reduced and enclosed in a calyx-like involucre. Stamens 1 to many. Ovary superior, 3 (4 or 1)-celled, with one or two pendulous ovules in each cell. Styles or stigmas as many or twice as many as the cells of the ovary. Capsule commonly 3-lobed, 3-valved. Embryo straight, the flat cotyledons almost as wide as the fleshy or oily endosperm.

Staminate flowers with a calyx, the pistillate with or without a calyx, neither kind borne in an involucre.

Ovary with 2 ovules in each cell; anthers erect in the bud; flowers pediceled, disposed in umbellate axillary clusters; shrubs.

Leaves alternate; capsule 3-celled.....1. SECURINEGA.

Leaves opposite; capsule 4-celled.....2. TETRACOCUS.

Ovary with 1 ovule in each cell; leaves alternate; shrubs or herbs.

Anthers in the bud bent inward and downward.

Ovary 1-celled; annual.....3. EREMOCARPUS.

Ovary 3-celled; perennial herbs or sometimes woody at base....4. CROTON.

Anthers erect in the bud.

Corolla present; flowers in much reduced axillary spikes or clusters; herbage mostly grayish or silvery.....5. ARGYTHAMNIA.

Corolla none; flowers in distinct spikes or racemes.

Herbage pubescent or canescent; leaves crenate or serrate, with stipules; shrubs.

Style very short or none; stigmas 3; leaves silvery-canescant beneath.....6. BERNARDIA.

Styles 3, filiform-dissected; leaves green-puberulent.....7. ACALYPHA.

Herbage glabrous; stipules none.

Leaves peltate; stamens many; styles 3, united at base; shrub...8. RICINUS.

Leaves ovate to linear; stamens 2; styles 3, distinct, simple; herbs...9. STILLINGIA.

Flowers all without calyx, borne however in a calyx-like involucre and appearing like a single flower; leaves alternate or opposite.....10. EUPHORBIA.

#### 1. SECURINEGA Comm.

Shrubs, ours with entire obovate small leaves. Flowers dioecious. Calyx imbricated. Staminate flower with a 5-lobed disk, the lobes alternate with the sepals; sepals 5 or 6, distinct; stamens in ours 6, surrounding a central

irregularly lobed disk; rudiment of pistil present, often 2 or 3-cleft. Pistillate flower with entire disk; ovary 3-celled, each cell 2-ovuled; styles 3, simple, united at base, stigmatic down the inside. Seeds in ours with a caruncle. (From Latin *securis*, an axe, in reference to the hardness of the wood.)

1. *S. fasciculata* Jtn. var. *hallii* Jepson n. comb. Two to 6 ft. high, with rigid branches and spinescent branchlets; herbage subglabrous; leaves in fascicles, obovate, 2 to 3 lines long; sepals 6, minute; capsule globose-oblong, minutely and thinly pubescent, 3 lines long.—Cottonwood Sprs. and Chuckawalla Bench, Colorado Desert. (*Tetracoccus hallii* Bdg.)

### 2. *TETRACÓCCUS* Engelm.

Shrubs with entire linear leaves. Flowers reddish, small, dioecious. Staminate flowers in umbellate clusters of 1 to 5 on axillary pedicels shorter than the leaves; calyx 6 to 10-parted, with about 6 to 8 stamens surrounding a circle of reniform disk glands at their base. Pistillate flower solitary, pediceled; calyx similar to the staminate; ovary 4-celled, the cells with 2 ovules; styles 4, simple, distinct. Capsule 4-celled and 4-lobed, the valves separating from a stout 4-angled columella; seed usually solitary, strophiolate. (Greek *tetra*, 4, and *coccus*, fruit, referring to the 4-lobed capsule.)

1. *T. dióicus* Parry. Two to 5 ft. high, the branches rather slender; leaves opposite or some alternate,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long, very shortly petioled; staminate flower-clusters 3 to 5 lines long; staminate calyx  $\frac{1}{2}$  line long, the stamens much exserted and a little woolly at base.—San Diego Co.; s. to L. Cal.

### 3. *EREMOCÁRPUS* Benth.

A low gray annual with entire 3-nerved leaves. Staminate flowers pediceled in terminal corymbs; calyx 5 or 6-parted; stamens 6 or 7 on a hairy receptacle; filaments exserted. Pistillate flowers 1 to 3 in the lower axils, without calyx; ovary 1-celled, with 4 or 5 small glands at the base; style undivided, stigmatic at apex; capsule 2-valved, 1-seeded. (Greek *eremos*, solitary, and *karpós*, fruit.)

1. *E. setigerus* Benth. TURKEY MULLEIN. Fig. 590. Stems dichotomously branched, forming a prostrate mat 1 to 3 ft. wide or a low broad plant 5 to 8 in. high, or reduced to a dwarf 1 to 2 in. high; herbage stellate-pubescent and rough-hispid; leaves alternate or the upper opposite, thick, ovate, the smaller varying to almost orbicular,  $\frac{1}{3}$  to  $2\frac{1}{2}$  in. long, the petioles nearly as long or longer; ovary and style densely pubescent; capsule 2 lines long; seeds smooth and shining,  $1\frac{1}{2}$  lines long.—Dry open areas, low hills and valley plains, 10 to 4500 ft.; very abundant towards the interior, especially on broken ground, common throughout cismontane Cal.; n. to Wash. The California Indians used the heavy-scented herbage of this plant to stupefy fish in small streams in order that they might be caught by hand, whence the Spanish-Californian name, Yerba del Pescado. The seeds are sought by turkeys and by turtle-doves. (*Piscaria setigera* Piper.)

590. *Eremocarpus setigerus* Benth.; a, entire plant resting on the ground  $\times \frac{1}{14}$ ; b, branchlet  $\times \frac{1}{2}$ ; c, fl.  $\times 3$ ; d, ovary  $\times 5$ ; e, seed  $\times 3\frac{1}{2}$ .

4. *CRÔTON* L.

Ours perennial herbs, the stems often woody at base. Leaves entire. Flowers monoecious, sometimes dioecious. Staminate flowers in racemes; calyx 5-divided; glands of the disk as many as and alternate with the petals; stamens 5 to many. Pistillate flowers mostly solitary; calyx 5-parted; ovary 3-celled, the cells 1-ovuled; styles twice forked. Capsule 3-lobed, globose in outline. Seeds smooth and shining, with a caruncle. (*Kroton*, a tick, the Greek name of the Castor Plant, its seeds resembling that insect.)

1. *C. californicus* Mull. Arg. Fig. 591. Stems branching, erect or diffuse, 1 to 3 ft. long; herbage hoary or the leaves green above; leaves oblong to elliptic,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long, on petioles 3 to 8 lines long; staminate racemes at length 6 to 7 lines long, developing gradually, the flowers soon deciduous after anthesis and leaving an elongated naked rachis; staminate calyx about 1 line long; stamens 7 to 14, with hairy filaments; pistillate flowers on short pedicels; capsule scurfy, 3 to 4 lines broad.—Sandy hills near the ocean, washes and sandy mesas in the interior: San Francisco and Contra Costa Co. s. to coastal S. Cal., thence e. to the interior deserts. Var. *MAJOR* Wats. Stoutier and with large leaves  $1\frac{1}{2}$  to 3 in. long; staminate racemes denser, with larger flowers; pistillate flowers more numerous.—Santa Barbara Co. to San Diego Co. Var. *TENUIS* Ferg. Stems more slender; leaves narrowly oblong to lanceolate,  $\frac{1}{2}$  to 1 in. long, on short petioles 1 to 4 lines long; flowers dioecious; caruncle prominent, with a broad appressed lobed base.—Potrero, San Diego Co.; Ft. Mohave, Ariz. Var. *LONGIPES* Ferg. Stems much branched; leaves oval, 5 to 10 lines long, only slightly pubescent.—S. Cal. Var. *MOHAVENSIS* Ferg. Much branched,  $1\frac{1}{2}$  to  $2\frac{1}{4}$  ft. high; leaves narrowly oblong, 3 to 10 lines long.—Mohave Desert.

591. *Croton californicus* Mull. Arg.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, staminate fl.  $\times 2$ ; c, pistillate fl.  $\times 2$ ; d, fr.  $\times 2$ .

5. *ARGYTHAMNIA* P. Br.

Herbs or herb-like, the stems often woody below. Flowers usually monocious, in very short or reduced axillary spikes or clusters consisting of about 2 to 5 flowers. Sepals 5, nearly distinct, hairy. Petals 5, straw-color, alternate with the calyx-lobes and with the lobes of the glandular disk. Glands 5, set between the petal claws. Stamens (in ours) 10 to 15, the filaments united into a central column, disposed in sets of 5, the third or upper whorl sterile. Anthers erect in the bud. Styles 3, once to thrice forked. Seeds shallowly pitted or reticulate. (Greek *argyros*, silver, and *thamnos*, bush, the species often hoary.)

Perennial, the stems arising from the branched crown of a woody root; sterile whorl of stamens stellate, i. e., reduced to 5 very short lobes stellately arranged.

Herbage silvery strigose; calyx pubescent outside, no dilation in the sinuses; capsule densely hairy..... 1. *A. sericophylla*.

Herbage glabrous or nearly so; calyx glabrous, white-margined, with a small bulbous dilation or short blunt spur in each sinus; capsule glabrous..... 2. *A. californica*.

Annual; herbage appressed-hairy; sepals pubescent, ciliate with short gland-tipped bristles; sterile whorl of stamens consisting of 5 filaments; capsule densely hairy..... 3. *A. serrata*.

1. **A. sèricophýlla** Gray. Stems slender, much-branched at the nodes and inextricably interlaced, very brittle, somewhat woody below, 8 to 18 in. high; herbage silvery-strigose; leaves lanceolate to linear or oblong, acute,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long; sepals ovate to lanceolate; petals white, deltoid or ovate, abruptly short-clawed, hairy on the back; seeds gray with shallow circular pits and stellate markings.—Rocky cañons, Colorado Desert; e. to Ariz., s. to L. Cal.

2. **A. califórnica** Bdg. Stems several from a woody root-crown, 8 to 12 in. long; herbage glabrous; leaves obovate, serrulate, abruptly short-acute, mostly petioled,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long; sepals linear-lanceolate, serrulate, with a whitish margin; petals about as in no. 1; seeds brownish, reticulated with bead-like ridges, the intervals lineate.—Coachella, Colorado Desert.

3. **A. serràta** Mull. Arg. Stems several, 2 or 4 to 12 in. long; herbage strigose; leaves ovate to obovate, obscurely serrulate or entire, contracted to a more or less distinct petiole,  $\frac{1}{2}$  to 1 in. long; petals thin, whitish, purple-veined, narrow-ovate, acute or acuminate, often serrulate, gradually narrowed at base but not definitely clawed, glabrous or merely ciliate at apex; seed gray, reticulate, not lineate.—Colorado River Valley; Ariz. to L. Cal.

#### 6. BERNÁRDIA P. Br.

Shrubs with alternate stipulate leaves. Flowers monoecious (in ours) or dioecious, in small spikes or racemes. Staminate flowers with 3 to 5-parted valvate calyx; stamens 3 to 20, distinct, on a central receptacle. Pistillate flowers with 6 (sometimes 3 or 9)-parted imbricate calyx; ovary 3-celled, 3-ovuled; stigmas nearly sessile, 2-lobed. Seeds without caruncle. (P. F. Bernard, 1749-1825, French botanist.)

1. **B. myricaefólia** Wats. Stems many, erect, 3 to 7 ft. high, the herbage grayish with a fine but often dense stellate pubescence; leaves thick, ovate, serrate, prominently veined,  $\frac{1}{4}$  to  $1\frac{1}{2}$  in. long; staminate flowers in axillary racemose clusters; stamens 5 to 7; pistillate flowers terminal, sessile; capsule globose, densely stellate-tomentulose, 5 to 7 lines in diameter; seeds subglobose, smooth, 3 to 4 lines long—S. Mohave Desert and w. Colorado Desert; s. to L. Cal. and Mex.

#### 7. ACÁLYPHA L.

Herbs or shrubs with serrate stipulate leaves. Flowers monoecious, in catkin-like spikes. Staminate spikes small; calyx 4-parted, valvate; stamens 7 to 9, usually 8, distinct, on a raised central receptacle. Pistillate spikes short, or the pistillate flowers often solitary or few at the base of the staminate spikes; calyx shallowly 8-lobed; ovary 3-celled, 3-ovuled; styles 3, red, in ours filiform-dissected. Capsule often surrounded by the enlarged bract. (Greek akalyphes, a nettle.)

1. **A. califórnica** Benth. Low shrub; herbage puberulent, the leaves a little glandular; leaves ovate-cordate, 3 to 10 lines long, short-petioled; spikes peduncled, the staminate 4 to 10 lines long, about 1 line broad, the pistillate 2 to 3 lines long.—Dry hills, 1000 to 4500 ft., San Diego Co. (Poway, Jamul); s. to L. Cal.

#### 8. RÍCINUS L.

Herb or shrub. Leaves large, peltate, palmately lobed. Flowers monoecious, in terminal racemes, the upper flowers pistillate, the lower staminate. Stamens many, the anthers erect in the bud; filaments much branched, each with many anthers. Styles 3, united at base, plumose, red. Capsule large, 3-lobed; seeds 3, with large caruncle. (Latin name, the seeds resembling ticks.)

1. **R. commúnis** L. CASTOR BEAN. Shrub 3 to 8 ft. high; leaves 7 to 11-cleft,  $\frac{1}{2}$  to 1 (or 2) ft. broad.—Cult. from the tropics: locally naturalized in coastal S. Cal.

9. *STILLINGIA* Gard.

Glabrous herbs. Flowers monoecious, disposed in spikes which are pistillate at base. Bracts conspicuously biglandular, the glands trumpet-shaped or pedicellate saucer-shaped. Calyx imbricate in the bud. Staminate calyx thin or scarious, in ours 2-parted; stamens in ours 2; anthers erect in the bud. Pistillate calyx in ours none; ovary 3-celled, each cell 1-ovuled; styles 3, nearly distinct, simple. Capsule lobes breaking away from a 3-horned base. Seeds usually carunculate. (Benj. Stillingwell, 1702-1771, London student of the ancient Greek plants.)

Leaves narrowly linear, entire or nearly so; central column of capsule persistent; stems tall, rush-like.....1. *S. linearifolia*.  
Leaves ovate, pectinately serrate; central column of capsule none; stems short, very leafy.....2. *S. annua*.

1. *S. linearifolia* Wats. Rush-like perennial with a tuft of slender stems 3 ft. high; leaves narrowly linear-lanceolate, 1 to 1½ in. long; spikes mostly terminal.—Cismontane S. Cal. and Colorado Desert. Var. *PAUCIDENTATA* Jepson n. comb. Leaves with 2 or 3 setaceous teeth on each side near the base; seeds slightly carunculate.—Mohave Desert, n. to Inyo Co. (*Stillingia paucidentata* Wats.)

2. *S. annua* Muell. Tufted annual or perennial, 3 to 6 in. high; leaves ovate, spinulose-serrate, acuminate, narrowed to a short petiole, 1 to 1½ in. long; spikes mostly axillary; glands at base of bracts somewhat trumpet-shaped.—Desert washes: Colorado and Mohave deserts.

10. *EUPHORBIA* L. SPURGE

Herbs or shrubs. Involucres solitary in the forks or disposed in terminal cymes, with 4 or 5 teeth or lobes alternating with glands borne in the sinuses; glands either naked or appendaged (that is, with a colored margin). Flowers monoecious, both pistillate and staminate naked and included in an involucre which itself resembles a flower but really encloses a cluster of flowers consisting of several staminate and 1 pistillate flower. Staminate flower very much reduced, consisting of a single stamen; filament jointed on a short pedicel like it, the pedicel often with a minute scale or bract at base, showing that the stamen is a distinct flower. Pistillate flower supported on a pedicel in the center of the involucre and soon protruded from it, consisting of a 3-celled ovary and 3 bifid styles. Capsule with 3 cells, each 1-seeded. (*Euphorbus*, King Juba's physician.)

A. STEM LEAVES OPPOSITE, OBLIQUE AT BASE; GLANDS 2 TO 4, USUALLY WITH A PETAL-LIKE WHITE OR REDDISH APPENDAGE (OR THIS LACKING IN NOS. 8, 9 AND 11).

1. *Leaves serrate or serrulate; stipules distinct; annuals.*

Plants erect or nearly so; herbage glabrous or slightly hairy; stipules triangular, entire or slightly lacerate; capsule obtusely angled.....1. *E. prostrata*.

Plants prostrate.  
Herbage glabrous; stem and leaves green or greenish, infrequently reddish; seeds clay-white.

Seeds smooth or irregularly rugulose.....2. *E. serpyllifolia*.

Seeds with 3 or 4 sharp transverse wrinkles on the sides.....3. *E. glyptosperma*.

Herbage hairy or puberulent; leaves often reddish or red-spotted.

Appendages of glands toothed; leaves reddish or green, but not spotted.....4. *E. hirtula*.

Appendages of glands entire; leaves often with a central red spot.....5. *E. maculata*.

2. *Leaves entire.*

Annuals.

Herbage pubescent; leaves round-ovate to oblong; seeds oblong, acutely 4-angled; Colorado Desert.

Seeds slightly rugose transversely; herbage glandular-pubescent....6. *E. setiloba*.

Seeds with 4 deep transverse grooves; herbage cinereous-pubescent.....7. *E. pediculifera*.

Herbage glabrous; leaves deltoid-ovate or oblong-ovate to elliptic; seeds more or less round-ovate.

Seeds broadly cylindric-ovate; glands entire, without appendages....8. *E. ocellata*.

Seeds round on back, flattish on face, very smooth; glands 2-toothed or horned on the outer margin.....9. *E. eremica*.

Perennials; leaves orbicular to round-ovate or oblong; seeds usually smooth.

Stipules united into a conspicuous membranous white triangular scale; glands orange or brownish.....10. *E. albomarginata*.

Stipules short-triangular to lanceolate, ciliate, minute; glands dark purple (sometimes yellow).....11. *E. polycarpa*.

**B. LEAVES MOSTLY ALTERNATE, MOSTLY NOT OBLIQUE AT BASE; GLANDS 5 OR 4; PLANTS NEVER PROSTRATE.**

- Glands of the involucre with a colored membranous appendage; pedicels of the flowers with a minute scale at base; leaves round-obovate, entire; shrub. .12. *E. misera*.  
 Glands of the involucre without a colored appendage; herbs, the stems erect or ascending.  
 Leaves linear, entire or nearly so; involucre in terminal head-like clusters; stipules gland-like, minute; glands cup-shaped; annual or biennial. .13. *E. eriantha*.  
 Leaves ovate, obovate or rotund, never linear; involucre in dichotomous or often umbellate cymes; stipules none.  
 Glands rounded and discoid, entire; capsule with warty lobes; leaves serrulate; annual. .14. *E. dictyosperma*.  
 Glands not entire, variously denticulate, lacerate, or horned; leaves entire.  
 Annuals (sometimes biennial).  
 Capsule smooth; stem leaves sessile or nearly so. .15. *E. crenulata*.  
 Capsule crested; stem leaves petiolate. .16. *E. peplus*.  
 Perennial; capsule smooth.  
 Glands rather longer than broad, 2-horned; leaves obtuse. .17. *E. palmeri*.  
 Glands much broader than long, a little lacerate, not horned; leaves cuspidate. .18. *E. schizoloba*.

1. *E. préslii* Guss. **LARGE SPURGE.** Stems simple below or branched from the base, erect or ascending, 9 to 14 in. high; herbage glabrous or scantily pilose; leaves broadly oblong, slightly cordate at base, serrulate, often reddish, or red-spotted, 5 to 12 lines long; stipules triangular, entire or somewhat lacerate; flowers in a small terminal panicle of cymes; involucre reddish-brown; glands small, their margins white or red, entire; capsule glabrous, obtusely angled; seeds brown, obtusely angled, with 2 or 3 broken transverse ridges.—N. Sierra Nevada foothills from Placer Co. to Butte Co., infrequent; e. to Atlantic. (*E. hypericifolia* Fl. W. Mid. Cal.; *E. nutans* Lag.)

2. *E. serpyllifolia* Pers. **THYME-LEAF SPURGE.** Fig. 592. Stems round, or more or less angled, repeatedly branched, forming prostrate mats 1 to 3 ft. across; herbage glabrous and green; leaves oblong-elliptic or obovate-spatulate, more or less minutely serrate toward the apex, 2 to 3 lines long; stipules setaceous or lacerate; involucre  $\frac{1}{2}$  line long or less; glands transversely oblong and more or less cupped in the center, the wing white, narrow, crenately serrate or nearly entire; seeds clay-white, sharply quadrangular, smoothish, rugulose or rugose-pitted.—Valleys and plains, 100 to 4000 ft., throughout Cal. Var. *RUGULOSA* Engelm. Leaves more serrate on the larger side of the blade; seeds pitted.—San Bernardino.

3. *E. glyptosperma* Engelm. Similar to no. 2; leaves oblong-linear; seeds with 3 or 4 sharp transverse ridges.—Adventive in S. Cal.; Ariz. and e.

4. *E. hirtula* Engelm. Stems prostrate or slightly ascending, 2 to 9 in. long; herbage villous; leaves elliptic-oblong,  $1\frac{1}{2}$  to 3 lines long; glands red, with a narrow white toothed appendage; capsules very small, acutely angled; seeds brown, acutely angled, shortly wrinkle-pitted or slightly wrinkled.—Pine belt of the mts., 3500 to 5500 ft.: Sierra Nevada from Mariposa Co. s.; San Jacinto Mts.; Cuyamaca Mts.; s. to L. Cal.

*E. OCCIDENTALIS* Drew. Herbage dull yellowish-green, puberulent; seeds coarsely sinuate-rugose.—Hy-am-pum, Humboldt Co.

592. *Euphorbia serpyllifolia* Pers.; a, habit x 1; b, involucre x 5; c, stamen x 12; d, seed x 5.

5. *E. maculata* L. SPOTTED SPURGE. Stems radiately branching, prostrate, 3 to 10 in. long; herbage thinly soft-hairy; leaves oblong-elliptic to oblong-linear, usually with a red blotch in center, serrulate, subcordate at base; stipules setaceous, sometimes lacerate or fimbriate; glands 4, cup-shaped, with white entire margins; capsule acutely angled; seeds reddish or brown, transversely ridged.—Introd. from e. U. S.: Marysville; Berkeley; Ione; Pasadena; San Bernardino.

6. *E. setiloba* Engelm. Stems repeatedly dichotomous from the base, prostrate, 2 to 6 in. long; herbage reddish, softly glandular-pubescent; leaves round-obovate to elliptic, entire, 1 to 3 lines long, on slender petioles; stipules minute, low triangular; involucre solitary in the axils and in small leafy clusters terminating the branchlets, narrowly turbinate, the lobes ciliolate; glands erect, purple, the margins white or rose-color, narrow, fimbriate; capsules hairy, angled,  $\frac{1}{2}$  line long; seeds oblong, acutely 4-angled, slightly rugose transversely.—Sandy soil, Colorado River Valley from Riverside Mt. to Ft. Yuma.

7. *E. pediculifera* Engelm. Stems pubescent throughout, slender, procumbent, much branched, 1 ft. long; herbage finely cinereous; leaves oblong to obovate, entire, moderately but distinctly unequal at base, 3 to  $4\frac{1}{2}$  lines long, on slender petioles; stipules very small, triangular; involucre clustered on short axillary branchlets; glands large, purple, the margins conspicuous, white, short-fan-shaped, crenulate; styles bifid almost to the base, divaricate; capsule pubescent; seeds 4-angled with 4 straight and deep transverse grooves.—Colorado Desert (Carrizo Mt.); e. to Ariz., s. to Mex. Apr.

8. *E. ocellata* D. & H. Stems many from the base, prostrate, 5 to 13 in. long; herbage glabrous; leaves deltoid to oblong-ovate, thickish, unequal at base, often cordate at base, entire, 2 to  $5\frac{1}{2}$  lines long; stipules subulate, mostly entire; involucre hemispheric, nearly 1 line long, the lobes fringed; glands 2 to 4, yellowish or purplish, short-stipitate, saucer-shaped, the appendages none or narrow; capsule 1 line long; seeds red-brown, round-ovate, smooth or slightly wrinkled.—Dry sandy valleys and foothills: inner South Coast Ranges; Great Valley; Sierra Nevada foothills; S. Cal.; e. to Nev. Var. *ARENICOLA* Jepson n. comb. Glands sessile; seeds clay-white.—Mohave Desert and n. (*E. arenicola* Parish.)

9. *E. eremica* Jepson n. sp. Stems few or several from the base, prostrate, slightly glandular, 4 to 8 in. long; herbage yellowish-green, glabrous; leaves oblong-elliptic, obtuse, entire, 2 to 5 lines long; involucre turbinate-cylindric, the glands saucer-shaped with the margin produced outwards into 2 acute lobes or horns; capsules obtusely angled,  $1\frac{1}{2}$  lines long; seeds clay-white, round on the back, flattish on the face, very smooth.—Conchilla Desert (Jepson 6047, type).

10. *E. albomarginata* T. & G. RATTLESNAKE WEED. Stems numerous from a woody base, prostrate or decumbent, 2 to 12 in. long; herbage glabrous; leaves nearly orbicular to round-ovate, 2 to 4 lines long, margined with a thin whitish edge, often retuse; stipules united into a conspicuous membranous white triangular scale, entire or slightly lacerate; involucre mostly solitary, nearly 1 line long; glands 4, orange or brownish, with conspicuous white or rose-color appendages; capsule nearly 1 line long, the lobes angled on the back; seeds oblong, 4-angled.—Plains and mesas, S. Cal.; e. to Tex., s. to Mex. May-June.

593. *Euphorbia polycarpa* Benth.;  
a, habit  $\times \frac{1}{2}$ ; b, invol.  $\times 3$ .

11. *E. polycarpa* Benth. Fig. 593. Stems numerous, ascending or prostrate from a woody root-crown, 2 to 11 in. long; herbage glabrous or somewhat finely pubescent, leaves round-ovate or ovate to oblong, slightly cordate at base or obtuse, obtuse or acutish at apex, 1 to  $2\frac{1}{2}$  lines long; stipules minute,

lanceolate to short-triangular, ciliate; involucre commonly solitary in the axils, turbinate-campanulate,  $\frac{1}{2}$  to  $\frac{3}{4}$  line long; glands transversely oblong, red-purple (sometimes yellow), the appendages varying from conspicuous (broad, white or rose-color and somewhat crenulate) to none; capsules  $\frac{3}{4}$  line long, puberulent, the lobes angled; seeds oblong, 4-angled,  $\frac{1}{2}$  line long.—Dry mesas and rocky slopes: San Diego Co.; Colorado Desert; Mohave Desert; Inyo Co.; e. to Tex. Var. *vestita* Wats. Hoary-pubescent.—Santa Monica; Glendora; Cahuenga Pass; Colorado Desert to Inyo Co.

12. *E. misera* Benth. Much branched straggling shrub 2 to 3 ft. high; herbage minutely puberulent or glabrate; leaves round-obovate, obtuse or retuse, 2 to 5 lines long, exceeding the petioles; stipules present; involucre solitary, terminal on the short branchlets of the season, hemispheric, 1 line long, their lobes short, inflexed; glands purple, with a white crenulate appendage; capsules 2 to  $2\frac{1}{2}$  lines long, with rounded lobes, somewhat warty; seeds round-ovate, reticulate-wrinkled or slightly pitted.—San Diego; s. to L. Cal.

13. *E. eriántha* Benth. Stems one or several from the base, slender, 7 to 18 in. high; herbage glabrous or finely puberulent above; leaves distant, narrowly linear, attenuate to a short petiole, 1 to  $2\frac{1}{4}$  in. long, the uppermost forming a whorl subtending the flower-cluster and many times exceeding the flowers; involucre in close clusters of 1 to 4 at the end of each branch, hoary-pubescent, campanulate, their lobes incurved, fimbriate with densely pubescent teeth; glands thin, the broad appendage fimbriate; styles undivided; capsule obtusely lobed, finely pubescent, 2 to  $2\frac{1}{2}$  lines long; seeds brown, quadrate-oblong, with low warty ridges; caruncle conspicuous.—Cañons and mesas among rocks, Colorado Desert: Eagle Mts.; Chuckawalla Bench; Andreas Cañon; Agua Caliente near Carrizo Creek; s. to L. Cal. and Mex., e. to Ariz. Apr.

*E. LATHYRUS* L. Caper Spurge. Stout annual or biennial 1 to 3 ft. high, very smooth and glaucous; stem-leaves linear or narrowly oblong, thick, in 4 vertical ranks, the floral oblong-ovate and cordate; umbels of 3 or 4 rays, once or twice forked; glands of the involucre crescent-shaped.—Mediterranean species, occasionally adventive: Myer's Ranch, South Fork Eel River; Berkeley; Seven Oaks, San Antonio Mts.

14. *E. dictyosperma* F. & M. Fig. 594. Stems erect, 5 to 15 in. high, simple or branching from the base, dichotomously branched above; herbage glabrous; lower leaves oblong- or obovate-spatulate, serrulate, often retuse,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long; upper and floral leaves opposite, round-ovate to oblong, 3 to 6 lines long; inflorescence umbelliform, the rays 2 or 3 times forked; involucre and glands small; glands not horned; capsule with warty lobes, 1 to  $1\frac{1}{4}$  lines long.—Hill country, 100 to 3000 ft., throughout cis-montane Cal. but infrequent; n. to Wash., e. to Neb. and Tex.

15. *E. crenulata* Engelm. Fig. 595. Stems several from the base, erect, rarely decumbent at base, 6 to 16 in. high, 2 or 3 times dichotomous above; leaves obovate to spatulate, obtuse, sometimes mucronate, entire, sessile or the lower shortly petioled, 4 to 15 lines long, the floral opposite or ternate, deltoid or broadly rhombic-ovate, sometimes cordate at base or connate, apiculate, 3 to 5 lines long; involucre turbinate, its transversely oblong lobes denticulate; glands large, crescent-shaped, the slender horns entire or cleft; capsule smooth,  $1\frac{1}{2}$  lines

594. *Euphorbia dictyosperma* F. & M.; a, habit x  $\frac{1}{2}$ ; b, involucre x 6.

595. *Euphorbia crenulata* Engelm.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, invol.  $\times 3$ ; c, stamen  $\times 5$ .

broad; seeds ash-colored, dark-pitted, 1 to  $1\frac{1}{2}$  lines long, with a prominent caruncle.—Common in the hill country throughout cismon-tane Cal.; n. to Ore.

16. *E. péplus* L. PETTY SPURGE. Stems simple or usually branched from the base, 4 to 7 in. high, umbellate above, the branches of the umbel dichotomous; herbage glabrous; leaves obovate or rotund, obtuse or retuse, 5 to 9 lines long, the slender petiole  $2\frac{1}{2}$  lines long; leaves of the umbel oblong or ovate, sessile; involucre about  $\frac{1}{2}$  line long, the triangular-ovate lobes ciliate with short thick hairs; glands with long spreading horns; capsule depressed-globose, the lobes with 2 crests on the back; seeds white, pitted, the caruncle conical.—Garden weed from Eur.: Berkeley; Monterey; San Bernardino.

17. *E. pámeri* Engelm. Stems several from the woody root-crown, erect,  $\frac{3}{4}$  to  $1\frac{1}{2}$  ft. high, umbelliferous above with 4 or 5 rays; herbage glabrous; leaves obovate, obtuse, shortly petiolate, 4 to 12 lines long, those of the inflorescence very broadly rhombic-ovate to subreniform, very obtuse, mostly apiculate; involucre 1 line long, the lobes rounded, entire, ciliate; glands shortly stipitate, crenate, somewhat 2-horned; capsule ovate, 2 lines long; seeds ovate, rugose,  $1\frac{1}{3}$  lines long.—Montane, 4000 to 6000 ft., Mt. Pinos and San Bernardino Mts. to Cuyamaca Mts.

18. *E. schizóloba* Engelm. Stems erect or decumbent at base, several from the root-crown, 6 to 16 in. high, at summit once to thrice dichotomous; herbage glabrous or slightly puberulent, somewhat glaucous; leaves ovate to obovate, cuspidate, 3 to 6 lines long, the floral ternate, round-ovate; involucre 1 line long, its lobes truncate, notched; glands stipitate, broad, irregularly toothed; styles united at base; capsule glabrous.—Desert ranges, 3000 to 4000 ft.: Panamint Mts.; Providence Mts.; e. to Nev. and Ariz.

### CALLITRICHACEAE. WATER STARWORT FAMILY

Herbs growing in shallow water or in the mud of drying vernal pools. Leaves opposite, entire, exstipulate, often crowded and forming a rosette at the ends of the branches. Flowers monoecious, axillary and solitary, or 2 or 3 together in one axil, without calyx or corolla but often with two membranous bracts. Staminate flower consisting of 1 terminal stamen. Pistillate flower consisting of a 4-celled ovary with 2 filiform stigmas. Fruit 4-lobed, splitting at maturity into as many nutlets.

#### 1. CALLITRICHE L.

The only genus. (Greek kallos, beautiful, and trichos, a hair, on account of the slender stems.)

Fruit pediceled; flowers bractless; leaves not notched at apex; annual; mainly terrestrial.

1. *C. marginata*.

Fruit sessile; submerged leaves notched at apex.

Flowers 2-bracted; emersed leaves rosulate, round-obovate.....2. *C. palustris*.

Flowers bractless; leaves linear, all submerged.....3. *C. autumnalis*.

1. *C. marginata* Torr. Stems 2 to 4 in. long, forming dense mats in former pool beds; leaves oblanceolate, 2 to 3 lines long; plants sometimes

submersed and the leaves linear or the upper floating ones spatulate; bracts none; styles long, reflexed, soon deciduous; fruit rather broader than long, notched both at apex and base,  $\frac{1}{3}$  to  $\frac{1}{2}$  line long, the lobes sharply winged or margined by a thin edge; fruiting pedicels 2 to 5 lines long, sometimes 2 from the same axil.—Coast Ranges from Humboldt and Solano Cos. to Los Angeles Co. Var. *LONGIPEDUNCULATA* Jepson n. comb. Fruiting pedicels 1 to 3 in each axil, 5 to 12 lines long.—W. San Diego Co. (*C. longipedunculata* Mor.)

2. *C. palustris* L. WATER FENNEL. Aquatic; stems 5 to 10 in. long; submerged leaves linear-subulate, 1-nerved, notched at the apex, 7 to 10 lines long; emerged or floating leaves roundish-obovate,  $1\frac{1}{2}$  to 2 lines long, abruptly narrowed at base into a slender winged petiole,  $1\frac{1}{2}$  to 2 times as long; fruit roundish elliptic, flattened, slightly notched at apex,  $\frac{1}{2}$  to 1 line long, each lobe sharply margined on the back for its whole length, the proximate lobes with a groove between them.—Cold pools or slow streamlets: Coast Ranges from Santa Clara Co. to Humboldt Co.; n. Sierra Nevada foothills; n. to B. C., thence e. to the Atlantic. Mar.-May. Var. *STENOCARPA* Jepson n. comb. Leaves oblong-spatulate, all submerged.—Lassen Co. to Siskiyou Co. (*C. stenocarpa* Hegelm.)

3. *C. autumnalis* L. Stems 4 to 6 in. long, submerged; leaves linear, 3 to 4 lines long, deep clear green, 1-nerved, retuse or bifid at the apex; bracts none; fruit sessile, roundish, notched,  $\frac{1}{2}$  to 1 line long, margined; styles long, reflexed, caducous.—Rare or local, Santa Clara and Sierra Cos.; n. to Ore., thence e. to Quebec; Eur., Asia.

### ZYGOPHYLLACEAE. CALTROPS FAMILY

Herbs or shrubs, ours with opposite pinnate leaves, interposed stipules and entire leaflets. Flowers perfect, regular, symmetrical or nearly so. Sepals 5, distinct or nearly so. Petals in ours 5. Stamens 10, inserted with the petals on the receptacle. Ovary usually of as many carpels as petals (rarely twice as many or fewer), its cells as many as the carpels or twice as many; style one; stigma barely lobed.

Herbs; leaflets 4 or more pairs; fruits usually spiny; seed without endosperm. 1. *TRIBULUS*.  
Woody plants; leaflets few; seed with endosperm; fruits not spiny.

Leaflets 3; flowers rose-purple; fruit nearly smooth, glabrous. . . . . 2. *FAGONIA*.  
Leaflets 2; flowers yellow; fruit densely hairy. . . . . 3. *LARREA*.

#### 1. *TRÍBULUS* Tourn. CALTROPS

Herbs, ours annuals, with even-pinnate leaves and several pairs of leaflets. Flowers yellow, solitary on the peduncles. Stamens opposite the sepals with a gland behind the filament at very base. Disk annular, 10-lobed. Ovary 5-celled; cells 3 to 5-ovuled. Fruit lobed, splitting into 5 nutlets; nutlets hard, indehiscent, usually muricate or spinescent on back. (Greek *tribulos*, ancient name of *Trapa*.)

1. *T. terrestris* L. PUNCTURE WEED. Branching from the base, the stems decumbent,  $\frac{1}{2}$  to 3 ft. long; herbage whitish-pubescent; leaflets 4 to 7 pairs, oblong, 3 to 4 lines long; flowers on short axillary peduncles; petals 1 to 2 lines long; ovary 5 (or 4)-celled, in fruit splitting into as many 1 to 3-seeded nutlets and having no central axis; nutlets warty on back and with 2 stout spreading spines 2 to 3 lines long; seeds superposed, separated by transverse partitions.—Native of Eur., becoming naturalized near railway stations, thence spreading as a serious pest in alfalfa fields and becoming a nuisance in waste lands and along roadways: Riverside; Colton; Bakersfield; Los Banos; Tracy; Antioch; Willows; Castle Crags sta.

#### 2. *FAGONIA* Tourn.

Suffrutescent plants, ours with 3-foliate leaves. Flowers rose-purple. Petals clawed, early deciduous. Ovary 5-celled, a pair of collateral ovules in each cell. Fruit deeply 5-lobed, smooth, breaking up into 5 distinct carpels which separate from the persistent axis; carpels 1-seeded, dehiscent ventrally. (G. C. Fagon, French botanist, 17th century.)

1. **F. californica** Benth. Erect, slender, very much branched and thickly interlaced,  $\frac{1}{4}$  to 2 ft. high; stems scabrous on the angles; stipules acerose, 1 to 3 lines long; leaflets lanceolate to obovate, cuspidate, 2 to 3 lines long, the lateral ones about equaling the petiole; flowers in cymes; petals crimson, obovate, obtuse, shallowly cupped on the upper side, clawed, spreading almost rotately, 2 to 4 lines long; fruit 2 lines long, much shorter than the deflexed peduncles.—W. side of the Colorado Desert: Coyote Cañon; San Felipe; Vallecito; Mountain Sprs.; Split Mt.; s. to L. Cal. Var. **BARCLAYANA** Benth. Stems granulose-glandular, not scabrous; leaflets rhomboidal, 3 to 7 lines long.—Colorado Desert (Grapevine Cañon); s. to L. Cal.

### 3. **LÁRREA** Cav.

Evergreen rank-smelling and copiously resinous shrubs. Leaves as if divergently 2-lobed, really consisting of

2 leaflets sessile on the short rachis by a broad base. Flowers yellow, terminal and solitary on the numerous short lateral branchlets. Sepals deciduous. Petals clawed, gnawed at base. Stamens on a small 10-lobed disk, the filaments with a lacinate-toothed scale at base on the inside. Ovary 5-celled, the cells about 6-ovuled; style slender with 5 stigmas. Fruit globose, densely white-hirsute, the 5 carpels at length separating from the axis as indehiscent 1-seeded parts. (J. A. de Larrea, Spanish promoter of science.)

1. **L. tridentata** (DC.) Cov. var. **glutinosa** Jepson n. comb. CREOSOTE BUSH. Fig. 596. Dark-green shrub, 2 to 5 ft. high, the branches ringed with a black-glandular band at the nodes and the leaves very resinous; leaflets oblong, somewhat curved, 2 to 5 lines long; petals twisted half round so as to resemble a turbine wind-mill, 3 to 4 lines long; fruit  $2\frac{1}{2}$  lines long, beaked by the style. —Very abundant in desert valleys and mesas in the Mohave and Colorado deserts; n. to Inyo Co.; e. to Tex., s. to Mex. Also called Greasewood. (*Covillea glutinosa* Rydb.)

596. *Larrea tridentata* var. *glutinosa* Jepson; a, fl. branchlet  $\times \frac{1}{2}$ ; b, fl.  $\times 1$ ; c, fr.  $\times 2$ .

### RUTACEAE. RUE FAMILY

Ours shrubs or small trees, with glandular-dotted or aromatic leaves. Flowers regular and symmetrical, or nearly symmetrical. Sepals and petals 4 or 5. Stamens (in ours) as many or twice as many, inserted on or outside of a hypogynous disk. Ovary superior, seated on this disk or its base encircled by it. Style 1.

Leaves simple.

Fruit a deeply 2-lobed capsule; leaves alternate.....1. **THAMNOSMA**.

Fruit globose, drupe-like; leaves opposite.....2. **CNEORIDIUM**.

Leaves compound; fruit a circular samara.....3. **PTELEA**.

#### 1. **THAMNOSMA** Torr. & Frem.

Switch-like shrubs. Leaves alternate, small, narrow, soon deciduous. Flowers on scaly peduncles, the peduncles very short or sometimes almost none, solitary and terminal or scattered along the branchlets. Calyx short, 4-lobed, persistent. Petals 4, erect, scarcely spreading in anthesis. Stamens 8, equally

inserted with the petals on a narrow hypogynous disk. Ovary stipitate. 2-celled, didymous, with several ovules in each cell; style one; stigma capitate. Fruit a coriaceous strongly 2-lobed capsule; cells few-seeded. (Greek *thamnos*, a bush, and *osme*, odor.)

1. *T. montana* Torr. & Frem. TURPENTINE BROOM. Fig. 597. Stems freely branching broom-like, yellowish green, 1 to 1½ ft. high, thickly covered with pustulate glands; herbage heavily odorous; leaves oblanceolate, 2 to 6 lines long; flowers 4 lines long, black-purple; petals ovate to elliptic, revolute at tip; stamens 4 long and 4 short; style slightly exserted; ovules 8 or 9 in each cell; capsule 5 lines broad, deeply parted into two subglobose lobes; lobes splitting dorsally from the apex, 1 to 3-seeded.—Dry or stony hills in the desert region: Colorado and Mohave deserts; Inyo Co.; e. to Utah and Ariz.

597. *Thamnosma montana* Torr. & Frem.; a, fr. branchlet x ½; b, fl. branchlet x ⅓.

### 2. CNEORIDIUM Hook. f.

Low glabrous shrub with narrow opposite entire leaves. Flowers 1 to 3 on short peduncles. Calyx short, 4-parted. Petals 4, white. Stamens 8, the ones opposite the petals much shorter; filaments dilated. Ovary globose, 1-celled, 2-ovuled, seated on an annular disk; style short, flattened, lateral (arising from near the base of the ovary); stigma capitate. Fruit globose drupe-like, 1 to 2-seeded. Seed globose, with curved embryo; endosperm fleshy. (Resembling *Cneorum*, an Old World genus.)

598. *Cneoridium dumosum* Hook.; fr. branchlet x 2.

1. *C. dumosum* Hook. f. Fig. 598. Much branched bush, 2 to 3½ ft. high, the herbage heavily odorous; leaves linear or tapering to base, glandular-dotted, ½ to 1½ in. long, 1½ to 2 lines wide; peduncles solitary or clustered, 1 to 3-flowered; flowers 3 lines broad; petals obovate or elliptic; fruit reddish brown, resinous-punctate, 3 lines in diameter.—Hills and mesas, w. San Diego Co. (Witch Creek to Bernardo, Encinitas and San Diego); s. to L. Cal. Mar.-Apr. Pistils or carpels rarely two and then the fruit geminate.

### 3. PTELEA L.

Shrubs or small trees. Leaves alternate, pinnately trifoliate with sessile leaflets. Flowers polygamous or dioecious, small, greenish white, in axillary paniculate cymes. Sepals, petals and stamens 4 or 5. Ovary 2-celled; cells 2-ovuled, the lower ovule abortive; style short; stigmas 2. Fruit a 2-celled 2-seeded samara, winged all around, broadly orbicular. (Greek name of the Elm, the fruit of which is similar.)

1. *P. baldwinii* T. & G. var. *crenulata* Jepson. HOP TREE. Fig. 599. Small tree 8 to 15 ft. high; herbage glabrous or slightly pubescent; leaflets elliptic, obovate or elongated-rhomboidal, rounded or acute at apex, often with abruptly cuneate base,

599. *Ptelea baldwinii* var. *crenulata* Jepson; a, leaf x ½; b, fr. x 1.

crenulate or almost entire, 1 to 2¾ in. long; sepals very small; petals 2 to 2½ lines long; stamens hairy towards the base; fruit straw-yellow, 5 to 8 lines long, a trifle broader, tipped by the persistent style.—Cañons and flats in the foothills: inner Coast Range from Shasta Co. to Contra Costa Co.; Sierra Nevada foothills from Tehama Co. to Calaveras Co. Apr.-May.

### SIMARUBACEAE. QUASSIA FAMILY

Shrubs or trees similar to Rutaceae, but the leaves without dots and the wood and bark very bitter. Leaves alternate. Flowers perfect or unisexual, regular. Sepals and petals 3 to 5. Disk prominent, 10-lobed; stamens 6 to 10. Carpels mostly 2 to 5 (in ours 1 to 10), distinct or united, superior. Fruit in ours drupe-like or forming a samara.

Leaves large, odd-pinnate; fruit a samara.....1. AILANTHUS.  
Leaves reduced to scales; fruit drupaceous.....2. HOLACANTHA.

#### 1. AILANTHUS Desf.

Large trees. Leaves odd-pinnate. Flowers small, in large terminal panicles, polygamous, the staminate very ill-scented. Fruit of 1 to 5 distinct oblong samaras, with the compressed seed in the middle. (Ailanto, a Malakka name, meaning Tree of Heaven.)

1. *A. glandulosa* Desf. TREE OF HEAVEN. Tree 20 to 60 ft. high; leaves 1½ to 2 ft. long; leaflets with 2 to 4 teeth near the base, the teeth with a gland beneath; samaras 1½ in. long.—Introduced from China and escaped from cultivation: Sierra Nevada foothills (San Andreas, Angels Camp, Columbia); Berkeley; Petaluma; Vacaville; Pleasant Valley, ne. Solano Co. It is the only exotic tree in California which is markedly spontaneous. It has in some localities become a pest as a tree weed.

#### 2. HOLACANTHA Gray

Very thorny shrubs with rigid branches. Leaves reduced to small deciduous scales. Flowers dioecious, glomerate on the branched thorns. Calyx 5

to 8-parted. Petals 7 or 8. Staminate flowers: stamens 12 to 16, the filaments hairy at base. Pistillate flowers: stamens 6 to 8, the anthers imperfect; pistils 5 to 10, lightly connivent. Drupes small, dry, ovoid. (Greek holos, complete, and akantha, thorn, all the branchlets thorn-like.)

1. *H. emoryi* Gray. CRUCIFIXION THORN. Fig. 600. Five to 8 ft. high; fruiting clusters very dense, 1 to 2 in. long; drupes soon dry and nut-like, 2½ to 3 lines long.—Desert region: lava bed ne. of Daggett, Mohave Desert; "Hayfields," Chuckawalla Mts.; e. to southern Ariz.

### BUXACEAE. BOX FAMILY

Evergreen shrubs with leathery simple leaves and unisexual apetalous flowers. Calyx of 5 (4 to 6) sepals. Ovary superior, 2 or 3-celled; styles 2 or 3; ovules 1 or 2 in each cell.

#### 1. SIMMÓNSIA Nutt.

Leaves opposite, entire. Flowers on short axillary peduncles, the pistillate solitary, the staminate in a capitate cluster; sepals distinct, somewhat un-

600. *Holacantha emoryi* Gray; a, fr. branchlet x ½; b, staminate fl. (after Bot. Mex. Bound. pl. 8) circa x 4; c, pistils x 3.

equal. Stamens 10 to 12. Styles 3; ovary 3-celled, becoming by abortion a 1-celled 1-seeded 3-valved fruit. (The naturalist, T. W. Simmonds.)

1. *S. californica* Nutt. JAJOBA. GOAT-NUT. Fig. 601. Rigid much-branched shrub 2 to 4 or 7 ft. high; leaves minutely, but the branchlets, peduncles and calyx obviously pubescent; peduncles 1 to 3 lines (rarely 1 in.) long; leaves oblong to ovate, 1 to  $1\frac{1}{2}$  in. long, barely petioled; staminate flower  $1\frac{1}{2}$  to 2 lines long, its sepals broadly oblong or subspatulate; pistillate flower much larger than the staminate, 6 lines long, its sepals ovate or lanceolate and often abruptly contracted above the roundish base; capsule short-cylindric, short-pointed, somewhat acorn-like, rather less than 1 in. long.—Arid hills: Chuckawalla Mts.; Conchilla Mts.; San Jacinto Mts.; San Diego Co.; e. to Ariz., s. to Mex.

601. *Simmondsia californica* Nutt.; a, staminate fl. branchlet  $\times \frac{1}{2}$ ; b, pistillate fl. branchlet  $\times \frac{1}{2}$ ; c, staminate fl.  $\times 2\frac{1}{2}$ ; d, pistillate fl.  $\times 2\frac{1}{2}$ ; e, cross sect. of ovary  $\times 2\frac{1}{2}$ ; f, nut  $\times \frac{1}{2}$ .

#### BURSERACEAE. TORCHWOOD FAMILY

Trees or shrubs with alternate pinnate leaves. Calyx 3 to 5-lobed, persistent, its base lined with a disk. Petals 3 to 5, the stamens twice as many as the petals, both borne under the disk. Ovary superior, 2 to 5-celled, each cell 2-ovuled; style 1. Fruit drupaceous but dry, 1 to 5-celled, indehiscent, or the epicarp splitting into valves and falling away. Seed solitary. Endosperm none.

##### 1. *BURSERA* Jacq.

Flowers polygamous. Ovary 3-celled. Fruit 3-angled, 3-valved, in ours by abortion 1-celled and 1-seeded. (J. Burser, a botanist of the 16th century.)

1. *B. microphylla* Gray. ELEPHANT TREE. Low round-headed tree with very thick stems and branches, 4 to 10 ft. high; trunk diameter  $\frac{1}{2}$  to 2 ft.; herbage glabrous; leaflets 13 to 25, linear-oblong, 2 to 3 lines long; flowers 5-merous.—Rocky banks of washes: between Fish Creek and Carrizo Creek, sw. Colorado Desert; Ariz. to L. Cal. and Sonora. (*Elaphrium microphyllum* Rose.)

#### ANACARDIACEAE. SUMAC FAMILY

Trees or shrubs with resinous or milky acrid juice and alternate leaves. Flowers very small, regular, either perfect or polygamous. Calyx commonly 5-parted, a glandular ring or cup-like disk lining its base. Petals commonly 5, the stamens as many or twice as many. Ovary free from the calyx and from the disk, 1-celled, 1-ovuled; styles 3. Fruit a dry berry-like drupe; seed without endosperm.

##### 1. *RHUS* L. SUMAC

Shrubs or small trees. Leaves (in ours) simple or 3-foliate. Stamens 5. Drupe flattened, with rather thin and dry flesh. (Ancient name.)

602. *Rhus diversiloba* T. & G.;  
a, fl. branchlet  $\times \frac{1}{4}$ ; b, pistillate  
fl.  $\times 3$ ; c, staminate fl.  $\times 3$ .

drupe marked with black fibres. — Foothills, valley streams, mountain slopes and mountain valleys, 50 to 5000 ft., widely distributed and often abundant: coastal S. Cal.; Coast Ranges; Great Valley (along rivers); Sierra Nevada foothills; n. to Ore. As a skin irritant the plant juice is highly poisonous, although some persons have immunity. The poison is a non-volatile oil and one may be poisoned only by actual contact or through clothing or other objects which have been in contact with the bushes, or through smoke particles. It is more widely spread in California than any other shrub. Bees make honey from the flowers; the honey contains no poison.

604. *Rhus laurina*  
Nutt.; leaf  $\times \frac{1}{2}$ .

3. *R. laurina* Nutt. LAUREL-SUMAC. Fig. 604. Very leafy shrub, 5 to 7 (or 13) ft. high, exhaling an aromatic odor; leaves ovate or lanceolate, abruptly mucronate,  $1\frac{1}{2}$  to 5 in. long; panicle dense; flowers  $\frac{1}{2}$  to 1 line long; drupe whitish, very small.—S. Cal. valleys near the sea. In San Diego Co. it is esteemed as a bee-food shrub.

4. *R. integrifolia* B. & W. LEMONADE-BERRY. Fig. 605. Shrub 2 to 12 ft. high; leaves entire or with a few small sharp teeth, 1 to  $2\frac{1}{2}$  in. long; panicles ashy-puberulent; flowers 2 to 3 lines long; bracts, sepals and petals ciliolate.—S. Cal., near the coast, often forming thickets. The excretion on the surface of the berry is used for an acid drink.

605. *Rhus integrifolia* B. & W.; leaf  $\times \frac{1}{2}$ .

- Leaves 3-foliolate; deciduous shrubs; throughout Cal.  
Flowers greenish, in panicles; drupe whitish, the stone rough.....1. *R. diversiloba*.  
Flowers yellowish, in spikes; drupe red, the stone smooth.....2. *R. trilobata*.  
Leaves simple, leathery; evergreen shrubs; flowers in panicles; S. Cal.  
Panicle much branched, with slender divisions, glabrous or nearly so; drupe whitish...3. *R. laurina*.  
Panicle composed of stout spikes, finely pubescent; drupe red.  
Leaves elliptic, rounded at apex.....4. *R. integrifolia*.  
Leaves ovate, acute or acuminate.....5. *R. ovata*.

1. *R. diversiloba* T. & G. POISON OAK. Fig. 602. Erect shrub 4 to 8 ft. high, or the stems climbing tree trunks by adventitious rootlets; leaflets variable, roundish to ovate, variously lobed or toothed; panicles axillary, appearing with the leaves, somewhat pendulous; flesh of the whitish

603. *Rhus trilobata* Nutt.; leaf  
 $\times \frac{1}{2}$ .

2. *R. trilobata* Nutt. SQUAW BUSH. Fig. 603. Diffusely branching, 2 to  $3\frac{1}{2}$  ft. high; leaflets broadly ovate or elliptic, cuneate at base, crenate or lobed; flowers pale yellow, appearing before the leaves, borne in terminal often clustered spikes; drupe viscidly pilose.—Narrow valleys or flats in cañon bottoms, 100 to 4000 ft., throughout Cal.; n. to Ore., e. to Rocky Mts. The slender but tough pliable branchlets were prized in basket-making by the native tribes. Var. *ANISOPHYLLA* Jepson n. comb. Leaves small, the lateral leaflets unequal; berries bright crimson.—Desert region from the Cottonwood Mts. to the Panamint Mts. (*Schmaltzia anisophylla* Greene.)

5. *R. ovata* Wats. SUGAR-BUSH. Fig. 606. Similar to no. 4; leaves shining; panicle dull-puberulent or glabrate. —Dry hills, montane S. Cal., back from the coast. The sweetish waxy covering of the berries is used by the native tribes for sugar.

**KOEBERLINIACEAE. KOEBERLIN FAMILY**

Trees or shrubs. Leaves minute or scale-like, alternate, early deciduous. Flowers in ours 5-merous, the stamens as many as the petals or twice as many. Ovary superior, seated on a short fleshy stipe or base; placentae axial.

**1. CANOTIA Torr.**

Leafless shrub or small tree with slender spinose branchlets. Flowers white in small axillary racemes. Pedicels bracted and jointed above the base. Sepals, stamens and petals 5. Ovary 5-celled; style 1; stigma 1. Capsule woody, septically 5-valved, the valves 2-cleft. Seeds solitary in each cell, winged. (The Mexican name.)

1. *C. holacantha* Torr. Eight to 18 ft. high; flowers 2 lines long; capsule oblong, beaked, 9 to 12 lines long, the seeds half as long.—Providence Mts.; e. to Ariz.

606. *Rhus ovata* Wats.; leaf  $\times \frac{1}{2}$ .

**CELASTRACEAE. BURNING BUSH FAMILY**

Shrubs with angled branches and simple leaves. Flowers small, perfect in ours, regular or a little irregular, 4 or 5 (or 6)-merous with jointed pedicels. Calyx deeply parted, persistent. Petals inserted under the free margin of a very thick and conspicuous disk which fills the saucer-like base of the calyx. Stamens commonly 4, 5 or 10, inserted on the disk. Ovary 2 to 5-celled, immersed in or surrounded by the disk; styles united into one, in ours short or none; stigma 3 to 5-lobed. Fruit a capsule or follicle, free from the calyx. Seeds with an aril; embryo large; endosperm fleshy.

Leaves opposite; petals red or purplish, roundish; fruit a capsule; unarmed shrubs; mostly cismontane.

Large erect shrubs; leaves petioled; seed completely enclosed in a fleshy red aril... 1. EUONYMUS.

Small prostrate shrubs; leaves subsessile; seed with a whitish aril at base... 2. PACHYSTIMA.

Leaves alternate; petals white or greenish white, narrow; fruit a follicle; seed with a white aril at base; branches spinescent; deserts... 3. GLOSSOPETALON.

**1. EUONYMUS L. BURNING BUSH**

Large shrubs. Leaves opposite, petioled, deciduous (in ours), with minute stipules or none. Flowers purplish, in few-flowered cymes on axillary peduncles. Calyx-lobes, petals and stamens 5 (rarely 6 or 4). Stamens inserted on the 5-lobed disk. Ovary 3 to 5-celled, the cells 2 to 6-ovuled. Capsule 3 to 5-lobed, the cells usually 1-seeded. Seeds covered with a fleshy red aril. (Greek eu, good, and onoma, a name.)

1. *E. occidentalis* Nutt. WESTERN BURNING BUSH. Fig. 607. Erect shrub (or sometimes a small tree) with slender often straggling branches, 6 to 18 ft. high, the greenish branchlets 4-angled; leaves glabrous, thin, ovate or often broadest above the middle and abruptly acuminate, serrulate,  $1\frac{1}{2}$  to 4 in. long, on petioles

607. *Euonymus occidentalis* Nutt.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, fl.  $\times 2$ .

3 to 7 lines long; peduncles 1 to 2½ in. long, 1 to 5-flowered; flowers 4 to 5 lines broad; petals roundish, brownish-purple, finely dotted and with scarious margins; capsule depressed, smooth, deeply 3-lobed.—Redwood region from the Santa Cruz Mts. to Marin and Humboldt Cos.; Plumas Co.; Washoe Co., Nev.; n. to Wash. May-June. Var. *PARISHII* Jepson n. comb. Bark whitish; peduncles 3 to 6-flowered.—S. Cal. mts., 5000 to 6000 ft.: Mt. San Jacinto; Palomar; Cuyamaca Mts. (*E. parishii* Trel.)

## 2. *PACHYSTIMA* Raf. MOUNTAIN LOVER

Low evergreen shrubs with squarish twigs and opposite coriaceous leaves with minute deciduous stipules. Flowers small, perfect, solitary or in few-flowered axillary cymes shorter than the leaves. Calyx-lobes, petals and stamens 4. Stamens inserted on the edge of the rounded disk. Ovary 2-celled, each cell with 2 ovules. Capsule not lobed, 1 to 2-seeded. Seed with a pale lacerate aril at base. (Greek *pachus*, thick, and *stima*, stigma.)

608. *Pachystima myrsinites* Raf.; a, fl. branchlet x ½; b, fl. x 4.

1. *P. myrsinites* Raf. OREGON BOX-WOOD. Fig. 608. Densely branched, very leafy, 1 to 3 ft. high, or sometimes nearly prostrate and rising about 6 in. from ground; leaves ovate to obovate or spatulate, ½ to 1 (or 1½) in. long, serrulate above the base, subsessile; peduncles about 1 line long, 1 to 3-flowered; flowers red-brown, 1½ to 2 lines wide.—Montane, 4000 to 5000 ft.: Butte Co. to Siskiyou Co.; n. to B. C., e. to Rocky Mts. May-July.

## 3. *GLOSSOPÉTALON* Gray

Deciduous shrubs with slender spinose branches. Leaves small, alternate, entire, with minute stipules. Flowers 4 to 6-merous, one at each axil, borne on a slender pedicel. Calyx parted into unequal lobes. Petals narrow-oblongate, much longer than the calyx. Stamens mostly 5 to 10, inserted under the edge of the crenately 8 or 10-lobed disk. Ovary 1-celled, with 2 ovules; stigma sessile. Follicle obliquely ovoid, finely striate, 1 or 2-seeded, splitting down the ventral suture. Seed with a small thin white aril. (Greek *glossa*, tongue, and *petalon*, petal, because of the shape of the corolla parts.)

1. *G. spinescens* Gray. Intricately branched, 1 or 2 ft. high; leaves oblong or obovate, glaucous, glabrous or nearly so, 2 or 3 lines long, narrowed to a very short but slender petiole with a broad base, with awl-like reddish stipules; pedicels shorter than the leaves; flowers 1 to 2 lines long; calyx-lobes and petals usually 5, sometimes 4; stamens 6 to 10, rarely 5 or 4; pod 2 lines long, containing 1 or 2 brown seeds.—Mohave Desert (Cushenbury Sprs.; Providence Mts.) and n. to White Mts. and Mt. Laura; e. Ore. to Nev., Tex. and n. Mex. Apr. (*G. nevadense* Gray.)

## STAPHYLEACEAE. BLADDER-NUT FAMILY

Shrubs or small trees. Leaves opposite, pinnately compound, with 3 to several leaflets, usually with minute often caducous stipules and stipels. Flowers regular, perfect. Calyx-lobes and petals 5. Stamens 5, inserted outside a large disk. Ovary superior, 3-celled. Fruit a capsule, thin, opening at apex. Seeds very hard, with shining testa; endosperm present.

1. **STAPHYLÉA** L. BLADDER-NUT

Shrubs. Flowers white, in drooping raceme-like clusters terminating the branchlets. Calyx deeply 5-parted, the lobes erect, whitish. Petals erect. Ovary consisting of 3 carpels united in the axis, their long styles lightly cohering. Capsule large, inflated, bladder-like, 3-celled, the cells 1 to 4-seeded. (Greek staphule, a cluster.)

1. **S. bolánderi** Gray. SIERRA BLADDER-NUT. Fig. 609. Glabrous shrub 6 to 10 ft. high, or a slender tree up to 20 ft. high; leaflets 3, roundish ovate, acute, finely serrate,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  in. long; pedicels  $\frac{3}{4}$  to 1 in. long; sepals several-nerved, a little shorter than the petals; petals 6 lines long, with broad claws as long or longer than the elliptic blade; style and stamens much exserted; bladder 3-horned,  $1\frac{1}{4}$  to 2 in. long.—Foothills, 2300 to 4500 ft., not common; Sierra Nevada from Tulare Co. to Siskiyou Co.

609. *Staphylea bolanderi* Gray; *a*, leaf  $\times \frac{1}{2}$ ; *b*, capsule  $\times \frac{1}{2}$ .

## ACERACEAE. MAPLE FAMILY

Deciduous trees or shrubs with opposite leaves. Flowers regular, polygamous or dioecious, borne in racemes, corymbs or fascicles. Calyx generally cleft into 5 segments, the petals as many or none. Stamens 3 to 10, borne on the edge of a disk or hypogynous. Pistil 1 with a 2-lobed 2-celled ovary and 2 styles. Ovary superior, developing a long wing from the summit of each lobe and thus ripening into a double samara; samaras separable at maturity, the wings serving to rotate them rapidly in the air and further their horizontal flight when carried away by the wind.

1. **ACER** L. MAPLE

Leaves simple or pinnate. Flowers small, the clusters always drooping. (Latin name of the Maple tree.)

Leaves simple; petals present.

Flowers in racemes; samaras more or less hispid; leaves large, deeply 5-lobed. . . . . 1. *A. macrophyllum*.

Flowers in corymbs; samaras glabrous.

Leaves shallowly but acutely 7 to 9-lobed; sepals nearly twice as long as the petals. . . . . 2. *A. circinatum*.

Leaves mostly 3-lobed or -parted; sepals equaling petals. . . . . 3. *A. glabrum*.

Leaves pinnately or ternately compound; flowers dioecious; petals none. . . . . 4. *A. negundo*.

1. **A. macrophyllum** Pursh. BIG-LEAF MAPLE. Fig. 610. Broad-crowned tree 30 to 95 ft. high; leaves roundish in outline, palmately parted into 5 broad fingers, 4 to 10 in. broad; perfect and staminate flowers mixed in the same raceme; stamens 7 to 9, villous below; body of samara short-bristly. — Along living streams throughout cismontane Cal., and also on east and north slopes of mt. ranges in the areas of about 25 to 50 inches rainfall; n. to B. C. and Alas. Also called Water Maple, White Maple and Oregon Maple.

610. *Acer macrophyllum* Pursh; *a*, leaf  $\times \frac{1}{2}$ ; *b*, fr.  $\times \frac{1}{2}$ .

2. **A. circinatum** Pursh. VINE MAPLE. Fig. 611. Shrub or sometimes a small tree, erect and 5 to 20 ft. high, but more often vine-like or reclining; leaves 2 to 4 in. broad, 5 to 7-lobed to the middle,

611. *Acer circinatum* Pursh; a, leaf  $\times \frac{1}{4}$ ; b, fr.  $\times \frac{1}{2}$ .

with toothed margin; flowers 4 to 10 or more in a corymb, most of them staminate, the cluster often setting but one fruit; stamens 6 to 10, shorter than the petals in the perfect flower but longer than the petals in the staminate flower; filaments villous below; samaras glabrous, the wings spreading at right angles to the stalk, scarlet when full grown; as the fruit ripens, the peduncle turns upward and finally the samara stands erect above the leaf.—Along the coast from Humboldt Co. to Del Norte Co.; n. to B. C.

3. *A. glabrum* Torr. SIERRA MAPLE. Fig. 612. Shrub 5 to 10 ft. high, with slender branchlets; leaves 1 to 3 in. broad, palmately 3-lobed or often with 2 supplementary lobes at base, the margin

unequally serrate; flowers 4 to 9, in loose umbel-like corymbs, the staminate without rudiments of pistils and the pistillate with short stamens; corymbs unisexual or with both pistillate and staminate flowers, the sexes often borne on different shrubs; stamens 7 to 10, glabrous; samaras usually several in a cluster, glabrous, the wings ascending.—Rocky or wet mountain sides, 6000 to 8000 ft.: San Jacinto Mts.; San Bernardino Mts.; Sierra Nevada; Salmon Mts. to Siskiyou Mts.; n. to Alas., e. to Rocky Mts.

612. *Acer glabrum* Torr.; a, leaf  $\times \frac{1}{4}$ ; b, fr.  $\times \frac{1}{2}$ .

4. *A. negundo* L. var. *californicum* Sarg. BOX ELDER. Fig. 613. Tree 20

613. *Acer negundo* var. *californicum* Sarg.; a, leaf  $\times \frac{1}{4}$ ; b, fr.  $\times \frac{1}{2}$ .

to 60 ft. high; leaves pinnately 3-foliolate, the leaflets  $1\frac{1}{4}$  to 5 in. long, serrate and incised, or deeply 2 or 3-lobed, or the lobes sometimes becoming distinct and petioled so that one or more of the primary leaflets is replaced by 2 or 3; staminate flowers clustered on thread-like hairy pedicels, the stamens 4 or 5; pistillate flowers borne in slender racemes; samaras straw-white, crimson when young, finely pubescent.—Along streams and in low moist valley bottoms: Great Valley; Coast Ranges; s. to the San Bernardino Mts.

#### SAPINDACEAE. BUCKEYE FAMILY

Deciduous trees or shrubs with opposite palmately compound leaves and slightly irregular flowers. Ovary superior, 3-celled with 2 ovules in each cell, commonly but one ovule maturing.

##### 1. *AESCULUS* L. HORSE CHESTNUT

Flowers showy, ill-scented, on jointed pedicels in a terminal cylindrical thyrs, of two sorts, perfect (fertile) with long thick styles and sterile with short styles; fertile flowers few near top of thyrs. Calyx tubular, unequally 5-cleft. Petals 4 or 5, slightly unequal, clawed. Stamens 5 to 7, becoming

successively much exserted and often unequal. Fruit a large 3-valved capsule releasing one large polished seed. (Latin name of an Italian oak with edible acorns.)

1. *A. californica* (Spach) Nutt. BUCKEYE. Fig. 614. Low broad-headed tree 10 to 20 ft. high; leaflets 5 to 7, oblong-lanceolate to oblong-elliptic, acute or acuminate, 3 to 5 in. long; thyrses 4 to 6 in. long; petals 6 to 7 lines long; axis of the thyrses at length naked and pendulous, bearing one pear-like pod or sometimes 2 to 9; seed 1 to 2 in. in diameter.—Dry hills or cañon sides, 10 to 4000 ft.: Coast Ranges from Siskiyou Co. to Antelope Valley, Los Angeles Co.; Sierra Nevada foothills. June.

#### RHAMNACEAE. BUCKTHORN FAMILY

Shrubs or small trees with simple leaves and mostly caducous stipules. Flowers small ( $\frac{1}{2}$  to  $1\frac{1}{2}$  lines long), regular, commonly in little umbels, the umbels often aggregated in racemes or panicles. Calyx-lobes, petals and stamens 5 (or 4). Calyx-tube lined with a disk, the petals and stamens inserted on the edge of the disk and alternate with the calyx-lobes. Petals hooded, commonly clawed, sometimes wanting. Ovary 3 (or 2)-celled, free from or adnate by the disk to the base of the calyx; ovules 1 in each cell, or 1 or 2 in *Condalia*. Style simple or 3-cleft. Fruit in ours a berry-like drupe or a capsule.

Fruit drupe-like; calyx-lobes, stamens and petals 4 or 5; calyx or its lower portion persistent as a collar beneath the fruit.

Drupe with 1 nutlet; petals clawed or none; calyx-lobes deciduous or persistent....

1. *CONDALIA*.

Drupe berry-like with 2 or 3 nutlets; petals clawless or none; calyx-tube circumscissile near middle, the upper portion of tube and lobes deciduous as one piece, the lower portion persistent.....

2. *RHAMNUS*.

Fruit a capsule; calyx-lobes, petals and stamens 5; petals clawed.

Calyx-tube joined to base of ovary, its lobes deciduous in fruit; style not jointed....

3. *CEANOTHUS*.

Calyx free from ovary, its lobes persistent in fruit; style jointed.....

4. *ADOLPHIA*.

#### 1. *CONDALIA* Cav.

Ours shrubs with divaricate mostly spiny twigs. Leaves alternate, entire, with minute stipules. Flowers in small axillary umbels, sometimes reduced to a single flower, sometimes developed into small panicles. Calyx deeply 5-lobed. Petals present or none. Ovary free from the calyx and annular disk, incompletely 2-celled, with 1 or 2 placentae and 1 or 2 ovules. Fruit drupaceous, the style-base persisting. (A. Condal, Spanish physician.)

Petals present; calyx deciduous; ovary with 2 placentae.

Umbels or panicles peduncled; branches and spines puberulent.....

1. *C. lycioides*.

Umbels sessile; branches and spines glabrous.....

2. *C. parryi*.

Petals none; calyx persistent; ovary with 1 placenta.....

3. *C. spathulata*.

1. *C. lycioides* Weberb. Straggly branching shrub 4 to 6 ft. high, the branches regularly armed with rigid slender often leafless spines  $\frac{3}{4}$  to  $2\frac{1}{4}$  in. long; branches and spines whitened and puberulent, the flower-bearing branchlets and the calyces finely tomentose; shrub commonly leafless, the leaves when present narrowly elliptic, 4 to 7 lines long, very shortly petioled; flowers minute (about 1 line broad); drupe subglobose or somewhat elongated, 4 lines long.—Colorado Desert: Mammoth Tank; Cottonwood Sprs.; Purple Hills Pass, Colorado River.

2. *C. parryi* (Torr.) Weberb. Glabrous shrub 6 to 10 ft. high with flexuous branches and slender spines; branches and spines grayish or reddish-brown; leaves mostly fascicled on short spurs, obovate to elliptical, 4 to 8 lines long, shortly petioled on petioles 1 to 3 lines long; drupe elliptic to oblong, 6 to 7

614. *Aesculus californica* Nutt.; fr. branchlet  $\times \frac{1}{4}$ .

lines long, shortly beaked, borne on a slender pedicel 4 to 5 lines long.—Western side of Colorado Desert: Morongo Cañon; Piñon Well, Conchilla Range; Palm Cañon; Grapevine Cañon; s. into L. Cal.

3. *C. spatulata* Gray. Shrub, intricately branched, the branchlets rigid, spinescent, leafy; herbage puberulent; leaves obovate or spatulate, 2 to 3 lines long, narrowed to short petioles, the under side with a few broad light-colored veins in relief; umbels sessile, 1 or 2-flowered; pedicels 1 line long; drupe ovoid, 2 lines long.—Colorado Desert (Mesquite sta.); e. to Tex., s. to Mex.

## 2. RHÁMNUS L. BUCKTHORN

Shrubs with alternate leaves. Flowers greenish, perfect or polygamous. Umbels axillary, sessile or peduncled. Calyx with 4 or 5 lobes or teeth, its tube after anthesis circumscissile near the middle, the upper portion of tube and the lobes deciduous as one piece, the lower portion persistent as a narrow collar beneath the fruit. Petals very small, hooded and without claws, or none. Stamens 4 or 5; filaments short. Ovary ovoid, free. Fruit berry-like, containing 2 or 3 separate seed-like nutlets of bony or cartilaginous texture. (The ancient Greek name.)

Petals present; berry black.

Foliage deciduous; leaves thinnish, 3 to 8 in. long. . . . . 1. *R. purshiana*.

Foliage evergreen; leaves  $\frac{3}{4}$  to 3 in. long.

Leaves thinnish; bark of branchlets cherry-red; petals when spread out somewhat rhomboidal, notched at apex, truncatish at base. . . . . 2. *R. rubra*.

Leaves thickish; bark of branchlets gray or brown; petals when spread out somewhat obcordate, sub-acute at base. . . . . 3. *R. californica*.

Petals none or very minute; foliage evergreen; berry red. . . . . 4. *R. crocea*.

1. *R. purshiana* DC. CASCARA SAGRADA. Small tree or shrub 8 to 20 ft. high; leaves in a tuft at end of branchlets, thinnish, deciduous, elliptic-oblong, obtuse or slightly cordate at base, obtuse or abruptly blunt-pointed at apex, serrulate,  $2\frac{1}{2}$  to 5 (or 8) in. long; petioles tomentulous; flowers 5-merous; berry black, with 3 (rarely 2) nutlets.—Mountain slopes and cañons, Mendocino and Humboldt Cos. near the coast; n. to Wash. Var. *ANONAEFOLIA* Jepson n. comb. Leaves obovate or oblong, the larger 4 to 7 in. long and  $1\frac{1}{4}$  to  $2\frac{1}{2}$  in. wide, mostly cuneately tapering at base.—Bear Valley, Nevada Co., to Mt. Shasta. (*R. anonaefolia* Greene.)

2. *R. rubra* Greene. Shrub 2 to 4 ft. high, with reddish twigs; leaves oblong, finely serrulate, glabrous,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long; umbels sessile or nearly so; berries obovoid or somewhat contracted at base, 2 to 3 lines long.—Sierra Nevada, 5000 to 7000 ft., from Mariposa Co. to Siskiyou Co.

615. *Rhamnus californica* Esch.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, fl.  $\times 5\frac{1}{2}$ ; c, long. sect. of fl.  $\times 6$ .

3. *R. californica* Esch. COFFEE BERRY. Fig. 615. Shrub commonly 4 to 6 ft. high; leaves scattered along the branchlets, narrowly or broadly oblong, serrulate, usually acute, glabrous or slightly puberulent, dark green when dried,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  in. long; flowers mostly 5-merous; peduncles 1 to 10 lines long; berry green when young, turning red or reddish and finally black when ripe, globose or oval, 3 to 4 lines in diameter, containing 2 (rarely 3) nutlets.—Cañons, hill and mountain slopes, 10 to 4000 ft.: Coast Ranges from Mendocino Co. to San Luis Obispo Co. and s. to the San Gabriel and San Bernardino mountains. June-July; fr. Sept.-Oct. Also called Pigeon Berry and Yerba del Oso. Very variable in foliage, various climatic areas having developed fairly distinctive leaf forms.

Var. *TOMENTÉLLA* B. & W. Leaves 2 to 3 in. long, elongated, oblong, varying to elliptic, obscurely serrulate or entire, abruptly acute or acuminate, usually conspicuously feather-veined, finely tomentose on the under side or even silvery, typically very olive-like; peduncles  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long.—Dry foothills, 500 to 5000 ft.: Sierra Nevada foothills; inner North Coast Ranges; Santa Cruz Mts. and Mt. Hamilton Range; s. to S. Cal. mts. (San Bernardino, San Jacinto, Palomar and Cuyamaca Mts.); L. Cal. Var. *VIRIDULA* Jepson n. var. Leaves obovate or oblong, obtuse or very shortly acute,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long, dark green above, velvety beneath to the touch but scarcely to the eye; umbels sessile or shortly peduncled.—Desert slopes, Inyo Co. (Cottonwood Creek, 7500 ft., Jepson 5086, type). Var. *OBTUSÍSSIMA* Jepson n. comb. Leaves elliptic or broadly oblong, very obtuse, serrulate, 1 to  $1\frac{1}{2}$  in. long, often puberulent beneath, slightly yellowish when dried; umbels disposed to be sessile.—Sierra Nevada, 3500 to 5500 ft., n. to Mt. Shasta, s. to Mt. San Jacinto. (*R. obtusissima* Greene.) Var. *CRASSIFÓLIA* Jepson n. var. Shrub 3 to 8 ft. high; branchlets and petioles very stout; leaves oval or elliptic, obtusish at apex, or sometimes shortly acute, rounded or obscurely cordate at base, very thick and leathery, very prominently parallel-nerved beneath,  $1\frac{1}{2}$  to 3 in. long, 1 to nearly 2 in. wide, finely tomentulose below, microscopically so above; leaf-scars prominent.—Inner North Coast Range foothills from Colusa Co. (ridge w. of Bear Valley, Jepson 8974, type) to Tehama Co., in the chaparral. Var. *OCCIDENTÁLIS* Jepson n. comb. Foliage yellowish; leaves oval or elliptic, obtuse or shortly acute, entire,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  in. long, glabrous; peduncles 1 to 6 lines long.—Three Creeks, n. Humboldt Co., Cal., to Josephine Co., Ore. Well-marked local form. (*R. occidentalis* Howell).

616. *Rhamnus crocea* var. *ilicifolia* Greene; fr. branchlet x 1.

4. *R. crócea* Nutt. RED-BERRY. Low densely branched glabrous shrub  $\frac{1}{2}$  to 2 or 3 ft. high, the branchlets rigid or even spinescent; leaves often fascicled, elliptic, firm coriaceous, 1 to 5 (or 8) lines long, serrulate, green above, yellowish beneath, very shortly petioled; flowers mostly polygamous and 4-merous; petals none or minute; berry 2 to 3 lines long, red, containing 2 (rarely 3) nutlets.—Napa Range and s. near the coast to Santa Barbara and San Diego. Feb.-May; fr. Sept. Var. *ILICIFÓLIA* Greene. Fig. 616. Tree-like with a distinct trunk, or the stems several and clustered, 3 to 12 ft. high; branchlets rather stout, repeatedly and shortly branched at the ends; leaves oval to orbicular, often golden beneath, spinulose-dentate, 4 to 12 lines long; sepals and stamens 4 or frequently 5; berry bright red, ovoid,  $2\frac{1}{2}$  lines long.—Inner Coast Range (w. Glenn Co., Vaca Mts., Mt. Diablo); Sierra Nevada foothills; coastal S. Cal. Var. *INSULÁRIS* Sarg. Tree 15 to 30 ft. high; similar to var. *ilicifolia*; leaves less prominently or scarcely at all toothed and berries larger.—Santa Barbara Isls. Var. *PILÓSA* Trel. Leaves more or less pilose.—Mts. of San Diego Co. (*R. pilosa* Abrams.)

### 3. *CEANÓTHUS* L.

Shrubs or small trees with petioled leaves, the branchlets often divaricate and rigid, sometimes spinescent. Flowers small but showy, borne in panicles or umbels. Calyx 5-lobed, the lower part adnate with the thick disk to the lower part of the 3-celled ovary. Petals 5, hooded by the inflexion of the acuminate apex, and with long claws. Stamens 5, filaments filiform, long-exserted. Style 3-cleft. Capsule subglobose, 3-celled, 3-lobed, becoming dry and separating into its 3 carpels, these elastically dehiscent along the inner edge and dispersing the seeds. Seeds obovate, convex on the back. (Greek *Keanothus*, name used by Dioscorides to designate some spiny plant.)

A. LEAVES ALTERNATE, ENTIRE OR IF NOT ENTIRE THE TEETH USUALLY GLANDULAR; STIPULES THIN, FUGACIOUS OR DECIDUOUS; FLOWERS IN SMALL UMBEL-LIKE CLUSTERS WHICH ARE RACEMOSELY DISPOSED ALONG A SIMPLE AXIS ("SIMPLE PANICLE") OR ALONG A MORE OR LESS BRANCHED AXIS ("COMPOUND PANICLE"); CAPSULES OFTEN RIDGED OR CRESTED ON BACK OF THE LOBES OR CELLS, NEVER WITH HORNS.—Subgenus EUCEANOTHUS.

1. *Branchlets mostly flexible; spines none; bark green or brown.*

Panicles mostly simple; flowers blue, mostly deep blue; foliage evergreen; leaves pinnately nerved (except in no. 8).

Branchlets terete; leaves pinnately nerved, usually with conspicuous glandular teeth, commonly of unequal size but mostly small, often thickly set on the branchlets or even crowded; panicles small, often subglobose or short-oblong, frequently on long peduncles; low or prostrate shrubs.

Leaf margin flat, glandular-toothed.

Leaves dull above.

Stems creeping; leaves rounded, villous pubescent; panicle few (3 to 8)-flowered.....1. *C. diversifolius*.

Stems not creeping; low flat-topped shrub; leaves pale and pubescent beneath.....2. *C. lemmonii*.

Leaves glossy or waxed above; low, densely branched.

Peduncles mostly 2 to 5 lines long; cent. Cal. near coast.....3. *C. foliosus*.

Peduncles 1½ to 2 in. long; San Diego Co.....4. *C. austromontanus*.

Leaf margin revolute.

Upper surface all over papillate; panicle oblong.....5. *C. papillosus*.

Upper surface papillate on margin; panicle subglobose.....6. *C. dentatus*.

Branchlets angular; leaves greener above than below; tall shrubs or small trees.

Leaves pinnately veined, with revolute edges.....7. *C. parryi*.

Leaves strongly 3-nerved, plane.....8. *C. thyrsiflorus*.

Panicles large and commonly compound (except no. 12); leaves mostly 3-nerved.

Leaves serrulate, ample, prominently 3-nerved; branchlets stout.

Foliage evergreen, firm and thick.

Flowers pale blue; leaves green but dull above, whitened beneath; small tree; Santa Barbara Isls.....9. *C. arboreus*.

Flowers white; leaves deep green and shining or varnished above; mostly northern mountains.....10. *C. velutinus*.

Foliage deciduous, thinner; flowers white; Siskiyou Co. and n.....11. *C. sanguineus*.

Leaves entire, mostly medium or small, distinctly or obscurely 3-nerved, rarely pinnately nerved; branchlets slender; foliage mostly deciduous.

Low shrub; panicle subsimple, the peduncles short; flowers blue; capsule nearly crestless; leaves oblong, small.....12. *C. parvifolius*.

Tall shrub; panicle compound, the peduncles long; flowers commonly white, sometimes blue or pinkish; capsule commonly with oblong glands.....13. *C. integerrimus*.

2. *Branchlets more or less rigid and divaricate, spinose or subspinose; bark mostly white or gray; panicles mostly short-peduncled.*

Capsules mostly crestless; flowers white or blue.

Branchlets with greenish or brownish bark, often angled, flexible but often with slender spines; leaves pinnately veined.....14. *C. spinosus*.

Branchlets with whitish bark, terete, rigid; leaves 3-nerved.....15. *C. divaricatus*.

Capsules crested.

Panicles simple, commonly cylindric; branchlets mostly rigid or stubby, not spinose, with greenish or brownish bark; leaves rather weakly 3-nerved, glandular-denticulate.

Flowers pale, sometimes deep blue.

Leaves white beneath with a dense close felt or tomentum.....16. *C. tomentosus*.

Leaves short-pubescent, pale or greenish beneath.....17. *C. sorediatus*.

Flowers deep blue or purplish; leaves hirsute.....18. *C. oliganthus*.

Panicles compound, not cylindric; branchlets rigid and spiny; leaves strongly 3-nerved; flowers white.

Low flat-topped shrub; capsule ridge-crested; leaves mostly 5 to 10 lines long; high montane.....19. *C. cordulatus*.

Tall shrub; capsule conspicuously warty or wavy-ridged; leaves mostly 1½ to 2½ in. long; near coast.....20. *C. incanus*.

B. LEAVES OPPOSITE (EXCEPT IN 2 SPECIES), MOSTLY THICK AND SMALL, ENTIRE OR WITH PUNGENT-TIPPED TEETH BUT NEVER GLANDULAR; STIPULE-BASES PERSISTENT, BECOMING WARTY AND CORK-LIKE; FLOWERS IN SESSILE UMBELS; CAPSULES COMMONLY WITH HORNS AS WELL AS CRESTS.—Subgenus CERASTES.

1. *Leaves alternate or exceptionally opposite; flowers white; S. Cal.*

Leaves mostly obcordate; capsule hornless.....21. *C. verrucosus*.

Leaves elliptic-obovate, entire, mostly refuse or notched at apex; capsule with stout horns.....22. *C. macrocarpus*.

2. *Leaves opposite; rigidly branched shrubs.*

Leaves not revolute.

Flowers white; leaves usually entire, the lower surface microscopically tomentose.

Leaves yellowish-green, denticulate all around; horns spreading.....23. *C. greggii*.

Leaves grayish or pale green, commonly entire (rarely dentate at apex); horns erect.....24. *C. cuneatus*.

Flowers blue or purple (exceptionally white).

Erect or spreading shrubs.

Leaves pungently dentate on upper half.....25. *C. rigidus*.

Leaves coarsely spinulose-dentate.

Leaves mostly with 7 or 8 teeth on a side; stipules conic, straight; horns very stout; s. Sierra Nevada.....26. *C. pinetorum*.

Leaves mostly with 4 or 5 teeth on a side; stipules conic, often curved; horns slender; cent. Coast Ranges.....27. *C. jepsonii*.

Prostrate shrubs; flowers blue; leaves coarsely few-toothed towards apex.....28. *C. prostratus*.

Leaves somewhat revolute, pungently dentate, the lower surface densely white-tomentose...29. *C. crassifolius*.

1. *C. diversifolius* Kell. Stems prostrate, 2 to 4½ ft. long, with short ascending or erect branchlets; young stems short villous; leaves thin, broadly elliptical, obtusish or sub-acute at apex, mucronulate-serrulate and sometimes undulate, ½ to ¾ (or 1¼) in. long, green and pubescent above, pale and hirsutely tomentose beneath, the veins sometimes prominent; petioles 1 to 3 (or 6) lines long; panicles simple, small and few (3 to 8)-flowered, 5 to 7 lines long, on much longer peduncles; flowers blue or almost white; capsules with apical wing-like ridges, 1½ to 2 lines in diameter.—Ridges and flats in the mts., 3000 to 6000 ft.: Sierra Nevada from Tulare Co. to Shasta Co.; inner North Coast Range from n. Lake Co. to Trinity Co. It is widely distributed, forming soft gray-green mats in the pine woods, but is nowhere common.

2. *C. lemmoni* Parry. Low spreading shrub with long rigid or at least firm branches and light gray bark; branchlets usually short, tomentose or pubescent; leaves elliptical to broadly ovate, 3 to 12 lines long, microscopically serrulate, plane, nearly glabrous above, pale and pubescent beneath; petioles very short or almost none; panicles simple, oblong or globose, 5 to 12 lines long, the tomentose peduncles little or no longer; flowers blue; capsules 1¾ lines broad, rather strongly crested.—N. Sierra Nevada, 2000 to 3500 ft., from Placer Co. to Shasta Co.; not common. In habit very near *C. parvifolius*.

3. *C. foliosus* Parry. Fig. 617. Depressed shrub (½ to 1 ft. high), commonly dense at base, with horizontally spreading or diffuse branches 1½ to 3 ft. long, or in chaparral often erect and 2 to 3 ft. high or taller; branchlets often long, straight, shortly villous; leaves broadly oblong, mostly obtusish, undulate or somewhat infolded longitudinally, quite glabrous or obscurely hairy on the veins beneath, 2 to 6 or 8 lines long, commonly with smaller ones fascicled in their axils, upper surface dark green, lower lighter green or whitish or glaucous, the minute teeth of the margin tipped with glands; petiole distinct but very short; panicles simple, globose to oblong, ¼ to 1 in. long, the peduncles naked, 2 to 5 (or rarely 9) lines long; flowers blue; capsules 1½ lines broad, smooth, reddish, lobed, crested.—North Coast Ranges, mainly on exposed slopes and ridges, 200 to 3500 ft.: Mt. Tamalpais, abundant; Hood's Peak Range; Mt. St. Helena, abundant; Mt. Hanna, Lake Co.; w. Mendocino Co. (where it becomes 16 ft. high); also in the Santa Cruz Mts.

4. *C. áustromontánus* Abrams. Erect shrub 4 to 8 ft. high, similar to no. 3; capsules shallowly lobed. — Cuyamaca Mts., too little known.

5. *C. papillósus* T. & G. Open irregularly spreading shrub, 4 to 6 ft. high; foliage and inflorescence usually crowded on the branches;

617. *Ceanothus foliosus* Parry;  
fl. branchlet x 1.

stems and peduncles hirsutulose; leaves oblong to linear, or even narrowly linear by the strong revolute of the margin,  $\frac{1}{2}$  to  $2\frac{1}{4}$  in. long, obtuse at base, rounded or truncate at summit, the upper surface deep green, minutely hirsutulose, usually corrugated or roughened and thickly sprinkled with glandular-papillate protuberances, the lower surface pale pubescent or more commonly densely whitish felt-like and often in addition hispidulose; panicles simple, cylindric or very short cylindric, usually dense,  $\frac{1}{2}$  to  $1\frac{3}{4}$  in. long, the peduncles naked, solitary or clustered, as long or often much longer; flowers blue; capsules distinctly 3-lobed with low narrow or lineate crests,  $1\frac{1}{2}$  lines broad.—South Coast Range on the mountain ridges lying next the ocean from the Santa Cruz Mts., where it is frequent, especially in the Redwood forest, to the Santa Lucia Mts. and San Luis Obispo Co. Var. *RÆGIUS* Jepson n. var. Papillae absent or nearly so.—Kings Mt., San Mateo Co. (C. F. Baker 804, type).

6. *C. dentatus* T. & G. Low densely branched shrub 1 to 3 ft. high; branchlets and peduncles tomentulose or pilose; leaves obovate or elliptical, becoming strongly or irregularly revolute and therefore narrow or irregular in outline, usually truncate or retuse at apex, the infolding of the margin often such as to increase the prominence of the apical notch, pubescent on both surfaces and pale below, glandular-papillate on the (apparent) margin, 3 to 5 (or 12) lines long but of very unequal size; panicles simple, cylindric to globose,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long, on leafy peduncles nearly as long; flowers blue; capsules 2 lines broad, with prominent thin crests.—Santa Cruz Mts. to Monterey and doubtless southward where it insensibly passes into the first variety. Var. *IMPRÆSSUS* Trel. Prostrate; leaves roundish, with deep straight furrows or impressions on the upper surface over the veins.—Santa Maria to Santa Barbara. Var. *LOBBIANUS* Jepson n. comb. Leaves sparingly glandular, little revolute, of more regular outline than in species.—Wm. Lobb 117, doubtless Monterey Co., but the special locality not known; related to *C. foliosus* and possibly better regarded as a form of that species. (*C. lobbianus* Hook.) Var. *FLORIBUNDUS* Trel. Flowers in dense globose subsessile clusters which closely crowd the branches.—Monterey. It has been treated as a hybrid but we see no necessity for so regarding it. (*C. floribundus* Hook.)

618. *Ceanothus thyrsiflorus* Esch.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, fl.  $\times 2$ ; c, capsule  $\times 3$ .

7. *C. párryi* Trel. LADY-BLOOM. Shrub 4 to 6 (or 18) ft. high; branchlets angular and, when young, tomentose, the 1-year-old ones reddish; leaves pinnately veined, narrowly to broadly oblong,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long, dark green above, cobwebby-tomentose beneath, the margin denticulate but seemingly entire because soon revolute; petioles 2 lines long; panicles simple, oblong or distinctly broader below, 1 to 3 in. long, on sparsely leafy peduncles twice as long; bractlets white, hairy; flowers blue; capsules globose, smooth, 2 lines broad.—Cañons, Napa Range to Humboldt Co., frequent.

8. *C. thyrsiflorus* Esch. BLUE BLOSSOM. Fig. 618. Shrub 3 to 8 ft. high, or becoming a small tree up to 18 or 25 ft. high, rather straight-limbed, the branchlets strongly angled and mostly ascending; leaves elliptical or oblong-ovate, green on both surfaces, glabrous and shining above, paler and usually scantily hairy along the veins beneath, strongly 3-nerved beneath, the margin mucronate-

serrate or serrulate with somewhat impressed glandular teeth,  $\frac{3}{4}$  to 2 in. long; flowers blue, rarely varying to white, borne in panicles; panicles dense,  $\frac{3}{4}$  to 3 in. long, on somewhat leafy peduncles 2 to 4 in. long; capsules globose, smooth, little lobed,  $1\frac{1}{2}$  to 2 lines broad, glandular and black when ripe.—Cañon sides, 10 to 1500 ft., Coast Ranges from Monterey Co. to Del Norte Co.; n. to Ore. It follows very closely and is especially abundant in the Redwood belt. It is also called Blue Myrtle and California Lilac. Var. *GRISEUS* Trel. Branchlets stout; leaves roundish-ovate to elliptic, obtusish, silky beneath with dense short hairs, as much as  $1\frac{3}{4}$  in. long, the margin revolute between the low teeth; panicles rather large ( $1\frac{1}{4}$  in. long) but dense and compact.—Ft. Ross and Monterey. Var. *CHANDLERI* Jepson n. var. Branchlets slender; leaves small (10 lines long or less), puberulent beneath; panicles subglobose, 7 to 8 lines long on peduncles 2 to  $3\frac{3}{4}$  in. long; flowers pale blue.—Pajaro Hills (Chandler 402, type).

9. *C. arboreus* Greene. Shrub, or often a small tree, 12 to 20 ft. high with distinct trunk and round but open crown; branches woolly-puberulent; leaves broadly ovate to elliptic, obtuse or acutish, rounded to obscurely obcordate at base, mucronate-serrulate, 1 to 3 in. long, above dark green and glabrescent, beneath 3-ribbed and whitened (or light slate-color) with a thin but close fine felt; panicles compound, 2 to  $3\frac{1}{2}$  in. long; flowers pale blue, fragrant; capsules large (4 lines broad), blackish when ripe and strongly ridge-crested on the back of the lobes and strongly wrinkled all over.—Santa Barbara Isls.: Catalina Isl.; Santa Cruz Isl. It is remarkable for its ample foliage, much whitened beneath, and large leaf scars on the old wood. Var. *GLABER* Jepson. Herbage glabrous or nearly so.—Santa Rosa Isl. (T. Brandegee, type).

10. *C. velutinus* Dougl. TOBACCO BRUSH. Stems several or many from the base, commonly diffusely spreading and forming a low rounded shrub 2 to 5 ft. high, rarely tree-like and up to 12 ft. high; herbage with a strong cinnamon odor; leaves round-ovate or elliptic, obtuse at apex, rounded or subcordate at base, glandular-serrulate, 1 to  $3\frac{1}{2}$  (mostly  $1\frac{1}{2}$  to  $2\frac{1}{2}$ ) in. long, dark green, glabrous and usually glandular-varnished above, often drying chocolate-brown, pale and with a very minute close pubescence beneath, the veins puberulent, strongly 3-nerved, the lateral nerves with marked marginal veins; panicles  $\frac{3}{4}$  to  $3\frac{3}{4}$ , commonly 2 to 3 in. long; flowers white; capsules lobed at top, very sticky-glandular, 2 lines broad, crests small or almost none.—Mountain slopes, often extensively gregarious (especially northward): Sierra Nevada, 5000 to 7000 ft., from Tulare Co. to Modoc Co.; thence w. to Siskiyou and Del Norte Cos.; n. to Wash. and northern Rocky Mts., e. to Nev. Also called Snow Brush, Mountain Balm and Sticky Laurel. Var. *LAEVIGATUS* T. & G. Veins beneath glabrous.—Mt. St. Helena to Humboldt Co. and n. Var. *LORENZENII* Jepson n. var. Leaves smaller, 1 to  $1\frac{1}{4}$  in. long, the two sides less unlike, not varnished above; panicles smaller.—Mt. Shasta (L. N. Lorenzen); near Junction Mdw., Kern Cañon (Jepson 5021, type).

11. *C. sanguineus* Pursh. OREGON TEA-TREE. Tall shrub; branchlets reddish, flexible; leaves broadly ovate, roundish or subcordate at base, 3-ribbed, nearly glabrous, serrate, thin,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  in. long; panicles on old wood from lateral winter buds, compound, 2 to 4 in. long, commonly on short leafless peduncles; flowers white; capsules  $1\frac{1}{2}$  to 2 lines broad, crestless.—Siskiyou Co. (Humboldt Mt.; Moffitt Creek); n. to B. C. and Ida. A rarity with us.

12. *C. parvifolius* Trel. SWEET BIRCH. Fig. 619. Low flat-topped shrub with slender flexible branches, 2 to 4 ft. high; herbage glabrous or nearly so; leaves oblong, entire, obtusish,  $\frac{1}{2}$  to 1 in. long; panicles simple, cylindric,  $\frac{1}{2}$  to 1 (rarely 2) in. long, the peduncles rather shorter, sometimes longer; flowers deep or pale blue; capsules  $2\frac{1}{2}$  lines broad, nearly crestless.—Mountain flats or ridges, 4700 to 6500 ft., Sierra

619. *C. parvifolius* Trel.; fl. branchlet x 1.

620. *Ceanothus integrerrimus*  
H. & A.; a, fl. branchlet  $\times \frac{1}{2}$ ;  
b, capsule  $\times \frac{2}{3}$ .

Nevada from Tulare Co. to Calaveras Co. It may be recognized by its rotately spreading stems, small entire leaves and simple inflorescence.

13. *C. integrerrimus* H. & A. DEER BRUSH. Fig. 620. Widely branched shrub, 4 to 12 ft. high, often of greater breadth; bark yellowish-green; branches slender, often half drooping, ending in pliant green branchlets; leaves ovate or oblong-ovate, entire,  $\frac{3}{4}$  to 2 (or 3) in. long, 3-nerved from the base, glabrous or minutely pubescent, green above, lighter green below; panicles compound, thyrsoid or pyramidal, sometimes simple, 3 to 5 in. long, the leafy or nearly leafless peduncles as long or longer; flowers commonly white, sometimes pale blue or pink; capsules globose, 2 to  $2\frac{1}{2}$  lines broad, somewhat 3-lobed, with oblong glands or evanescent crests on the back of each lobe near the middle. — Mountain slopes and ridges: Sierra Nevada, 3500 to 6000 ft. in the south and 2000 to 5000 ft. in the north; Coast Ranges (Mt. Shasta, Yollo Bolly, Mayacamas, Santa Cruz and Santa Lucia ranges), 1500 to 4000 ft.; San Gabriel, San Bernardino and San Jacinto mountains, 5000 to 7000 ft. The Coast Range

form is often small leaved and commonly blue-flowered. At lower altitudes and in S. Cal. mts. the leaves are often puberulent above (= var. *puberulus* Abrams). Var. *PEDUNCULARIS* Jepson n. var. Panicles long and narrow, on peduncles nearly as long (3 to 4 in.).—Shasta and Trinity Cos. (Shasta Sprs., Jepson, type).

14. *C. spinosus* Nutt. RED-HEART. Straggling shrub 5 to 10 ft. high, or forming a small tree up to 24 ft.; branchlets flexible, often ridged, glabrous or nearly; bark of the branchlets greenish-yellow, spines (not always present) slender, rigid, leafy below the middle; leaves oblong to elliptic, obtuse or emarginate, entire or serrulate, nearly or quite glabrous,  $\frac{1}{2}$  to 1 or  $1\frac{1}{2}$  in. long, drying reddish-brown above, greenish below, obscurely pinnate-veined; panicles simple or compound, long and narrow, sometimes pyramidal or loose, usually interrupted and leafy below,  $1\frac{1}{4}$  to  $4\frac{1}{2}$  in. long; flowers pale blue or white; capsules scarcely lobed, resinous, not crested, 2 to  $2\frac{1}{2}$  lines broad.—Mountains near the south coast: San Luis Obispo; Santa Inez Mts.; Ojai Valley; Santa Monica Mts.; Santa Ana Mts., Orange Co. Var. *PALMERI* Jepson n. comb. Not divaricate nor spinose; glabrous throughout or very nearly; panicle compound, 2 to 6 in. long; flowers white; capsules narrowly ridged or crested.—Palomar Mt.; Cuyamaca Mts. (*C. palmeri* Trel.; not *C. spinosus* var. *palmeri* K. Bdg.)

15. *C. divaricatus* Nutt. Fig. 621. Shrub 5 to 14 ft. high, with white bark; branchlets rigid, divaricate, subspinose, whitish or glaucous; leaves thickish, ovate, rounded at base, subacute at apex, entire or glandular-serrulate,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long, short-petioled, glabrous or almost so above and commonly drying brownish, paler beneath and puberulent, especially along the veins, and often drying dull reddish; panicle simple, often long and narrow, often interrupted below, 1 to 2 in. long on much shorter naked or scarcely leafy peduncles, or at times almost sessile; flowers white or blue; capsules little lobed, not crested or scarcely, but very glandular, 2 to  $2\frac{1}{2}$  lines broad.—Foothills and mts., 900 to 5000 ft.: San Gabriel, San Bernardino, San Jacinto and Cuyamaca mountains; n. through Santa Barbara Co. to the Mt. Hamilton Range, n. through the Sierra Nevada to Mariposa Co.; s. to L. Cal. An important member of the chaparral in its region. Var. *LAETIFLORUS* Jepson n. var. Panicles sometimes compound and very large,

4 to 6 in. long.—Palomar Mt. (Pala Mission, Jepson 8494, type). Var. *EGLANDULOSUS* Torr. Leaves small, entire, glabrous or nearly, glaucous; flowers white, sometimes blue.—San Gabriel Mts., 4000 to 6000 ft. Var. *GROSSE-SERRATUS* Torr. Leaves large, strongly serrate, acute.—San Gabriel Mts.

16. *C. tomentosus* Parry. Shrub 4 to 8 ft. high; branchlets long and very slender, with gray or reddish bark, the young shoots rusty-tomentose; leaves ovate to oblong-elliptic, obtuse, thickish but brittle, mostly 6 to 10 lines long (varying from 3 to 14 lines), obtuse, glandular-serrate, above dark green and minutely pubescent, beneath bright white with a close tomentose covering, or velvety, or sometimes rusty, sometimes merely pubescent; petioles 1 to 2 lines long; panicles lateral or terminal, mostly cylindric,  $\frac{1}{2}$  to  $1\frac{1}{2}$  (or 2) in. long, often interrupted below, borne on peduncles 5 to 10 lines long which often bear 1 or 2 small leaves at base; flowers azure-blue (sometimes nearly white); capsules 3-lobed, 2 lines broad; crests thin.—Foothills, 300 to 2500 ft., Sierra Nevada from Placer Co. to Mariposa Co.; not common. Apparently hybridizes with *C. integririmus*. Var. *OLIVACEUS* Jepson n. var. Leaves olive-green beneath with a fine dense felt-like covering, the margin glandular-denticulate, rarely serrate.—San Bernardino Valley to San Diego Co. (Clevinger Cañon, Ramona, Jepson 8509, type); s. to L. Cal.

17. *C. soledadensis* H. & A. JIM BRUSH. Erect shrub 4 to 7 ft. high with rigid divaricate branchlets; branchlets sparingly villous, at length olive-color or purplish; leaves ovate or elliptic-ovate, green above, paler or whitish and slightly pubescent beneath, glandular-denticulate, 3-nerved, 5 to 10 lines (or to  $1\frac{1}{2}$  in.) long, on petioles a line or two long; panicles simple, terminal or subterminal, 1 or 2 (to 6) on each branchlet, ovate or broadly oblong,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long; flowers blue or almost white; capsules lobed, crested, 2 to  $2\frac{1}{2}$  lines broad.—N. and e. slopes of cañon sides, 500 to 2500 ft., Monterey Co. to Mendocino and w. Solano Cos. It often forms extensive thickets.

18. *C. oliganthus* Nutt. Shrub, often with tree-like trunk, 4 to 9 ft. high; branchlets densely short hispid or villous, sometimes glabrescent, sub-flexible; leaves ovate, obtuse or sub-acute, rounded at base or subcordate, denticulate, the teeth mostly glandular,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long, thinly or scantily pubescent above, drying brown or blackish, beneath pale green or chestnut brown and pubescent or hirsute, especially along the veins; panicles mostly simple, broad, more or less open,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long; flowers deep blue or purplish; capsules roughly resinous, rather strongly crested, slightly depressed, 2 to  $2\frac{1}{2}$  lines broad.—Near the coast from San Luis Obispo Co. to Santa Barbara and the San Gabriel Mts. Var. *ORCUTTII* Trel. Flowers paler blue; fruit strongly rugose and loosely villous.—Mountains of San Diego Co., 500 to 1500 ft. (*C. orcuttii* Parry.)

621. *Ceanothus divaricatus* Nutt.; a, fl. branchlet x 1; b, capsule x  $2\frac{1}{2}$ .

19. *C. cordulatus* Kell. SNOW-BRUSH. Low widely-spreading thorny shrub (1 to 4 ft. high and 3 to 9 ft. across), rigidly and intricately branched, its whitish somewhat crooked branches spreading horizontally or eventually recumbent, rather closely armed with stout spine-tipped leafy or flower-bearing branchlets; leaves elliptic or ovate, obtuse, rarely roundish and subcordate at base, entire, or rarely denticulate, minutely puberulent, or almost glabrous, 3-nerved from the base,  $\frac{1}{4}$  to  $\frac{3}{4}$  (or 1) in. long; flowers white; panicles simple or subsimple, small, but usually dense, broadly oblong or ovate,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long; capsules lobed, nearly 2 lines broad, ridged on the back of each cell.—Open or thinly forested slopes and ridges, 4000 to 7500 ft.: San Jacinto, San Bernardino and San Gabriel mountains; Sierra Nevada; Yollo Bolly Mts.; Mt. Shasta; n. to Ore. Closely related to *C. divaricatus* but growing at much higher altitudes and of different aspect.

20. *C. incanus* T. & G. "WHITE THORN." Shrub 4 to 8 ft. high, with white bark and very glaucous branchlets; branchlets thick, stout and short like bluntish apple tree spurs, or on vigorous shoots slender spinose; leaves ovate to elliptic or roundish, acute or obtuse, entire (rarely serrulate), rounded at base,  $1\frac{1}{4}$  to  $2\frac{1}{2}$  in. long, strongly 3-ribbed from the base, above glabrous and green, often drying dark brown, whitish beneath with a very fine close indument; petioles 2 to 7 lines long; panicles compound,  $\frac{1}{2}$  to  $1\frac{3}{4}$  in. long, their axes finely velvety; flowers white; capsules all over thickly warty or wavy-ridged, shallowly lobed at top,  $2\frac{1}{2}$  lines in diameter.—Along stream banks or swales in the Coast Ranges: Santa Cruz Mts. to w. Lake Co. and sw. Humboldt Co.

21. *C. verrucosus* Nutt. Small shrub; leaves roundish-obcordate or deltoid-obovate, commonly retuse or truncate at apex, 4 to 9 lines long, entire or some of the leaves dentate or denticulate along the sides, green and glabrous above, pale beneath; stipules spreading horizontally, finally large and wart-like, roughening the stems; capsules 2 to 3 lines in diameter, commonly hornless, but variable, sometimes with unequal or with rudimentary horns.—Low hills, w. San Diego Co.

22. *C. macrocarpus* Nutt. Shrub 6 to 12 ft. high; branches very slender; leaves elliptic-obovate, sometimes varying to cuneate,  $\frac{1}{2}$  to 1 (or  $1\frac{1}{4}$ ) in. long, thickish, entire or rarely retuse or notched at apex, glabrous above, finely and closely tomentose beneath between the straightish parallel veins; flowers white; umbels 1 to several on each short branchlet, only 1 to 3 flowers in each umbel setting fruit; capsules not lobed, 3 to 5 lines broad, provided with stout diverging lateral horns.—Mountains from Santa Barbara Co. to Orange Co.; Santa Barbara Isls.

23. *C. gréggii* Gray. Very rigid and intricately branched shrub 2 to 4 ft. high, closely related to *C. cuneatus*; leaves grayish-green, oblong to elliptical, acute at both ends or obtuse at apex, entire or sometimes denticulate, puberulent on both faces, 4 to 6 lines long; flowers white; horns of the capsules small, often unequal or rudi-

622. *Ceanothus cuneatus* Nutt.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, fr.  $\times 3\frac{1}{2}$ .

mentary, spreading from the middle.—Mountain slopes bordering the Mohave Desert and Death Valley region: San Bernardino Mts.; Tehachapi Mts.; s. Sierra Nevada (Tulare Co.); Panamint Range; e. to N. Mex., s. to Mex. Var. *PERPLEXANS* Jepson n. comb. Shrub 2 to 5 ft. high; leaves obovate, very thick, spinulose-dentate, yellowish-green, glabrous above but minutely papillate beneath with minute white-flocculent dots, 3 to 4 lines long; flowers white; capsules with 3 small spreading horns borne on the middle of the lobes or sometimes none.—Summits and desert slopes: s. Sierra Nevada (Tulare Co.); e. San Bernardino Mts., s. along the San Jacinto Range to the Cuyamaca Mts. (*C. perplexans* Trel.)

24. *C. cuneatus* (Hook.) Nutt. BUCK-BRUSH. Fig. 622. Rigid divaricately and densely branched shrub 4 to 14 ft. high, with gray bark; branchlets stout and short, often very unequal and interruptedly disposed; leaves oblong- or cuneate-obovate to broadly obovate, entire, light green above, paler beneath with a microscopic tomentum and often obscurely quilted, 2 to 7 (or 10) lines long, on very short petioles; umbels  $\frac{1}{2}$  to 1 in. broad, borne on short spur-like branchlets; flowers white, with sweetish odor; capsules globose or slightly oblong,  $2\frac{1}{2}$  to 3 lines long, with 3 short erect horns near the top.—Dry mountain slopes, ridges and semi-arid valleys, 300 to 4000 ft.: throughout the Coast Ranges, Sierra Nevada and mts. of S. Cal.; n. to Ore., s. to L. Cal. The most abundant and widely distributed species of the genus in Cal., it is commonly gregarious and forms extensive and impenetrable thickets on the driest or most rocky mountain sides. A constant species in the main parts of its range, it is somewhat variable on the margins of its distribution. The leaves on young crown-sprouts are regularly and coarsely dentate and commonly occur in threes. Cattlemen use for it the general term, chaparral. Var. *RAMULOSUS* Greene. Possible hybrid with *C. rigidus*; branchlets more numerous; leaves somewhat floccose-tomentose beneath; flowers said to be scentless.—Napa Co. to Marin Co.

25. *C. rigidus* Nutt. Shrub 3 to 6 ft. high, rigidly and intricately branched with numerous often unequal branchlets; leaves rather crowded, cuneate-obovate, mostly retuse, of medium thickness but firm, soon nearly glabrous on both surfaces, the apical half finely dentate or quite entire, 2 to 5 lines long, nearly sessile; stipules conspicuously warty; flowers bright blue; capsules not lobed, 3 lines in diameter, provided with prominent horns.—Coast hills from Monterey to Mt. Tamalpais. Very closely allied to *C. cuneatus* and probably no more than a dentate-leaved blue-flowered state of it. Var. *FRESNENSIS* Jepson n. comb. Leaves narrow-obovate, more or less toothed at the truncatish apex, thinly woolly above, below with a minute quilted felt; capsules 2 lines long; horns slender.—Mountain ridges, Fresno Co., 4500 to 5200 ft. (*C. fresnensis* Dudley.)

26. *C. pinetorum* Cov. Low-spreading or erect shrub,  $\frac{1}{2}$  to 1 or up to 4 ft. high; leaves orbicular to elliptic, pungently dentate all around, shining and glabrous above, minutely flocculent beneath,  $\frac{1}{2}$  to 1 in. long; flowers blue, sometimes white, in dense umbellate clusters;

623. *Ceanothus jepsonii* Greene; a, fl. branchlet x  $\frac{1}{2}$ ; b, fl. x 2; c, capsule x 2.

capsules 3 to 4 lines broad with prominent stout horns 1 to  $1\frac{1}{2}$  lines long.—Open pine woods, 7000 to 8800 ft., s. Sierra Nevada in the upper Kern River basin.

27. *C. jepsonii* Greene. MUSK-BUSH. Fig. 623. Rigid erect shrub 4 to 5 ft. high; branchlets short, rigid, with gray bark; leaves elliptic, coriaceous, green and glabrous above, tomentulose-areolate beneath, spiny-toothed, undulate-margined, or somewhat infolded longitudinally, 4 to 10 lines long; warty stipules small; flowers white or blue, exhaling a musky odor; pedicels 2 to 3 lines long; capsule 2 to  $2\frac{1}{2}$  or 3 lines broad, with horns  $1\frac{1}{2}$  to 2 lines long.—Mountain slopes: Lake Co. to Marin Co. Var. *PURPUREUS* Jepson n. comb. Branchlets brownish or reddish; leaves thick, orbicular, 1 in. long or less, coarsely and pungently toothed all around; warty stipules large; flowers large, purple; pedicels 5 to 7 lines long.—Southern Napa Range. (*C. purpureus* Jepson.)

28. *C. prostratus* Benth. MAHALA MAT. Prostrate plants, the branches thickly matting the ground, often rooting and forming dense mats 2 to 10 ft. broad; branchlets often reddish, at first pubescent; leaves green on both surfaces, glabrous or finely flocculent-pubescent beneath, thick and firm, cuneate-obovate, coarsely and pungently 3-toothed at the apex, and often with 1 or 2 similar teeth on each side mostly above the middle, 4 to 9 lines long (or even to  $1\frac{1}{4}$  in. long); flowers blue; fruit globose, not lobed, 3 to 4 lines broad, with 3 large wrinkled horns and 3 intermediate crests.—Pine woods, 3000 to 7000 ft.: Sierra Nevada from Mariposa Co. to Mt. Shasta; Cobb Mt. to Yollo Bolly Mts.; Siskiyou Mts.; n. to Wash. Also called Squaw Mat. Var. *LAXUS* Jepson n. var. Not so prostrate or so dense; branches ascending; leaves obovate, dentate, 9 to 10 lines long.—Hot Springs Valley near Lassen Peak (Jepson 4099, type). Var. *DIVERGENS* K. Bdg. Low scrambling shrub, the branches horizontally spreading or trailing; leaves strongly dentate-spinose; horns of capsule more lateral.—Mountain slopes: Mt. Konocti; Mt. St. Helena; Hood's Peak Range; Mt. Tamalpais; Santa Cruz Mts. Var. *GRANDIFOLIUS* Jepson n. comb. Leaves  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long.—Coastal: Pt. Reyes peninsula to Sonoma Co. (*C. rigidus* var. *grandifolius* Torr.)

624. *Adolphia californica* Wats.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, fr. branchlet  $\times \frac{1}{2}$ ; c, fl.  $\times 9$ ; d, fr.  $\times 2$ .

29. *C. crassifolius* Torr. Much-branched shrub 3 to 11 ft. high; leaves thick and coriaceous, elliptic,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long, shortly petioled, dentate with the margin strongly infolded between the small teeth, or the teeth quite concealed by the strongly revolute edge, rarely entire, the upper surface light green, minutely roughened, the lower surface densely white-tomentose, more or less concealing the straight lateral veins; flowers white; capsules not lobed, 3 lines broad, provided with stout or minute horn-like crests.—Hills and mts. of cismontane S. Cal., 1000 to 3000 ft., from Santa Barbara Co. to San Diego Co.; s. to L. Cal.; common. Var. *PLANUS* Abrams. Leaves glabrescent or comparatively so, entire, plane.—Mts. of Santa Barbara and Ventura Cos.; Santa Cruz Isl.

4. **ADÓLPHIA** Meisn.

Rigid oppositely branched shrubs with numerous thorny branchlets obscurely jointed at base. Leaves opposite, petioled, stipulate, falling early. Flowers few in axillary clusters or only one. Petals strongly hooded. Ovary 3-celled, free from the calyx; style often jointed at or near the ovary, the portion above the joint deciduous; stigma 3-lobed. Capsule 3-celled, 3-lobed, the lower one-third surrounded by but mostly free from the persistent cup-like calyx. (Adolphe T. Brongniart, 1801-1876, French botanist who monographed the family Rhamnaceae.)

1. **A. californica** Wats. Fig. 624. Two to 3 ft. high; branchlets short, thorn-like, divaricately spreading; younger parts finely pubescent; leaves oblong or obovate, entire or nearly so, 1 to 3 lines long, shortly petioled; flowers 1 to 4 in a cluster, the pedicels 1 line long or in fruit 3 to 4 lines long; calyx greenish white; petals minute, white; disk dull green; capsule 2 to 3 lines broad; seeds smooth, 2 lines long.—San Diego Co.: Penasquitas; Sweetwater Dam; Chollas Valley; s. to L. Cal. Apr.

**VITACEAE. VINE FAMILY**

Woody plants, mostly climbing by tendrils. Leaves in ours simple, alternate. Flowers small, regular, greenish or whitish, in a compound thyrse. Calyx minute, the limb mostly obsolete and truncate. Petals 5 (4 or 6), valvate, caducous or early deciduous, the stamens as many and opposite them. Fruit a 2-celled berry. Seeds with a thick and bony testa. Embryo minute, in a tough endosperm.

1. **VITIS** L. GRAPE

Leaves opposite the tendrils or flower clusters. Tendrils at least once branched. Calyx-tube filled with the disk, which bears the stamens and petals. Ovules 2 in each cell. (Classical Latin name.)

Young shoots and young leaves thinly arachnoid-tomentose or pubescent but mostly green; berries purple, very glaucous.....1. *V. californica*.

Young shoots and young leaves densely white-tomentose; berries black, only slightly glaucous.....2. *V. girdiana*.

1. **V. californica** Benth. CALIFORNIA WILD GRAPE. Fig. 625. Stems 5 to 60 ft. long; leaves roundish, pubescent or thinly arachnoid-tomentose, especially beneath, the tomentum in age flocculent, 2 to 5½ in. broad, coarsely or minutely dentate, cordate at base with open or closed sinus, slightly or not at all lobed, or sometimes a 3 to 5-lobed leaf with narrow sinuses at the next node above or below an unlobed one; petals and stamens 5; fruit purple, with a bloom, 3 to 5 lines in diameter.—Along streams throughout the Coast Ranges, Great Valley and Sierra Nevada foothills. Climbing trees, especially oaks and cottonwoods, and frequently killing such by covering them with its drapery of leaves. Very fragrant at flowering time (May-June) with a pleasant sweet odor.

2. **V. girdiana** Munson. DESERT GRAPE. Stems 5 to 20 ft. long; leaves round-cordate, 2 to 5 in. wide, irregularly dentate, or more commonly promi-

625. *Vitis californica* Benth.; a, portion of fr. stem x ½; b, fl. with calyx breaking away x 4; c, fl. with calyx fallen x 4.

nently lobed, the lobes typically contracted at base; upper side of leaves glabrate and green, under side arachnoid-pubescent; petals and stamens 6; berries black, slightly glaucous, 2 to 3 lines in diameter.—Coastal S. Cal., e. to the deserts, thence n. to Inyo Co.

### MALVACEAE. MALLOW FAMILY

Herbs or soft-woody shrubs with mucilaginous juice, tough fibrous inner bark, and usually stellate pubescence. Leaves alternate, simple, palmately veined and commonly lobed, stipulate. Flowers commonly perfect, sometimes polygamous or dioecious, regular. Calyx with 5 lobes, valvate in the bud, often with an involucl of bractlets at base. Petals 5, twisted in the bud. Stamens indefinite, hypogynous, monadelphous in a column or tube around the pistils, the petals inserted on the base of the tube. Pistil 1, composed of several to many carpels, the superior ovary commonly with as many cells as styles or stigmas. Fruit a loculicidal capsule, or the carpels separating at maturity. Anthers scattered along the outside of the tube of filaments; carpels or cells of the ovary 5 to 8.

- Involucl consisting of 3 to many distinct slender bractlets; stigmas capitate; fruit a loculicidal capsule.....1. *HIBISCUS*.
- Involucl broadly 2 to 3-lobed; styles stigmatic lengthwise; fruit a depressed whorl of smooth carpels.....2. *LAVATERA*.
- Anthers borne in a cluster at the top of the tube of filaments; carpels several, crowded and united around a central axis, separating at maturity.
- Styles stigmatic lengthwise on the inside; herbs.
- Bractlets 3, distinct, inserted on the calyx.....3. *MALVA*.
- Bractlets none or one and inserted on base of calyx.....4. *SIDALCEA*.
- Styles with a terminal or capitate stigma.
- Bractlets slender or even filiform.
- Flowers cream-color; low decumbent herb.....5. *SIDA*.
- Flowers roseate, rose-purple, yellow or white; shrubs or herbs.
- Carpels with 2 ovules, the ovules separated by transverse partitions; herbs.....6. *MODIOLA*.
- Carpels with 1 to 3 ovules, without transverse septa; shrubs or herbs...7. *SPHAERALCEA*.
- Bractlets none; flowers salmon-color; woody plant.....8. *HORSFORDIA*.

#### 1. *HIBISCUS* L. ROSE-MALLOW

Stout herbs. Flowers showy, in ours solitary. Involucl consisting of several to many slender bractlets. Stamen column with anthers scattered along the upper part but naked at the truncate 5-toothed summit. Ovary 5-celled with 2 to many ovules in each cell. Capsule loculicidal. (Greek name for the Marsh Mallow, used by Dioscorides.)

- Leaves cordate; peduncles subterminal, 2 to 3 in. long, jointed near the middle, united with the petiole at base; calyx cleft to the middle; seeds globose, glabrous, minutely papillate.....1. *H. californicus*.
- Leaves ovate; peduncles mostly axillary, 1 to 9 lines long; calyx cleft nearly to the base; seeds reniform, densely silky.....2. *H. denudatus*.

1. *H. californicus* Kell. Stems pubescent, cane-like, 3 to 7 ft. high; leaves cordate, dentate, acuminate,  $2\frac{1}{2}$  to 4 in. long; petioles  $1\frac{1}{2}$  to  $2\frac{1}{4}$  in. long; calyx campanulate, cleft to the middle, conspicuously nerved at maturity and filled by the capsule; corolla white or roseate, with deep crimson center,  $2\frac{1}{2}$  to 4 in. long; capsule 1 to  $1\frac{1}{8}$  in. long.—Swamps and deltas, lower Sacramento and San Joaquin rivers.

2. *H. denudatus* Benth. PALE FACE. Stems slender, woody at base, somewhat flexuose above, 1 to 2 ft. high; herbage densely and closely tomentose; leaves ovate, serrulate,  $\frac{1}{2}$  to 1 in. long, short-petioled; flowers short-peduncled in the axils and along the somewhat naked flexuose summit of the branches; calyx 5-parted, canescent-tomentose; bractlets 3 to 7, setaceous, commonly less than half as long as the calyx or almost obsolete; petals white or pale lavender, often deep purple at center,  $\frac{1}{2}$  to 1 in. long; capsule acute, dehiscent to the base, shorter than the calyx.—Mesas and cañons, Colorado Desert; e. to Tex., s. to Mex.

#### 2. *LAVATERA* L.

Ours shrubs with ample maple-like leaves and small caducous stipules. Flowers showy, axillary, subtended by a 2 to 3-lobed involucl. Pedicels jointed above the middle. Petals reflexed after anthesis, truncate or retuse,

long-clawed. Styles 5 to 8. Fruit a depressed whorl of smooth carpels. (Two brothers Lavater, Swiss physicians and naturalists.)

1. *L. assurgentiflora* Kell. Shrub 4 to 10 ft. high; leaves palmately 5-lobed and dentately toothed; calyx-lobes triangular, acute, shorter than the tube; corolla  $1\frac{1}{2}$  to  $2\frac{1}{4}$  in. broad, the petals rose-color with darker veins; claws bearded at base.—Santa Barbara Isls.; cult. on the mainland as a wind-break for gardens.

### 3. MÁLVA L. MALLOW

Ours annuals or biennials. Involucre of 3 distinct bractlets, inserted on the base of the calyx. Calyx cleft to the middle into 5 broad lobes. Petals whitish or rose-color, obcordate or emarginate. Style-branches 7 to 10, subulate. Fruit circular and flattish, splitting up when ripe into about 6 to 12 carpels or nutlets. Nutlets round-reniform, 1-seeded. (Greek malache, soft, on account of the emollient properties.)

Petals much surpassing the calyx.

Carpels not reticulate, puberulent on back.....1. *M. rotundifolia*.

Carpels glabrate at maturity, rugose-reticulate on back, the margin entire or obscurely denticulate; calyx-lobes mostly closed over the mature fruit...2. *M. borealis*.  
Petals slightly longer than the calyx; carpels rugose-reticulate on back, the margin winged and denticulate; calyx-lobes spreading or erect.....3. *M. parviflora*.

1. *M. rotundifolia* L. DWARF MALLOW. Sparsely hispidulous or hirsute; stems slender, procumbent, 1 to 2 ft. long, from a large deep root; leaves rounded, crenate, slightly or scarcely at all 5 to 7-lobed; corolla surpassing the calyx, pale blue; carpels 14 or 15, puberulent, not reticulated on the back or at least not obviously so.—Nat. from Eur.; waysides and old gardens.

2. *M. borealis* Wallm. BULL MALLOW. Fig. 626. Erect; leaves like no. 1; pedicels tending to be reflexed in fruit; bractlets ovate or lanceolate; corolla pinkish, 5 to 6 lines long, surpassing the calyx; carpels 7 to 9, dorsally rugose-reticulate or even somewhat favose, the margin entire or more or less denticulate. — Nat. from Eur.; weed about towns and cities.

*M. sylvestris* L. High Mallow. Corolla mauve or reddish-purple, 1 to  $1\frac{1}{2}$  in. broad.—Garden plant from Eur., an occasional escape: Guerneville; Redlands.

3. *M. parviflora* L. CHEESE-WEED. Widely branching, 1 to 3 ft. high; petioles and ascending branches more or less stellate-hairy on the upper side, glabrous below; leaves roundish in outline, with a red spot at base of blade, shallowly 7-lobed, 5 in. broad or less, on petioles more than twice as long as the blade; flowers in rather close axillary clusters; bractlets linear; corolla pinkish with notched petals,  $2\frac{1}{2}$  lines long, slightly longer than the calyx; calyx commonly spreading under or about the mature fruit; carpels about 11, sharply rugose-reticulate and pubescent on the back, the margin winged and denticulate.—Nat. from Eur.; waste places, especially near dwellings.

*M. pusilla* Sm. Similar to no. 3; calyx-lobes usually closed over the fruit; pedicels usually somewhat longer, tending to be reflexed in fruit; margins of carpels obscurely if at all denticulate, not at all winged.—Adventive from Eur.: Alton, Humboldt Co.; San Pedro.

626. *Malva borealis* Wallm.; a, fl. branchlet x  $\frac{1}{4}$ ; b, fl. x 1; c, fr. x 1.

4. **SIDÁLCEA** Gray

Herbs. Leaves rounded, either crenate, crenately incised, parted or divided, or palmately lobed. Flowers in terminal spikes or racemes, either perfect, gynodioecious (that is, with perfect and pistillate flowers on separate plants, the pistillate flowers being smaller and with sterile stamens) or dioecious. Corolla purple, rose-pink or white. Bractlets none, rarely 1. Petals emarginate or truncate. Stamen-tube with double series of terminal free filaments, the filaments of the outer series often distinctly below the filaments of the inner series; filaments more or less united into sets. Fruit consisting of 5 to 9 carpels, commonly beaked. (Sida, a genus of this family, and Alkea, ancient name for a mallow, alluding to the appearance and relationship of these plants.)

*A. Leaves round in outline, at least some (usually the upper) pedately parted or divided; flowers usually rose-pink or purple.*—Subgenus **EUSIDALCEA**.

Annuals (except no. 5) with short roots; spring flowering; staminal column conspicuously divided into outer and inner series.

Carpels rugose-reticulate or somewhat foveate on the back; annuals.

Bracts conspicuous, foliaceous, palmately divided into filiform segments; plants hairy.....1. *S. diploscypha*.

Bracts inconspicuous, narrowly linear and entire.

Herbage nearly glabrous to sparsely stellate-puberulent; carpels reniform, incurved at maturity; flowers sparse in short racemes; slender plants.....2. *S. hartwegii*.

Herbage more or less densely hirsute; carpels orbicular, not incurved at maturity; spike densely flowered; stout plants.....3. *S. hirsuta*.

Carpels longitudinally grooved or striately nerved on the back.

Annual; stipules and bracts broadly to narrowly ovate, acuminate, 1 to 3 lines long.....4. *S. calycosa*.

Perennial; stipules and bracts broadly ovate, mostly obtuse, papery and purple-tinged, 4 to 8 lines long.....5. *S. rhizomata*.

Strong-rooted perennials, mostly summer flowering; lobes of the outer stamen-tube closely approximating those of the inner.

Stems usually hirsute; leaves, inflorescence and calyx hirsute to stellate-pubescent; carpels usually reticulate, incurved at maturity and beaked.

Flowers in spikes.

Plants as a whole very hirsute, even on the calyx.

Spikes broad, very dense; plants coarse; coastal species.....6. *S. eximia*.

Spikes narrow, often lax, sometimes interrupted; plants slender; mostly montane.....7. *S. spicata*.

Plants sparsely hirsute at base; inflorescence and calyx closely stellate-pubescent.....8. *S. oregana*.

Flowers in racemes; plants hirsute to stellate-pubescent; mostly coastal.....9. *S. malvaeflora*.

Stems not hirsute, usually glabrous and often glaucous, sometimes stellate-puberulent; leaves lightly stellate-puberulent or almost glabrous; carpels lightly reticulate to almost smooth.

Plants slender; racemes few-flowered; Sierra Nevada.....10. *S. glaucescens*.

Plants stout; racemes many-flowered; S. Cal.....11. *S. parviflora*.

*B. Leaves roundish in outline, none parted or divided; carpels smooth (or nearly so); perennials.*—Subgenus **HESPERALCEA**.

Flowers white, in oblong spikes; plants stout; leaves like those of a grape.....12. *S. malachroides*.

Flowers rose-purple, in elongate spicate racemes; plants more slender; leaves crenate, orbicular.....13. *S. hickmanii*.

1. *S. diploscypha* (T. & G.) Gray. Stem erect and simple, or more robust and freely branching, 1½ to 2 ft. high; herbage pilose-hispid and also with a minute stellate pubescence; basal leaves more or less deeply crenate, the cauline parted and 2 or 3-cleft, the bracteal filiform-divided; flowers on short pedicels in umbellate clusters at the ends of the branches; calyx-lobes lanceolate-subulate; petals dark pink, with or without a dark purple center, minutely erose-denticulate, ¾ to 1¼ in. long; filaments of the outer series united nearly to the summit into sets of 5 to 10; carpels nearly orbicular, dorsally reticulated; receptacle at separation of the achenes marked by as many obtuse longitudinal processes as there are carpels.—Open foothills or valleys, 20 to 2500 ft.: Coast Ranges from Humboldt Co. to Santa Clara Co.; Sacramento Valley; Sierra Nevada foothills from Calaveras Co. to Tulare Co.

2. *S. hartwegii* Gray. Stem slender, sparingly branched, 7 to 12 in. high; herbage sparsely stellate-pubescent or almost glabrous below, but scarcely or not at all hispid; leaves pedately 5 to 7-divided into linear entire divisions

or the lower with broader trifid divisions; flowers few in a short spike; filaments of the outer series closely approximating the inner, more or less united in pairs or sets as in the perennial species; corolla rose-purple, 6 to 8 lines long; carpels strongly incurved, favosely rugose-reticulate.—Dry hillsides: Napa Co. to Lake Co.; Sacramento Valley; Sierra Nevada foothills from Butte Co. to Calaveras Co. May.

3. *S. hirsuta* Gray. Stem erect, stout, 1 to 2 ft. high, its branches ending in dense spikes; herbage more or less hirsute-pubescent; cauline leaves palmately or pedately divided into 7 to 9 narrowly linear and entire acute divisions; bracts mostly small and inconspicuous; calyx densely cinereous-pubescent and hirsute, the tube somewhat chartaceous, the lobes triangular-lanceolate; corolla deep rose-color,  $\frac{1}{2}$  to 1 in. long; petals erect, induplicate; carpels more or less hirsute, orbicular, not incurved at maturity, reticulated on the back and tipped at the central apex with a bristly beak.—Low wet but soon desiccated spots: Sierra foothills from Tuolumne Co. to Butte Co.; Sacramento Valley; w. to Mendocino Co.

4. *S. calycosa* Jones. Stem slender, sparingly branched, 1 to 3 ft. high; herbage glabrous or sparsely pubescent with scattered hairs; leaves roundish, crenate or crenately incised,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. wide, long-petioled, the upper divided into 6 or 7 linear divisions, stipules usually purple, the lower ones linear-acuminate, the upper becoming ovate, serrate and scarious; bracts stipular, parted into 2 ovate lobes, commonly glabrous; raceme spike-like, loose, few-flowered; calyx large, loose, often purple-tinged or scarious, thinly hirsute with long simple hairs, the lobes ovate, acuminate; corolla light purple, 8 to 12 lines long; carpels striate-ridged on the back, commonly reticulate on the sides, strongly incurved.—Valleys: Napa, Sonoma and Marin Cos.; Sierra Nevada foothills from Butte Co. to Mariposa Co. (*S. sulcata* Curran.)

5. *S. rhizomata* Jepson n. sp. Stems succulent, green or purplish, erect or ascending,  $1\frac{1}{2}$  ft. high, the decumbent or prostrate base rhizomatously rooting; herbage mostly glabrous below or sparingly hirsute above; basal leaves 1 to 4 in. broad, crenately but shallowly incised, long-petioled; cauline leaves divided into 8 or 11 broadly cuneate divisions; stipules 4 to 8 lines long, broadly ovate, acuminate, or obtuse and toothed, green or purple; bracts scarious to membranous, hairy, deeply 2-lobed (the lobes ovate, acuminate), 4 to 6 lines long; flowers in short spikes; spikes short, dense,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long; calyx densely hairy, the hairs straw-color, long, simple; calyx-lobes ovate, acuminate, scarious and purple-tipped, 3 to 6 lines long; corolla light purple,  $\frac{3}{4}$  to 1 in. long; carpels purple-tinged, strongly striate-grooved on the back and lightly reticulate on the sides, strongly incurved; beaks very slender, soon deciduous.—Marshes, Pt. Reyes peninsula (Russell Ranch, Jepson 1174, type).

6. *S. eximia* Greene. Stems stout, erect or decumbent at base, paniculately branched above, 2 to 3 ft. high; herbage, especially the stems, markedly hirsute; lower leaves palmately cleft or divided (the divisions 3-lobed), 3 to 5 in. wide, on petioles 7 to 19 in. long; upper leaves divided into 5 to 9 linear or oblong segments  $2\frac{1}{2}$  to 3 in. long, shortly petioled (the petioles 1 to  $3\frac{1}{2}$  in. long); spikes very dense,  $\frac{3}{4}$  to  $2\frac{3}{4}$  in. long; bracts linear, entire or deeply notched, purple-tinged, hairy, 2 to 4 lines long; calyx conspicuously hairy on short hairy pedicels, the lobes triangular-acuminate, 3 to 6 lines long; calyx in fruit papery, 5 to 6 lines long; carpels smooth, 1 to 2 lines long, slenderly beaked; seeds blackish.—Meadows, Humboldt Co., 30 to 3500 ft.

7. *S. spicata* Greene. Stems slender, often paniculately branched above 1 to 4 ft. high; pubescence hirsute on the stem, petioles, and particularly on the calyx; leaves roundish in outline, crenately lobed or incised or parted, 1 to  $1\frac{1}{2}$  in. broad, almost glabrous to densely stellate-pubescent; upper leaves pedately parted; spikes commonly dense, 1 to 4 in. long; flowers 4 to 7 lines long; calyx usually densely hirsute (sometimes not), the lobes ovate, acute or acuminate, 2 to 4 lines long; petals narrow, notched at apex, 4 to 8

lines long; carpels small, 1 line long, more or less tomentose, not reticulate, slightly beaked, the beak hairy.—Meadows and along rivulets, montane, 4000 to 9000 ft.; Sierra Nevada from Tulare Co. to Nevada Co.; Trinity Co. Var. *REPTANS* Jepson n. comb. Stems at base creeping and rooting; spikes loose.—Sierra Nevada from Amador Co. to Tulare Co., 4000 to 6500 ft. (*S. reptans* Greene.) Var. *PEDATA* Jepson n. comb. Leaves once or twice pedately divided into linear segments  $\frac{1}{4}$  to  $\frac{1}{2}$  line wide; spikes often loose.—San Bernardino Mts. (*S. pedata* Gray.)

8. *S. oregana* Gray. Stems few from a woody root-crown, nearly naked above and paniculately branched, 1 to 5 ft. high; plant more or less thinly hirsute below, the leaves and inflorescence finely stellate-pubescent; lower leaves round in outline, shallowly toothed or cleft (rarely deeply parted), 3 to 4 in. broad; cauline leaves incisely parted with the lobes toothed or cleft, or the uppermost pedately divided into 5 to 7 lanceolate, linear or 3-

lobed divisions; spikes many, dense, typically oblong, 1 to 2 in. long (much elongated in fruit), long-peduncled; bracts narrowly linear or subulate; calyx 1 to 3 lines long, its lobes ovate, acute, about as long as the tube; corolla rose-pink, 5 to 6 lines long; carpels semi-orbicular, slightly beaked, glabrous and smooth or sometimes slightly wrinkled on the sides near the dorsal angle, 1 line long.—Mountain meadows, 2500 to 4500 ft.; Coast Ranges from Napa Co. to Siskiyou Co., thence s. in the Sierra Nevada to Nevada Co.; n. to Ore.

627. *Sidalcea malvaeflora* Gray; a, base of plant  $\times \frac{1}{2}$ ; b, male fls.  $\times \frac{1}{2}$ ; c, female fls.  $\times \frac{1}{2}$ ; d, achene  $\times 3$ .

9. *S. malvaeflora* Gray. CHECKER BLOOM. Fig. 627. Stems several from a woody root-crown, simple or branched, erect or half decumbent at base,  $1\frac{1}{4}$  to 2 ft. high, retrosely hispid below with scattered hairs, usually stellate-pubescent above; basal leaves crenate or crenately incised or cleft into cuneate-obovate 2 to 4-toothed lobes, 1 to 2 in. wide; upper leaves palmately twice cleft into linear or narrowly oblong divisions; raceme rather loose, 3 to 12 in. long; bracts ovate, herbaceous, often notched at apex

or decidedly bifid; flowers of two sorts: one perfect with large corollas, the other pistillate with small corollas; corolla of perfect flowers  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long, the outer series of filaments united for about half their length into sets of 4 and 2, the inner filaments mostly distinct; corolla of pistillate flowers 4 to 7 lines long, the filaments destitute of good anthers; carpels subglabrous, more or less rugulose-reticulate and beaked, the beaks often hairy at tip.—Open hills, 50 to 1500 ft., near the coast from Mendocino Co. to San Luis Obispo Co. and s. to coastal S. Cal. Var. *CALIFORNICA* Jepson n. comb. Herbage mostly stellate-pubescent; calyx-lobes 3 to 5-nerved; carpels hispidulose.—Santa Inez Mts. (*S. californica* Gray.) Var. *ASPRELLA* Jepson n. comb. Stems lightly scurfy-pubescent; leaves and inflorescence stellate-puberulent; leaves divided into 3 to 5 usually equal mostly entire divisions.—Sierra Nevada foothills, 1500 to 2500 ft. and sometimes to 5000 ft., from Mariposa Co. to Shasta Co., thence w. to Humboldt Co. (*S. asprella* Greene.)

10. *S. glaucescens* Greene. Stems slender, 1 to 2 ft. high; herbage minutely stellate-puberulent or glabrous, glaucous; leaves palmately cleft or divided,  $\frac{3}{4}$  to 2 in. wide, the divisions entire or few-toothed; pedicels and calyx somewhat stellate-puberulent; bracts bifid; corolla 5 to 7 lines long; carpels large, inflated, lightly reticulate and dorsally grooved; beaks small, erect or entirely absent.—Montane, 4000 to 7000 ft.: Shasta Co. to Kern Co.

11. *S. parviflora* Greene. Stems stout,  $1\frac{1}{2}$  to 4 ft. high; herbage nearly glabrous throughout, or (especially the leaves) sparsely hirsute or somewhat stellate-pubescent; leaves palmately toothed, cleft, parted or divided, 1 to 2 in. wide; racemes long, slender; bracts slender, bifid; calyx slightly hirsute or sparsely stellate-pubescent, its segments acute, 3 to 5-nerved, 3 lines long; petals rose-color, arose at summit, 3 to 6 lines long; carpels glabrous, lightly reticulated when mature; beaks small, recurved.—Brackish marshes: San Bernardino Valley and Santa Monica to the Ojai and Antelope valleys; San Luis Obispo Co.; Mohave Desert.

12. *S. malachroides* Gray. Stems stout, 2 to 4 ft. high, equably leafy to the summit, several from the base, simple below, ending above in a panicle of spikes; herbage stellate-hispidulous; leaves vitiform, palmately but shallowly lobed, unequally dentate, 1 to 6 (mostly 2 to 3) in. broad; spikes oblong, very dense,  $\frac{1}{2}$  to  $2\frac{1}{2}$  in. long; bracts linear or subulate; calyx-lobes ovate, acuminate; petals white, broad, broadly notched, abruptly clawed; staminate flowers with the filaments of the outer series united for about  $\frac{1}{2}$  their length or less into pairs, or two such pairs slightly united by their bases making a set of 4; carpels sometimes present; pistillate flowers 3 to  $3\frac{1}{2}$  lines long, the tube of filaments short, more or less truncate and without anthers; carpels 7 to 9, half dehiscent by a ventral suture.—Seaboard species, Santa Lucia Mts. to Del Norte Co.

13. *S. hickmanii* Greene. Stems several, erect, 2 to 3 ft. high, leafy throughout; herbage stellate-pubescent, sometimes densely so and almost tomentose, and even somewhat hirsute, especially on calyx; leaves roundish, serrate or shallowly incised,  $1\frac{1}{4}$  to 2 in. wide, the lowest smaller than the middle ones; petioles usually longer than the blade; racemes many, 3 to 7 in. long, the pedicels 1 line long; bracts narrowly linear, villous; calyx-lobes ovate, acuminate, thin, sandy-pubescent, 3 to 6 lines long; corolla rose-purple, 7 to 8 lines long; carpels mostly smooth.—Monterey and San Benito Cos. Var. *PARISHII* Rob. Stems 1 to  $1\frac{1}{2}$  ft. high; leaves  $\frac{1}{2}$  to 1 in. wide; corolla 4 lines long.—San Bernardino Mts., 6000 ft. (*Malvastrum confertum* Parish.)

##### 5. *SIDA* L.

Ours low whitish scurfy-tomentose perennial herbs. Pedicels articulated. Involucel of 1 to 3 slender deciduous bractlets. Flowers cream-color. Carpels 1-seeded, indehiscent or splitting into 2 valves. Seeds pendulous. (Greek name used by Theophrastus for a species of Water-lily.)

1. *S. hederacea* (Dougl.) Torr. ALKALI MALLOW. Fig. 628. Stems decumbent, more or less branching,  $\frac{1}{2}$  to 1 ft. long; leaves round-reniform or ovate, dentate or serrate,  $\frac{3}{4}$

628. *Sida hederacea* Torr.; a, fl. branch x  $\frac{1}{2}$ ; b, long. sect. of fl. x 1; c, calyx and fruit x 1; d, carpel x 2.

to 2 in. broad, on petioles  $\frac{1}{2}$  to 1 in. long; flowers pediceled, axillary, solitary or in small clusters; petals  $\frac{1}{2}$  in. long; carpels 6 to 10, triangular, attached by a straight edge to the slender axis.—Subsaline soils in valleys, almost throughout Cal.; n. to Wash., e. to Tex. It is often a troublesome weed in orchards and is sometimes called White-weed on account of its whitish herbage. May-Sept.

## 6. *MODIOLA* Moench

Low herb. Leaves rounded, coarsely crenate, palmately lobed or incised. Flowers small, solitary on axillary peduncles, subtended by 2 or 3 narrow bractlets. Corolla dull red. Fruit a somewhat depressed circle of 15 to 30 carpels with 2 seeds in each. Carpels reniform, septate between the seeds, tardily 2-valved from the top, at length deciduous from the axis. (Latin *modiolus*, relating to the wheel-like fruit.)

1. *M. caroliniana* Don. Perennial; stems spreading, 6 to 18 in. long; leaves 1 to  $1\frac{1}{2}$  in. broad; petals 2 to 3 lines long; carpels hirsutulose.—Introd. from se. U. S.: Ferndale, Humboldt Co.; Auburn; Los Banos; Swift ranch, Madera Co.; Riverside.

## 7. *SPHAERÁLCEA* St. Hil.

Herbs or shrubs, ours mostly hoary-tomentose or canescent, with commonly roundish or angular leaves. Flowers commonly in racemes, the racemes often subpaniculate, sometimes corymbose, or often reduced to axillary fascicles. Bractlets present (in ours), slender or filiform. Carpels 5 or more, each 1 to 3-seeded, the fruit often dehiscent and 2-valved. Seeds (at least the lower) ascending. (Greek *sphaera*, a sphere, and *alkea*, mallow, the carpels commonly spherical.) *MALVASTRUM* Gray.

### A. *Carpels one-ovuled, one-seeded*.—Subgenus *MALVASTRUM*.

Annuals; leaves orbicular.

Petals rose-purple with crimson blotch at base; leaves crenate. . . . . 1. *S. rotundifolia*.

Petals white or violet-purple, without blotch; leaves 5 to 7-lobed.

Flowers  $2\frac{1}{2}$  to 4 lines long; herbage stellate-pubescent. . . . . 2. *S. exilis*.

Flowers 6 to 12 lines long; herbage hirsute. . . . . 3. *S. parryi*.

Perennials.

Calyx hirsute or villous; flowers in heads.

Heads terminal and usually solitary. . . . . 4. *S. palmeri*.

Heads numerous, sessile along the naked summit of branches. . . . . 5. *S. densiflora*.

Calyx densely stellate-pubescent, not hirsute; flowers in subpaniculate racemes.

Herbage covered with a dense white tomentum.

Flower-buds heavily invested in a dense wool, the calyx-lobes concealed in bud; corolla rose-pink; leaves pentagonal or roundish, cordate at base, the lobes roundish. . . . . 6. *S. fremontii*.

Flower-buds tomentulose, the calyx lobes not concealed.

Corolla rose-color, aging yellow; flower-buds contracted at apex into a slender beak; leaves round-cordate. . . . . 7. *S. davidsonii*.

Corolla rose-color; flower-buds shortly acute, not beaked; leaves ovate, rugose. . . . . 8. *S. arcuata*.

Herbage finely stellate-canescens.

Flowers in rather close clusters, the clusters loosely disposed in a virgate raceme; corolla rose-pink; mainland. . . . . 9. *S. fasciculata*.

Flowers in a close panicle; corolla rose-purple; insular. . . . . 10. *S. nesiotica*.

### B. *Carpels 2 or 3-ovuled, 1 to 3-seeded; ours perennial*.—Subgenus *EUSPHAERALCEA*.

Fruit depressed-globose; mature carpels usually one-seeded.

Upper sterile portions of carpel minute and inconspicuous; flowers small but numerous, racemes from upper axils, corolla vermillion; plants large, robust; leaf-lobes very rounded. . . . . 11. *S. orcuttii*.

Upper sterile portion of carpel thin, smooth and moderately incurved; inflorescence racemose, showy; calyx large, with long acuminate lobes; deserts.

Leaves crenate or shallowly lobed.

Leaves apricot-color.

Carpels reticulate-scarious on the sides opposite lower seed, canescent on back; stems glabrate to tomentose; common. . . . . 12. *S. ambigua*.

Carpels entirely smooth on sides, densely woolly on back; stems covered with a close white felt; local. . . . . 13. *S. pulchella*.

Flowers pink, drying violet-purple; local. . . . . 14. *S. purpurea*.

Leaves palmately parted or divided, with cleft or toothed lobes; rare. . . . . 15. *S. eremicola*.

Fruit little or not at all depressed; mature carpels 1 to 3-seeded; perennials.

Carpels canescent or glabrous on the back; leaves not maple-like, mostly rather small.

Leaves thick or thickish, rugose, somewhat oblong to linear; flowers few in the leaf axils, lavender; Colorado Desert.....16. *S. angustifolia*.

Leaves usually thin; flowers numerous in an elongated thyrsoid panicle.....17. *S. fendleri*.

Carpels covered on the back with long bristles, thus forming a somewhat bur-like fruit; flowers large, rose-color, sparse.

Calyx-lobes ovate, acuminate; leaves deeply 5-lobed, truncate or subcordate at base,  $2\frac{1}{2}$  to 6 in. long.....18. *S. acerifolia*.

Calyx-lobes round-ovate, abruptly acute; leaves typically cuneate-obovate,  $\frac{3}{4}$  to 1 in. long.....19. *S. bakeri*.

1. *S. rotundifolia* Jepson n. comb. Stem erect, branching, 4 to 16 (or 24) in. high; herbage hirsute; leaves few, orbicular-cordate, crenate,  $\frac{1}{2}$  to 2 in. wide, the petioles 1 to 3 in. long; bractlets filiform; flowers in terminal corymbs or corymbose racemes; petals rose-pink with a large red-purple spot below middle of petal, 9 to 13 lines long; carpels 35 to 45, very flat, narrow on the back, black, rugose-reticulate.—Washes and sandy mesas: Mohave Desert. n. to Inyo Co.; e. to Ariz. and Colo. (*Malvastrum rotundifolium* Gray.)

2. *S. exilis* Jepson n. comb. Stems several from the base, diffuse or decumbent, 4 to 18 in. long; herbage stellate-pubescent; leaves palmately 3 to 5-cleft with dentate or incisely-toothed lobes, 3 to 5 lines wide; bractlets 3, slender; calyx-lobes ovate, acuminate; petals white or rose-color, obovate,  $2\frac{1}{2}$  to 4 lines long; anthers blue; carpels subreniform, transversely rugose.—Sandy washes and desert mesas: Colorado and Mohave deserts; spreading as a weed in the San Joaquin Valley and w. to the coast. (*Malvastrum exile* Gray.)

3. *S. parryi* Jepson n. comb. Similar to no. 2 but the flowers larger; herbage hirsute and often glandular; calyx-lobes ovate, the attenuate or subulate apex as long as the body; corolla rose-color or violet-purple, 6 to 12 lines long.—Upper San Joaquin Valley, its bordering foothills and w. to the Salinas River, 500 to 3000 ft.: Poso Creek; Caliente Creek; Buena Vista Hills; Alcalde; Paso Robles; Nacimiento River. (*Malvastrum parryi* Greene.)

4. *S. palmeri* Jepson n. comb. Stems stout, herbaceous, markedly and equally leafy to the summit, 6 to 8 ft. high; leaves broadly or round-ovate, mostly 3-lobed, dentate, truncate or cordate at base, 1 to  $2\frac{1}{4}$  in. long; stipules lanceolate, 4 to 6 lines long; flowers sessile in terminal clusters, subtended by conspicuous foliaceous bracts; bractlets linear, nearly equaling the calyx-lobes; calyx-lobes ovate, acuminate; petals light rose-color, 7 to 10 lines long.—Foothills bordering the Salinas Valley, 200 to 1000 ft. (*Malvastrum palmeri* Wats. *M. involueratum* Rob.)

5. *S. densiflora* Jepson n. comb. Stems woody below, 2 to 3 ft. high; herbage finely stellate-tomentose; leaves orbicular-cordate, dentate, not lobed or commonly obscurely or evidently 3-lobed, 1 to  $1\frac{3}{4}$  in. wide, the petioles 3 to 11 lines long; flowers in dense sessile heads (often appearing as if in whorls), forming an interrupted naked or leafy spike; bractlets conspicuous, filiform, densely hispid; calyx hirsute-stellate, often papery-white in age, its lobes lanceolate, acuminate; petals rose-red, 6 to 8 lines long.—Valleys and cañons, 1000 to 4100 ft., both e. and w. sides of the Cuyamaca and San Jacinto mountains, and n. to north slope of San Gabriel Mts.: El Nido; Alpine; Ramona; Menifee; Palm Cañon of San Jacinto; Rock Creek; Ravenna. (*Malvastrum densiflorum* Wats.)

6. *S. fremontii* (Torr.) Jepson n. comb. Stems stout, woody at base, 2 to 5 ft. high; herbage densely white-tomentose; leaves very thick, orbicular-ovate, not lobed or shallowly 5 to 7-lobed, crenate,  $1\frac{1}{2}$  to 4 in. broad, on petioles  $\frac{1}{2}$  to 1 in. long; flower-clusters somewhat head-like or close, sessile in the axils or short-peduncled and thus interrupted-spicate at summit of stem; calyx globose-ovate in bud, conspicuously and very densely and closely woolly, only the subulate tips of the lobes visible, almost equaled by the 3 linear-setaceous bractlets of the involucre; corolla pale pink or rose-color, aging white-scarious, 7 to 8 lines long; carpels smooth, promptly dehiscent.—Foothills surrounding the Great Valley, 800 to 4000 ft.: Sierra Nevada

foothills from Tulare Co. to Amador Co.; Mt. Hamilton Range; Mt. Diablo; Yollo Bolly foothills. (*Malvastrum fremontii* Torr.) Var. *CERCOPHORUM* (Rob.) Jepson n. comb. Calyx-lobes lanceolate-linear, caudate-attenuate, nearly as long as the petals.—N. end of Mt. Hamilton Range. (*Malvastrum fremontii* var. *cercophorum* Rob.)

7. *S. davidsonii* Jepson n. comb. Stems erect, 2 to 3 ft. high; herbage finely stellate-tomentulose; leaves round-cordate, dentate, somewhat shallowly or obscurely lobed,  $\frac{3}{4}$  to  $2\frac{3}{4}$  in. long; flowers in short simple or forking racemes, the racemes peduncled or sessile in the leaf axils and thus forming an interrupted panicle; calyx-lobes ovate, attenuate into a subulate apex as long; petals rose-color, changing in age to yellow, 6 to 7 lines long; carpels glabrous on the back and sides, hairy-tufted and densely tomentulose at apex, 1-nerved on back.—San Gabriel Mts., 2000 to 3100 ft. (*Malvastrum davidsonii* Rob.)

8. *S. arcuata* (Greene) Arthur. Stems woody below, 2 to 5 ft. high; herbage covered with a dense or felt-like white tomentum; leaves ovate to ovate-orbicular, dentate, slightly or not at all lobed, truncate at base, more or less rugose, becoming green above,  $\frac{3}{4}$  to 2 in. long, on petioles  $\frac{1}{4}$  to  $1\frac{1}{4}$  in. long; flowers in dense or head-like clusters sessile in the upper axils and at the ends of the branches, forming long interrupted spikes; bractlets linear-filiform, equaling the rusty tomentose calyx; petals rose-color, 7 to 9 lines long; carpels tomentulose on back, at length glabrate.—Foothills, e. slope Santa Cruz Mts. and w. slope Mt. Hamilton Range. (*Malvastrum arcuatum* Rob.)

9. *S. fasciculata* (Nutt.) Arthur. Stems 3 to 8 ft. high, woody below, with long slender wand-like branches; pubescence short and close; leaves round-ovate, dentate, not lobed or obscurely lobed or pentagonal, mostly truncate or subcordate at base,  $\frac{3}{4}$  to  $1\frac{1}{4}$  (or  $2\frac{1}{2}$ ) in. long; petioles 5 to 8 lines long; buds subacute; flowers in sessile or short-peduncled, often head-like, clusters, the clusters distant, or at least not crowded, but virgately racemose, the inflorescence often a little leafy below; calyx-lobes triangular-ovate, obtuse or with a very short point; petals rose-pink, unsymmetrical, 5 to 10 lines long; carpels smooth, promptly dehiscent.—Hill slopes, 500 to 5000 ft.: South Coast Ranges from Santa Lucia Mts. s.; coastal S. Cal. and e. to west side Colorado Desert. Var. *LAXIFLORA* Jepson n. comb. Clusters tending to lengthen or to be racemose, the inflorescence thus becoming more truly paniculate.—Santa Monica Mts.; San Bernardino Valley; Pacheco Pass. (*Malvastrum thurberi* var. *laxiflorum* Gray.)

10. *S. nesiotica* Jepson n. comb. Similar to no. 9; leaves round-ovate, cordate at base, 3-lobed, crenulate, green or greenish and sub-glabrous above, 1 to  $1\frac{1}{2}$  in. long; buds obtuse; flowers in a fastigate leafless panicle.—Santa Cruz Isl. (*Malvastrum nesioticum* Rob.)

11. *S. orcútti* Rose. Stems erect, 1 or several from the base,  $1\frac{1}{4}$  to 3 ft. high; herbage thinly stellate-puberulent or canescent; leaves  $\frac{3}{4}$  to 2 in. long, ovate in outline, truncatish at base, the lateral angles toward the base commonly enlarged so that the blade is somewhat 3-lobed with flowing outline, the margin entire or nearly so; flowers in short racemes in the upper axils, the upper leaves mostly reduced and bracteate, the inflorescence thus interruptedly spicate; calyx 2 to 3 lines long; corolla bright terracotta or red, 3 to 4 lines long; carpels 1 line long, reniform in outline from the strong recurving of the empty scarious apex, thin-walled or subscarious, deeply reticulate on the sides, the areola often dark-colored; seed 1.—Colorado Desert: Carrizo Creek; Signal Mt.; Meloland.

*S. CÔULTERI* Gray. Slender annual; flowers small, orange, clustered in the axils of the upper leaves.—Sw. Ariz.; to be looked for near Ft. Yuma.

12. *S. ambigua* Gray. APRICOT MALLOW. Stems several or many from the base, usually unbranched or simple above, erect or spreading, forming roundish clusters 1 to 4 ft. broad; herbage finely but densely stellate-puberulent; leaves 1 to  $2\frac{1}{2}$  in. long, mostly as broad as long, cordate to round-ovate

crenate, scarcely or not at all lobed to strongly 3-lobed or somewhat 5-lobed; calyx 3 to 4 lines long, usually shorter than the fruit; bractlets filiform, hardly longer than calyx-tube; petals rose-red to brick-red, notched at apex, 5 to 10 lines long, the claws with a dense ciliate tuft of hairs on each side at base; anthers purple; stigmas black or purple; sides of carpels glabrous, smooth-chartaceous opposite the upper seed, reticulate-scarious opposite the lower seed, canescent on the back.—Desert slopes and desert ranges, 2000 to 6000 ft.: Cuyamaca, San Jacinto and San Bernardino mountains; Colorado and Mohave deserts; n. to Inyo Co.; e. to Ariz.

13. *S. pulchella* Jepson n. sp. Stems erect from a woody root-crown, making a bushy plant 2 to 3 ft. high, covered with a close white felt; leaves roundish-cordate in outline, dentate, not lobed or somewhat 3 or 5-lobed, stellate-canescant, soon green above,  $\frac{1}{2}$  to 1 in. long, on petioles  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; flowers in a loose narrow panicle; calyx rusty-puberulent, its tube  $1\frac{3}{4}$  to 2 lines long (about as long as the carpels), the lobes ovate-lanceolate, 4 to 5 lines long; petals deep apricot-color,  $\frac{3}{4}$  to 1 in. long; ovary covered with a dense white felt; carpels smooth on sides, densely woolly on back.—Panamint Range, Inyo Co. (Hanaupah Cañon, 4000 ft., Jepson 7064, type).

14. *S. purpurea* Parish. Similar to no. 11; stems clothed with a close, fine whitish felt.—Sw. Colorado Desert: Mountain Spr., San Diego Co.; Coyote Well. (*S. violacea* M. & J.)

15. *S. eremicola* Jepson n. sp. Stems slender, erect or ascending, several from the thick root-crown, 12 to 17 in. high, green and glabrous or nearly so; leaves roundish-cordate in outline, 4 to 11 lines long, 3 to 5-parted with the lobes again cleft and toothed, thinly stellate-puberulent, green; flowers few in a loose and narrow nearly naked panicle; calyx woolly, its tube  $1\frac{1}{2}$  to 2 lines long, almost as long as the fruit, the lobes lanceolate, acuminate, 4 to 5 lines long; bractlets filiform, about as long as the tube; petals apricot-color, 7 to 8 lines long; ovules 2; sides of carpels smooth.—Panamint Mts. (Emigrant Cañon, 4200 ft., Jepson 7120, type).

16. *S. angustifolia* Don var. *cuspidata* Gray. Stems many from the base, 3 to 4 ft. high; herbage finely puberulent, the older stems and upper side of leaves glabrate; leaves oblong- to linear-lanceolate, sometimes with 1 more or less obscure lobe at the base angle on each side, minutely crenulate,  $\frac{3}{4}$  to 3 in. long; flowers in few-flowered clusters in the axils of the upper leaves; calyx-lobes ovate, acuminate; corolla saffron-red, 4 to 6 lines long; carpels glabrous on the sides, the sides smooth above, reticulate below.—Colorado Desert, rare; e. to Ariz. and Col.

17. *S. fendleri* Gray var. *californica* Parish. Stems several from the base, woody below, forming an erect shrub 2 to 4 ft. high; herbage glabrate or minutely stellate-flocculent; leaves 1 to  $3\frac{1}{2}$  in. long, 3-lobed, with sharply acute sinuses, the lateral lobes small, the central one ovate to oblong and 3 to 5 times as long as the lateral, the margin irregularly crenate; flowers in clusters in the axils of the reduced upper leaves, or the inflorescence becoming a somewhat spicate panicle; petals salmon-red,  $3\frac{1}{2}$  to 5 lines long; carpels smooth on sides opposite upper seeds, finely reticulate opposite lower seed, finely puberulent or glabrate on back.—Mesas and washes, 25 to 1500 ft.: San Bernardino Valley; Conchilla Desert.

18. *S. acerifolia* Nutt. Stems erect, 2 to 3 ft. high; herbage green, finely puberulent; leaves maple-like, deeply 5-lobed (the lobes acute, irregularly serrate), truncate or subcordate at base, 2 to  $6\frac{1}{2}$  in. long; petioles  $\frac{1}{2}$  to  $3\frac{1}{4}$  in. long; flower-clusters sessile or nearly so in the upper axils and thus interruptedly spicate at the summit of the branches; calyx-lobes ovate, acuminate, shorter than the mature carpels; petals rose-color,  $\frac{3}{4}$  to 1 in. long; back of carpels densely puberulent and also conspicuously covered with long ascending bristles.—Cañons, n. Humboldt Co. (Bald Mt.; Three Creeks); n. to Wash.

19. *S. bakeri* Jepson n. sp. Stems erect, several from the root-crown, 1 to  $1\frac{1}{4}$  ft. high; herbage finely puberulent; leaves 3 to 12 lines long, the lower sub-orbicular, truncatish at base, crenately lobed and crenate, the upper

leaves often cuneate-obovate in outline, irregularly serrate on upper half or somewhat 3-lobed,  $\frac{3}{4}$  to 1 in. long; flowers mostly solitary in the upper axils, on peduncles 2 to 7 lines long; calyx-lobes round-ovate, abruptly acute; petals rose-pink,  $\frac{3}{4}$  in. long; carpels closely puberulent and also densely covered with long ascending dull-white bristles.—Lava beds on the boundary of Shasta and Modoc Cos. (Fall River Valley, M. S. Baker, type).

### 8. *HORSFORDIA* Gray

Woody plants, the herbage yellowish or greenish-yellow, covered with a dense felt. Leaves ovate-lanceolate, cordate at base, leathery, subentire or irregularly erosulate. Flowers 1 to 3 in the axils, peduncled. Bractlets none. Corolla salmon-color. Carpels 3-ovuled, 1 to 3-seeded, at maturity 2-valved above, the valves spreading, scarious and wing-like, 3 to 4 times as long as the lower seed-bearing portion which is firm and reticulate. (F. H. Horsford of Vermont, botanical collector.)

1. *H. newberryi* (Wats.) Gray. Stems erect, 5 to 8 ft. high, with lateral branches on upper  $\frac{2}{3}$ ; stems and petioles yellow stellate-tomentose, the leaves with a somewhat paler or greenish-yellow but very dense and fine stellate-tomentum; leaves  $1\frac{1}{4}$  to  $2\frac{3}{4}$  in. long, on petioles  $\frac{1}{4}$  to  $1\frac{1}{4}$  in. long; petals orbicular, rotate, 3 lines long; stamen-tube with simple spreading non-glandular hairs; anthers yellow; stigmas yellow; fruit 4 lines long, the wings ovate.—Sw. Colorado Desert: Palm Cañon of San Isidro; Carrizo Mt.; Signal Mt.; e. to Ariz., s. to Mex.

## STERCULIACEAE. STERCULIA FAMILY

Shrubs or trees with alternate leaves and perfect regular or nearly regular 5-merous flowers. Stamens united below into a tube. Ovary superior, 5 (or 4)-celled. Style in ours one, stigmatic at apex. Fruit a capsule.

Flowers yellow, showy; petals none; calyx-lobes with a conspicuous gland at base; ovary not stiped.....1. *FREMONTIA*.  
Flowers brownish, minute; petal claws filiform, ending in a hood; calyx glands none; ovary stipitate.....2. *AYENIA*.

### 1. *FREMONTIA* Torr.

Evergreen shrub with small often lobed leaves and stellate pubescence. Flowers showy, short-pedicled, solitary and axillary on the branchlets. Stipules caducous. Bractlets 3 to 5, small. Calyx yellow and corolla-like, deeply 5-cleft into round-ovate lobes or sepals; these imbricated in the bud, the 3 inner a little larger, all with a rounded and sharply defined glandular area at base. Corolla none. Stamens 5; filaments united to the middle.

Capsule 4 or 5-celled, loculicidally dehiscent. (General John C. Fremont, Pathfinder of the Rocky Mts. and Sierra Nevada, and first United States Senator from California, who discovered it.)

1. *F. californica* Torr. FLANNEL BUSH. Fig. 629. Loosely branching shrub 6 to 10 ft. high, sometimes a small tree up to 18 ft. high; branches tough and flexible, with many short leaf- and flower-bearing branchlets or spurs; leaves green above, covered beneath with a dense gray or whitish felt,  $\frac{1}{4}$  to 1 in. long, or on sterile shoots somewhat larger; petioles short; calyx somewhat flannel-like,  $1\frac{1}{2}$  to 2 in. broad, persistent, the lobes

629 *Fremontia californica* Torr.; fl. branchlet  $\times 1$ .

commonly mucronate; gland hairy; capsule ovate, covered with a dense brown felt and short bristly hairs,  $\frac{3}{4}$  to  $1\frac{1}{8}$  in. long, persistent.—Mountain slopes, 1500 to 5300 ft.: Sierra Nevada (Tehama Co. foothills, rare; Mariposa Co. to Kern Co., abundant); Coast Ranges from Lake Co. to San Luis Obispo Co., rare or localized; S. Cal. (n. slope San Gabriel and San Bernardino mountains, common, and s. to San Diego Co., rare). Var. *MEXICANA* Jepson n. comb. Gland of the calyx not hairy.—Sonoma Co. to Mt. Pinos and San Gabriel Mts.; s. to Mex. (*Fremontodendron mexicanum* Dav.)

## 2. *AYÈNIA* Loefl.

Small shrubby plants with small flowers. Calyx 5-parted. Petals with a long filamentous claw ending in a hood; hoods inflexed, adnate to the stamencolumn and covering the anthers. Fertile stamens 5, these alternate with 5 truncate staminodia at summit of stamen-tube; anthers with 3 parallel cells. Ovary on a stipe, 5-celled, 2 ovules in each cell. Capsule globose, muricate, splitting septically into 5 one-seeded carpels which separate from a central column; carpels loculicidally 2-valved. Seeds strongly rugose; endosperm none. (Named for the Duc d'Ayen.)

1. *A. californica* Jepson n. sp. Stems several from the base, minutely canescent, woody below,  $\frac{1}{2}$  to 1 ft. high; leaves ovate to oblong-ovate, serrate, 3 to 6 lines long, the petioles  $\frac{1}{2}$  to 3 lines long; flowers 1 to  $1\frac{1}{4}$  lines long, brownish; capsule  $1\frac{3}{4}$  lines long.—Mts. on w. side of Colorado Desert (Palm Cañon of San Jacinto, Jepson 1407, type).

## HYPERICACEAE. ST. JOHN'S WORT FAMILY

Ours herbs or slightly suffrutescent plants. Leaves opposite, entire, without stipules and with pellucid dots or dark glands. Flowers perfect, regular and hypogynous. Sepals 5 (in ours) or 4, herbaceous, persistent. Petals 5 (in ours) or 4, yellow (in ours). Stamens usually numerous, distinct or more or less united into 3 to 5 clusters. Ovary superior, 1 or 3-celled; styles in ours 3. Fruit a septical capsule. Seed without endosperm.

### 1. *HYPÉRICUM* L. ST. JOHN'S WORT

Leaves sessile. Flowers in terminal cymes, rarely solitary. Petals deciduous or marcescent. (Ancient Greek name.)

Annuals; sepals longer than the petals; styles short; capsule 1-celled.

Erect from the base, more or less branching; stamens 6 to 12.....1. *H. mutilum*.

Procumbent, forming mats with ascending or erect branches; stamens 15 to 21.....

2. *H. anagalloides*.

Perennials; petals much longer than the sepals; styles long, divaricately spreading; capsule 3-celled; stamens very numerous.

Stems tall, few, from rootstock; leaves not folded.

Stems with numerous short sterile shoots; sepals lanceolate; capsule not lobed..

3. *H. perforatum*.

Stems destitute of sterile shoots; sepals ovate; capsule 3-lobed..4. *H. formosum*.

Stems low, numerous, from a woody crown; leaves commonly conduplicate; capsule 3-lobed.....5. *H. concinnum*.

1. *H. mutilum* L. Stem mostly simple below and branching above, 10 to 17 in. high; leaves ovate, 5 to 10 lines long, 3 to 6 lines broad, 5-nerved at base, sessile; flowers in leafy cymes at the ends of the branches; stamens 6 to 12; sepals linear to lanceolate, mostly shorter than the capsule.—Shores of the lower Sacramento and lower San Joaquin rivers. Aug.-Sept.

2. *H. anagalloides* C. & S. TINKERS PENNY. Fig. 630. Commonly forming dense mats 6 to 15 in. broad, with ascending or erect branches 2 to 5 (or 7) in. high; leaves lanceolate to ovate or orbicular, obtuse, 5 to 7-nerved at base, 2 to 6 (or 9) lines long; flowers 1 to  $1\frac{1}{2}$  lines long, borne 1 to 3 in a leafy cyme, or the cyme becoming paniculate; petals salmon-color; sepals ovate or linear-oblong, unequal, longer than the capsule; stamens 15 to 21.—Springy places and streamlets in the hills and mountains, almost throughout Cal., 500 to 6000 ft., common northward; very variable in size, branching and foliage.

630. *Hypericum anagalloides* C. & S.; a, habit x  $\frac{3}{4}$ ; b, fl. x 2; c, capsule x 3.

3. *H. perforatum* L. KLAMATH WEED. Stems simple but the main axis bearing many very leafy short sterile shoots and ending above in a densely flowered cyme, 2 (or 1) ft. high; leaves linear to oblong, soon revolute,  $\frac{1}{2}$  to 1 in. long, those of the sterile shoots about  $\frac{1}{2}$  in. long; flowers about 1 in. broad; sepals lanceolate, acuminate, about 4 times as long as broad; petals linear-oblong, copiously black-dotted, twisting after anthesis.—European weed, becoming a pest in abandoned or poorly tilled fields in the hill country in n. Cal., 500 to 2300 ft.: Tuolumne and Mendocino Cos. to Siskiyou Co.

4. *H. formosum* H.B.K. var. *scouleri* Coulter. Stems from running rootstocks, slender, simple or branching at summit, 1 to 3 ft. high; leaves ovate to oval or oblong, obtuse, black-dotted along the margins, sessile by a more or less clasping base,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long; flowers  $\frac{1}{2}$  to  $\frac{3}{4}$  in. broad, in more or less panicle cymes; sepals and petals black-dotted; sepals ovate, mostly obtuse, sometimes acute, twice as long as broad; petals obovate; stamens numerous, in 3 clusters.—Hills and mountains, almost throughout Cal., 500 to 6000 ft.

5. *H. concinnum* Benth. GOLD-WIRE. Fig. 631. Stems wiry, numerous from the woody crown, forming a bushy plant 6 to 11 in. high; leaves thickish, linear to lanceolate, acute, inserted by a narrow base, usually folded, scantily black-dotted,  $\frac{3}{4}$  to  $1\frac{3}{4}$  in. long; flowers  $\frac{7}{8}$  to  $1\frac{1}{8}$  in. broad, in rather close clusters at summit of the stem; sepals ovate, somewhat abruptly short-pointed; petals obovate, black-dotted on the margin; stamens numerous, 4 of the filaments in each of the 3 clusters distinctly united at base, the others free.—Dry bushy mountain slopes and ridges, 500 to 3000 ft.: North Coast Ranges; Sierra Nevada from Mariposa Co. to Butte Co. June-July.

631. *Hypericum concinnum* Benth.; a, fl. stem x  $\frac{3}{4}$ ; b, pistil x  $2\frac{1}{2}$ ; c, cross sect. of ovary x 6; d, capsule x 2.

#### ELATINACEAE. WATER-WORT FAMILY

Small annuals with opposite leaves and membranous stipules between them. Flowers 2 to 5-merous, small, perfect, symmetrical, solitary in the axils. Sepals, petals and stamens all distinct and hypogynous. Ovary with as many cells as there are sepals; styles distinct. Capsule 2 to 5-celled, septicidal or the partitions more or less persisting with the axis; placentae central.

Flower-parts 2 to 4; sepals obtuse, without midrib. . . . . 1. ELATINE.  
 Flower-parts 5; sepals pointed or acute, with thickened midrib and scarious margins. . . .  
 . . . . . 2. BERGIA.

### 1. ELÁTINE L. WATER-WORT

Glabrous dwarfs, somewhat succulent, growing in water or in wet places, rooting at the nodes. Leaves entire. Flowers 2 to 4-merous. Sepals sub-membranous, obtuse. Petals white or whitish. Capsule globose, thin-membranous, 2 to 4-celled, several- or many-seeded. Seeds striately and regularly reticulated. (Greek, etymology obscure.)

Flowers sessile; flower-parts 3 or 2; seeds straight or nearly so.

Flower-parts mostly 2; petals equal. . . . . 1. *E. americana*.

Flower-parts mostly 3; petals unequal. . . . . 2. *E. brachysperma*.

Flowers pediceled; flower-parts 4; seeds strongly curved. . . . . 3. *E. californica*.

1. *E. americana* Arn. Stems  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long, often fistulous; leaves obovate, 1 to  $1\frac{1}{2}$  lines long; flowers mostly 2-merous; capsule valvate-dehiscent; seed with 9 or 10 rows of areoles, 20 to 30 areoles in a row.—Shallow water, San Bernardino Mts., exceedingly rare; Ore. and B. C. to Ont. and Tex.

2. *E. brachysperma* Gray. MUD PURSLANE. Plants forming little mats (2 to 3 in. across) in wet places or late vernal beds of winter pools; leaves oblong or narrowly ovate, narrowed at base, 1 to 2 lines long; flowers sessile, mostly 2-merous; sepals commonly unequal, 3 (or 2); petals 3, pink, roundish obovate, commonly unequal; stamens 3 to 6; capsule valvate-dehiscent or bursting irregularly; seed with about 8 longitudinal rows of areoles, about 11 or 12 areoles in a row.—Mostly terrestrial, Coast Ranges and s. to S. Cal., mostly toward the coast; occasional. May.

3. *E. californica* Gray. Thickly branched, forming a dense mat  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. across; leaves obovate or oblanceolate, the lower ones petioled; flowers on short pedicels; sepals 4, oblong, equal; petals 4, obovate, equal; stamens 8; seeds curved into a partial ring, with about 10 longitudinal rows of areoles and about 25 areoles in each row.—Montane: San Diego Co.; Sierra Nevada; n. to Wash.; rare.

### 2. BÉRGIA L.

Stems glandular-pubescent. Flowers pediceled and often fascicled, 5-merous. Sepals abruptly cuspidate, with strong midrib and scarious margins. Petals oblong. Capsule globose, with a coriaceous wall. (Dr. P. J. Bergius, Swedish naturalist of the 18th century.)

1. *B. texana* Seubert. Stems diffusely branched, 6 to 12 in. high; leaves obovate or oblanceolate, tapering at base, serrulate at apex,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long; sepals 2 lines long, denticulate on the midrib and serrulate on the margin towards the apex, equaling or exceeding the whitish obovoid petals; stamens 5 or 10.—Sacramento; Merced; Elsinore; rarely seen; e. to Tex. and Mo.

## FRANKENIACEAE. FRANKENIA FAMILY

Low perennial herbs or dwarf bushes with opposite entire leaves. Flowers perfect. Ovary superior, 1-celled, with parietal placentae. Seeds with a straight embryo.

### 1. FRANKÈNIA L.

Leaves small, crowded and fascicled in the axils. Flowers sessile, solitary, or by the reduction of the upper leaves to bracts becoming somewhat cymose. Calyx tubular, furrowed or almost prismatic, 4 or 5-toothed. Petals 4 or 5, appendaged at the very base of the blade, the appendage decurrent on the claw. Stamens in ours 4 to 7, hypogynous, exerted from the calyx-tube. Style 2 or 3-cleft, included. Capsule linear, angled, included in the persistent calyx, 2 to 4-valved, the seeds attached by filiform funiculi to the side of the cell. (Johann Franko, 1590-1661, Professor at Upsala, the first author who treated of Swedish plants.)

Style 3-cleft; ovules many; herbaceous or nearly so; common. . . . . 1. *F. grandifolia*.

Style 2-cleft; ovules 2 or 3; dwarf bush; San Diego. . . . . 2. *F. palmeri*.

1. *F. grandifolia* C. & S. ALKALI-HEATH. Fig. 632. Erect or diffuse, often slightly woody at base, 6 to 13 in. high, glabrous or somewhat pubescent or short-hirsute, particularly at the nodes; leaves obovate to linear-oblancoate, 3 to 5 lines long, with revolute margins, sessile or short-petiolate, the opposite pair mostly united by a somewhat membranaceous sheathing base; calyx 3 lines long, narrow-cylindrical, with acute teeth; petals slightly irregular, pinkish, exserted  $1\frac{1}{4}$  to 2 lines, with oblong or obovate blade erose at summit; stamens 4 to 7; seeds numerous.—Common along the sea-shore and in salt-marshes: Marin Co. to San Diego and L. Cal. June-Oct. Also called Yerba Reuma by Spanish-Californians. Var. *CAMPÉSTRIS* Gray. Tufted, 4 to 20 in. high; leaves mostly linear-spatulate to oblanceolate, strongly revolute-margined, 2 to 4 lines long; petals less exserted ( $\frac{3}{4}$  to 1 line).—Interior alkaline plains, Great Valley to S. Cal. and e. to Inyo Co.

632. *Frankenia grandifolia* C. & S.; a, fl. branchlet  $\times 1$ ; b, petal  $\times 4$ ; c, pistil  $\times 4$ .

2. *F. pálmeri* Wats. YERBA REUMA. Dwarf spreading bush 5 to 7 in. high, the branchlets thickly clothed with leaves; leaves linear-oblong, thick and strongly revolute so as to be nearly terete, canescent, 1 to 2 (or  $2\frac{1}{2}$ ) lines long; calyx  $1\frac{1}{2}$  lines long; petals whitish, the blade oblong; stamens 4.—Coast at San Diego and s. to L. Cal.

#### TAMARICACEAE. TAMARISK FAMILY

Shrubs or low trees, inhabitants of alkaline soils, with long slender branches bearing numerous minute appressed leaves. Flowers minute, numerous, in long clusters at the ends of the branches. Sepals 4 or 5. Petals 4 or 5, these and stamens (as many or twice as many) borne on a fleshy disk. Ovary superior, 1-celled, the placenta basal; styles 3 to 5. Fruit a capsule; seeds numerous, usually with a tuft of hairs at one end.

##### 1. *TAMARIX* L. TAMARISK

Our only genus. (*Tamaris*, a river in Spain.)

1. *T. gallica* L. FRENCH TAMARISK. Densely branched shrub 3 to 8 ft. high and often twice as broad; leaves  $\frac{1}{2}$  to  $\frac{3}{4}$  line long; stamens 4 or 5.—Cult. from Eur., an escape along summer beds of winter flood streams: Sulphur Creek, sw. Colusa Co.; White Sulphur Creek, Napa Valley; Cache Creek, Tehachapi Pass; Furnace Creek, Death Valley; Salton Sink.

#### FOUQUIERIACEAE. CANDLEWOOD FAMILY

Heavily armed shrubs, leafless in the drought periods between the rains. Primary leaves of the season's shoots soon deciduous but developing their petioles into stout spines, the ordinary leaves borne on short spurs in the axils of the spines. Flowers showy, perfect, in terminal panicles. Sepals 5, unequal, imbricated. Corolla tubular, shortly 5-lobed. Stamens 10 to 17; filaments with a firm or red portion at base, this portion puberulent on back and developed at apex into a tooth or short ligule on the inside. Ovary superior; placentae parietal, lamellate, intruded in cavity and partly united at base so as to make an incompletely 3-celled ovary; ovules 4 to 6 on each placenta; styles 3, united to the middle. Fruit a capsule.

1. **FOUQUIERIA** HBK. COACH-WHIP.

The only genus. (P. E. Fouquier, professor of medicine at Paris.)

1. *F. splendens* Engelm. OCOTILLO. Fig. 633. Stems mostly simple, 8 to 25 ft. high, in clusters from a common root-crown; bark whitish, deeply furrowed between the decurrent bases of the slender but rigid spreading thorns; leaves fleshy, obovate, rounded at apex, 5 to 10 lines long, forming axillary rosettes on old wood; panicles racemose, dense, 4 to 10 in. long; flowers scarlet,  $\frac{3}{4}$  to 1 in. long; sepals roundish, 2 to 3 lines broad; corolla-lobes recurving; stamens 15 to 17, exserted; capsule 8 lines long, 3-valved; seeds with a long fringe of hairs.—Desert mesas, Colorado Desert; e. to Tex., s. to Mex.

633. *Fouquieria splendens* Engelm.; a, fl. x 1; b, leaf rosette in axil of a thorn x 1.

## CISTACEAE. ROCK-ROSE FAMILY

Low shrubs but ours herb-like or woody only at base. Flowers complete, regular, hypogynous. Sepals 5, persistent (2 smaller, wholly on the outside and bract-like). Petals 5, ephemeral. Stamens indefinite. Ovary superior, 1-celled with 3 parietal placentae; style one; ovules orthotropus on slender funiculi. Capsule 3-valved.

1. **HELIANTHEMUM** Pers.

Leaves alternate, simple, entire. Flowers yellow, opening but once. Stamens usually numerous, with filiform filaments and short anthers. Style very short or none; stigma capitate, 3-lobed. Capsule 1-celled or nearly 3-celled by the intrusion of the placentae. (Greek helios, sun, and anthemon, blossom.)

634. *Helianthemum scoparium* Nutt.; a, fl. branchlet x  $\frac{3}{4}$ ; b, pistil x  $7\frac{1}{2}$ ; c, long. sect. of pistil x  $7\frac{1}{2}$ .

Flowers in a panicle or raceme; herbage pubescent or glabrate.....

1. *H. scoparium*.

Flowers corymbose; herbage woolly; Santa Cruz Isl..... 2. *H. greenii*.

1. *H. scoparium* Nutt. RUSH-ROSE.

Fig. 634. Stems numerous, tufted, erect, very leafy, 8 to 20 in. high, arising from a much-branched woody crown and ending above in a small leafy panicle or short raceme; herbage and calyx minutely stellate-pubescent or glabrate; leaves narrowly linear,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long, early deciduous; inner sepals 2 to 3 lines long, the two outer minute; corolla 5 to 7 lines broad; petals obovate; stamens 17 to 21; placentae partition-like; embryo slender and much coiled.—Along the coast, Mendocino Co. to Monterey Co. Apr.-May. Var. VULGARE Jepson n. var. Stems rush-like, the leaves sparse or early deciduous; calyx usually smaller; raceme or panicle naked.—Dry sunny slopes and ridges of the chaparral belt, 1500 to 4000 ft.: Coast Ranges from Lake Co. to San Luis Obispo Co. and

s. to San Diego Co.; Sierra Nevada from Eldorado Co. to Mariposa Co. (Coulterville, Jepson, type.)

2. *H. greenei* Rob. Stems from a woody base, branching, 6 to 10 in. high; young parts white-woolly; leaves linear, 1 to 1¼ lines broad; flowers on short (1 to 2 lines) pedicels in a somewhat condensed corymbose panicle; outer sepals linear or lanceolate, ½ to as long as the ovate acuminate inner ones.—Santa Cruz Isl.

### RESEDACEAE. MIGNONETTE FAMILY

Herbs with simple alternate leaves. Flowers perfect, irregular, in racemes or spikes, ours inconspicuous. Sepals 4 to 7. Petals 2 to 6. Stamens 3 to 40, always more numerous than the petals, borne on one side of the flower. Ovary superior, 1-celled, with parietal placentae, opening at the top before the seeds are full grown. Stigmas 2 to 6, sessile, minute.

#### 1. OLIGOMÉRIS Cambess.

Low branching somewhat succulent herb. Leaves linear, entire. Flowers white, in terminal spikes. Sepals 4. Petals (2) and stamens (in ours 3) inserted on the upper side of the flower. Capsule depressed, 4-lobed (each lobe sulcate on the back), opening at the summit. (Greek oligos, little, and meris, parts.)

1. *O. linifolia* (Vahl) Mcbr. Erect, branching from the base, ¾ to 2 ft. high; leaves ½ to 1¾ in. long; flowers 1 line long; petals oblong, acute; capsules 1½ lines broad.—Colorado Desert; e. to Tex., s. to Mex.

*Reseda* L. MIGNONETTE. Annual herbs; flowers in racemes; sepals 4 to 8; petals 4 to 7, lacinate; stamens 8 to 40, inserted on a disk on one side of the flower; capsule 3 to 6-lobed, horned. 1. *R. odorata* L. Leaves mostly entire; petals deeply 5 to 8-cleft.—Garden escape in Marin Co. 2. *R. lutea* L. Leaves divided; petals greenish-yellow, all cleft but 1 or 2.—Garden escape about Los Angeles. 3. *R. alba* L. Leaves pinnatifid; petals all 3-cleft at summit.—Occasional garden escape.

### VIOLACEAE. VIOLET FAMILY

Perennial herbs with alternate stipulate leaves and complete flowers. Sepals 5, persistent. Corolla irregular, consisting of 5 somewhat unequal petals, 2 upper, 2 lateral and 1 lower, the lower spurred at base. Stamens 5, with short and broad filaments bearing the anthers on their inner face and connivent over the ovary. Ovary superior, 1-celled, maturing into a 3-valved capsule with valves placenta-bearing along the middle. Style and stigma one. Seeds rather large, with a hard coat and straight embryo in fleshy endosperm.

#### 1. VIOLA L. VIOLET

Peduncles axillary, 1-flowered. Stipules persistent. Sepals unequal, produced below the point of insertion into auricles, persistent. Stamens with broad connectives which are prolonged beyond the anthers, the two lower bearing wings which project into the spur of the corolla. The valves of the capsule bear the seeds along the middle, and after dehiscence fold together firmly lengthwise and eject the seeds with violence. (Old Latin name used by Virgil.)

##### A. Leaves divided or parted (merely toothed in one var. of no. 5).

Upper petals deep blue or purple; lateral petals with a bearded spot.

Leaves puberulent (sometimes glabrous); lateral and lower petals bluish or white with yellowish base.....1. *V. beckwithii*.

Leaves glabrous; lateral and lower petals yellow or cream-color.....2. *V. hallii*.

Petals all yellow or purplish or brownish externally or purple-veined; lateral petals with or without beard.

Leaves pinnately twice-parted into narrow segments; petals orange-yellow, the 3 lower purple-veined, the others brownish externally.....3. *V. douglasii*.

Leaves palmately cleft or divided.

Stems mostly below ground, the peduncles mostly basal or scape-like; petals pale yellow.....4. *V. sheltonii*.

Stems 4 to 14 in. high, naked below the leafy summit which bears the axillary peduncles; petals yellow, purple externally.....5. *V. lobata*.

*B. Leaves undivided.*

Flowers yellow (blue or purple in one var. of no. 7).

Stems prostrate, stolon-like; leaves round-cordate, rounded at apex; Redwood belt... 6. *V. sarmentosa*.

Stems erect.

Leaves mostly elongate.

Leaves ovate to lanceolate, mostly abruptly cuneate at base; petioles not margined; herbage pubescent.

Peduncles usually surpassing the leaves; capsule puberulent; leaves commonly dentate, mostly  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long... 7. *V. purpurea*.

Peduncles usually not surpassing the leaves; capsule glabrous; leaves entire or subentire, mostly  $1\frac{1}{2}$  to 3 in. long... 8. *V. nuttallii*.

Leaves oblong-lanceolate to ovate, attenuate at base into the petiole; petioles margined; herbage usually glabrous; capsule puberulent... 9. *V. praemorsa*.

Leaves not elongate.

Peduncles  $1\frac{1}{2}$  in. long; corolla bright yellow, more or less purple-veined; leaves thin; wet woods... 10. *V. glabella*.

Peduncles 4 to 5 in. long; corolla golden yellow with brown-purple lines at base; leaves thickish; open hills... 11. *V. pedunculata*.

Flowers not yellow (or with some other color predominating).

Stems erect, bearing leaves and peduncles, and arising from short or creeping rootstocks; (stems in no. 14 at first very short; compare also no. 16).

Lateral petals with a purple spot or blotch at base; stems mostly naked below, leafy above, 3 to 12 in. high; stipules entire.

Leaves mostly cordate at base; stipules membranous... 12. *V. ocellata*.

Leaves mostly truncatish or subcuneate at base; stipules submembranous... 13. *V. cuneata*.

Petals not spotted, blue or violet, rarely white.

Stems (at least at first) very short (mostly  $\frac{1}{2}$  to 1 in. long) or almost none; herbage puberulent; stipules herbaceous, lacerate or toothed; common... 14. *V. adunca*.

Stems 5 to 8 in. high; herbage glabrous; stipules entire or almost entire; rare... 15. *V. howellii*.

Peduncles scape-like, these and the leaves arising directly from rootstocks or stolons; herbage glabrous.

Leaves cordate.

Petals blue or violet-purple; leaves commonly 1 to 2 in. wide; rare species in Cal.

Rootstock thick.

Rootstock sending off short leafy stolons above ground; lower petals with a bearded spot at base; north coastal... 16. *V. langsdorffii*.

Rootstocks thick and rather short, creeping underground, never sending off runners or stolons; lower petals hairy at base, the others more or less so; montane... 17. *V. nephrophylla*.

Rootstock filiform; petals pale violet or whitish, the lateral ones with a sparsely bearded spot or beardless; Del Norte Co... 18. *V. palustris*.

Petals white, commonly beardless; rootstock filiform; leaves  $\frac{1}{2}$  to 1 in. wide; montane, common... 19. *V. blanda*.

Leaves narrow-ovate to rhomboid-elliptic, not cordate; rootstock thickish; petals white, the lateral with a bearded spot; Del Norte Co., rare... 20. *V. occidentalis*.

1. *V. beckwithii* T. & G. Plants 2 to 4 in. high, the cluster of slender stems mainly below ground, arising from a short and usually deep rootstock; herbage puberulent or sometimes nearly glabrous; leaves palmately about 3 times 3-parted into linear or spatulate-linear segments, the segments mostly obtuse or sometimes mucronulate; primary divisions more or less petiolulate; peduncles scape-like; petals 4 to 7 lines long, the upper deep purple, the others white or light blue and purple-veined, with a yellowish base; spur short-saccate; stigma beakless, with a tuft of spreading or reflexed bristles on each side.—Moist gravelly soil, 3000 to 5000 ft.: Sierra Nevada from Nevada Co. to Siskiyou and Modoc Cos.; Nev. to Ore. May-July.

2. *V. hallii* Gray. Habit of no. 1; herbage glabrous; leaves ovate or oblong and irregular in outline, subpinnately or palmately twice parted into lanceolate or linear segments, the segments callous-apiculate; petals 3 to 6 lines long, strongly 2-colored, the upper deep blue or dark purple, the others yellow or white, purple-veined at base, the lateral with a bearded spot on claw; stigma beakless, bearded below its margin.—Montane, gravelly soil, 2500 to 6600 ft.: Mendocino, Humboldt and Trinity Cos.; n. to Ore.

3. *V. douglasii* Steud. Plants 2 to 5 in. high, the cluster of stems wholly or almost completely underground, arising from a deep short rootstock;

635. *Viola lobata* Benth.; a, habit  $\times \frac{1}{2}$ ; b, capsule with divergent valves  $\times 1$ .

Montane, rocky places or in woods, 3000 to 6300 ft.: Calaveras Co. to Plumas Co.; Lake and Colusa Cos. to Siskiyou Co.; n. to Wash.

5. *V. lobata* Benth. PINE VIOLET. Fig. 635. Stem erect, naked below the leafy summit, 4 to 14 in. high; rootstock short, deep-seated; leaves 1 to 3 in. long, ovate or almost round in outline, cordate or truncate at base, palmately 3 to 7-cleft or -divided, the lobes entire or somewhat repandly toothed, and the lateral usually larger; inflorescence somewhat umbellate; peduncles 1 to 2 in. long; petals yellow, all dark-veined towards base, purple on the outside.—Woods, 2000 to 6000 ft.: Cuyamaca Mts.; Sierra Nevada from Tulare Co. to Siskiyou Co.; North Coast Ranges. Mar.-May. Var. *INTEGRIFOLIA* Wats. Leaves crenate or with a few coarse teeth, but not at all lobed.—Cuyamaca Mts.; Howell Mt. to Mt. Shasta; s. Ore. June.

6. *V. sarmentosa* Dougl. WOOD VIOLET. Stems prostrate, stolon-like, sparsely leafy; peduncles commonly longer than the leaves, at first scape-like and arising from the cluster crowning the stipular-scaly rootstock;

leaves bipinnatifid with long linear or oblong segments; stipules lanceolate, entire or incised; flowers usually large, on peduncles (2 to 3 in. long) equaling or exceeding the leaves; petals 6 to 8 lines long, orange-yellow, the two upper brownish-purple externally, the others purple-veined; capsule 3 to 4 lines long, acute.—Open hills, 100 to 4000 ft., Coast Ranges from Siskiyou Co. to the Mt. Hamilton Range and s. to San Diego Co.; Sacramento Valley; Sierra Nevada foothills from Butte Co. to Tehachapi. Mar.-May. (*V. chrysantha* Hook.)

4. *V. sheltónii* Torr. Plants 3 to 6 in. high, the stems mostly below ground, arising from a short rootstock; herbage glabrous; leaves orbicular in outline,  $\frac{3}{4}$  to  $1\frac{3}{4}$  in. wide, palmately 3-divided, the cuneate-obovate divisions palmately 3-parted or again cleft into linear or oblong lobes, the lobes obtuse; peduncles scape-like; petals pale yellow, beardless, 4 to 6 lines long; style with a hairy tuft on either side below the stigma.—

636. *Viola purpurea* Kell.; a, habit  $\times \frac{1}{2}$ ; b, fl. from the back  $\times \frac{1}{2}$ ; c, pistil  $\times 5$ ; d, cross sect. of ovary  $\times 8$ .

stipules brown-scarious, ovate-subulate; leaves round-cordate, deep green above, often rusty beneath, finely crenate, in age brown-punctate,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. broad; petioles 1 to 7 in. long; petals uniform light yellow, a little purple-veined, 4 lines long; spurs very short and broad.—Woods near the coast, 100 to 500 ft., especially in the Redwood belt, or montane up to 3500 ft.: Monterey Co. to Humboldt Co.; n. to B. C. and Ida. (*V. sempervirens* Greene.)

7. *V. purpurea* Kell. MOUNTAIN VIOLET. Fig. 636. Plants 2 to 6 in. high, the stems very short and densely tufted, from a stout vertical root, the young herbage hirsutulose-canescens; leaves rhombic-ovate or oblong (1 or 2 frequently nearly round), dentate or crenate or sometimes nearly entire,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long, on petioles 1 to 3 in. long; peduncles surpassing the leaves, 2 to 4 in. long; petals yellow, brownish-purple on the outside, the lower brown-veined at base.—Peaks and mountain ridges, 2500 to 8500 ft.: San Bernardino Mts.; San Gabriel Mts.; Coast Ranges from the San Carlos Range to Siskiyou Co.; Sierra Nevada from Tulare Co. to Modoc Co. Mar.-July. Var. *PINETORUM* Greene. Herbage more or less tomentose; leaves mostly lanceolate or oblong-lanceolate, deeply serrate to entire; flowers small, blue or purple on long filiform peduncles.—Montane, 5200 to 8500 ft.: s. Sierra Nevada from Mariposa Co. to Tehachapi Range; Mt. Pinos; mts. of S. Cal. Var. *VENDSA* (Wats.) Brainerd. Leaves often purple-veined, the lower ones round-ovate, 5 to 6 lines long.—Plumas Co. to Shasta Co.

8. *V. nuttallii* Pursh. Plants 2 to 5 (or 7) in. high, the stems leafy and peduncles shorter than or scarcely exceeding the leaves; herbage puberulent, sometimes canescens; leaves oblong-lanceolate to lanceolate or ovate, entire or slightly denticulate or crenulate, 1 to  $2\frac{1}{4}$  in. long, rather shortly attenuate at base into the long petiole; petals yellow, the lowest brown-veined, 2 to 4 lines long.—Meadows or dry pine woods, 2000 to 7000 ft.: Mendocino Co. to Siskiyou Co., thence e. to Modoc Co., thence s. to Tuolumne Co.; n. to Wash., e. to Rocky Mts. Var. *LINGULAEFOLIA* Jepson n. comb. Blades oblong-ovate to elliptic or ovate, ciliate, otherwise glabrous or subglabrous, or often hirsutulose on the nerves.—Montane valleys, Nevada Co. to Siskiyou Co.; n. to Ore. (*V. lingulaefolia* Nutt.)

9. *V. praemorsa* Dougl. Plants  $2\frac{1}{2}$  to 10 in. high, at first flowering from the ground, later producing ascending or erect leafy stems which arise from erect or ascending rootstocks; herbage villous-pubescent to nearly glabrous; leaves oblong-ovate to ovate-lanceolate, obtuse, entire or slightly repand-crenulate or barely denticulate, 1 to 3 in. long, more or less attenuate into the long margined petiole; peduncles usually shorter than the leaves; petals canary-yellow, more or less tinged with brown or purple, 5 to 6 lines long; stigma not beaked, bearded below its margin; capsule ovate, pubescent.—Swales in pine woods, 1700 to 7000 ft., Siskiyou and Modoc Cos., thence s. to Mariposa Co.; n. to B. C., e. to Rocky Mts.

10. *V. glabella* Nutt. Stems erect, mostly weak, naked below or nearly so, 3 to 12 in. high; rootstock horizontal, thick, fleshy-scaly, often branching; herbage glabrous or puberulent, bright green; basal leaves reniform-cordate,  $1\frac{1}{2}$  to  $3\frac{3}{4}$  in. broad, on elongated (2 to 11 in.) petioles, the cauline similar or cordate, on petioles 4 to 5 lines long; stipules small and thin-membranous; peduncles about  $1\frac{1}{2}$  in. long; petals bright yellow, the lateral and lower purple-veined, 3 to 6 lines long, the lateral ones bearded; spur short and saccate; capsule oblong, 4 lines long, abruptly beaked.—Wet places in woods: Sierra Nevada, 3500 to 7700 ft., from Tulare Co. to Shasta Co.; Coast Ranges near the coast, 25 to 5000 ft., from Monterey Co. to Marin Co. and n.; n. to Alas., e. to northern Rocky Mts. Mar.-May.

11. *V. pedunculata* T. & G. YELLOW PANSY. Fig. 637. Plants 4 to 13 in. high; stems from a thick and short deeply seated rootstock, branching at the surface of the ground; leaves round-ovate, usually with a truncate base, coarsely crenate,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long, on petioles 1 to 2 in. long; stipules foliaceous, narrowly lanceolate, uppermost often sparingly incised; peduncles erect, 4 to 5 in. long, much surpassing the leaves, bearing flowers

637. *Viola pedunculata* T. & G.; a, habit x  $\frac{1}{4}$ ; b, fl. x 1; c, anther column x 3; d, capsule x 1; e, dehiscent capsule x 1.

$\frac{3}{4}$  to  $1\frac{1}{2}$  in. broad; petals golden-yellow, the upper ones dark brown on the outside, the others purple-veined within; lateral petals with a bearded spot; stigma bearded.—Low hills, 100 to 2000 ft.: Solano and Napa Cos. to Monterey Co.; s. to coastal S. Cal.

12. *V. ocellata* T. & G. WESTERN HEART'S EASE. Fig. 638. Stems erect, 5 to 12 in. high, from deep-seated rootstocks; leaves cordate- to triangular-ovate, crenate, acute or abruptly acuminate or somewhat pointed at apex, 1 to  $2\frac{1}{2}$  in. long, the basal long-, the cauline short-petioled; stipules small and scarious; peduncles mostly shorter than the leaves; petals 5 to 7 lines long; two upper petals white, violet-purple on the outside, the other petals white or yellow, the lateral with a deep purple spot at base, the lower one purple-veined at base.—Shady woods, chiefly in the Redwood belt, Monterey Co. to Humboldt Co.; n. to Ore. Mar.-June.

638. *Viola ocellata* T. & G.; a, habit x  $\frac{1}{2}$ ; b, fl. x 1.

13. *V. cuneata* Wats. Stems leafy, ascending from a short thickish rootstock, 2 to 7 in. long; herbage glabrous; basal leaves deltoid- or round-ovate, abruptly acute, truncatish or subcuneate at base, serrulate or crenulate,  $\frac{1}{2}$  to 1 in. long, the petioles slender; the cauline leaves rhombic- to oblong-ovate; peduncles little exceeding the leaves; petals 4 to 6 lines long, the two upper deep purple (especially on the back), the 3 lower ones paler or whitish, the lateral with a purple

blotch at base, the lower purple-veined at base, bordered or blotched with white; spur short, yellowish.—Montane, 2000 to 4000 ft.: n. Humboldt Co.; Trinity, Siskiyou and Del Norte Cos.; n. to southwestern Ore.

14. *V. adunca* Sm. WESTERN DOG VIOLET. Fig. 639. Stems tufted, very short (3 to 6 lines long) or becoming 1 to 4 in. long, leafy; leaves round-ovate to elliptic-ovate, the lower inclining to be subcordate, obscurely crenate,  $\frac{1}{3}$  to 1 in. long; peduncles surpassing the leaves; petals violet, turning to red-purple, 4 to 6 lines long, the lateral strongly bearded on the upper side at base, the upper pair with a slight tuft in the middle at base; spur varying from much shorter to quite as long.—Meadows, 3500 to 9500 ft.: San Bernardino Mts.; Sierra Nevada and n. to Siskiyou Co.; hilltops near the sea, 50 to 2000 ft., San Francisco to Humboldt Co.; n. to Alas., e. to Rocky Mts. (*V. canina* var. *adunca* Gray.) Var. *OXYCERAS* Wats. Peduncles mostly shorter than the leaves; spur narrow, acute, about as long as the petals.—Sierra Nevada from Mariposa Co. to Nevada Co.

639. *Viola adunca* Sm.; a, habit  $\times \frac{1}{2}$ ; b, cross sect. of capsule  $\times 2\frac{1}{2}$ .

15. *V. howellii* Gray. Similar to no. 14; leafy stems 5 to 8 in. high; leaves cordate-ovate,  $1\frac{1}{4}$  to  $1\frac{3}{4}$  in. long; peduncles long and scape-like; petals blue, 6 to 8 lines long.—North coastal swamps, rare: Pt. Reyes, Marin Co., and Noyo, Mendocino Co. (acc. E. Brainerd); n. to Wash.

16. *V. langsdoerffii* Fisch. Plants 3 to 8 in. high, the leaves and scape-like peduncles from creeping rootstocks or from short ascending stolons; leaves round-cordate, crenulate, 1 to  $1\frac{1}{4}$  in. long, petioles  $1\frac{1}{2}$  to 8 in. long; stipules rather large; petals blue or violet (or white), 7 to 10 lines long; lateral petals usually bearded; spur saccate, as broad as long.—Along the coast, Mendocino Co. to Del Norte Co.; n. to Alas.

640. *Viola blanda* Willd.; a, habit  $\times \frac{1}{2}$ ; b, c, side and rear views of flower  $\times 1$ .

17. *V. nephrophylla* Greene. Plants 3 to 8 in. high, the leaves and scape-like peduncles arising direct from a short thick rootstock; herbage glabrous; leaves ovate-reniform or -cordate, crenate,  $\frac{3}{4}$  to  $2\frac{1}{4}$  in. long, long-petioled; peduncles usually exceeding the leaves; petals blue or violet, 5 to 7 lines long, the upper slightly and the lower and lateral strongly bearded, the spur saccate.—Montane, springy spots, 3000 to 6000 ft.: San Jacinto Mts.; San Bernardino Mts.; San Gabriel Mts.; Sierra Nevada from Nevada Co. n. to Modoc Co.; n. to B. C., e. to Ariz. Apr.-June. (*V. cucullata* Bot. Cal. *V. palmata* var. *cucullata* Auth.)

18. *V. palustris* L. Peduncles scape-like, these and the leaves arising directly from the slender or filiform rootstock, 3 to 4 in. high; leaves round-

cordate, 1 to 2 in. long; petals pale violet, sometimes white, 3 to 4 lines long.—Del Norte Co.; n. to B. C., thence e. to N. Eng.

19. *V. blánda* Willd. Fig. 640. Plants  $\frac{3}{4}$  to 3 in. high; peduncles scape-like, these and the leaves arising from underground filiform rootstocks; herbage glabrous or nearly so; leaves ovate-cordate to round-reniform, crenulate, thin,  $\frac{1}{4}$  to  $1\frac{1}{2}$  in. long, on slender marginless petioles; flowers faintly sweet-scented; sepals oblong- to broadly-lanceolate; petals white, 3 to 4 lines long, commonly beardless, the lowermost usually conspicuously dark-veined.—Montane, 6000 to 8800 ft.: San Jacinto Mts.; San Bernardino Mts.; Sierra Nevada; n. to B. C., e. to the Atlantic. Var. *MACLOSKEYI* Jepson n. comb. Petals translucent.—Fresno Co. to Nevada Co.; n. to Ore. (*V. macloskeyi* Lloyd.)

20. *V. occidentális* Howell. Peduncles scape-like, these and the leaves arising directly from the rootstock, 3 to 6 in. high; herbage glabrous; leaves ovate to rhomboid-ovate,  $\frac{3}{4}$  to 2 in. long, attenuate at base into a long petiole; petals white, the lower veined with purple, the lateral ones with a bearded spot.—Marshes, Del Norte Co. (M. S. Baker); n. to southwestern Ore.

### LOASACEAE. LOASA FAMILY

Herbs or bushes with either rough or stinging hairs, and often with white deciduous bark. Leaves in ours alternate. Flowers regular, complete, white, yellow or reddish. Calyx limb 5-lobed. Petals 5. Stamens usually very numerous, sometimes few and definite, inserted with the petals on the base of the calyx-tube. Ovary inferior, 1-celled; style 1, entire or cleft. Fruit a capsule, crowned with the calyx-lobes (except in *Petalonyx*).

Stamens many; seeds few to many.

Stamens inserted below petals; style entire or 3-cleft; seeds on 3 parietal placentae...

1. *MENTZELIA*.

Stamens adnate to the united bases of the petals; style 5-cleft; seeds on 5 parietal placentae.....2. *EUCNIDE*.

Stamens 5; style entire; seed solitary.....3. *PETALONYX*.

#### 1. *MENTZELIA* L.

Erect annuals or biennials. Leaves in age brittle, adhering very tightly to clothing by means of barbed hairs. Flowers terminal, solitary or cymose, small or showy. Capsule dehiscent at the summit, few to many-seeded. Seeds prismatic, irregularly angled or flat; endosperm scanty. (C. Mentzel, a German botanist of the 17th century.)

A. Petals  $\frac{3}{4}$  to  $2\frac{1}{2}$  in. long ( $\frac{1}{2}$  to 1 in. long in one var. of no. 4).

Outer filaments dilated above and prolonged on either side of the anther as a shoulder or tooth.

Flowers subtended and the ovary concealed by a pair of white scarious bracts with green lacinate margin; prolongation of filament equaling or exceeding the anther.....1. *M. involucreta*.

Flowers subtended by small foliaceous bracts not concealing the ovary; prolongation of filament not equaling the anther.....2. *M. tricuspis*.

Outer filaments not prolonged on either side of anther.

Petals broadly oblanceolate, light yellow,  $1\frac{3}{4}$  to  $2\frac{1}{2}$  in. long; 5 of the stamens with petaloid filaments.....3. *M. laevicaulis*.

Petals obovate, abruptly acuminate, golden-yellow, 1 to  $1\frac{1}{4}$  in. long; 15 of the stamens with dilated bases.....4. *M. lindleyi*.

B. Petals commonly 2 to 3 lines long, never exceeding 9 lines.

Flowers subtended and partly hidden by floral leaves or bracts.

Filaments all filiform; floral leaves white-membranous; petals 3 to 6 lines long.....

5. *M. congesta*.

Five of the filaments petaloid; floral leaves green-herbaceous; petals  $1\frac{1}{2}$  to 2 lines long.....6. *M. micrantha*.

Flowers not hidden by floral leaves or bracts.

Seeds margined all around with broad white wing.....7. *M. multiflora*.

Seeds not wing-margined.

Stamens about 10 to 25; seeds prismatic or 3-sided, mostly truncate at the ends, grooved on the angles, microscopically muricate or tuberculate, seemingly smooth.

Petals 1 to  $2\frac{1}{2}$  lines long; leaves commonly entire (rarely toothed).....

8. *M. dispersa*.

Petals  $2\frac{1}{2}$  to  $3\frac{1}{2}$  lines long; leaves usually deeply pinnatifid.....

9. *M. affinis*.

Stamens 25 or more (or 9 to 13); seeds irregularly angled, not grooved on the angles or rarely on one angle, minutely but obviously tuberculate or muriculate.

Flowers in terminal cymes; capsules erect.

Petals 1 to 2 lines long; stems very white; deserts... 10. *M. albicaulis*.

Petals 3 to 6 lines long; stems mostly green or greenish; mostly coastal.

11. *M. gracilentia*.

Flowers solitary in the upper forks of the stem; capsules pendulous or deflexed on the pedicels which are recurved at apex... 12. *M. reflexa*.

1. *M. involucrâta* Wats. Stems branching, with very white bark, 3 to 16 in. high; herbage hispid with stiff hairs; leaves linear to oblong-lanceolate or oblanceolate, coarsely sinuate-dentate, 2 to 6½ in. long, the lower attenuate into a petiole, the upper sessile and clasping; flowers solitary, terminal, closely subtended by a pair of broad white scarious bracts with deeply laciniate-toothed green margin; petals obovate, abruptly acuminate, pale cream-color with a tinge of crimson in center, (¾ or) 1 to 2½ in. long; stamens numerous, slender, ½ as long as the petals, the outer dilated above and continued with a long cusp on each side of the anther; style 3-lobed; capsule 9 to 12 lines long, 3 lines broad at apex; seeds flattened, rugose, minutely tuberculate.—Gravelly washes and rocky cañon sides, 250 to 2200 ft.: Colorado Desert and e. Mohave Desert. May.

2. *M. tricúspis* Gray. Stems branching from or near the base, 3 to 7 in. high; herbage hispidulous; leaves narrow-oblong to oblanceolate, saliently toothed or serrate to subentire, 1 to 1¾ in. long, attenuate at base into a short petiole; flowers terminal on short branches; calyx-lobes filiform-subulate, becoming involute and caudiform-rotate after anthesis; petals straw-white, narrow-obovate, obtuse, sharply apiculate, 6 to 10 lines long; stamens in 4 or 5 rows, the 2 outer rows with dilated filaments, the anthers borne on a short filiform prolongation in the acutely notched apex; ovary oblong, hirsute, papillate-tesselated; style 3-cleft; capsule in age reflexed; seeds strongly rugose, the wrinkles between the rugae few and deep.—Stony hills: Mohave and Colorado deserts; e. to Nev.

3. *M. laevicaulis* (Dougl.) T. & G. BLAZING STAR. Fig. 641. Stout branching biennial, 2 to 3½ ft. high, with shining white nearly smooth stems; leaves narrowly oblong or lanceolate, sinuately toothed, 3 to 7 in. long; flowers in clusters of 2 or 3 at the ends of the branches, 3 to 4 in. broad, light yellow; calyx-segments lanceolate, 1 to 1¼ in. long; petals broadly oblanceolate, 1¾ to 2½ in. long, the numerous stamens almost as long; 5 stamens with petaloid filaments; capsule oblong, 1¼ in. long; seeds flat, with a broad thin margin or wing.—Gravelly summer beds of winter flood streams, 100 to 5000 ft., almost throughout Cal.; n. to Ore., e. to Wyo.

4. *M. lindleyi* T. & G. Fig. 642. Stem slender, simple or branching, 6 in. to 2 ft. high; leaves ovate to narrowly lanceolate, pectinately pinnatifid with entire or toothed lobes, or coarsely toothed, 2 to 3 in. long; flowers axillary and terminal; calyx-lobes 5 to 9 lines long, broadly lanceolate, acuminate; petals obovate, abruptly acute, golden yellow with vermilion base

641. *Mentzelia laevicaulis* T. & G.; a, fl. branchlet x ½; b, leaf x ½; c, d, stamens x 1; e, cross sect. of ovary x 4½.

1 to  $1\frac{1}{2}$  in. long; stamens numerous, about  $\frac{3}{4}$  as long as the petals; filaments very slender, about 15 of the outer ones with somewhat dilated bases; style entire; capsule linear-clavate, 1 to  $1\frac{1}{4}$  in. long; seeds irregularly angular, minutely tuberculate.—Rocky cañon slopes, 500 to 2000 ft.: Mt. Hamilton Range; Sierra Nevada foothills from Tuolumne Co. to Tulare Co. Var. *EREMOPHILA* Jepson n. var. Petals rounded at apex or with a very slight acumination,  $\frac{1}{2}$  to 1 in. long; stamens about  $\frac{1}{2}$  as long as petals.—Desert mesas: Big Pine, Inyo Co. (Hall & Chandler 6680, type); Randsburg.

5. *M. congesta* T. & G. Stems branching from near the base, 4 to 26 in. high; herbage hispidulous; leaves ovate to lanceolate, pinnatifid, coarsely few-toothed, 1 to  $2\frac{1}{2}$  in. long, sessile or the lower sharply petioled; flowers clustered at the ends of the branches, subtended by conspicuous bracts; bracts broad, toothed, 3 to 9 lines long, with a large circular white-membranous center; petals golden-yellow, 3 to 6 lines long; filaments all filiform; capsule clavate, 6 to 9 lines long; seeds irregularly angled, minutely tuberculate,  $\frac{1}{2}$  to  $\frac{3}{4}$  line long.—Washes, cañons or montane valleys, 3500 to 8500 ft.: e. slope, c. summits or e. side of the Sierra Nevada from Inyo Co. to Lassen Co.; n. to Ore., e. to Nev. Var. *DAVIDSONIANA* Mcbr. Much less branched; leaves mostly entire; flower clusters smaller; bracts and calyx-lobes about half as large.—San Gabriel and San Bernardino mountains; s. Sierra Nevada in Tulare Co.

6. *M. micrantha* T. & G. Fig. 643. Stems branched from the base, 1 to 3

ft. high, sometimes compactly dichotomous and forming low mounds 1 to 2 ft. broad; herbage rough-hispid, at least above; leaves ovate to lanceolate, acute or acuminate, coarsely serrate or sinuate-toothed, 1 to  $3\frac{3}{4}$  in. long, the basal to 9 in. long, the uppermost roundish, entire, 2 to 6 lines long; flowers congested in very compact clusters, very small, shorter than or scarcely exceeding the short broad floral leaves; petals oval or obovate,  $1\frac{1}{2}$  to 2 lines long, twice

642. *Mentzelia lindleyi* T. & G.; a, basal leaf  $\times \frac{1}{4}$ ; b, fl. branchlet  $\times \frac{1}{2}$ ; c, seed  $\times 3$ .

643. *Mentzelia micrantha* T. & G.; a, fl. branchlet  $\times \frac{2}{3}$ ; b, fl.  $\times 2\frac{1}{2}$ ; c, stamen  $\times 4$ ; d, petaloid stamen  $\times 4$ .

longer than the calyx-lobes; stamens 10 to 12, 5 of the filaments (opposite the sepals) petal-like, usually with emarginate apex; capsule linear, sharply triangular. 3 lines long; seeds prismatic with grooved angles, 1 line long, twice as long as broad.—Coast Range hills, 1000 to 3000 ft., from w. Colusa Co. and Lake Co. to Monterey Co., and s. to the San Gabriel and San Bernardino Mts. and western Riverside Co. May-June.

7. *M. multiflora* Gray. Stem shining white, freely and often diffusely branched, 8 to 24 in. high; herbage harshly short-hispid; leaves oblong to oblanceolate, entire to sinuate-pinnatifid, 1 to 3 in. long, the upper sessile, the lower with winged petioles; flowers numerous, terminal on the branches in cymose clusters, subtended by a minute lanceolate bract; calyx-teeth lanceolate-subulate,  $3\frac{1}{2}$  lines long, closely reflexed in flower; petals narrow-obovate, 4 to 6 lines long; stamens numerous; about 10 filaments of outer stamens dilated or petaloid, the 5 alternate the petals with anthers, the others without anthers; capsule broadly oblong-obconic, 6 to 11 lines long, commonly naked at summit in maturity, that is without calyx-lobes; seeds white, flat, broadly wing-margined.—Desert washes, 300 to 5000 ft.: Colorado Desert and e. Mohave Desert; Inyo Co.; e. to N. Mex. and Col., s. to L. Cal. Apr.-May. (*M. pumila* var. *multiflora* Urb. & Gilg.)

8. *M. dispersa* Wats. Fig. 644. Stems usually branching, 8 to 18 in. high; herbage minutely pubescent; leaves oblong to ovate, lanceolate or linear, entire or sometimes toothed,  $\frac{1}{2}$  to 4 in. long; flowers approximate near the ends of the branches; petals yellow with a small orange spot at base, elliptic or obovate, 1 to 2 lines long; stamens 12 to 14; filaments not dilated; capsule linear, 6 to 9 lines long; seeds cubical.—Montane, 2500 to 7000 ft.: San Bernardino Mts.; San Gabriel Mts.; Mt. Pinos; Sierra Nevada; North Coast Ranges. Var. *PINETORUM* Jepson n. comb. Stems slender, with few long branches, the branches nearly naked, that is with few much-scattered leaves.—San Gabriel Mts.; Mt. Sanhedrin. (*M. pinetorum* Hel.) Var. *OBTUSA* Jepson n. var. Upper leaves usually many, disposed to be orbicular or round-ovate, often very obtuse, 3 to 5 lines long.—Montane, 4000 to 7000 ft.: San Bernardino Mts. (H. P. Chandler, type); San Gabriel Mts. (San Antonio and Icehouse cañons).

9. *M. affinis* Greene. Stem stoutish, branched from the base or simple below, 1 to 3 ft. high; herbage harsh-puberulent; leaves lanceolate or ovate in outline, deeply and often sharply pinnatifid, 1 to 2 (or  $3\frac{1}{2}$ ) in. long; flowers numerous but not congested; calyx-lobes subulate, 2 lines long; petals yellow, often fading whitish,  $2\frac{1}{2}$  to 3 lines long; capsule linear, subterete, 9 to 11 lines long, hispid with short stiff white hairs; seeds very short-prismatic, somewhat irregularly or obliquely truncate at each end, with grooved angles.—Stony hillslopes or sandy valley levels, 100 to 2000 (or 4000) ft.: coastal S. Cal.; Colorado and Mohave deserts; n. to the San Joaquin Valley; inner South Coast Ranges.

10. *M. albicaulis* Dougl. Stem slender, branched from the base, 3 to 12 (or 15) in. high; herbage rough-hispidulose, or the stems glabrous, commonly very

644. *Mentzelia dispersa* Wats.; a, habit x  $\frac{1}{2}$ ; b, fl. x  $1\frac{1}{2}$ .

white; leaves linear-lanceolate in outline, sessile, 1 to 4½ in. long, pinnatifid with numerous narrow subequal lobes, the upper broader and often lobed or toothed at base only, or rarely entire; flowers in terminal cymes; calyx-lobes a little shorter than the petals; petals yellow, spatulate or obovate, 1½ to 3 lines long; filaments all filiform; style shortly 3-cleft; capsule linear-clavate, 6 to 9 lines long; seeds irregularly angled with obtuse margins, microscopically but markedly muriculate, ½ line long.—Stony mesas and cañon sides, 300 to 5700 ft.: Colorado and Mohave deserts; n. on east side Sierra Nevada to eastern Wash., e. to N. Mex.

11. *M. gracilenta* T. & G. Stem mostly green or greenish, sparingly branched or often simple, ½ to 1½ ft. high; leaves narrowly oblong in outline, pinnatifid into broadly linear lobes or only coarsely sinuate-toothed; upper leaves sometimes disposed to be ovate or lanceolate, somewhat sharply cleft or entire; flowers clustered at the summit; petals lemon-yellow with orange base, obovate or oblanceolate, rounded or retuse at apex, 4 to 7 lines long; filaments dilated and somewhat united at base; capsule clavate to obconic, 6 to 9 lines long; seeds in 3 rows, prismatic, minutely tuberculate, ⅔ line long.—Valleys and hillslopes, 200 to 4000 ft.: Monterey Co. to Ventura Co. and the San Jacinto Mts., thence e. to Inyo Co. and Nev., s. to L. Cal. Var. *PECTINATA* Jepson n. comb. Leaves mostly pectinately pinnatifid; petals golden yellow, broadly obovate.—Sierra Nevada foothills from Tuolumne Co. to Kern Co.; Marysville Buttes. (*M. pectinata* Kell.) Var. *VEATCHIANA* Jepson n. comb. Petals 2½ to 3 lines long.—San Gabriel and San Bernardino Mts.; Mohave Desert; e. to Nev. (*M. veatchiana* Kell.)

12. *M. reflexa* Cov. Stems stout, diffusely branching from the base, 5 to 8 in. high; herbage hirsute; leaves ovate, coarsely dentate, ¾ to 1¼ in. long, shortly petioled or sessile; flowers solitary in the upper forks; calyx-lobes subulate from a triangular base, 2 to 2½ lines long; petals oblong-oblanceolate, equaling the calyx-lobes; stamens 9 to 13; filaments somewhat dilated; style cleft for ½ its length; capsule oblong, 3½ to 4½ lines long, its pedicel reflexed at apex; seeds angular, somewhat compressed, grooved on either face, muriculate.—Desert ranges about Death Valley.

645. *Eucnide urens* Parry; a, fl. branchlet x ½; b, long. sect. of fl. x ¾; c, cross sect. of ovary x 2.

## 2. *EUCNIDE* Zucc.

Herbs or bushes armed with stinging hairs and barbed pubescence. Leaves alternate, ovate, petioled, coarsely toothed. Flowers yellow, pediceled, mostly in terminal bracted cymes. Calyx-limb 5-lobed, persistent. Petals 5, united at base and inserted on the throat of the calyx. Stamens numerous, the filaments filiform, inserted on the base of the petals in a broad band and deciduous with them in a ring. Placentae 5, prominently expanded, covered with ovules; style 5-cleft, the lobes often twisted. Capsule obovate, opening by 5 valves at the summit. Seeds minute, longitudinally striate. (Greek eu, true, and cnide, sea-nettle.)

1. *E. urens* Parry. Fig. 645. Low bush 1 to 2 ft. high, the stout stems erect-spreading, or often all decumbent and 2 to 5 ft. long; herbage finely puberulent and covered with 2 kinds of bristles, simple bristles and barbed bristles; bristles on upper surface of leaves with broad

disks at base; leaves broadly ovate, 1 to 2½ in. long; pedicels 3 to 6 lines long; calyx-lobes lanceolate, 6 to 10 lines long; corolla lobes narrowly obovate, abruptly acuminate, 1½ in. long, united at the base into a tube 3 lines long; filaments equaling the calyx-lobes; style stout, cleft to the middle, the cleft portion twisted; capsule ½ in. long.—Shade of cliffs or in rocky places, desert ranges, 2000 to 3000 ft.: Inyo Co.; e. to Utah, thence s. to L. Cal. May.

### 3. PETALONYX Gray.

Rough-pubescent perennial herbs or low shrubs, with alternate leaves and small whitish or yellowish flowers. Calyx-limb with 5 linear deciduous lobes as long as ovary. Petals 5, the long claws of the blades connivent, thus simulating a 5-lobed sympetalous corolla. Stamens 5, free, long-exserted. Ovary linear, densely short-hairy, 5-ribbed, 1-celled with one pendulous ovule; style 1. long, exserted; stigma 1. Capsule small, oblong, dehiscing irregularly. (Greek, petalon, leaf, petal, and onyx, claw.)

Leaves sessile, dull or greenish-white.....1. *P. thurberi*.  
Leaves petioled, shining.....2. *P. nitidus*.

1. *P. thurberi* Gray. SANDPAPER PLANT. Fig. 646. Thickly branched bush, woody at base, 1 to 3 ft. high and 2 to 7 ft. broad; leaves sessile, narrow-ovate, lanceolate or triangular-lanceolate, mostly entire or some few-toothed toward the base, 3 to 8 lines long; flowers greenish-white, in short spikes or heads, these corymbosely disposed; calyx-lobes short, woolly, 1 line long; petals 2 lines long, the blades obovate, obtuse, the claws hairy; stamens 1½ times as long as the corolla; ovary subtended by 2 short bractlets; capsule 1 line long.—Desert plains and mesas, frequent: Colorado and Mohave deserts; Inyo Co.; e. to Ariz. and southern Nev. July.

2. *P. nitidus* Wats. Stems many 646. *Petalonyx thurberi* Gray; a, fl. branch-  
let x 1; b, fl. x 6.  
from the root-crown, erect or bush-like, 13 to 16 in. high; leaves broadly or round-ovate, coarsely few-dentate on each side, 7 to 12 lines long; inflorescence densely panicle.—Desert slopes, 4000 to 7000 ft., rare: Colorado and Mohave deserts; Inyo Co.; e. to Utah.

## DATISCACEAE. DATISCA FAMILY

Perennial herbs with alternate and in ours divided leaves. Flowers dioecious or in ours the pistillate commonly with a few stamens. Calyx synsepalous. Corolla none. Stamens indefinite. Ovary inferior, 1-celled, with 3 parietal placentae; styles 3, bifid. Fruit a capsule, opening at the top between the styles.

### 1. DATISCA L.

Stout glabrous herb. Leaves divided and more or less incised and sharply serrate. Flowers in clusters in the axils of the leafy branches. Calyx of staminate flower very short, with 4 to 9 unequal lobes; stamens in ours 8 to 12, mostly 10; filaments short. Calyx of pistillate flowers with ovoid tube, somewhat 3-angled, 3-toothed; stamens (when present) 2 to 4, alternate with the teeth. Seeds numerous, small, in 2 to several rows on the placentae. (Derivation unknown.)

647. *Datisca glomerata* Brew. & Wats.; a, lower leaf  $\times \frac{1}{4}$ ; b, pistillate fl. branchlet  $\times \frac{1}{4}$ ; c, pistillate fl.  $\times 2$ ; d, staminate fl.  $\times 2$ .

1. *D. glomerata* (Presl.) Baill. DURANGO ROOT. Fig. 647. Stems commonly clustered, stoutish and somewhat fistulose, erect, branching above,  $2\frac{1}{2}$  to 5 (or 8) ft. high; leaves 5 to 6 in. long; staminate calyces less than 1 line long, the pistillate calyces 4 to 5 times as long.—Dry stream beds or washes, 150 to 5000 ft.: Coast Ranges; Sierra Nevada; S. Cal.; s. to Mex. May-June.

## CACTACEAE. CACTUS FAMILY

By SAMUEL B. PARISH

Succulent plants, the stems columnar, globose, terete or flattened, ours leafless or (in *Opuntia*) with small subulate early caducous leaves. Branches, spines, flowers and other parts developed from specialized organs called areoles. Flowers usually perfect, solitary and sessile. Sepals and petals numerous, commonly intergrading, imbricated in several rows, their bases coalescent, forming a tube or cup adherent to the ovary. Stamens numerous, the filaments inserted on the throat of the perianth. Style 1; stigmas 2 to many; ovary inferior, 1-celled; ovules numerous, parietal. Seeds usually numerous.

Stems jointed, cylindrical or flattened; areoles containing numerous minute barbed bristles (glochids); leaves small, subulate, early deciduous; flowers and barbed spines produced from the same areoles. . . . . 1. *OPUNTIA*.

Stems continuous, leafless; areoles destitute of glochids; spines never barbed; spiniferous and floriferous areoles distinct.

Stems globose, obovoid, cylindrical or columnar, ribbed; spines borne in bundles on the ribs.

Flowers produced above mature spine-bundles below the summit of the ribs. . . . . 2. *CEREUS*.

Flowers produced above nascent spine-bundles at the summit of the ribs. . . . . 3. *ECHINOCACTUS*.

Stems globose or obovoid; spines borne on tubercles and the small flowers produced between the tubercles. . . . . 4. *MAMILLARIA*.

### 1. *OPUNTIA* Mill. PRICKLY PEAR

Plants shrub-like, with jointed cylindrical and tuberculate or flattened stems. Areoles situated at the axils of the small leaves, and bearing numerous glochids and usually spines and wool. Flowers with rotate corollae. Sepals thick, green or partly colored, grading into the purple, yellow or reddish petals. Stamens shorter than the petals. Ovary bearing leaves and glochids, spiny or spineless; stigma-lobes short. Fruit succulent or dry, obovate-truncate; seeds large, meniscoidal or discoidal, often margined; cotyledons foliaceous; embryo curved. (Old Latin name.)

#### A. Joints cylindrical, tuberculate.—Subgenus *CYLINDROPUNTIA*.

Spines polished, covered with loose hyaline sheaths.

Stems slender, the woody axis solid; tubercles flattened. . . . . 1. *O. ramosissima*.

Stems thick and fleshy, the woody axis a reticulated cylinder.

Ultimate joints readily disarticulating; fruit proliferous, spineless, or nearly so.

Tubercles nearly quadrangular; spines whitish, shining; deserts. . . . . 2. *O. bigelovii*.

Tubercles longer than wide; spines dull, yellow; coastal. . . . . 3. *O. prolifera*.

Joints firmly attached; tubercles prominent, elongated.

Tubercles 2 to 3 times as long as wide.

Fruit-spines stoutish, in bundles of 8 to 12; deserts. 4. *O. acanthocarpa*.

Fruit-spines acicular, solitary or few; interior. . . . . 5. *O. parryi*.

Tubercles less than twice as long as wide.  
 Tubercles ovate; principal spines 3 or 4; deserts... 6. *O. echinocarpa*.  
 Tubercles flattish; principal spines 7 to 20; coastal... 7. *O. serpentina*.  
 Spines rugulose, roughened, gray, sheathless; woody skeleton wanting, or rudimentary...  
 8. *O. clavata*.

*B. Joints flattened, not tuberculate.*—Subgenus *PLATYOPUNTIA*.

Fruit dry.

Fruit spineless, or nearly so.

Joints spineless... 9. *O. basilaris*.

Spines few, short and slender... 10. *O. treleasei*.

Fruit spiny.

Areoles approximate.

Spines acicular, or a few bristle-like... 11. *O. erinacea*.

Spines all bristle-like, elongated, copious... 12. *O. ursina*.

Areoles distant; spines subulate; usually unarmed below... 13. *O. rhodantha*.

Fruit fleshy or juicy.

Arboreous, with definite trunk and upwardly-spreading branches; or sometimes large shrubs.

Spines wanting or few, if present whitish or brown; joints large; introduced species.

Fruit yellowish or reddish, fleshy; umbilicus flat... 14. *O. megacantha*.

Fruit purple throughout, soft; umbilicus depressed... 15. *O. ficus-indica*.

Spines present, yellow; fruit purple with green flesh; deserts... 16. *O. chlorotica*.

Shrubby, much-branched from the base; spinose.

Joints 6 to 12 in. long; flowers yellow.

Stems erect or ascending; cismontane... 17. *O. occidentalis*.

Stems assurgent or prostrate; deserts... 18. *O. mojaviensis*.

Joints 3 to 6 in. long, prostrate or assurgent; flowers yellow or purplish; cismontane... 19. *O. vaseyi*.

1. *O. ramosissima* Engelm. Erect, few (rarely numerous) -stemmed, 2 to 4 ft. high; mature stems grayish, very woody; usually sparsely spinose above, sometimes spineless, rarely spiny throughout; tubercles tessellate, 4 to 6-angled, the solitary spines from an apical groove, 1 to 1½ in. long, the yellow sheaths loose and shining; flowers ¼ in. long, purplish; fruit dry, 1 in. long, densely covered with slender tawny spines and abundant axillary wool.—Gravelly benches or washes, frequent but solitary or distant: Colorado and e. Mohave deserts; Inyo Co.; s. Nev. to Ariz. and Sonora.

2. *O. bigelovii* Engelm. Erect, 2 to 4 ft. high, the usually solitary stem upwardly branched, above forming a close head; joints short, turgid, the ultimate readily detached, the primary strongly adherent, the lowest hanging dead and blackened about the trunk; tubercles quadrangular, elevated, concealed by the abundant divergent spines, 1 to 1¼ in. long, yellowish and glistening; flowers in clusters, greenish-yellow, 1½ in. high; fruit dry, spineless or nearly so, 1 in. high, few-seeded, usually sterile.—Hillsides or benches, usually gregarious, often extensively so: Colorado and Mohave deserts; s. Nev. to Ariz. and n. L. Cal.

3. *O. prolifera* Engelm. Stems several, stout, erect, 3 to 6 ft. high, with numerous spreading branches, the tumid ultimate joints 3 to 6 in. long, disarticulating; tubercles short, each with 6 to 12 spines ½ to 1 in. long, their loose sheaths rusty-yellow; flowers red; fruit subglobose, 1 in. long, spineless, or nearly so, usually sterile.—Arid hills near the coast, forming dense thickets: San Pedro to San Diego; n. L. Cal.

4. *O. acanthocarpa* Engelm. & Bigel. Erect, 4 to 6 ft. high, the stout stems few, with numerous alternate and acutely ascending branches; tubercles prominent, elongated and laterally flattened, each bearing 8 to 25 unequal yellow spines, 1 in. long or less, their sheaths whitish or yellow; flowers reddish; fruit dry, armed with bunches of 10 to 12 stoutish spines; seeds more or less angled, the margins channeled.—E. Mohave Desert (New York Mts.; Providence Mts.); Nev. to s. Utah, Ariz. and Sonora; usually gregarious, but rare in Cal.

5. *O. parryi* Engelm. Stems few, erect, 2 to 4 ft. high, branches upwardly spreading; joints 6 to 12 in. long; tubercles prominent, ¾ in. long; areoles oblong, ½ in. long, bearing abundant white wool and 1 to 3 unequal acicular yellow spines (these brown in age, ½ to 1 in. long, deflexed or porrect) and 4 to 7 shorter ones; flowers numerous, ¾ in. long, clustered about the ends of older stems, yellowish, tinged with red; fruit broadly obovate, ¾ to 1 in. long, with 3 or 4 rows of prominent tubercles, the upper ones each

bearing a single acicular spine,  $\frac{1}{4}$  to  $\frac{1}{2}$  in. long; seeds 1 to several, their margins channelled.—Gravelly soil, interior arid valleys of cismontane S. Cal.: Riverside; San Bernardino; Banning; abundant but scattered and not forming close thickets. The fruit remains green and attached to the joint at least a year, at last becoming dry and falling off.

6. *O. echinocarpa* Engelm. & Bigel. Erect, assurgent or declined, either 1 to few-stemmed and loosely few-branched, or with few ascending stems and numerous spreading branches forming a compact bush, 3 to 5 ft. high (var. *robustior*); joints 3 to 6 in. long; tubercles short, ovate, each armed with 3 to 4 stout yellowish spines,  $\frac{1}{2}$  to 1 in. long, and 8 to 10 shorter ones; flowers clustered, yellowish, tinged with red; fruit dry, the upper areoles bearing bundles of 8 to 12 spines  $\frac{1}{4}$  to  $\frac{3}{4}$  in. long, usually unarmed below the middle; seeds numerous, their margins strongly channelled.—Mohave and Colorado deserts; e. to Utah and Ariz., s. to L. Cal.; individuals common but solitary, not forming thickets.

7. *O. serpentina* Engelm. Prostrate or assurgent, with divaricately ascending branches; branches elongated-cylindrical, not tumid, 6 to 12 in. long; tubercles prominent, short and flattish, each bearing 7 to 20 yellowish spines; flowers greenish-yellow, tinged with red; fruit broadly ovoid, deeply umbilicate, very spiny.—Dry coastal hills, San Diego; s. to northern L. Cal.

8. *O. clavata* Engelm. Stems prostrate, rooting along the lower surface; branches approximate, simple or 1 to 2-branched, clavate, erect, 3 to 5 in. high; tubercles prominent,  $\frac{1}{4}$  to  $\frac{1}{2}$  in. high; areoles circular, filled with white wool and few glochids; spines in clusters of 3 or 4, stout, flattened, divergent, ashy gray, becoming brownish at the joint, transversely rugulose, the lowest dagger-like, 1 to 2 in. long, and 6 to 10 unequal and acicular, all destitute of sheaths; flowers yellow; fruit becoming dry, ovate, 2 in. long, the deep umbilicus filled with the withered floral remains, the large tubercles having cushions of white wool and margined with abundant radiate yellow glochids,  $\frac{1}{4}$  in. long, with or without a few slender spines; seeds nearly  $\frac{1}{4}$  in. wide.—Sandy soil, forming mats, the prostrate stems often buried in the sand: Colorado Desert; e. Mohave Desert; e. to southern Nev., Col. and N. Mex. The spines and glochids appear to the touch, and even under a lens, to be destitute of barbs, but with the microscope a few weak barbs are seen near the points.

9. *O. basilaris* Engelm. Low and spreading, not over 1 ft. high, few-jointed; joints orbicular to obovate, mostly obtuse, 3 to 8 in. long, glaucous, glabrous or somewhat pubescent; areoles approximate, filled with abundant brown glochids, spineless; flowers 2 to  $2\frac{1}{2}$  in. long, purple to rose-purple; fruit dry, spineless; seeds about  $\frac{1}{4}$  in. wide, more or less angled, the raphe prominent.—Frequent in small clumps: Colorado and Mohave deserts and bordering mountain ranges, 3000 to 7000 ft; n. to Inyo Co.

10. *O. treléasi* Coulter. Stems spreading at base, branches assurgent, of 2 to 4 obovate joints, somewhat glaucous; areoles elevated, filled with yellow-brown glochids and mostly solitary (1 to 3) acicular divergent spines  $\frac{1}{4}$  in. or less long; flowers "red to scarlet" or "rose-colored"; fruit dry, subglobose, spineless or spiny; seeds nearly  $\frac{1}{4}$  in. wide.—Forming clumps on plains and hills, upper end of the San Joaquin Valley.

11. *O. erinacea* Engelm. Stems prostrate, the ascending or erect branches forming low clumps; joints ovate to oblong, 2 to 5 in. long; areoles approximate; spines white to brown, 1 to 3 in. long, acicular, or some bristle-like and longer; flowers nearly 2 in. long, "red" or yellow; fruit covered with slender spines.—Gravelly or stony slopes, Mohave Desert; e. to Nev., Utah and Ariz.

12. *O. ursina* Weber. GRIZZLY BEAR CACTUS. Several-stemmed, the ascending or erect branches forming clumps 8 to 12 in. high; joints obovate or oblong, 4 to 6 in. long; areoles approximate, bearing copious flexile bristle-like ashy-gray spines 3 to 8 in. long, which conceal the joints; flowers yellow, 1 to 2 in. high; ovary-areoles bearing wool and short slender spines; fruit dry and very spiny.—Gravelly slopes, e. Mohave Desert.

13. *O. rhodantha* Schuman. Stems prostrate; branches few-jointed, forming clumps; joints obovate to oblong, 1 to 4 in. long; areoles distant; spines 3 or 4, stout,  $\frac{1}{2}$  to 1 in. long, brownish, and 2 or 3 shorter, mostly confined to the uppermost areoles; flowers about  $\frac{1}{2}$  in. long, pink, or "red to salmon-color"; fruit dry and spiny; seeds small.—White Mts., ne. Inyo Co., 8000 to 11,100 ft.: e. to Neb.

14. *O. megacantha* Salm-Dyck. Usually arboreous, with a distinct trunk, 8 to 12 ft. high, or a stout bush, with ascending branches, 4 to 6 ft. high; joints thick, oblong, 6 to 18 in. long; areoles 1 to 2 in. distant, glochids soon deciduous, spineless, or with few brown spines, mostly near the margins; flowers large, yellow; fruit ovoid, 3 to 5 in. long, the umbilicus broad and flat, flesh crisp, palatable; seeds brownish.—Valleys, coastal S. Cal. Formerly much cultivated at the missions and ranchos, about some of which remains yet persist, it is in places spontaneous, and occasional in ornamental cultivation. Both this species and the next were in cultivation as fruit trees long previous to the discovery of America, and exhibit a diversity of variation comparable with that of the common cultivated fruits.

15. *O. ficus-indica* Mill. INDIAN FIG. Like no. 14 in habit, size and articulation, but usually more spinose; spines 1 to 3, whitish, somewhat flattened, unequal, the longest 1 to  $1\frac{1}{2}$  in. long; flowers yellow "or red"; fruit ovoid, 2 to 3 in. long, purple throughout, with a juicy flesh, edible; umbilicus deeply depressed.—Coastal S. Cal. (Santa Barbara; San Gabriel).

16. *O. chlorotica* Engelm. & Bigel. Arborescent in habit, 3 to 8 ft. high, with short and stout spiny trunk and ascending branches; joints 4 to 8 in. long, orbicular to ovoid or obovoid, light green; areoles approximate, prominent, each bearing 3 to 6 unequal slender yellow spines, mostly reflexed, about 1 in. long; flowers yellow; fruit  $1\frac{1}{2}$  to 2 in. long, purple without, the flesh green, edible; seeds small.—Stony slopes or in cañons, bases of the mountains; solitary or distant: Mohave and Colorado deserts; Nev. to Ariz., Sonora and n. L. Cal.

17. *O. occidentalis* Engelm. & Bigel. Several-stemmed from the base, the stout assurgent branches 3 to 5 ft. long; joints elongated-obovate, 6 to 12 in. long; areoles remote, prominent, each bearing 1 to 4 stout brown spines  $\frac{1}{2}$  to 1 in. long; flowers yellow, 2 to 3 in. long; fruit obovoid, 2 in. long, spineless; seeds orbicular, prominently margined,  $\frac{1}{4}$  in. wide.—Common on sandy or gravelly mesas or dry washes, 1500 to 7000 ft., often forming thickets, Santa Barbara to the San Bernardino Mts. Var. *COVILLEI* Parish n. comb. More erect, with thinner joints and slenderer spines.—Interior valleys of coastal S. Cal.: Claremont; San Bernardino; Elsinore. (*O. covillei* Britt. & Rose.) Var. *LITTORALIS* Parish n. comb. Joints thick, orbicular to oblong; spines becoming flattened, yellow.—Near the coast, Santa Barbara to San Diego. (*O. engelmannii* var. *littoralis* Engelm.) These opuntias (no. 17), here regarded as forming a single variable species, are alike in flower and fruit, but differ considerably, but indefinitely in the size, shape and thickness of the joints, characters apparently having some relation to geographical distribution, but affording no satisfactory lines of specific, and hardly of varietal, distinction.

18. *O. mojavensis* Engelm. Stems declined, the stout branches assurgent; joints widely obovate, 9 to 12 in. in diameter; spines in clusters of 2 to 6, somewhat flattened, white, and at base reddish-brown, unequal, the longest 2 in. long; spicules prominent, as long as  $\frac{1}{2}$  in.; flowers yellow; fruit ovate, about 1 in. long, spineless.—Mts., e. Mohave Desert.

19. *O. vaseyi* Britt. & Rose. Stems declined or prostrate, the spreading branches forming close often extensive mats 6 to 12 in. high; joints ovate, obovate or orbicular, 3 to 6 in. long; areoles large, each bearing 1 to 3 short brownish spines, or spineless; flowers clear to salmon-yellow; fruit spineless, ovate to globose, purple, juicy; seeds numerous, brown.—Abundant on gravelly mesas or in dry washes, inner valleys of cismontane S. Cal. Var. *MAGENTA* Parish n. comb. Usually somewhat smaller and with smaller joints; flowers magenta.—With the species and completely intergrading with it. (*O. magenta* Griff.)

2. **CEREUS** Mill. TORCH CACTUS

Plants varying greatly in form and habit, ours columnar, oblong or cylindric, with spine-bearing ribs. Floriferous areoles immediately above mature spiniferous areoles, flowers therefore lateral. Flowers funnelliform, ours with short tube and spreading limb. Ovary bearing scales, which are with or without wool or spines in the axils. Seeds small, black, numerous. (Latin *cereus*, waxen, referring to the candle-like stem of some species.)

Flowers yellow or white.

Stems cylindric; flowers small, yellow; scales of the tube and ovary spiny in the axils; fruit spiny.—Subgenus *BERGEROCTUS*.....1. *C. emoryi*.

Stems stout, columnar, erect; flowers large, white; scales of the tube and ovary sparsely woolly in the axils; fruit spineless or nearly so.—Subgenus *CARNEGIEA*.....2. *C. gigantea*.

Flowers purple or red; stems oblong to globose; scales of the tube and ovary spiny; fruit spiny.—Subgenus *ECHINOCTUS*.

Stems few, in a loose cluster; flowers purple.....3. *C. engelmannii*.

Stems many, in dense masses; flowers scarlet.....4. *C. mojavensis*.

1. *C. emoryi* Engelm. Branches numerous, 6 to 18 in. long, densely spinose; ribs 20 to 25; areoles approximate; spines 10 to 30, yellow, in age brown, unequal, the central 1 to 1½ in. long, stout and exceeding the slender radials; flowers about ½ in. long; ovary and fruit globose.—Near the coast, Orange and San Diego Cos., San Clemente Isl.; n. L. Cal.

2. *C. gigantea* Engelm. GIANT CACTUS. SUWARRO. Stems simple, or with one or few candelabriform branches, up to 36 ft. high; ribs about 20; spines in clusters of 10 to 25, the central up to 2 in. long, exceeding the radials; flowers borne near the summit of the stem; tube stout, green; limb widely spreading, at length reflexed; ovary oblong; stigma lobes 12 to 18; fruit oblong, red or purple, edible.—Rocky hillsides, in groups along Colorado River: Riverside Mts.; opposite mouth of Bill Williams River; above Yuma dam; e. to Ariz.

3. *C. engelmannii* Parry. Stems 5 to 20, stout, oblong, erect, 6 to 12 in. high; ribs 11 to 13; spines in clusters of 10 to 12, straight, or somewhat curved, white or yellowish, becoming brown, divergent, the central 3 or 4 stout, subulate, 1 to 1½ in. long, and 8 to 15 unequal, short and acicular; flowers showy, purple, 2 to 3 in. long; fruit orbicular to obovate, clothed with clusters of acicular spines ½ to ¾ in. long; seeds punctulose.—Stony or gravelly hills and dry washes, frequent: Inyo Co., e. Mohave Desert; Colorado Desert; e. to Utah and Ariz., s. to Sonora and L. Cal.

4. *C. mojavensis* Engelm. Stems 10 to 600, 4 to 8 in. long, compact in dense rounded clumps; ribs 10 to 12, strongly tuberculate; spines 3 to 8, whitish or gray, straight or curved, the 1 to 3 central slender and porrect, 1 to 1½ in. long, the others similar but shorter, radiate and interlocking; flowers scarlet, 2 to 2½ in. high; ovary and fruit bearing slender spines.—Crevices of cliffs or rocky slopes in the mts.: Inyo Co.; Mohave Desert; e. to southern Nev. and to Ariz.

3. **ECHINOCTUS** Mill. HEDGEHOG CACTUS

Stems cylindric, oblong or ovoid, ours all with spine-bearing ribs. Flowers short-tubular, borne on areoles above or near the young spiniferous areoles, therefore circular at the summit. Ovary scaly. Fruit globose to oval, dry or fleshy. (Greek *echinos*, a hedgehog, and *cactus*, the stems beset with spines.) Some of our species afford a relief to thirsty desert travelers, who by slicing off the top of a stem and pounding the succulent tissue form a basin containing a considerable quantity of potable juice.

Principal spines annulate.

Scales of the ovary acicular, their axils copiously woolly.....1. *E. polycephalus*.

Scales of the ovary scaly.

Stems columnar, rarely obovoid: deserts.....2. *E. cylindraceus*.

Stems depressed-globose; coastal.....3. *E. viridescens*.

Spines never annulate.

Principal spines flattened, 1-ridged above.....4. *E. polyancistrus*.

Spines all subulate, bulbous at base.....5. *E. johnsonii*.

1. *E. polycéphalus* Engelm. & Bigel. NIGGER-HEADS. Stems globose, 8 to 10 in. in diameter, forming compact rounded clumps of 10 to 60 heads; ribs 10 to 20, tuberculately interrupted; central spine 1, stout, 1 to 3 in. long, curving but not hooked, and 3 to 4 slender ones; radials 8 to 10, shorter and unequal, all ashy-gray and flattened; flowers yellow, 1½ to 2 in. long, little surpassing the acicular scales of the ovary, and enveloped in the abundant wool of their axils; fruit dry, densely woolly; seeds angulate, minutely tuberculate.—Rocky places in the deserts: Mohave Desert; Inyo Co.; e. to Utah and Ariz.

2. *E. cylindræus* Engelm. BARREL CACTUS. Stems simple, erect, stout, columnar, up to 8 ft. high, rarely elongated-obovoid and 2 to 3 ft. high; ribs 20 or more, interruptedly tuberculate; central spines 1 to 4, stout, compressed, erect or decurved, 2 to 6 in. long, one or more of them hooked; radials 5 to 7 stout and 3 to 7 slender, none of them hooked; flowers yellow, 1 to 2 in. long, the outer segments narrowly oblong, the inner linear; fruit elongated-obovoid, 1 to 1¼ in. long, greenish, at length dry; seeds smooth and shining.—Frequent on rocky hills or gravelly benches, Colorado and e. Mohave deserts; Inyo Co.; e. to Utah and Ariz., s. to northern L. Cal. Rarely small globose branches are developed at the base or on the sides of the stems; the spines are usually more or less red, but sometimes yellow or white; they vary greatly in length and degree of curvature, and are frequently very long and much intertangled.

3. *E. viridescens* Nutt. Simple (rarely 1 to few-branched at base), 10 to 15 in. high, and usually broader than high; ribs 10 to 20, tuberculately interrupted; central spines 4, stout, brown, compressed, cruciately divergent, 1 in. long, or less, the lowest longer and broader than the others; radials 10 to 20, acicular, unequal, less than ½ in. long; flowers yellowish, 1½ in. high, the petals with a reddish midvein; fruit obovate to subglobose, greenish, the broadly subcordate scales distant and few; seeds minutely pitted.—Dry grassy hills about the bay of San Diego; much depressed, and often nearly hidden by the surrounding herbage.

4. *E. polyancistrus* Engelm. & Bigel. Stems simple, columnar to ellipsoidal, 8 to 12 in. high; ribs 12 to 16, tuberculately interrupted; central spine 1, stout, flattened and ribbed, 2 to 3 in. long; radials 5 to 7, brown, hooked, 2 in. long, and 15 to 20 slender, straight and unequal, less than ½ in. long; flowers yellow, about 2 in. high; scales of the ovary few and small, hyaline-margined; fruit dry, pyriform, nearly naked; seeds tuberculate.—Occasional on gravelly mesas, Mohave Desert; e. to southern Nev.

5. *E. johnsonii* Parry. Simple, or few-branched from the base, erect, short-cylindrical, 4 to 9 in. high; ribs 10 to 20, tuberculately interrupted; principal spines 6 to 10, yellow, in age brown, straight or curved, nearly equal, about 1 in. long, radiate; radials 10 to 20, short, bristle-like, all bulbously enlarged at base; flowers "pink," about 1 in. high and as wide; fruit densely covered with bristle-like spines.—Infrequent, Inyo Co.; e. to Utah.

#### 4. MAMILLARIA Haw.

Globose to oblong, simple or few-branched. Areoles naked or woolly, in our species all spiniferous, borne at the apex of mamilliform tubercles. Flowers campanulate or funnelform, produced from distinct areoles at the bases of the spiniferous areoles, mostly near the summit of the stems. Fruit clavate to globose, scarlet or greenish. Seeds black, smooth or punctate. (Latin *mamilla*, a nipple, the stem bearing tubercles.)

Tubercles not grooved; one or more of the central spines hooked.

Seeds with a spongy appendage; radial spines 30 to 60.....1. *M. tetrandra*.

Seeds unappendaged; radial spines 10 to 20.

Young areoles densely woolly; coastal.....2. *M. dioica*.

Areoles naked; deserts.....3. *M. grahami*.

Tubercles grooved; spines all straight.

Central spines 3 or 4; flowers straw-color.....4. *M. deserti*.

Central spines 12 to 14; flowers purplish.....5. *M. alversonii*.

1. *M. tetrandra* Engelm. FISH-HOOK CACTUS. Simple, or rarely few-branched at base, globose to oblong, 4 to 10 in. high; young tubercles woolly

in the axils, at length naked; central spines 1 to 4, dark purple nearly to the base, about 1 in. long, one or all hooked; radials shorter, very numerous, bristle-like, white, radiately interlocked; flowers pinkish, about 1 in. long; fruit ovoid to obovoid, scarlet,  $\frac{1}{2}$  in. long; seeds black, tuberculately roughened, partially immersed in an ash-colored conical spongy appendage.—Gravelly plains and hillsides: Colorado Desert; e. Mohave Desert; Inyo Co.; e. to Nev. and Utah.

2. *M. dioica* K. Bdg. Simple or caespitously few-branched, globose to obovoid, 2 to 10 in. high; central spines 1 to 4, brown, the lowest stouter, about  $\frac{1}{4}$  in. long; radials 10 to 20 white, about  $\frac{1}{8}$  in. long, interlocking; flowers less than 1 in. long, yellowish-white, incompletely dioecious; fruit clavate to ovate.—Sandy soil, about San Diego; s. to L. Cal.

3. *M. grāhami* Engelm. Simple or caespitously few-branched, 2 to 3 in. high; lower central spine purple, hooked,  $\frac{3}{4}$  in. long, usually exceeding the 1 to 2 straight ones, or these wanting; radials 12 to 15, white, nearly equal; flowers about  $\frac{3}{4}$  in. long, white with purple midvein; fruit obovate to clavate,  $\frac{1}{2}$  to 1 in. long, scarlet; seeds minutely punctate.—Arid hills, Colorado Desert; e. to Ariz., s. to Sonora.

4. *M. déserti* Engelm. Simple or 4 to 5-branched at the base, globose to oblong, 3 to 8 in. high; central spines 3 to 4,  $\frac{1}{2}$  in. long, brown-tipped; radials 15 to 20, slender, radiate and interlocking, concealing the surface; flowers about 1 in. high, the outer segments fimbriate.—Mts., e. Mohave Desert; e. to southern Nev.

5. *M. alverssonii* Orcutt. Simple or 1 to few-branched at or above the base, 3 to 8 in. high; spines dark purple above the white base,  $\frac{1}{2}$  to  $\frac{3}{4}$  in. long; radials numerous, white, slender, divergent, interlocked, concealing the surface; flowers light purple, the outer segments strongly ciliate; fruit clavate; seeds brown, tuberculate.—Arid mountains dividing the Colorado and Mohave deserts. A larger plant than *M. déserti* and with stouter spines, but perhaps no more than a form of it; both are insufficiently known.

#### CUCURBITACEAE. GOURD FAMILY

Herbs, mostly tendrill-bearing and succulent, with simple palmately lobed leaves. Flowers unisexual. Corolla 5 to 7-lobed, inserted on the calyx. Calyx-lobes narrow or tooth-like. Calyx-tube in the pistillate flower adherent to the 1 to 6-celled ovary; stigmas 2 or 3; placentae parietal or projecting from the axis. Staminate flower with 3 stamens, 2 of these with 2-celled anthers, the third one with a 1-celled anther. Fruit gourd-like, or dry and dehiscent. Seeds large, anatropous, without endosperm.

Flowers large, yellow or yellowish, all solitary; fruit smooth, fleshy, 3 to 5-celled. . . . .

1. CUCURBITA.

Flowers small, white or whitish, the staminate in racemes; fruit more or less spiny or echinate, becoming dry.

Fruit 2 or 4-celled, 2 to many-seeded; leaves scaberrulous or puberulent to glabrous; mostly cismontane species. . . . .

2. ECHINOCYSTIS.

Fruit 1-celled, 1-seeded; leaves thickly sprinkled with disk-like pustules; desert species. . . . .

3. BRANDEGEA.

#### 1. CUCURBITA L.

Ours perennial herbs with large roots. Stems prostrate, vine-like, scabrous. Flowers large, yellow, solitary. Filaments distinct. Fruit a smooth globose gourd, 3 to 5-celled. (Latin name of the gourd.)

Leaves triangular-ovate; fruit 3-celled, its pedicel without thickened ridges. . . . .

1. *C. foetidissima*.

Leaves palmate; fruit 5-celled, its pedicel with thickened ridges at summit. . . . .

2. *C. palmata*.

1. *C. foetidissima* H.B.K. CALABAZILLA. Stems 5 to 15 ft. long; leaves erect, triangular-ovate, cordate or subcordate at base, 4 to 10 in. long; calyx-tube of staminate flower 6 to 8 lines long; corolla 3 to 4 in. long; gourd 3 to 4 in. in diameter.—Sandy flats or plains, San Joaquin Valley to S. Cal. Also called Chili Coyote and used by Spanish-Californians, the root as a cleanser, the leaves medicinally.

2. *C. palmata* Wats. COYOTE MELON. Stems trailing, several ft. long;

leaves palmately 5-cleft, 3 to 4½ in. broad; calyx-tube of staminate flower 10 to 12 lines long; corolla 1¾ to 2¾ in. long; gourd 3 in. in diameter; seeds thicker than in *C. foetidissima*.—Dry plains and mesas: coastal S. Cal. and n. to the San Joaquin Valley; Colorado Desert and n. to Inyo Co.

## 2. ECHINOCYSTIS T. & G. BIG ROOT

Trailing or climbing herbs with branched tendrils and ivy-like but thin leaves. Flowers small, greenish or white, monoecious, the staminate in axillary racemes or panicles, the pistillate pediceled and solitary in the same axils. Calyx-teeth very small or obsolete. Corolla rotate or campanulate with 5 to 7 lobes or lanceolate segments. Staminate flowers with the short filaments united and the anthers distinct or coherent. Pistillate flowers with staminodia or none; ovary globose or oblong, 2 to 4-celled, with 1 to 4 ovules in each cell; style very short; stigmas 2 or 3-parted or -lobed. Fruit prickly, somewhat fleshy or pulpy, at length dry and bursting irregularly on the sides or near the apex. Seeds ovoid or broadly oblong, more or less compressed, surrounded by a marginal line. (Greek echinos, a hedgehog, and kustis, a bladder, in reference to the spiny fruit.) Our species (subgenus *Marah*) are all perennial from exceedingly large, often deep-seated, fusiform or globose roots, sometimes as large as and not unlike the shape of a man's body, whence the common name, "Old Man in the Ground." The germination of the seed is hypogeous.

Corolla rotate or somewhat saucer-shaped; staminate racemes mostly with many to numerous flowers; spines more or less puberulent.

Corolla dull or greenish white; fruit globose; central Cal. .... 1. *E. fabacea*.

Corolla clear white; fruit oblong; S. Cal. to Monterey Co. .... 2. *E. macrocarpa*.

Corollas campanulate; staminate racemes relatively few-flowered.

Herbage green; pistillate flowers with abortive stamens; spines puberulent or sometimes glabrous.

Fruit cylindrical; s. Sierra Nevada foothills. .... 3. *E. horrida*.

Fruit ovate or globose-ovate, commonly long-beaked; Coast Ranges. .... 4. *E. oregana*.

Herbage glaucous; pistillate flowers without abortive stamens; prickles glabrous; n. Sierra foothills. .... 5. *E. watsonii*.

1. *E. fabacea* Naud. COMMON MAN-ROOT. Fig. 648. Stems 12 to 30 ft. long; herbage nearly glabrous or rough-scabrous; leaves more or less round-cordate in outline, 2 to 4 in. broad, shallowly or often rather deeply 5 to 7-lobed; staminate flowers many in slender simple or compound racemes 3½ to 5 in. long, the pedicels 1 to 3 lines long; corolla 3 to 4 lines broad, dull or greenish-white; pistillate flowers 5 to 6 lines broad, destitute of abortive stamens, the pedicels 5 to 9 lines long; ovary globose, 2-celled, ovules 1 or 2 in each cell; stigma depressed, circular, almost sessile; fruit globose, 2 in. in diameter, very densely spinose; spines stout or more commonly slender, 3 to 4 (or 5) lines long, sparingly and mostly obscurely puberulent; seeds commonly 4, sometimes less, oblong-ovoid, 9 to 13 lines long, 6 lines broad, surrounded by a shallow groove or darker line.—Hillslopes or high sandy places in valleys: Coast Ranges from Sonoma Co. to Monterey Co.; Great Valley; cent. Sierra Nevada foothills (Amador Co.) Var. *AGRÉSTIS* Greene. Fruits

648. *Echinocystis fabacea* Naud.; a, fl. branchlet x ½; b, pist. fl. x ½; c, fr. x ½.

649. *Echinocystis horrida* Cong.; a, pist. fl.  $\times \frac{3}{4}$ ; b, fr. branchlet  $\times \frac{1}{4}$ .

smaller with few short spines.—E. Contra Costa Co.

2. *E. macrocarpa* Greene. CHILICOTHE. Stems 10 to 20 ft. long; leaves usually deeply lobed, 3 to 8 in. broad; corolla saucer-shaped; fruit broadly oblong, densely spiny, 3 to 4 in. long, 2 to 3 in. in diameter; spines stout, very unequal, not very rigid,  $\frac{1}{2}$  to 1 (or  $1\frac{1}{2}$ ) in. long; ovary 2 to 4-celled; style obvious ( $\frac{1}{2}$  line long), bearing 3 staminodial scales; seeds 12 to 14, oblong-cylindric, nearly terete at one end, flattened at the other, 6 to 8 (or 12) lines long, 5 to 6 lines broad.—Coastal S. Cal., n. along the coast to Monterey Co., s. to L. Cal.

3. *E. horrida* Congdon. Fig. 649.

Similar to no. 2; corolla campanulate; fruits 4 to 6 in. long, 2 to 3 in. in diameter, strongly spinose; seeds 8 to 10, oblong, one end terete, the other flattened, 1 to  $1\frac{1}{8}$  in. long, 7 to 8 lines broad.—S. Sierra Nevada foothills from Tuolumne Co. to Tulare Co. The presumed differences between this and *E. macrocarpa* may disappear when tested further, especially with ample series of specimens of *E. horrida*.

4. *E. oregana* Cogn. HILL MAN-ROOT. Stems 4 to 25 ft. long, often climbing over trees and shrubs, mostly smooth; leaves muriculate-scabrous, especially on the upper surface, or almost smooth, reniform or round-cordate, 3 to 7 (or 9) in. broad, shallowly or deeply 5 to 7-lobed; staminate racemes 6 to 10 in. long, the pedicels (3 or) 6 to 11 lines long; corolla 6 to 7 lines broad, clear white; pistillate flowers with abortive stamens (staminodia), the pedicels 3 to 6 lines long, or in fruit to  $1\frac{3}{4}$  in. long; ovary ovate, 2 or 3-celled; ovules 1 to 4 in each cell, attached to the outer side; fruit ovate, 2 to  $3\frac{1}{2}$  in. long, somewhat attenuate at each end, often markedly beaked at apex, nearly smooth or sparsely covered with short weak spines; spines 2 to 3 lines long, glabrous or puberulent; seeds 6, horizontally placed, nearly circular, markedly flattened, 10 to 11 lines long, 3 to 4 lines thick.—Hill country, Santa Clara Co. to Humboldt and Siskiyou Cos.; n. to Ore. (*E. marah* Cogn.)

5. *E. watsonii* Cogn. Stems slender, not succulent, 4 to 8 ft. long; herbage glaucous, especially on the under side of the leaves, smooth or only slightly scabrous, glabrous or nearly so; leaves orbicular-cordate or broadly reniform, 2 to  $4\frac{1}{2}$  in. broad, rather broader than long, deeply 5-parted, the lobes broader above and sinuately 3-lobed; staminate racemes slender, often few-flowered, the flowers small ( $1\frac{1}{2}$  to  $2\frac{1}{2}$  lines in diameter), white; pistillate flowers 3 to 5 lines broad, without abortive stamens, on slender pedicels 1 to 2 in. long; ovary smooth or somewhat prickly, the prickles much dilated below the middle; fruit nearly globose, 1 to  $1\frac{1}{4}$  in. in diameter, sparsely covered with weak glabrous prickles  $1\frac{1}{2}$  to  $2\frac{1}{2}$  lines long or somewhat naked toward the summit, 2 to 4-celled, 2 to 6-seeded; seeds subglobose, 7 to 9 lines long, 6 to 7 lines broad.—Sierra Nevada foothills from Amador Co. to Butte Co.; inner North Coast Ranges.

### 3. BRANDÈGEA Cogn.

Perennial herbs with large thick roots. Leaves 3 to 5-parted. Flowers small or minute. Corolla rotate, 5-parted almost to the base. Staminodia in the pistillate flower none. Ovary 1-celled, the filiform beak very oblique; ovule 1. Fruit narrowly obovoid, indehiscent, smooth or sparsely echinate, thin-walled. (T. S. Brandegee, student of the Mexican flora.)

1. *B. bigelovii* Cogn. Stems slender, trailing; leaves 1 to 2 in. long, almost as if palmately 3-lobed, the basal lobes mostly very small or obsolete, the upper surface densely sprinkled with disk-like pustules; corolla 1 line long; body of fruit 2 to 2½ lines long, either smooth or with a few prickles above the middle or on the beak.—Colorado Desert; s. to L. Cal. (*B. parviflora* Wats.)

### THYMELAEACEAE. MEZEREUM FAMILY

Ours deciduous shrubs with simple entire alternate leaves. Flowers perfect, with corolla-like shallowly 4-cleft calyx. Stamens inserted upon the calyx, twice as many as its lobes. Corolla none. Ovary superior, 1-celled; ovule 1, pendulous.

#### 1. *DİRCA* L. LEATHERWOOD

Flowers in fascicles from buds containing flowers and leaves. Scales of the bud yellowish or whitish, silky, forming an involucre to the flowers, soon falling. Calyx slightly oblique, tubular below, expanded into a short throat above. Stamens 8, exserted, inserted at the base of the throat. Style slender, exceeding the stamens. Fruit drupe-like, reddish. (Greek name of a celebrated fountain in Boeotia, the plants growing in moist places.)

1. *D. occidentalis* Gray. WESTERN LEATHERWOOD. Fig. 650. Erect shrub 2 to 5 (or 11) ft. high, with soft pliable wood and leathery bark; leaves oval or obovatish, 1½ to 2¼ in. long; flowers yellow, in clusters of 2 or 3 from lateral and terminal buds, turned downward at an angle; calyx 4 lines long, its lobes a little erose; stamens commonly 8, sometimes 9, rarely 10.—N. and e. slopes of hills surrounding San Francisco Bay (Santa Cruz Mts., Oakland and Berkeley hills, Marin Co. hills). Feb.-Mar.

650. *Dirca occidentalis* Gray; a, fl. branchlet x ½; b, fr. branchlet x ½; c, fl. x 2; d, fr. x 2.

### ELAEAGNACEAE. OLEASTER FAMILY

Shrubs or small trees, the foliage scurfy with scarios scales. Flowers regular. Calyx herbaceous. Corolla none. Ovary inferior, 1-celled; ovule 1; style 1, stigma 1.

#### 1. *SHEPHERDIA* Nutt.

Shrub with silvery foliage. Leaves opposite, entire, deciduous. Flowers dioecious, nearly sessile in axillary clusters or the pistillate solitary. Staminate flower: calyx 4-parted, rotate; stamens 8, alternating with the processes of the thick disk. Pistillate flower: calyx urn-shaped, 4-cleft, the orifice closed by the teeth of the 8-lobed disk. Fruit berry-like, the membranous achene closely covered by the fleshy calyx-tube. (John Shepherd, one-time curator of the Liverpool Botanic Garden.)

1. *S. argentea* Nutt. BUFFALO BERRY. Fig. 651. Stout spiny shrub or small tree 6 to 15 ft. high; thorns rigid, leafy at base; leaves silvery-scurfy below, greener above, mostly oblong, 1 to 1½ in. long, on petioles 2 to 4 lines long; berries red, oblong, 2½ to 3½ lines long, on pedicels ½ to 1 line

651. *Shepherdia argentea* Nutt.; a, staminate fl. branchlet  $\times \frac{1}{2}$ ; b, long. sect. of staminate fl.  $\times 3$ ; c, pistillate fl.  $\times 3$ ; d, fr.  $\times 2$ .

long.—Along streams or winter water-courses: Mt. Pinos region (Mono Creek in the San Rafael Mts., Ozena on the Cuyama River, San Emigdio Potrero); Mono and Alpine Cos.; e. to Rocky Mts.

### LYTHRACEAE. LOOSE-STRIPE FAMILY

Glabrous herbs with entire simple leaves. Flowers perfect, axillary or whorled, in ours minute or inconspicuous. Calyx tubular, free from but enclosing the ovary, 4 to 6-toothed, sometimes with accessory teeth in the sinuses. Petals 4 to 6, inserted with the stamens on the calyx. Stigmas in ours 4 to 8. Ovary and capsule in ours 2 to 4-celled; style 1; stigma capitate, 4-lobed. Seed without endosperm.

Flowers subsessile or pediceled, solitary in the axils; calyx cylindrical; leaves alternate.....1. *LYTHRUM*.

Flowers sessile in the axils, 2 to 4 in a whorl; calyx campanulate or globose; leaves opposite.

Capsule bursting irregularly, its walls not striate; leaves sessile by an auricled base....2. *AMMANNIA*.

Capsule septicidally dehiscent, its valves densely striate transversely; leaves tapering at base or shortly petioled....3. *ROOTALA*.

#### 1. *LYTHRUM* L. LOOSE-STRIPE

Slender herbs with 4 or 5-angled stems. Leaves sessile, in ours alternate. Flowers solitary in the axils, purple or whitish. Calyx cylindric or subcylindric, 8 to 12-ribbed, its 4 to 6 teeth thin, erect, smaller than the greenish accessory ones which are at first spreading and later erect. Petals 5 or 6, the stamens in ours as many. Capsule oblong or cylindrical, 2-celled. (Greek luthron, blood, applied either on account of the color of the flowers or the styptic properties of certain species.)

Flowers distinctly pediceled; corolla 2 to 3 lines long, bright purple; perennial.....

1. *L. californicum*.

Flowers subsessile; corolla  $\frac{1}{2}$  to 1 line long, pale purple or almost white.

Perennial, stoloniferous.....2. *L. adsurgens*.

Annual, not stoloniferous.....3. *L. hyssopifolia*.

1. *L. californicum* T. & G. COMMON LOOSE-STRIPE. Stems erect, paniculately branching above, 2 to 3 or even 6 ft. high; leaves linear-lanceolate, the lowest ovate-oblong,  $\frac{1}{2}$  to  $\frac{3}{4}$  or  $1\frac{1}{2}$  in. long; flowers distinctly pediceled; calyx narrowly vase-shaped or in fruit clavate,  $2\frac{1}{2}$  to  $3\frac{1}{2}$  lines long, its teeth sharply acute; petals 2 to 3 lines long, bright purple.—Common in low valley and marshy lands and about springs in the foothills: Coast Ranges, Great Valley, Sierra Nevada foothills and coastal S. Cal.

2. *L. adsurgens* Greene. Stems several from the root-crown, decumbent or assurgent, 1 to 3 ft. long; herbage pallid, slightly succulent; calyx cylindric, 2 to  $2\frac{1}{2}$  lines long, 12-ribbed, the ribs in maturity widened and thickened below; accessory teeth minute, subulate; petals pale purple or almost white, minute ( $\frac{1}{2}$  to  $\frac{3}{4}$  line long).—Low wet places in valley and mountain flats: Santa Clara Co. to the Sacramento Valley and Siskiyou Co. Perhaps a robust perennial variety of no. 3.

3. *L. hyssopifolia* L. Fig. 652. GRASS POLY. Stems erect, slender and simple or with several branches from below the middle, 4 to 9 in. or even 2 ft. high; herbage pale, glabrous; leaves linear to oblong, 3 to 7 lines long; flowers subsessile in the axils; calyx 2 lines long; petals  $\frac{3}{4}$  to 1 line long,

pale purple or whitish.—Hillside hollows or beds of former pools in the valleys, throughout Cal.; all continents. May-Sept.

## 2. AMMANNIA L.

Annuals with mostly 4-angled stems. Leaves opposite, sessile by an auricled base. Flowers purplish, 1 to 5 in each axil. Calyx campanulate (in fruit globose or nearly so), the tube 8-ribbed, 4-toothed and usually with small accessory teeth in the sinuses. Petals 4, purplish, small and deciduous, or wanting. Stamens in ours 4. Capsule globose, bursting irregularly. (Johann Ammann, a German botanist of the 18th century.)

1. *A. coccinea* Rottb. Erect, simple or branching below, 4 to 14 in. high; leaves horizontally spreading, broadly linear or somewhat narrowed towards the apex, 1 to 2 in. long, sessile by a broad auricled base; flowers in whorls of 2 to 5; petals purple, roundish,  $\frac{1}{2}$  to 1 line long, fugacious; calyx in flower narrowly campanulate, strongly 8-ribbed, in fruit globose-distended and the ribs less obvious; capsule 2 lines long.—Lowlands along rivers: Great Valley; S. Cal.; e. to N. J., s. to Brazil.

652. *Lythrum hyssopifolia* L.; a, habit x  $\frac{1}{4}$ ; b, fl. x 3; c, pistil x 6.

## 3. ROTULA L.

Annuals similar to Ammannia. Flowers 1 or 2 in each axil. Petals in ours 4. Stamens 4. Capsule septicidal. (Latin *rota*, wheel, the leaves whorled in some species.)

1. *R. ramosior* Koehne. TOOTH-CUP. Slender, 2 to 3 (or 7) in. high; leaves linear-oblongate, tapering at base and thus sometimes short-petioled, 4 to 7 lines long; flowers 1 to 3 in each axil; petal ovate, acuminate,  $\frac{3}{4}$  line long; stigma subsessile.—Wet lowlands, San Joaquin Valley; N. Am., S. Am.

## ONAGRACEAE. EVENING PRIMROSE FAMILY

Herbs. Leaves simple, entire, toothed, lobed or divided. Flowers mainly showy, borne in spikes or racemes, or solitary. Calyx-tube adnate to the ovary, the petals inserted at its summit, and the stamens twice as many or as many. Calyx-lobes 4 (sometimes 5 or 2). Petals 4 (sometimes 5 or 2). Pollen commonly cobwebby. Ovary 4 (sometimes 5 or 2)-celled; style 1; stigma capitate or discoid, or 4-lobed. Fruit a capsule, rarely bur-like or indehiscent. Seeds mostly small, naked or with a tuft of hairs at apex (coma); endosperm none.

A. Calyx-limb divided down to the ovary and persistent on the fruit after flowering; parts of the flowers in 4s or 5s; fruit a capsule (indehiscent in no. 1).

Petals 5, 6 to 7 lines long; fruit at length reflexed.....1. JUSSIAEA.  
Petals none or minute; fruit erect.....2. LUDWIGIA.

B. Calyx-limb deciduous after flowering.

Parts of the flowers in 4s.

Fruit a capsule, dehiscent.

Ovary 4-celled; calyx-tube produced above the ovary.

Seeds with a tuft of hairs at one end.

Flowers large; corolla and calyx scarlet.....3. ZAUSCHNERIA.

Flowers small; corolla white, red or purplish.....4. EPILOBIUM.  
Seeds naked.

Anthers innate (attached at or near the base); flowers purple, rose-color or white, never yellow.

Calyx-lobes erect or ascending; petals small or minute.....

5. BOISDUVALIA.

Calyx-lobes reflexed or the tips remaining united and turned to one side in anthesis.

Petals distinctly clawed, often much lobed.....6. CLARKIA

- Petals sessile, not lobed (except in one species); stamens 8. . . 7. *GODETIA*.  
 Anthers versatile (attached near the middle); flowers yellow or white. . . 8. *OENOTHERA*.  
 Calyx-tube 1 line to  $5\frac{1}{2}$  in. long; anthers all alike. . . 9. *EULOBUS*.  
 Calyx-tube none or scarcely evident; alternate anthers of different shape. . . 10. *GAYOPHYTUM*.  
 Ovary 2-celled; calyx-limb divided down to the ovary; flowers white or pink. . . 11. *GAURA*.  
 Fruit indehiscent. . . 12. *CIRCAEA*.  
 Parts of the flowers in 2s; fruit bur-like. . .

### 1. *JUSSIAEA* L.

Glabrous perennial herbs, ours aquatic or of muddy shores. Leaves alternate. Flowers yellow, solitary in the axils, pediceled. Calyx-tube elongated, not produced beyond the ovary, its lobes 5. Petals 5. Stamens twice as many. Fruit (in ours) 5-celled. Seeds very numerous. (Bernard de Jussieu, who founded the natural system of classification.)

1. *J. californica* Jepson. YELLOW WATER-WEED. Fig. 653. Stems 1 to 10 ft. long; leaves oblong to obovate,  $\frac{7}{8}$  to 2 in. long, the floating ones elliptic or orbicular and with longer petioles; calyx-lobes lanceolate,  $\frac{1}{2}$  in. long; petals broadly obovate, 6 to 7 lines long; fruit woody, cylindric, 10 lines long, indehiscent, at length reflexed and the calyx-segments deciduous from the mature fruit; fruiting pedicel  $\frac{1}{2}$  to  $\frac{3}{4}$  in. long; seeds large for the order, with a very thick tough outer coat.—Rivers, streams and lakes, 5 to 1500 ft.: widely distributed in cis-montane Cal.

653. *Jussiaea californica* Jepson; a, fl. stem  $\times \frac{1}{2}$ ; b, and c, pods  $\times 1$ .

### 2. *LUDWIGIA* L. FALSE LOOSE-STRIPE

Aquatic or marsh perennial herbs, with the aspect of *Jussiaea*, but the leaves (in ours) opposite, parts of the flower in 4s, and the petals often absent. Stamens as many as the petals and alternate with them. Ovary broad at apex and usually flattened, or crowned with a conical style-base. Capsule 4-celled, dehiscent by lateral slits or terminal pores. Seeds minute. (C. G. Ludwig, 1709-1773, Professor of Botany at Leipsic.)

1. *L. palustris* Ell. WATER PURSLANE. Stem 6 to 12 in. long; herbage glabrous; leaves obovate, acute or acuminate, narrowed at base into a rather long petiole, the whole leaf 8 to 13 lines long; petals none, or minute and reddish; capsule erect, broadly oblong,  $1\frac{1}{2}$  to 2 lines long, more or less 4-sided or -angled, a narrow longitudinal band of low tubercles on each side, yellowish, the persistent sepals green.—Muddy shores or low overflowed lands: Glen Ellen; Healdsburg; Lakeport; Oroville; Oro Fino, Siskiyou Co.; Sierra Co.; e. to the Atlantic, n. to Can.; Eur.

### 3. *ZAUSCHNERIA* Presl

Low perennials with alternate leaves (the lowest opposite) and large scarlet Fuchsia-like flowers. Calyx above the ovary colored like the corolla, its tube funnelform with a globose base (nectar-bearing within), and appendaged within at the most constricted portion with several erect and deflexed scales. Petals inserted on the throat of the calyx and rather shorter than its erect lobes, obcordate or 2-cleft. Stamens 8, exserted, colored like the corolla; anthers linear-oblong, attached by the middle. Style long and exserted; stigma 4-lobed. Capsule linear, obtusely 4-angled, 4-valved and imperfectly 4-celled. Seeds oblong, with a tuft of hairs at the apex. (M.

Zauschner, a Bohemian botanist, one time Professor of Natural History in the University of Prag.)

Leaves linear to linear-lanceolate, the lateral veins commonly not evident; calyx-tube not veiny or not markedly so.

Petals exceeding calyx-lobes; leaves (1 or)  $1\frac{1}{2}$  to 4 lines wide.....1. *Z. californica*.

Petals shorter than calyx-lobes; leaves  $\frac{1}{4}$  to 1 line wide.....2. *Z. cana*.

Leaves ovate to ovate-lanceolate, 4 to 9 lines wide, the lateral veins usually obvious; calyx-tube commonly with prominent longitudinal veins.....3. *Z. latifolia*.

1. *Z. californica* Presl. MEXICAN BALSAMEA. Fig. 654. Stems decumbent or suberect,  $\frac{1}{2}$  to  $2\frac{1}{2}$  ft. high, usually simple and leafless below, but leafy above; bark tending to exfoliate below; herbage green-pubescent, often a little glandular; leaves linear or lanceolate-linear, entire or somewhat denticulate, lateral veins usually not evident, greenish or canescent,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long; flowers 1 to  $1\frac{1}{2}$  in. long above ovary, disposed in few-flowered spikes.—Dry benches, rocky hillsides or cliffs, 50 to 4000 ft.: Coast Ranges from Mendocino and Lake Cos. to coastal S. Cal. (*Z. eastwoodae* Moxley.) Variable species, passing by intergrades into no. 3. Var. *VILLÒSA* Jepson n. comb. Herbage white-tomentose.—Coast Ranges; S. Cal. (*Z. villosa* Greene.)

2. *Z. cana* Greene. Leaves fascicled in the axils, linear or linear-filiform, 3 to 10 lines long; herbage tomentose-canescens, not glandular.—Dry hills near the coast, 100 to 1500 ft.: San Luis Obispo to Los Angeles; Santa Barbara Isls. (*Z. californica* var. *microphylla* Gray.)

3. *Z. latifolia* Greene. Stems 4 to 14 in. high; leaves ovate, oblong-ovate or elliptical, usually rounded at base, commonly denticulate, lateral veining usually evident,  $\frac{3}{4}$  to  $1\frac{3}{4}$  in. long; herbage green, thinly villous, often viscid; flower above ovary 10 to 16 lines long.—Montane, 5000 to 9300 ft.: e. Mendocino Co. to n. Humboldt Co.; Sierra Nevada from Plumas Co. to Tulare Co.; s. to San Gabriel, San Jacinto and Santa Rosa mountains. (*Z. glandulosa* and *hallii* Moxley. *Z. elegans*, *velutina* and *canescens* Eastw.) Var. *TOMENTÈLLA* Jepson n. comb. Leaves ovate to lanceolate, 8 to 15 lines long, 3 to 6 lines wide; herbage white-villous; flower above ovary 10 to 12 lines long.—Montane, 4000 to 8500 ft.: Sierra Nevada from Placer Co. to Mariposa Co. (*Z. tomentella* Greene.) Var. *viscosa* Jepson n. comb. Herbage extremely viscid; leaves ovate, abruptly acute.—San Gabriel Mts. (*Z. viscosa* Moxley.)

654. *Zauschneria californica* Presl; a, fl. branchlet  $\times \frac{2}{3}$ ; b, long. sect. fl.  $\times \frac{1}{4}$ .

#### 4. EPILÒBIUM L. WILLOW HERB

Herbs; annual, perennial by creeping rootstocks, or propagating in the autumn by offsets. Leaves opposite or alternate. Flowers purple, rose-color or white, borne in racemes. Petals 4, often emarginate or bifid. Stamens 8, the 4 alternate shorter. Stigma oblong or 4-lobed. Ovary long and narrow, 4-celled. Capsule 4-valved. Seeds numerous, the summit bearing a tuft of long hairs (coma). (Greek epi, upon, lobus, a pod, and ion, a violet.)

A. Calyx-tube divided down to the ovary or essentially so; flowers large, the petals 5 to 9 lines long, entire, spreading; stigma 4-lobed; capsules long-pedicled; leaves alternate; perennials with stout horizontal rootstocks.—Subgenus CHAMAENERION.

Racemes many-flowered, elongate, not leafy; petals purple; leaves green above but pale and veiny below.....1. *E. angustifolium*.

Racemes few-flowered, short, very leafy; petals rose-color; leaves pallid and veinless on both surfaces.....2. *E. latifolium*.

*B. Calyx-tube prolonged a little beyond the ovary; petals ascending.*—Subgenus  
EUEPILOBIUM.

- Perennials; leaves opposite or mainly so (often more or less alternate in no. 9).  
 Flowers large, the petals  $\frac{1}{2}$  to 1 in. long; stigma with oblong lobes; low plants; high montane.....3. *E. obcordatum*.  
 Flowers small, the petals 1 to 6 lines long; stigma entire or rarely lobed.  
 Leaves tipped with a brown subulate gland; stem arising from a short woody caudex; xerophilous.....4. *E. nivium*.  
 Leaves not gland-tipped.  
 Plants pallid, glabrous and glaucous.....5. *E. glaberrimum*.  
 Plants green and not at all glaucous.  
 Rootstocks not producing fleshy-scaly buds.  
 Stems 2 to 12 in. high, simple, stoloniferous; high montane.  
 Stems curved or ascending from a creeping base; leaves ovate or elliptic-oblong with a short petiole, 2 to 4 lines wide; flowers nodding in bud.6. *E. anagallidifolium*.  
 Stems erect, straight.  
 Leaves elliptic or oblong-ovate, thin, bright green, distinctly though shortly petioled, 4 to 8 lines wide.....7. *E. alpinum*.  
 Leaves linear to oblong or ovate-oblong, thicker, dark green, sessile,  $\frac{3}{4}$  to 2 lines wide.....8. *E. oregonense*.  
 Stems 1 to 4 ft. high, almost always branched above, not stoloniferous; foothills and lower valleys; hydrophilous.  
 Stems reddish; leaves mainly opposite; petals 3 to 5 lines long; coastal.....9. *E. walsonii*.  
 Stems greenish or light-colored; leaves opposite or the upper mostly alternate; petals  $1\frac{1}{2}$  to  $2\frac{1}{2}$  lines long; mostly interior.....10. *E. californicum*.  
 Rootstocks producing fleshy-scaly globose winter buds; plants simple stemmed; herbage commonly glabrous....11. *E. brevistylum*.  
 Annuals; stems with shreddy bark; xerophilous plants.  
 Plants 2 in. to  $1\frac{1}{2}$  ft. high, more or less pubescent; stem simple or equally branched throughout; calyx-tube less than  $\frac{1}{2}$  line long; leaves opposite.....12. *E. minutum*.  
 Plants  $1\frac{1}{2}$  to 5 ft. high, glabrous, at least below; stem paniculately branched above; calyx-tube 1 to 2 lines long.....13. *E. paniculatum*.

1. *E. angustifolium* L. FIRE-WEED. Fig. 655. Stem erect, mostly simple, 2 to 6 ft. high, glabrous, or puberulent above; leaves lanceolate, nearly entire, lateral veins confluent in submarginal loops, 4 to 6 in. long, sessile or nearly so, or the lower short petioled; flowers large, in long racemes with small slender bracts; calyx cleft almost to the ovary; corolla slightly irregular, lilac-purple; petals 5 to 8 lines long, entire or slightly emarginate; stamens purple, in a single row, with filaments dilated at base; style exceeding the stamens, hairy at base, at first recurved; capsule 2 to 3 in. long.—Moist or boggy ground, especially in fire-swept areas: Sierra Nevada and s. to the Cuyamaca Mts., 2000 to 6600 ft.; North Coast Ranges, 50 to 3000 ft.; n. N. Am.; Eur.

655. *Epilobium angustifolium* L.; a, fl. stem; b, capsule  $\times \frac{1}{2}$ .

2. *E. latifolium* L. Stems few, stout, commonly branched,  $\frac{1}{2}$  to 2 ft. high, erect or ascending from a short caudex, puberulent above; leaves lanceolate to elliptic-ovate, rather coriaceous, glaucous and veinless on both surfaces, entire, sessile or nearly so,  $\frac{3}{4}$  to 2 in. long; racemes short, few-flowered, very leafy; petals purple, 6 to 10 lines long; style much shorter than the stamens; stigma-lobes oblong; capsules 2 to 3 in. long.—Wet ground, subalpine (8000 to 9000 ft.), e. side Sierra Nevada in Mono Co.; Sonora Pass; Lundy; rare in Cal.; Alas. to Quebec and Col.

3. *E. obcordatum* Gray. ROSE EPILOBIUM. Stems simple, decumbent, several from the slightly soft-woody base, 2 to 6 in. long; herbage glabrous and frequently glaucous; leaves ovate, obscurely denticulate, 5 to 9 lines long, crowded or approximate, sessile or on very short winged petioles; flowers 1 to 4 in the axils of the scarcely reduced upper leaves; petals bright rose-purple, roundish-obovate, obcordately 2-lobed, 6 to 10 lines long; anthers yellow, on purplish filaments; style purplish; capsules 1 to 1¾ in. long, comparatively few-seeded.—Alpine or subalpine slopes, 8000 to 13,000 ft.: Sierra Nevada from Tulare Co. to Nevada Co. and n. to Siskiyou and Modoc Cos.; e. to Nev. Var. *PUBERULUM* Jepson n. var. Stems and sometimes the leaves minutely puberulent.—Range of the species (Silver Pass, Fresno Co., A. L. Grant 1534, type).

4. *E. nivium* Bdg. Stems erect, tufted on a shortly branched woody caudex, 5 to 10 in. high; herbage finely short-villous; leaves elliptic to linear or lanceolate, coriaceous and not at all veiny, entire, a subulate brown gland at apex, 3 to 7 lines long, narrowed to a short petiole; raceme few-flowered, the subtending leaves much reduced; calyx-tube 2½ to 3½ lines long; petals violet-purple, notched at the apex, 3 to 5 lines long; stigma 4-notched; capsule stoutish, 5 to 6 lines long.—Shaly slopes, high montane, 7000 to 8000 ft., inner North Coast Range: Snow Mt.; St. John's Peak; South Yollo Bolly.

5. *E. glaberrimum* Barbey. Stems slender, erect, unbranched or occasionally with a few short strict laterals, (½ or) 1 to 3 ft. high, arising from branching scaly rootstocks; herbage pallid, glabrous, very glaucous; leaves oblong-lanceolate to linear, entire or essentially so, 1 to 2½ in. long, mostly rather closely ascending, sessile or the lowermost very short-petiolate; petals pale lavender or nearly white, 2 to 4 lines long.—Springy ground in the mts., 3000 to 10,000 ft., throughout Cal.; n. to Wash. and Ida., e. to western Nev. Var. *FASTIGIATUM* (Nutt.) Trel. Stems 8 to 12 in. high; leaves broader and tending to be shorter.—High montane, Tulare Co.

6. *E. anagallidifolium* Lam. Stems simple, erect or decumbent at base, 2½ to 6 in. high, producing stolons at base; herbage glabrous or the stems with pubescent lines; leaves elliptic or oblong to narrow-ovate, obtuse, entire, 2 to 5 lines long, contracted to a short but distinct petiole; racemes nodding at first; petals lilac or purple, 1 to 1½ lines long; racemes maturing 1 to 4 capsules.—High montane, 9000 to 10,400 ft.: Farewell Gap and Mt. Silliman in Tulare Co.; Eagle Peak, Warner Mts.; e. to Col., n. to arctic Am.; Eur., Asia.

7. *E. alpinum* L. Stems slender, erect, simple but several to many from the rootstock, 4 to 12 in. high, stoloniferous; herbage glabrous; leaves elliptic or oblong-ovate, mostly obtuse, entire or obscurely denticulate, very thin, bright green and glabrous, ¾ to 1½ in. long, narrowed to a petiole 1 to 2 lines long, somewhat spreading; petals white or pinkish, 1½ to 2½ lines long; racemes maturing 1 to 6 (or 9) capsules.—Wet ground, 6000 to 8300 ft.: Sierra Nevada from Tulare Co. to Siskiyou Co.; n. to Alas.; circumpolar.

8. *E. oregonense* Hausskn. Stems simple, slender, erect, 3 to 6 (or 9) in. high, stoloniferous, the leaves more or less crowded below, reduced and sparse above; herbage glabrous; leaves linear to oblong or ovate-oblong, usually obtuse, sessile with a more or less rounded base, usually entire or rarely obscurely denticulate, 3 to 8 lines long; petals cream-color or pink, deeply emarginate, 2 to 3½ lines long; racemes maturing usually 1 to 4 capsules.—Boggy ground in the higher mts., 5300 to 8000 ft.: San Jacinto Mts.; Yosemite region; Yollo Bolly Mts.; Ore. to B. C.

9. *E. watsonii* Barbey. Stems rather stout, erect, simple below though more or less branched above, usually reddish, shortly pilose-pubescent and sometimes glandular above, 2 to 4 ft. high, producing in the late fall rosettes of foliage leaves that are sessile at the base of the stem or on short scaly shoots; leaves prevailing opposite, oblong-lanceolate to narrowly ovate, serrulate, the base round with a short petiole or subsessile, commonly about 2 (1 to 3) in. long; racemes very floriferous, leafy, elongate; petals red-purple or paler, deeply emarginate, 3 to 5 lines long.—Sonoma Co. coast

656. *Epilobium watsonii* var. *franciscanum* Jepson; a, fl. branchlet x  $\frac{1}{2}$ ; b, seed with coma x  $2\frac{1}{2}$ .

Var. *FRANCISCANUM* Jepson n. comb. Fig. 656. Herbage glabrate; inflorescence densely compact or loose.—Low or moist ground near the coast, Monterey Co. to Humboldt Co. (*E. franciscanum* Barbey.)

10. *E. californicum* Hausskn. Stem slender, not colored, 2 to 4 ft. high, remotely leafy; herbage glabrous or whitish-pubescent above; leaves lanceolate or oblong-lanceolate, denticulate, 1 to 3 in. long, short-petioled or sessile, passing into the small floral ones; flowers small; petals white, 1 to  $1\frac{1}{2}$  lines long; capsule slender, nearly glabrous, short-pedicel.—Springs and low ground, Coast Ranges, Great Valley, Sierra Nevada foothills. Var. *EXALTATUM* Jepson n. comb. Stems slender; flowers large, the petals becoming 4 to 5 lines long.—Sierra Nevada, 3800 to 7000 ft., n. to Siskiyou Co., thence s. to n. Humboldt Co. at 2500 ft. (*E. exaltatum* Drew.) Var. *OCCIDENTALE* Jepson n. comb. Pubescence more or less glandular, especially on the branches.—Wet ground, valleys and mountains, middle and n. Cal. (*E. adenocaulon* var. *occidentale* Trel.) Var. *PARISHII* Jep-

son n. comb. Buds white-tomentose.—Valleys of coastal S. Cal. and adjacent cañons. (*E. parishii* Trel.) Var. *HOLOSERICUM* Jepson n. comb. Canescent throughout with a dense short pubescence.—Moist ground, lower valleys, San Diego to Butte Co. Intergrading completely with the species. (*E. holosericeum* Trel.)

11. *E. brevistylum* Barbey. Stems erect, simple or usually at most with one or two inconspicuous laterals above, 1 to  $1\frac{3}{4}$  or occasionally  $2\frac{1}{2}$  ft. high; rootstocks producing globose or ovoid winter buds, the scales of which are thick and fleshy and which frequently persist as a series of cotyledon-like scales at the base of the stem developing from the bud; herbage glabrous, rarely finely pubescent; leaves narrow-ovate to oblong or linear-lanceolate, finely denticulate, sessile, base rounded, ascending or suberect, 1 to  $2\frac{3}{4}$  in. long; petals purplish or white, emarginate,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  lines long.—Wet ground in the pine belt, 5000 to 8500 ft., throughout Cal.; n. to Wash., e. to Col. In foliage much suggesting a low simple-stemmed form of the *E. watsonii* group but differing widely from it in its innovations. Var. *URSINUM* Jepson n. comb. Leaves more pronouncedly lanceolate, more remotely and distinctly serrate.—With the species. (*E. ursinum* Parish.) Var. *PRINGLEANUM* Jepson n. comb. Low, about 4 to 6 in. high; leaves linear-oblong or linear-lanceolate, entire or inconspicuously denticulate, usually 4 to 6 times as long as wide, sessile, marked by a dense short dull-colored pubescence.—Wet soil, Sierra Nevada from Tulare Co. to Siskiyou Co.; n. to Wash. Apparently not common. (*E. pringleanum* Hausskn.) Var. *TENUIS* Jepson n. comb. Like the last variety but the herbage glabrous or glabrate.—Little Yosemite; Donner Pass. (*E. delicatum* Trel. var. *tenuis* Trel.)

12. *E. minutum* Lindl. Stems simple or subsimple and erect, or with many ascending opposite branches, 2 to 14 in. high; herbage puberulent; leaves lanceolate or oblanceolate, thickish, rather remote, entire or remotely denticulate, 4 to 10 lines long, tapering to a distinct petiole; flowers distributed along the stem in the axils of the reduced leaves; calyx-tube less than  $\frac{1}{2}$  line long; petals rose-color or white, emarginate, 1 to  $2\frac{1}{2}$  lines long; capsule arcuate, short-pedicel or even sessile.—Dry or rocky

slopes, often in chaparral, 100 to 4500 ft.: Mariposa Co. to Modoc Co.; San Benito Co. to Siskiyou Co.; n. to B. C. Var. *BIOLETTII* Greene. Plants 12 to 16 in. high, of strict growth; flowers minute, the petals  $\frac{1}{2}$  to  $\frac{3}{8}$  line long.—Coast Ranges from Santa Clara Co. to Humboldt Co.; Calaveras Co.

13. *E. paniculatum* Nutt. Fig. 657. Stem simple below, paniculately branched above,  $1\frac{1}{2}$  to 3 or even 6 ft. high; herbage glabrous throughout, sometimes glandular-puberulent on the inflorescence; leaves lanceolate to linear, mostly alternate, with smaller ones fascicled in the axils, sharply but minutely denticulate, mostly veined,  $1\frac{1}{4}$  to  $2\frac{1}{2}$  in. long, usually early deciduous; flowers many to numerous, racemose on the filiform nearly leafless branches of the panicle, the bracts almost subulate; petals deeply 2-cleft into linear-oblong lobes, rotate-spreading, rose-purple, 3 to 5 lines long; capsule pediceled, 10 to 12 lines long, sharply 4-angled and acuminate beaked.—Open dry ground everywhere, 10 to 5500 ft., throughout Cal.; n. to B. C., e. to Col. and Ariz.

657. *Epilobium paniculatum* Nutt.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, style  $\times 2\frac{1}{2}$ ; c, seed  $\times 2$ .

everywhere, 10 to 5500 ft., throughout Cal.; Var. *JUCUNDUM* Trel. Flowers large, the petals 5 to 8 lines long.—Humboldt Co. to Siskiyou Co.; n. to Wash.

##### 5. *BOISDUVALIA* Spach

Erect annuals with alternate leaves. Flowers small or minute, in leafy spikes or axillary along the branches. Calyx-tube (above the ovary) short, obconic, the lobes erect. Petals 4, obovate, sessile, 2-lobed, purple to white. Stamens 8, those opposite the petals shorter; anthers basifixed. Capsule 4-celled, 4-valved, sessile. (Jean-Alphonse Boissduval, French naturalist and physician, author of *Flora Francaise*.)

Capsule terete, membranous.

Capsule septifragal, the septa wholly persistent on the placental axis, which is thus 4-winged. .1. *B. densiflora*.

Capsule loculicidal, the septa adherent to the valves in dehiscence.

Floral leaves ovate or oblong. . . . .

2. *B. glabella*.

Floral leaves linear. . . . .3. *B. stricta*.

Capsule 4-sided, coriaceous; dehiscence unknown.

4. *B. cleistogama*.

1. *B. densiflora* (Lindl.) Wats. Fig. 658. Stem erect, 1 to 5 ft. high, branched above; leaves lanceolate, 2 in. long, the floral ovate, acute, about 3 to 6 lines long; inflorescence spicate, commonly elongated; petals about 2 lines long, about

658. *Boissduvalia densiflora* Wats.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, fl.  $\times 2\frac{1}{2}$ ; c, capsule  $\times 2\frac{1}{2}$ .

twice as long as the lobes of the calyx, and exceeding the subtending leaves; capsule 2 lines long, dehiscent; seeds ovate or triangular-ovate.—Low ground, where water stood in spring pools, 10 to 4000 ft.: San Bernardino Mts.; Coast Ranges; Great Valley; Sierra Nevada foothills; n. to Wash., e. to Nev. June-Sept. Var. *IMBRICATA* Greene. Bracts densely imbricated, concealing the capsules; spikes commonly very long and virgate.—Santa Cruz; Marin Co.; Vaca Valley. Var. *MONTANA* Jepson. Short lateral spikelets numerous below the short terminal spike, each spikelet subtended by a narrowly lanceolate bract  $1\frac{1}{2}$  to 2 in. long.—Howell Mt. Var. *BIPARTITA* Jepson. Herbage pale, villous; petals white, parted into 2 unequal lobes.—N. end Mt. Hamilton Range.

2. *B. glabélla* Walp. Stem commonly branched from the base, 5 to 9 in. high; herbage glabrous or nearly, the foliage bright green; leaves lanceolate to ovate, 5 to 7 lines long; petals 2 lines long, purple; stamens opposite the sepals  $1\frac{1}{2}$  lines long, the alternate ones shorter (sometimes with nearly sessile anthers); capsule almost straight, pointed at apex, 3 lines long; seeds fusiform, about 60.—N. Cal. (Modoc and Siskiyou Cos.); n. to Wash. Var. *CAMPÉSTRIS* Jepson. Herbage more or less pubescent; upper portion of branches densely imbricated with leaves, in fruiting stage concealing the capsules.—Beds of former vernal pools in valleys, 20 to 500 ft.: coastal S. Cal.; Great Valley. May-June.

3. *B. stricta* (Gray) Greene. Stems simple or often diffusely branched from the base, frequently flowering from the very base, 5 to 13 in. high, pilose-pubescent or somewhat canescent; branches often with sparse foliage, or the foliage strict; leaves linear,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; petals 1 line long, violet; capsule slender, attenuate, arcuate-recurved, 6 to 7 lines long, not promptly dehiscent.—Moist spots in the valleys or hill flats, 50 to 2000 ft.: Coast Ranges from Monterey Co. to Mendocino and Lake Cos.; Sacramento Valley; s. Sierra Nevada. June.

4. *B. cleistógama* Curran. Stem commonly with stout rigid whitish branches or rarely simple, 4 to 8 in. high; herbage pilose-pubescent, somewhat glandular, glaucescent; leaves linear or lanceolate, 1 to  $1\frac{1}{2}$  in. long, remotely denticulate; flowers axillary along the branches, the earliest fertilized in the bud and never expanding, the later light pink; petals 2 lines long, bifid; capsule 4-sided, sharply angled, sharply pointed, the septal lines on each side distinct, 5 lines long, hard coriaceous, very tardily dehiscent, if ever.—Beds of former vernal pools, 20 to 500 ft.: Great Valley. May.

#### 6. *CLÁRKIA* Pursh

Annuals with brittle stems and alternate leaves. Flowers showy, in terminal racemes (nodding in the bud). Calyx-tube above the ovary short and obconic, or long and slender, its lobes reflexed in flower, or remaining united and turned to one side. Petals 4, purple or rose-color, with claws, the limb entire or lobed, widespreading. Stamens 8, those opposite the petals short or rudimentary. Ovary 4-celled; style elongated, the stigma with 4 broad lobes. Capsule linear, or attenuate above, straight or somewhat curved, coriaceous, with very smooth sides, somewhat 4-angled, 4-valved. Seeds numerous, angled or margined.—The lower leaves in this and in the two succeeding genera often disappear very early. (Captain Clark of the Lewis & Clark party, first expedition across the Rocky Mts. to the Pacific, 1806.)

Stamens 8; calyx-tube short, obconical.

Petals entire.

Claw very short, much shorter than limb of petal.

Filaments without scales; claw slender, not toothed.....1. *C. modesta*.

Filaments with whitish hairy scales at base, those alternate the petals with longer scales; claw broad, often toothed.....2. *C. rhomboidea*.

Claw about as long as limb of petal, not toothed.....3. *C. elegans*.

Petals lobed.

Petals 2-lobed with a subulate tooth in the sinus; claw short, not toothed.....

4. *C. xantiana*.

Petals 3-lobed; claw long, a tooth on each side at the middle.....5. *C. pulchella*.

Stamens 4; calyx-tube elongated, filiform; petals 3-lobed.

Petals 3-lobed, the lobes nearly equal.....6. *C. concinna*.

Petals fan-shaped and obcordate, a linear or spatulate lobe proceeding from the deep sinus and exceeding in length the lateral lobes, which are several times larger.....7. *C. breweri*.

1. *C. modesta* Jepson n. sp. Stems slender, simple or strictly branched above, 13 to 15 in. high; herbage glabrous or the stems minutely puberulent; leaves linear-lanceolate, 9 to 11 lines long; racemes few-flowered; petals pink, oblong, very acute, 4 lines long, narrowed at base to a short but slender and distinct claw.—San Carlos Range (Waltham Creek, Jepson 2690, type). This is the most primitive species yet made known in *Clarkia* and forms a connecting link with *Godetia*.

2. *C. rhomboidea* Dougl. Fig. 659. Stem erect, 1 to 3 ft. high, simple or branching; herbage finely puberulent; leaves oblong to ovate, entire,  $\frac{1}{2}$  to 2 in. long, on petioles  $\frac{1}{2}$  in. long, more or less; calyx-tube above ovary  $1\frac{1}{2}$  lines long; calyx-lobes narrowly linear, carinate; petals rose-purple, often purple-dotted toward the base, rhomboidal, 3 to 5 lines long, the limb with a short broad often toothed claw; filaments with whitish hairy scales at base, those alternating with the petals with longer scales; capsule sessile or very shortly pediceled, commonly somewhat curved, appressed-puberulent, 1 in. long.—Cañon sides, often where there is sliding surface soil, 3000 to 7000 ft.: mts. of S. Cal.; Coast Ranges; Sierra Nevada; n. to Wash., e. to Nev.

659. *C. rhomboidea* Dougl.; fl. x 1.

3. *C. elegans* Dougl. Fig. 660. Stem erect, simple or branching, 1 to 3 ft. high; herbage glabrous, glaucous, often reddish; leaves ovate to oblong-ovate, entire or sometimes repand-denticulate, 1 to  $1\frac{3}{4}$  in. long, short-petioled; calyx-lobes broadly linear, plane; petals often spreading laterally in pairs, about 8 lines long, the limb about equaling the narrow entire claw; filaments with a reddish densely hairy scale at base, most developed opposite the short stamens; anthers of long stamens bright crimson, 3 lines long; anthers of short stamens commonly white; capsule usually curved, sessile, 7 to 12 lines long, hirsute with spreading hairs. — Cañon sides and chaparral slopes, 200 to 3000 ft.: Mendocino Co. to mts. of S. Cal.; Sierra Nevada foothills.

660. *Clarkia elegans* Dougl.; a, fl. stem x  $\frac{1}{2}$ ; b, c, stamens x 2; d, capsule x 1.

4. *C. xantiána* Gray. Stem 1 to  $2\frac{1}{4}$  ft. high; herbage glabrous, glaucous; petals 2-lobed, with a subulate lobe in the sinus; capsule slender, rather strict and nearly straight, puberulent, 10 to 11 lines long.—Region of Fort Tejon.

5. *C. pulchélla* Pursh. Stems simple or rather strictly branched, 6 to 13 in. high; leaves linear- to filiform-lanceolate,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long; petals pink, 3-lobed, 5 to 10 lines long, the claw about half as long as the blade and bearing a tooth at the middle on each side; long stamens with a scale on each side at base, the short stamens with

rudimentary anthers.—Plumas Co. (acc. Fl. Fr. 223, but needs confirmation); ne. Ore. to B. C. and Mont. June-July.

6. *C. concinna* (F. & M.) Greene. RED RIBBONS. Fig. 661. Stems simple below or diffusely much branched from the base,  $\frac{1}{2}$  to 2 ft. high; herbage nearly glabrous; leaves ovate-oblong to oblong,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long; calyx-tube above ovary 8 lines long; calyx-lobes crimson, linear-lanceolate, 9 lines long, abruptly recurved from the middle; petals rose-purple, 7 to 12 lines long, cuneate-obovate, 3-lobed, 3 upper petals are commonly approximate

661. *Clarkia concinna* Greene.; a, fl. stem x  $\frac{1}{2}$ ; b, anther x 6; c, capsule x 1.

and ascending, the lower one opposite these and declined, thus making a corolla which is physiologically irregular and as if 2-lipped; filaments not at all or scarcely dilated at base or apex, the anthers recurved after dehiscence and sparsely short-ciliate; capsule sessile, nearly straight,  $\frac{3}{4}$  to 1 in. long; seeds short subcylindric, pointed at one end, the other end oblique and margined with a dense row of short teeth.—Wooded districts, especially on hillslopes where the surface soil is loose or sliding, 50 to 2000 ft.: Coast Ranges from Humboldt and Colusa Cos. to Santa Barbara Co. May-June. The common name received from Julia Harbison.

7. *C. br weri* (Gray) Greene. FAIRY FANS. Stems with few and spreading branches, 5 to 9 in. high; calyx-tube above ovary 1 to 1 $\frac{1}{4}$  in. long; petals luminous pink, fan-shaped and obcordate, about 1 in. long, the rather deep sinus with a linear or spatulate lobe proceeding from it which surpasses the large lateral lobes; filaments clavate or globose-dilated at apex; anthers linear, brick-red, 3 lines long, conspicuously ciliate; style much longer than the stamens; stigmas white; capsule stout, sessile, straight, 1 $\frac{1}{4}$  in. long; seeds as in no. 6.—Loose shale slopes, 2000 to 3000 ft.: Mayacamas Range; e. side Santa Cruz Mts.; Mt. Hamilton Range; San Carlos Range. (*Eucharidium breweri* Gray.)

#### 7. GOD TIA Spach

Mostly erect annuals with narrow shortly petioled or sessile alternate leaves. Flowers showy, red, purple, cream-color or nearly white, opening during the day, disposed in leafy racemes or spikes, the inflorescence sometimes reduced to but few flowers or a single one. Calyx often colored, its lobes reflexed in anthesis, or united and turned to one side; calyx-tube obconic or funnelform. Petals 4, commonly broad and entire, sometimes notched or 2-lobed. Stamens 8, those opposite the petals shorter; anthers basifixed. Capsule linear, rarely ovate, 4-sided or terete, often longitudinally ribbed, 4-celled, 4-valved. Seeds in 1 or 2 rows. (C. H. Godet, 1797-1879, author of *Flora de Jura*.)

A. Flowers loosely spicate; capsule commonly terete, sometimes ribbed (see nos. 11 and 12)

Buds nodding; calyx-lobes remaining united and turned to one side under the open flower  
Sierra Nevada species; stigmas distinct.

Petals 2-lobed.....1. *G. biloba*  
Petals not lobed.

Calyx-tube without annular process.

Capsule sessile or subsessile, not at all or scarcely beaked; style no longer than stamens.....2. *G. dudleyana*

Capsule long-pedicelled and long-beaked; style much longer than stamens.....3. *G. arcuata*

Calyx-tube with an annular swelling at summit of ovary.....4. *G. hanssenii*

Coast Range species; stigmas partly united so as to form a saucer-shaped or shallowly cup-shaped base.

Ovary often curved before anthesis; inflorescence usually very loose; capsule typically with flat sides.....5. *G. bottae*

Ovary straight and deflexed before anthesis; flowers in a closer spike.....6. *G. deflexa*

Buds erect.

Tube of calyx long (2 $\frac{1}{2}$  to 5 $\frac{1}{2}$  lines).

Calyx-lobes remaining united and turned to one side under the flower.

Flowers loosely spicate-paniculate; capsule shortly attenuate at apex.....

7. *G. amoena*

- Flowers spicate on short slender branchlets of the single main stem; capsule thick, blunt at apex. . . . . 8. *G. blasdalei*.  
 Calyx-lobes commonly distinct and closely reflexed.  
 Erect; capsules straight or nearly so; Sierra Nevada. . . . . 9. *G. viminea*.  
 Diffuse; capsules curving; Coast Ranges. . . . . 10. *G. parviflora*.  
 Tube of calyx short (1 to 1½ lines long).  
 Calyx-lobes commonly distinct and closely reflexed.  
 Capsule long and slender, not strongly ribbed; spikes usually long and flowers scattered. . . . . 11. *G. quadrivulnera*.  
 Capsule short and thick, strongly ribbed; spikes short or at least not loose. . . . . 12. *G. goddardii*.  
 Calyx-lobes united and turned to one side under the open flower; capsule pedicellate. . . . . 13. *G. epilobioides*.  
**B. Flowers in dense clusters; capsule 8-ribbed (the ribs on the lateral faces sometimes indistinct), more or less 4-sided.**  
 Petals 5 to 11 lines long; mostly interior.  
 Stems regularly leafy.  
 Ovary hairy; petals pale crimson with a dark blotch at apex, 5 to 11 lines long. . . . . 14. *G. purpurea*.  
 Ovary glabrous; petals rose-red, without blotch, 6½ lines long. . . . . 15. *G. arnottii*.  
 Stem interruptedly leafy; petals purplish with a spot toward summit, 5 lines long. . . . . 16. *G. sparsifolia*.  
 Petals large, 1½ to 1¾ in. long; north coast. . . . . 17. *G. grandiflora*.

1. *G. biloba* (Dur.) Wats. Stem simple or branching, 1 to 2 ft. high; leaves oblong-lanceolate or linear, ½ to 2 in. long, entire or remotely denticulate, the lower on long slender petioles; buds nodding, narrowly ovate, commonly abruptly tipped with a slender point; calyx-lobes united and turned to one side in anthesis, purplish brown, the tips not free in the bud; calyx-tube with a dense ring of short white hairs at the mouth; petals broadly cuneate, emarginate or with a deep v-shaped notch at apex, 5 to 11 lines long; capsule 4-sided, weakly 8-ribbed, 5 to 7 (11) lines long, on pedicels ½ to 1 line long.—Hillslopes, 25 to 2300 ft.: Sierra Nevada foothills from Butte Co. to Mariposa Co.; Contra Costa Co. from Mt. Diablo to Crockett. June-July.

2. *G. dudleyana* Abrams. Stem slender, simple or with rather strict branches above the middle, less commonly from the base, ¾ to 2¾ ft. high; herbage puberulent or the older parts glabrous; leaves filiform to oblong, entire or remotely denticulate, ½ to 2½ in. long, petioled or sessile; conduplicate upper leaves few or none; buds slender, ovate, often abruptly attenuate near apex, nodding, the tips of the calyx-lobes not free; calyx purple to lavender, its lobes turned to one side in anthesis; petals pink-crimson with crimson dots in center, 6 to 13 lines long; stamens as long as the style; filaments all or only those of the short stamens purple; anthers yellow; style purplish; capsule slender, sessile or nearly so, 2-ribbed on each face, 6 to 10½ lines long.—Barren hills or open chaparral, 1800 to 6000 ft.: Sierra Nevada foothills from Tuolumne Co. to Tulare Co.; s. to the San Gabriel Mts. and San Bernardino Mts. June-July. Var. *BRANDEGEAE* Jepson n. comb. Petals broad (mostly 5 to 10 lines), shallowly notched.—Sweetwater Creek, Eldorado Co. (f. *brandegeae* Jepson.)

3. *G. arcuata* (Kell.) Jepson. KELLOGG *GOETIA*. Stem slender, sparingly branched, more or less falsely dichotomous on account of the repeated divergence of axis and branch, 7 to 20 in. high; leaves linear, entire, obtusish, 1¼ to 2 in. long, the fascicled and upper leaves narrow (½ to 1 line broad), commonly conduplicate and appearing much narrower, more or less arcuate-curving, with long slender acute tips, 2 to 2½ in. long; flower buds large, ovate, acute; calyx-tube 2 to 3 lines long, often purple inside, the lobes remaining united and turned to one side; petals fan-shaped, lilac, 10 to 15 lines long, usually retuse at the more or less truncate apex; style much longer, often twice longer than stamens; anthers yellow; ovary hispidulose with short spreading hairs; capsule 8-ribbed, the ribs separated by broad sharply defined channels, those opposite the partitions broader, about 12 lines long, with a beak 2½ to 3 lines long, the pedicels 2½ to 5 lines long; seeds sharply pointed at one end, the other end obliquely flattened and with a thin margin.—Foothills, 1000 to 2000 ft., Eldorado Co. to Mariposa Co.

4. *G. hansèni* Jepson. Stem very slender, sparingly branched, 4 to 10 in. high; herbage puberulent or the stem glabrous; leaves narrowly linear ( $\frac{1}{2}$  to 1 line broad), acute or long acuminate, entire and sparsely or obscurely denticulate, 1 to  $1\frac{1}{2}$  in. long, subsessile or shortly petioled; buds at an early stage nodding but soon erect, the calyx-tips not free; flowers few, scattered in the upper axils; sepals in anthesis remaining united and turned to one side; calyx-tube narrowly vase-shaped, 3 to  $3\frac{1}{2}$  lines long, with a distinct annular swelling at summit of the ovary; ovary apparently glabrous, but sparingly covered with minute short spreading gland-tipped hairs, inversely clavate; stamens about half the length of the petals; style nearly as long as petals; stigmas whitish; capsules about 10 lines long including the marked beak (1 to 3 lines long); lateral faces of capsule with a very shallow furrow sloping to center, the other faces with 2 or 3 filiform ridges; pedicels 1 to  $3\frac{1}{2}$  lines long.—Amador Co., 5000 ft.

5. *G. bóttæ* Spach. Stem slender, erect, simple or more commonly branching at or from the base, 1 to  $3\frac{1}{4}$  ft. high; leaves linear or lanceolate, or the lower oblong, remotely denticulate,  $\frac{3}{4}$  to  $2\frac{1}{2}$  in. long, petioled or sessile; flowers axillary but falsely terminal through usurpation, the growing capsules thrusting the shoot to one side so that the latter seems proliferous; buds nodding, slender ovate, abruptly tipped with a slender short point; calyx-tube very short, 1 to  $1\frac{1}{2}$  lines long; calyx-limb turned to one side with the lobes united in anthesis, commonly crimson-tinted; petals pink or light crimson, 8 to 13 lines long; stamens equaling the style; stigma deeply parted into 4 oblong or elliptic lobes but united at base so as to form a swollen somewhat cup-shaped apex to the style; capsules scattered, rather distinctly 4-sided with the plane sides not at all ribbed or obscurely so,  $\frac{3}{4}$  line broad, 11 to 16 lines long, on pedicels  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; seeds all over minutely granulate.—Hill and chaparral slopes, 50 to 1500 ft.: San Gabriel Mts.: Santa Monica Mts.; n. to Monterey Co. May-June. Var. *USITATA* Jepson. Stigma short-oblong or quadrate; capsule commonly sessile or nearly so, thick, rather obviously 8-ribbed.—Valleys, coastal S. Cal. Var. *CYLINDRICA* Jepson. Nearly or quite simple, 7 to 15 in. high, few-flowered; leaves narrowly linear or subfiliform,  $\frac{1}{4}$  to  $\frac{1}{2}$  line broad; calyx

662. *Godetia amoena* Lilja; a, fl. branchlet  $\times \frac{1}{2}$ ; b, anther  $\times 1\frac{1}{4}$ ; c, style and stigmas  $\times 1\frac{1}{4}$ ; d, cross sect. of ovary  $\times 5$ .

indigo-purple, its tube with a ring of white hairs at mouth; petals 9 to 11 lines long, lilac-purple, or paler with a sprinkling of dark dots, at base with a dark purple band; anthers sometimes purple-dotted; capsules slender (scarcely more than  $\frac{1}{4}$  line broad), teretish, not costate, as much as  $1\frac{1}{2}$  in. long, sessile (or sometimes with a pedicel  $3\frac{1}{2}$  lines long). — Mountain slopes, 1000 to 4000 ft., surrounding the upper San Joaquin Valley from Squaw Valley, Fresno Co., to Ft. Tejon, thence n. to Alcalde and w. to San Luis Obispo Co.

6. *G. deflexa* Jepson. Similar to no. 5; stem stout; calyx-buds large (7 lines long), borne on abruptly deflexed sessile ovaries; stigma peltate or somewhat saucer-shaped, undulately 4-lobed. — Sandy plains, Los Angeles.

7. *G. amoena* (Lehm.) Lilja. SUMMER'S DARLING. Fig. 662. Stem erect, simple or more commonly branching, 1 to 3 ft. high; leaves linear to lanceolate, narrowed at base to a petiole or sessile,  $\frac{1}{2}$  to 2 in. long (or with smaller ones fasciated in the axils), the uppermost half-conduplicate and curved; buds erect,

rarely drooping; calyx-lobes united and turned to one side in anthesis but usually distinct at base, less commonly wholly distinct, 6 to 11 lines long, their tips not free in the bud; petals lilac-crimson or red-pink, often with a darker central splotch and base, abruptly narrowed to a short claw, 7 to 11 lines long; stigmas yellow, linear,  $1\frac{1}{2}$  to 3 lines long; ovary canescent; capsule teretish, not ribbed, tapering very slightly to each end, 1 to  $1\frac{3}{8}$  in. long, sessile or on pedicels to 3 lines long.—Dry hills, bushy or wooded slopes, 100 to 1500 ft.: near the coast from Monterey Co. to Del Norte Co.; n. to B. C. July-Aug. It is prized in cultivation and is also called Farewell to Spring, but both the common names are invented by some poet or other as Herodotus would say. The species is plastic. Var. *CÓNCOLOR* Jepson. Simple, 8 to 12 in. high; leaves narrowly linear; sepals united and turned to one side; petals 5 to  $7\frac{1}{2}$  lines long, uniform crimson.—Napa Range. Var. *PYGMAEA* Jepson. Very slender, unbranched, 4 to 11 in. high, all the parts small; petals crenulate, often abruptly acute,  $2\frac{1}{2}$  to 5 lines long, usually with central blotch.—Conn Valley, Napa Range. Var. *ALBICÁULIS* Jepson. Stems white shining, simple or strictly branched, 20 in. high; leaves narrow; petals  $1\frac{1}{4}$  to  $1\frac{3}{4}$  in. long; capsules about  $1\frac{3}{4}$  in. long, with a beak usually 5 lines long.—Butte Co. plains. Var. *HUNTIANA* Jepson n. comb. Diffuse, widely branching, 1 to  $2\frac{1}{2}$  ft. high; flowers small; petals crimson with a mostly 3-forked blotch in the center, 5 to 7 lines long.—Blue Lakes. (f. *huntiana* Jepson.) Var. *LINDLEYI* Jepson. Spotted Blush. Petals 10 to  $17\frac{1}{2}$  lines long, almost uniformly with a large central blotch.—Along or toward the coast, Humboldt Co.; n. to B. C.

8. *G. blasdalei* Jepson. Stem erect, often stout, simple or with slender short strict branches, 2 to 3 ft. high, soon leafless except above; leaves oblong to linear-lanceolate, acute,  $1\frac{1}{8}$  to  $1\frac{3}{4}$  in. long; herbage puberulent; flowers essentially like those of the large-flowered form of *G. amoena*, but petals notched at apex or even deeply bilobed; ovary thick below middle, tapering to base, and also to apex something like a rifle cartridge; capsule canescent, thick, terete, rather short (6 to 8 lines long), on pedicels  $\frac{3}{4}$  to 2 in. long.—E. shore of San Francisco Bay.

9. *G. viminea* Spach. Stems whitish and shining or sometimes reddish above, strictly erect and simple or with simple suberect branches, 1 to 3 ft. high; herbage finely pubescent, the older parts of the stem glabrescent; leaves linear to lanceolate, entire, narrowed at base to a short petiole or the upper sessile and commonly conduplicate,  $\frac{1}{2}$  to 2 in. long; buds erect; calyx-tube broadly vase-shaped or narrowly campanulate, whitish membranous, 3 to  $5\frac{1}{2}$  lines long; calyx-lobes lanceolate, acuminate, distinct, primly reflexed, their tips free in the bud; petals purplish or crimson, with a large purple splotch in center or at apex, and often yellow at base, 6 to 12 lines long; stamens about  $\frac{1}{2}$  the length of the petals or less; anthers white, longer than the filaments; style as long as or longer than the stamens; stigmas purple, hispidulose; capsule 4-sided with 2 ribs on each side, or those of the lateral faces obscure or wanting, puberulent, sessile or rarely with a pedicel  $\frac{1}{2}$  line long; seed very short, weakly margined.—Dry hillslopes, 1300 to 5000 ft.: Sierra Nevada foothills from Kern Co. to Calaveras Co.; n. to Ore. May-July. Var. *CONGDONII* Jepson. One to  $1\frac{1}{2}$  ft. high; buds loosely pilose; calyx-tips slender and very distinct; petals yellow at base.—Hetch-Hetchy. Var. *INCERTA* Jepson. Very leafy, 7 to 15 in. high; petals deep crimson, 6 to 10 lines long; capsules abundant, 8-ribbed; stigmas oval.—Yosemite Valley. Var. *MARGARITAE* Jepson. Buds and flowers few and widely scattered on the very slender stems; calyx-tube very slender,  $4\frac{1}{2}$  to 7 lines long, the segments more or less cohering in anthesis.—Margarita Valley, San Luis Obispo Co.

10. *G. parviflora* Jepson. Stems usually diffusely branching from the base,  $\frac{1}{2}$  to  $2\frac{1}{4}$  ft. long, the branches numerous and wiry; leaves narrowly lanceolate or linear, 5 to 12 lines long, the lowest oblong or oblong-ovate; calyx in bud 4-sided and its tips free, the segments in anthesis commonly distinct; calyx-tube pinkish, long and slender ( $2\frac{1}{2}$  to 5 lines long), usually longer than the ovary and commonly swollen slightly at the summit of ovary; petals cuneate-obovate, rose-red, 4 to  $7\frac{1}{2}$  lines long, the stamens  $\frac{2}{3}$  their length;

style nearly or quite equaling the petals; stigmas purple, elliptic, somewhat united at base; capsules teretish, rather strongly curved, obscurely 2-ribbed on the sides,  $4\frac{1}{2}$  to 9 lines long.—Monterey Co. June.

11. *G. quadrivulnera* (Dougl.) Spach. Stem erect, simple or with simple branches from below the middle,  $\frac{2}{3}$  to  $1\frac{2}{3}$  ft. high; herbage pubescent or puberulent; lowest leaves obovate or oblong, 5 to 11 lines long, the upper narrowly or broadly linear, the uppermost lanceolate and somewhat conduplicate,  $\frac{5}{8}$  to  $1\frac{3}{8}$  in. long; flowers discrete or remote; calyx-lobes usually distinct and reflexed (in the earliest flowers sometimes united and turned to one side); petals lilac or pale crimson, usually with a spot at the top,  $2\frac{1}{2}$  to 5 lines long; ovary canescent to densely villous; stigmas purple, short-oblong; capsule sharply 4-sided, the sides smooth or obscurely ribbed, often rather strongly beaked,  $\frac{1}{2}$  to 1 in. long, sessile.—Open hillsides, 300 to 4400 ft., throughout cismontane Cal.; n. to Ore. and Wash. The most common species; it is very variable in habit, pubescence, color of flowers, and ribbing and length of capsules. May-June. The following varieties, which in some cases intergrade freely, give an idea of the range of variation. Var. *APICULATA* Jepson. Pale, slender; buds strongly apiculate.—Howell Mt. Var. *VACENSIS* Jepson. Stems slender, often branched at the base; flowers very remote; capsules slender,  $1\frac{1}{4}$  in. long.—Vaca Mts. Var. *DÄVYI* Jepson. Leaves all or mainly oblong and mostly obtuse, about 6 lines long; midrib of valves prominent, ribs none or 4.—Point Reyes. Var. *FLAGELLATA* Jepson n. comb. Simple or with few elongated very slender whip-like branches,  $1\frac{1}{4}$  to 2 ft. high; flowers very remote.—Vaca Mts. (f. *flagellata* Jepson.) Var. *HALLII* Jepson. Freely branching, 2 ft. high; petals ovate, with an abrupt short small point, light pink with a sharply defined deep purple or reddish wedge-shaped spot at apex; stigmas very short, subquadrate; ovary and capsule hairy; ribs filiform.—Box Springs Mt., Riverside. Var. *SETCHELIANA* Jepson n. comb. Branching from base; young parts very canescent; style longer than stamens; capsule short; densely short villous.—Santa Cruz Mts. (f. *setchelliana* Jepson.) Var. *RUBRIFISSIMA* Jepson. Petals roundish ovate,  $4\frac{1}{2}$  to  $6\frac{1}{2}$  lines long, uniformly deep reddish purple; ovaries canescent; capsules strigulose-pubescent.—Box Springs Mt., Riverside.

12. *G. goddardii* Jepson. Stem simple or sparingly branched, 1 to  $2\frac{1}{3}$  ft. high, foliage and buds as in no. 11 but spikes not so lax; petals pink-crimson or purple-crimson, with or without dark crimson spot at apex,  $2\frac{1}{2}$  to 6 lines long; calyx-lobes primly reflexed, in pairs or quite distinct; capsule sessile, almost glabrous or canescently puberulent, terete, 8-ribbed, and with 8 distinct but small nerves which are median and at the sutural angles, 4 to 7 lines long.—Dry open hills, Contra Costa Co. to Humboldt Co. June. Var. *MIGUELITA* Jepson. Stem branching mainly above (sometimes simple); petals deep crimson; capsules pilose or pubescent, short (5 to 8 lines long) and thick ( $1\frac{1}{2}$  lines broad), strongly 2-ribbed on each side and strongly nerved at the angles, very shortly pediceled.—San Antonio River Valley, Monterey Co. Var. *CAPITATA* Jepson n. comb. Stem about 20 in. high, with simple secondary branches from the base,  $2\frac{1}{4}$  to 6 in. long; herbage puberulent; flowers in head-like bracteate clusters at end of branches; ovaries densely pilose.—Centreville, Fresno Co. (f. *capitata* Jepson.)

13. *G. epilobioides* Wats. Stem slender, simple or nearly so, erect, 6 to 19 in. high; herbage minutely puberulent; leaves oblong to linear, remotely and minutely toothed, 5 to 11 lines long; petioles 1 to 3 lines long, the uppermost leaves nearly sessile; buds nodding, the tip of the calyx-lobes not free; calyx-tube  $\frac{1}{4}$  line long; calyx-lobes united and turned to one side in anthesis; petals obovate, commonly cream-yellow, rarely lavender-pink and dotted on the lower half, 3 to  $4\frac{1}{2}$  lines long; stamens about half the length of the petals; anthers nearly twice the length of the filaments; stigmas very slightly lobed, as if capitate; capsules 4-sided, with plane or flattish faces, or with the reddish or brown midnerve somewhat depressed, 10 to  $12\frac{1}{2}$  lines long, pedicels 1 to  $2\frac{1}{2}$  lines long, sometimes very short but always present.—Hills and valleys, 300 to 2000 ft.: coastal S. Cal.; n. to San Luis Obispo Co. May.

14. *G. purpurea* (Curtis) Don. Stems prevailingly simple and usually stoutish,  $\frac{1}{3}$  to 2 ft. high, the flowers capitately congested at the summit or disposed in the upper axils of the leafy stem, the single flowers sometimes replaced by a cluster of 2 to 4 and borne on very short branchlets; herbage minutely pubescent; leaves ovate-oblong or oblong, obtusish or merely acute, the upper oblong-lanceolate or lanceolate, entire or remotely denticulate, sessile or very shortly petioled,  $\frac{1}{2}$  to  $1\frac{3}{8}$  in. long; buds commonly pilose, their calyx-tips but slightly free; calyx-tube  $2\frac{1}{2}$  to  $3\frac{1}{2}$  lines long; petals broadly cuneate, truncate and eroded at apex, 5 to 10 lines long, light crimson, usually with a wedge-shaped darker spot in middle at apex; stigmas oval, purple; ovary shaggy villous or canescent; capsule 4-sided, sessile, stoutish and mostly short, 5 to 7 (or 11) lines long, shaggy or merely pubescent, 8-ribbed; seeds faintly granulate on sides.—Dry open valleys: Sacramento and San Joaquin valleys; South Coast Ranges; coastal S. Cal. May. Var. *ELMERI* Jepson. Flowers loosely spicate below the dense terminal cluster of young buds; petals broadly ovate, dark red in dried specimens, 7 lines long; capsule stout and rather short.—Santa Barbara. Var. *PROCERA* Jepson. Slender, tall ( $1\frac{3}{4}$  to  $2\frac{1}{2}$  ft. high), simple or with few short slender branchlets; flowers small, the petals  $2\frac{1}{2}$  to 3 lines long.—Berkeley. Var. *LACUNARUM* Jepson. Tall ( $1\frac{1}{4}$  to  $1\frac{3}{4}$  ft. high), freely branching, upper portions of the branches angled or compressed; flowers congested at the ends of the branches; petals 4 to  $6\frac{1}{2}$  lines long.—Oakdale, San Joaquin Valley.

15. *G. arnottii* (T. & G.) Walp. Simple, 6 to 14 in. high, wholly glabrous; leaves thickish, rhomboidal-ovate to oblong or oblong-lanceolate, entire or sparingly denticulate,  $\frac{5}{8}$  to  $1\frac{1}{2}$  in. long, subsessile; buds glabrous, their calyx-tips free; flowers congested in a terminal head; calyx-tube  $1\frac{1}{2}$  lines long; petals rose-red, with whitish base, orbicular, entire, 6 lines long; stigma whitish or pale crimson; ovary deeply grooved, quite glabrous; capsule teretish, 8-ribbed, 6 lines long.—Sandy-clay plains, Sacramento Valley.

16. *G. sparsifolia* Jepson. Stem simple or branching at the base, 11 in. high; flowers collected in a dense and leafy terminal cluster, the stem sparsely leafy below; leaves linear-oblong, acute,  $\frac{3}{4}$  to  $1\frac{1}{8}$  in. long, sessile; herbage pubescent or pilose, the deeply grooved ovary densely hairy; sepals distinct, calyx-tube narrow,  $1\frac{1}{2}$  lines long; petals oblong-ovate, purplish with a spot towards summit, 5 lines long; stigma almost entire, purple; style as long as the long stamens, about half the length of the petals.—Lower San Joaquin Valley.

17. *G. grandiflora* Lindl. Dwarfish, the stem stout, simple, or with short slender branches above the base, 8 to 12 in. high, very leafy; herbage minutely strigulose; leaves oblong, tapering strongly to apex and to the short petiole at base,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long; buds very large,  $1\frac{1}{4}$  to  $1\frac{3}{4}$  in. long, the calyx-tips not free; flowers in a short spike or dense cluster of short subterminal branchlets; petals cuneate-obovate, retuse at apex,  $1\frac{1}{2}$  to  $1\frac{3}{4}$  in. long, rose-red with a deeper flush or blotch in center; stigmas yellow, linear, 3 lines long; capsule canescent, thick and short,  $\frac{3}{4}$  in. long, strictly sessile; seeds in 2 rows in each cell.—Hills near the ocean, Sonoma and Mendocino Cos.

## 8. OENOTHERA L.

Herbs with alternate or basal leaves. Flowers yellow or white, often turning greenish or reddish. Calyx-tube prolonged beyond the ovary, mostly deciduous, the lobes 4, reflexed. Petals 4. Stamens 8, equal, or those opposite the petals shorter, mostly versatile, sometimes basifixed. Capsule chartaceous to woody, straight, contorted or spirally coiled, 4-celled, 4-valved, dehiscent. Seeds many, naked. (Greek oinos, wine, and therea, pursuit, name given by Dioscorides to some now unknown plant, the roots of which were eaten to incite desire for wine.)

A. STIGMA DIVIDED INTO 4 LINEAR LOBES; CAPSULE SESSILE OR NEARLY SO.

1. *Plants with stems bearing leaves and flowers; calyx-tube  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long.*

Flowers yellow, the buds erect; stems tall,  $1\frac{1}{2}$  to 5 ft. high; seeds in 2 rows in each cell; biennial.—Subgenus ONAGRA.....1. *O. hookeri*.

Flowers white, the buds nodding; stems low; capsules linear, smooth; seeds in 1 row in each cell.—Subgenus *ANOGR*.

Tips of calyx-lobes not free in the bud; pubescence usually spreading; stems sparsely leafy; annual.....2. *O. trichocalyx*.

Tips of calyx-lobes free in the bud; stem very leafy; pubescence appressed; perennial.....3. *O. pallida*.

2. Plants with the leaves and flowers borne at the ground in a basal tuft or rosette on the root-crown; flower-buds erect; perennials.

Flowers yellow.—Subgenus *LAVAUXIA*.

Tips of calyx-lobes not free; calyx-tube 1 to 2 in. long; seeds not angled, in 1 row in each cell; herbage pubescent.

Leaves deeply and regularly pinnate, the lateral lobes numerous and well-developed, or sometimes sublyrate; angles of capsule with a small rounded or acutish ridge but not winged; seeds coarsely and irregularly tuberculate.....4. *O. primiveris*.

Leaves lyrate pinnatifid with few and small lateral lobes, sometimes entire; angles of capsule with thick wings below; seeds minutely tuberculate.....5. *O. xylocarpa*.

Tips of calyx-lobes free in the bud; calyx-tube 2 to 4 in. long; seeds evidently angled, in 2 rows in each cell; herbage glabrous or glabrate.....6. *O. triloba*.

Flowers white; capsule oblong, the angles with a coarsely-toothed narrow wing or with tubercles; seeds in 2 rows in each cell; leaves and flowers borne in a tuft on the root-crown.—Subgenus *PACHYLOPHUS*.....7. *O. caespitosa*.

#### B. STIGMA CAPITATE OR DISCOID.

1. Calyx-tube slender or filiform,  $\frac{1}{2}$  to 4 in. long, 3 to 5 times the length of the ovary; capsule sessile or nearly so; seeds in 2 rows in each cell.—Subgenus *TARAXIA*.

Perennials; leaves and flowers borne in a rosette or tuft on the ground; leaves evidently narrowed to a petiole; capsule not winged.

Leaves deeply pinnatifid; capsule densely pubescent.....8. *O. tanacetifolia*.

Leaves entire or with 1 or 2 small lobes or teeth; capsule glabrous.

Capsule linear, 2 lines wide, at maturity shrunken about the seeds; seeds with a scurfy bran-like surface; petioles pubescent; coastal.....9. *O. ovata*.

Capsule oblong to ovate, 3 to 4 lines wide, not at all shrunken about the seeds; seeds smooth, foveo-pitted; petioles glabrous; high montane.....10. *O. subacaulis*.

Annuals; leaves and flowers borne in a tuft on the root-crown or short stem or on its very short ( $\frac{1}{4}$  to 2 in. long) branches; leaves linear (1 to 3 lines wide), not narrowed to a petiole; capsule short, obovoid-quadrate, with 4 thick obliquely truncate wings.

Petals 4 to 5 lines long; leaves 1 to 4 in. long; stems very short, commonly unbranched, but if branched, the branches slender; cismontane.....11. *O. graciliflora*.

Petals 1 to 2 lines long; leaves 1 to 1½ in. long; stems commonly with several very stout horizontal branches; deserts.....12. *O. palmeri*.

2. Calyx-tube obconic or narrow-funneliform,  $\frac{1}{2}$  to 2 lines long, less than half the length of the ovary; annuals except no. 14.

Capsule sessile or nearly so; seeds in 1 row in each cell.—Subgenus *SPHAEROSTIGMA*.

Flowers yellow, solitary in the axils of the leafy stems.

Capsules evidently quadrangular; low, more or less spreading plants; leaves entire or sinuate-toothed; capsule contorted, the base of it ascending.

Petals 2 lines long.....13. *O. micrantha*.

Petals 3 to 10½ lines long.

Leaves white-pubescent; perennial.....14. *O. spiralis*.

Leaves green or greenish; annual.....15. *O. bistorta*.

Capsules terete, or at least not evidently quadrangular; stem leafy to the top, the leaves of the inflorescence scarcely shorter than those below.

Petals 3 to 8 lines long.....16. *O. dentata*.

Petals 1 to 2 lines long.

Capsules linear, more or less curved, 8 to 18 lines long; petals 1½ to 2 lines long.....17. *O. contorta*.

Capsules lanceolate, straight, 3 to 6 lines long; petals about 1 line long.....18. *O. andina*.

Flowers white (rarely yellow), borne in terminal spikes, the spikes commonly nodding in the bud; stems with the leaves strongly reduced above or inconspicuous.

Flowers minute (petals about 1 line long); spikes very loose; capsules terete, straight, ascending.....19. *O. chamaenerioides*.

Flowers conspicuous (petals 2 to 3 lines long).

Capsules terete, commonly refracted (at least some of the lowest); spikes rather loosely flowered.....20. *O. refracta*.

Capsules quadrangular, or subterete, all ascending (or at least the base of them); spikes densely flowered.....21. *O. alyssoides*.

Capsule long-pediceloid; seeds in 1 row in each cell; flowers in dense terminal spikes, the spikes nodding at tip; desert species.—Subgenus *CHYLISMIA*.

Leaves orbicular-cordate, scattered; under side of leaves green-veined.....22. *O. cardiophylla*.

Leaves oblong to ovate and more or less pinnatifid, usually more or less basally clustered or on lower part of stem; under side of leaves purple-veined.

Capsules 4 to 5 lines long, on pedicels over half as long; petals shortly clawed. . .

23. *O. scapoidea*.

Capsules 1 to 2¾ in. long, on pedicels about ½ as long; petals not clawed. . . . .

24. *O. brevipes*.

1. *O. hookeri* T. & G. EVENING PRIMROSE. Fig. 663. Stem erect, usually simple, 2 to 4 ft. high; herbage canescently puberulent and often hirsute; leaves ovate to lanceolate, or oblanceolate, 4 to 9 in. long, the lowest drawn down to petioles ½ to ½ as long; calyx-tube 1 to 1½ in. long, the tips free in the bud; petals yellow, 1 to 2 in. long and quite as broad; anthers versatile, ½ in. long; style disk-shaped below the cylindric stigmas; capsule obtusely quadrangular, woody, ½ to 2 in. long, the valves with a strong midrib; seed sharply angled.—Moist lowlands or along streams, 10 to 5000 ft., cismontane Cal. (*O. grandiflora* Fl. W. Mid. Cal.)

2. *O. trichocalyx* Nutt. Stem simple, short, very thick or even conical, 1 to 2 (or 6) in. high, very densely flowered, commonly developing from beneath this short dense spike several ascending stems 4 to 14 in. (or even 2½ ft.) high which are loosely flowered above, and sparsely pilose or almost glabrous; leaves oblong to ovate or lanceolate, tapering to both ends, subentire or rather remotely denticulate to coarsely and saliently toothed or lobed, pubescent or pilose, 1 to 7 in. long, margin at first undulate, shortly petioled; calyx-tube ¾ to 1¼ in. long; calyx-tips not free in the bud; bud (just before anthesis) oblong, woolly-pilose; petals ¾ to 1¼ in. long, usually with a deep sinus; capsules very slender, terete, thickened towards the broad sessile base, slightly curved or nearly straight, widely spreading or in maturity strongly deflexed, woody, 1½ to 3 (4) in. long; seeds narrowly ovate, mottled, somewhat compressed.—Sandy plains and flats, 100 to 4000 ft.: Colorado and Mohave deserts; n. along e. side Sierra Nevada to Lassen and Siskiyou Cos.; San Joaquin Valley and bordering foothills; e. to Wyo. and N. Mex. In age the ascending curving stems tend to approximate at tip, the plant becomes loosened from the soil and so forms a roundish "basket" which rolls along under the wind and so scatters the seed. (*Anogra trichocalyx* Small.) Var. *COGNATA* Jepson n. var. Leaves green and glabrate.—Inner South Ranges (Corral Hollow, Brewer 1217, type); upper San Joaquin Valley. Var. *CINERACEA* Jepson n. var. Leaves finely strigulose; buds white with short appressed hairs.—Borrego Spr., w. Colorado Desert (T. Brandegee, type).

3. *O. pallida* Lindl. Stems slender, 5 to 14 in. high, ascending from a perennial running rootstock; leaves narrowly to broadly lanceolate or oblanceolate, entire, remotely denticulate, or pinnately lobed or toothed, bright green, glabrous or subglabrous, 1 to 2 (or 4) in. long, sessile or shortly petioled; flowers several, axillary, vespertine; calyx-tips free in the bud; buds narrowly ovate, or oblong, glabrous; calyx-tube ¾ to 1½ in. long; petals white, turning pink, broader than long, 1 to 1½ in. long; capsule narrow-linear, 8-ribbed, obtusely quadrangular, sessile, 1 to 2¼ in. long, not thickened at base; seeds oblong, turgid, smooth, one row in each cell.—Sandy plains and flats, 1000 to 5000 ft.: Santa Monica Mts. to the San Bernardino Mts.; Mohave Desert; e. to Rocky Mts. (*Anogra pallida* Britt.) Var. *CALIFORNICA* Jepson n. comb. Stems 6 to 22 in. high; herbage ashy with a dense

663. *Oenothera hookeri* T. & G.; a, leaf; b, fl. stem; c, capsule. x ½.

short strigose pubescence; flowers vespertine, remaining open 2 or 3 hours in the morning.—Sandy soil, valleys, desert washes and mountain flats, 200 to 7000 ft.: coastal S. Cal.; Mohave Desert; n. to Inyo Co. and the Sacramento Valley. (*O. californica* Wats.)

4. *O. primiveris* Gray. Leaves in a basal tuft, these and the flowers borne on the very short thick-conical axis of the root-crown; herbage more or less pilose, sometimes densely so; leaves lanceolate or oblong in outline, unequally and usually deeply pinnatifid, less commonly subentire or denticulate, 1 to 6 in. long, on petioles  $\frac{1}{4}$  to 2 times as long; flowers vespertine; calyx-tube  $1\frac{1}{2}$  to 2 in. long; petals yellow, aging pinkish, 1 to  $1\frac{1}{8}$  in. long; capsules oblong-ovate or oblong-lanceolate, strongly 4-sided or quadrangular, straight or only very slightly curved, with a round or acutish ridge on the angles, 1 to  $1\frac{3}{4}$  in. long; seeds irregularly tuberculate.—Sandy soil, 2000 to 3000 ft.: central and e. Mohave Desert; e. to southern Nev. and western Tex.; n. L. Cal. (*Lavauxia primiveris* Small.)

5. *O. xylocarpa* Cov. Leaves and flowers borne in a tuft on the crown of the very stout root; leaves lyrate-pinnatifid (with the terminal lobe ovate to elliptic and the laterals few and small) or entire, 1 to 3 in. long, puberulent, on petioles as long or nearly so; calyx-tube 1 to 2 in. long; petals yellow, aging orange-red, 1 to  $1\frac{1}{2}$  in. long; capsules thick-lanceolate, attenuate, curved or contorted,  $2\frac{1}{2}$  to 3 in. long, the angles developed into thick somewhat undulate wings, the back of each valve prominently ribbed; seeds minutely tuberculate.—Sandy flats, high plateau country, upper Kern River, 8000 to 9800 ft. (*Anogra xylocarpa* Small.)

6. *O. triloba* Nutt. Leaves and flowers borne in a tuft on the root-crown; herbage glabrous or subglabrous; leaves lanceolate in outline, deeply and irregularly pinnatifid below the entire apical portion, 3 to 4 in. long, on petioles  $\frac{1}{4}$  as long; flowers diurnal; calyx-tube 2 to 4 in. long; petals yellow, aging pinkish, 10 to 12 lines long; capsule ovate to broadly oblong, angles winged, sides prominently ribbed and reticulate-veined, 7 to 10 lines long; seeds angled, minutely and densely tuberculate.—Plateau country: Shasta and Modoc Cos.; n. to Can., e. to Col., thence s. to Mex. (*Lavauxia triloba* Spach.)

664. *Oenothera ovata* Nutt.; a, habit  $\times \frac{1}{8}$ ; b, fl.  $\times \frac{3}{8}$ ; c, long. sect. of ovary  $\times 1\frac{1}{2}$ .

7. *O. caespitosa* Nutt. Leaves in a basal rosette, these and the flowers borne in a tuft on the short axis of the root-crown; herbage green, pilose-pubescent or glabrate; leaves ovate to lanceolate in outline, coarsely and irregularly or often sparsely dentate, sometimes subentire, 1 to 4 in. long, narrowed to a petiole half to as long; tips of calyx-lobes not free in the bud; calyx-tube 3 to  $5\frac{1}{2}$  in. long, dilated upward into a narrow-funnel-form dilation; petals white, turning pink, 1 to  $1\frac{3}{4}$  in. long; capsule oblong or linear to narrow-ovate, obtusely quadrangular, 1 to  $1\frac{3}{4}$  in. long, the angles with 2 narrow coarsely toothed wings, or the angles merely warty; seeds minutely and densely tubercled.—Desert slopes, plains and washes, 2000 to 7400 ft.: e. Mohave Desert, n. through Inyo Co. and along e. side Sierra Nevada to eastern Nevada Co., Cal., and to Washoe Co., Nev.; n. to eastern Ore., e. to Col. (*Pachylophus caespitosa* Raim.)

8. *O. tanacetifolia* T. & G. Leaves in a basal rosette, these and the flowers crowded on the root-crown; herbage canescent to scantily puberulent; leaves narrow-oblongate, irregularly and unequally pinnatifid or pinnately divided,  $1\frac{1}{2}$  to 4 in. long, on petioles  $\frac{1}{4}$  to  $\frac{2}{3}$  as long; calyx-tube 1 to 2 in. long; petals yellow, aging yellowish or pinkish, 5 to 7 lines long; capsules narrow-ovate to broadly lanceolate, quadrangular, 5 to 10 lines long; seeds minutely and regularly areolate.—Valleys and hillslopes, easterly summits or e. side of the Sierra Nevada, 4800 to 7000 ft., from Sierra Co. to Siskiyou and Modoc Cos.; w. Nev. to Ida. (*O. nuttallii* T. & G.)

9. *O. ovata* Nutt. GOLDEN EGGS. Fig. 664. Leaves in a basal rosette, these and the flowers arising from the crown of the thick root; herbage glabrous or the leaf margins and veins beneath ciliate; leaves oblong to ovate, acute, entire or subentire, 3 to 6 in. long, the under ones of the rosette narrowed at base to rather long petioles; calyx-tube very slender, 3 to 4 in. long, the segments glabrous; petals orbicular,  $\frac{1}{2}$  in. long; capsules more or less below the surface of the ground, chartaceous, 1 in. long, tardily dehiscent.—Open hillslopes towards the coast, 200 to 1500 ft.: San Luis Obispo Co. to Mendocino Co.; also sw. Ore. Feb.-Apr. (*Taraxia ovata* Small.)

10. *O. subacaulis* Jepson n. comb. Leaves in a broad rosette, these and the flowers seated on the root-crown; herbage glabrous or nearly so; leaves lanceolate to narrow-ovate, entire or denticulate, or with 2 or 3 pairs of small supplementary lobes at base,  $1\frac{1}{4}$  to 5 in. long, on petioles  $\frac{1}{3}$  to  $\frac{2}{3}$  as long; calyx-tube slender or filiform, 1 to  $2\frac{1}{2}$  in. long; petals yellow, aging pale yellow or white,  $3\frac{1}{2}$  to 7 lines long; capsule oblong to elliptic or ovate, quadrangular, smooth or more or less rugulose, ridged on the angles, 6 to 9 lines long; seeds yellowish, favose-pitted.—Moist meadows, 4000 to 8600 ft.: easterly summits or e. side Sierra Nevada from Tulare Co. to Nevada Co. and n. to Modoc Co. (*Jussiaea subacaulis* Pursh. *O. heterantha* Nutt.) Var. *TARAXACIFOLIA* Jepson n. comb. Leaves markedly lyrate-pinnatifid.—Sierra and Plumas Cos. (*Oenothera heterantha* var. *taraxacifolia* Wats.)

11. *O. graciliflora* H. & A. Fig. 665. Leaves and flowers in a tuft, crowded on the root-crown or short branches; herbage hirsute-pubescent; leaves erect or ascending, linear, entire or sometimes obscurely denticulate, 1 to  $3\frac{1}{2}$  in. long, sessile; calyx-tube beyond ovary filiform,  $\frac{1}{2}$  to 1 in. long, the segments hirsute-pubescent; petals broadly obovate, the broad shallow notch at apex with a middle tooth or acumination, 3 to 4 lines long; capsule quadratish in outline, with a short wing-like tooth on the angles near the summit, coriaceous, 3 to 6 lines long.—Hill country and rolling plains, 500 to 2000 ft.: Great Valley and surrounding foothills, w. to Mendocino, Monterey and San Luis Obispo Cos., n. to Siskiyou Co. (*Taraxia graciliflora* Raim.)

665. *Oenothera graciliflora* H. & A.; a, habit; b, capsule. x 1.

12. *O. palmeri* Wats. Stem branched at the ground into several short very stout horizontal or contorted branches  $\frac{1}{4}$  to 2 in. long, the bark white, exfoliating; leaves linear (or oblanceolate), entire or obscurely denticulate, exceeded in width by the broad sessile leaf base, minutely strigulose, 1 to  $1\frac{1}{2}$  in. long; calyx-tube filiform, 6 to 8 lines long; petals yellow, 1 to  $2\frac{1}{2}$

lines long; capsule ovate,  $2\frac{1}{2}$  to 4 lines long, coriaceous, quadrangular, the angles with a thick obliquely truncate wing; seeds minutely roughened.—Sandy soil, 2000 to 4000 ft.: Mohave Desert; Inyo Co.; n. through Nev. to eastern Ore., e. to Ariz. Stems and capsules very tough in age. (*Taraxia palmeri* Small.)

13. *O. micrantha* Hornem. Stems 1 to several from the base, procumbent or diffuse, 8 to 24 in. long; pubescence thinly hirsutulous; leaves ovate- to narrow-lanceolate, slightly undulate, more or less denticulate, 1 to  $3\frac{1}{2}$  in. long, the upper mostly sessile, the lower narrowed to a petiole; calyx-tube  $\frac{3}{4}$  to 1 line long; petals entire or emarginate, 1 to 2 lines long; capsule sharply 4-angled, contorted, often coiled into a single spiral, slightly attenuate upwards, sparsely hirsutulous,  $\frac{1}{2}$  to 1 in. long.—Sandhills and sandy fields along the coast, San Francisco to coastal S. Cal. May-June. (*Sphaerostigma micranthum* Walp.) Var. *IGNOTA* Jepson n. var. Stem usually simple, erect; herbage subglabrous; leaves usually sparser; capsule purplish.—Interior valleys of S. Cal. (Jurupa Hills, Wilder 90, type); s. Sierra Nevada. Var. *REEDII* Jepson n. comb. Petals with a more or less salient tooth in the apical notch.—S. Cal. foothills and valleys, rare. (*Sphaerostigma histortum* var. *reedii* Parish. *S. hirtellum montanum* Dav.) Var. *ABRAMSII* Jepson n. name. Leaves grey with a close short pubescence.—W. side Colorado Desert. (*Sphaerostigma pallidum* Abrams.) Var. *HIRTELLA* Jepson n. comb. Stems flowering from the base or near it, thinly hispid-hirsute; leaves oblong-ovate, often subcordate at the sessile base, crenately toothed, crisped, 6 to 12 lines long, the basal oblong or oblong-spatulate, narrowed to a petiole, 1 to  $2\frac{1}{2}$  in. long.—Mountain slopes and ridges, at middle altitudes: Mendocino and Lake Cos. to S. Cal.; Sierra Nevada from Amador Co. to Tulare Co. (*O. hirtella* Greene.)

14. *O. spiralis* Hook. Fig. 666. Stems decumbent or mostly prostrate, radiating from a central rosette crowning the taproot,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  ft. long,

666. *Oenothera spiralis* Hook.; a, habit  $\times \frac{1}{2}$ ; b, long. sect. of fl.  $\times \frac{3}{4}$ ; c, capsule  $\times \frac{3}{4}$ .

rigid and tough; leaves thick, white-pubescent, obovate to oblong or oblong-oblancoate, obtuse,  $\frac{1}{2}$  to 1 in. long, sessile or the lower petioled; calyx-tube 1 to 2 lines long; petals yellow, 3 to 7 lines long; capsule linear-oblong, stout, chartaceous, acutely quadrangular or almost fluted, 7 to 10 lines long, spirally once coiled, the attenuate apex mostly spreading.—Sandhills and sandy beaches along the coast: Humboldt Co. to San Diego; n. L. Cal. (*O. cheiranthifolia* Jepson, Fl. W. Mid. Cal.) Var. *VIRIDESCENS* Jepson n. comb. Leaves green, round-ovate, cordate at the sessile base, denticulate, hirsute.—S. Cal. coast. (*O. viridescens* Hook.) Var. *NITIDA* Jepson n. comb. Wholly glabrous.—San Miguel Isl.; Monterey. (*O. nitida* Greene.) Var. *LINEARIS* Jepson n. var. Leaves linear, weakly strigose.—W. San Diego Co. (Sunnyside, Hall 3908, type).

15. *O. bistorta* Nutt. Stems several from the base, ascending or prostrate, 2 or 3 in. to 2 ft. long; herbage thinly pilose or puberulent; leaves linear-oblongate or the upper lanceolate, irregularly or obscurely denticulate or subentire, 1 to 3 in. long, the cauline sessile, or the lower ones narrowed to a petiole, the earliest in a basal tuft; calyx-tube 1 to  $2\frac{1}{2}$  lines long; petals yellow, without a dark spot at base, commonly drying greenish, orbicular-obovate, 3 to 5 lines long; capsule filiform-linear, attenuate upward, sharply quadrangular, curved or arcuate, or spirally contorted,  $\frac{3}{4}$  to  $1\frac{3}{4}$  in. long.—Gravelly washes, sandy valleys and grassy hillsides, 100 to 5800 ft.: cismontane S. Cal. from Santa Barbara to the San Jacinto Mts. and San Diego Co.; w. side Colorado Desert; n. to Inyo Co.; s. to L. Cal. (*Sphaerostigma bistortum* Walp.) Var. *HALLII* Jepson n. comb. Leaves pallid with short appressed hairs.—Mohave and Colorado deserts and bordering ranges, rare. (*Sphaerostigma hallii* Dav.)

16. *O. dentata* Cav. Stems diffusely branched from the base, 3 to 9 in. high; herbage glabrous or puberulent; leaves linear, mostly tapering to both ends, denticulate,  $\frac{1}{4}$  to  $1\frac{3}{4}$  in. long, often with smaller leaves fascicled in the axils; calyx-tube 1 to 2 lines long; petals yellow, changing to dull red, round-obovate, 2 to 3 lines long; anthers versatile; capsule filiform-linear, arcuate-recurved, 7 to 12 lines long.—Sandy plains, valleys and mountain slopes, 100 to 5000 ft.: coastal S. Cal.; Chile. Apr.-June. (*Sphaerostigma dentatum* Walp.) Passing into the var. *CAMPÉSTRIS* Jepson n. comb. Petals ( $2\frac{1}{2}$  or) 4 to 6 lines long.—San Joaquin Valley; Mohave Desert. (*O. campestris* Greenè.) Var. *CRUCIATA* Wats. Petals 3 lines long, often emarginate.—Sacramento Valley.

17. *O. contorta* Dougl. Fig. 667. Stems slender, 1 to several from the base, at first strict, at length diffusely branched, 4 to 16 in. high; herbage glabrous or minutely pubescent; leaves linear, remotely low-denticulate,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long; calyx-tube  $\frac{1}{2}$  to  $\frac{3}{4}$  line long; petals 1 to  $1\frac{1}{2}$  lines long, yellow, aging to deep red; anthers innate; capsule narrow-linear, straight and ascending, or with the lower part curved and the upper part ascending,  $\frac{3}{4}$  to  $1\frac{3}{4}$  in. long,  $\frac{1}{4}$  line wide.—Rather dry ground, plains, hillslopes and desert mesas, 100 to 7000 ft., throughout Cal.; n. to Wash., e. to Nev. and s. to northern Mex. (*Sphaerostigma contortum* Walp. *O. strigulosa* T. & G.) Var. *PUBENS* Cov. Grayish with a short dense hirsute pubescence.—Deserts on e. side Sierra Nevada.

18. *O. andina* Nutt. Stems several from the base, diffuse or ascending, 1 to 4 in. long; herbage finely puberulent or glabrate; leaves linear, 4 to 7 lines long, narrowed at base to a short petiole; flowers in the axils of the densely leafy branches; calyx-tube  $\frac{1}{2}$  to  $\frac{3}{4}$  line long; petals yellow,  $\frac{3}{4}$  to 1 line long; capsules linear, a little narrowed upward, straight or nearly so, 3 to 5 lines long.—Valleys and mountain slopes, 4000 to 6500 ft.: Lassen and Modoc Cos.; e. to Utah and Wyo., n. to Wash. (*Sphaerostigma andinum* Walp.)

19. *O. chamaenerioides* Gray. Stems slender, 1 to several from the base, simple or branched, erect or ascending, 6 to 11 in. high; herbage glabrous or nearly so; leaves linear-oblong to oblong-ovate, entire or remotely denticu-

667. *Oenothera contorta* Dougl.; a, habit x  $\frac{1}{2}$ ; b, fl. x 2.

late,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long; flowers commonly few in very loose spikes, the spikes usually nodding; calyx-tube 1 line long; petals white or pinkish,  $\frac{1}{2}$  to 1 line long; capsule filiform-linear, straight, ascending or even strict,  $1\frac{1}{4}$  to 2 in. long.—Sandy washes and mesas and dry mountain slopes, 1400 to 7400 ft., infrequent: Inyo Co.; s. Sierra Nevada in Kern Co.; Mohave and Colorado deserts. (*Sphaerostigma chamaeneroides* Gray. *O. deserti* Jones.)

20. *O. refrácta* Wats. Stems 1 to several from the base, simple or mostly sparingly branched, 7 to 13 in. high; herbage glabrous or slightly puberulent, sometimes a little glandular; leaves mostly basal or on lower part of plant, linear-lanceolate, or the upper narrow-linear or filiform, 1 to  $1\frac{3}{4}$  in. long, the lower ones shortly petioled; flowers in spikes, the spikes somewhat nodding in bud; calyx-tube narrow-funnelform,  $1\frac{1}{2}$  to 2 lines long; petals yellow,  $1\frac{1}{2}$  to 2 lines long; capsules filiform-linear, cylindric, straight or somewhat curved or contorted, mostly sharply refracted,  $1\frac{1}{4}$  to  $1\frac{1}{2}$  in. long.—Desert plains and dry slopes, 100 to 4500 ft.: Inyo Co.; Mohave and Colorado deserts; e. to Ariz. and Utah. (*Sphaerostigma refractum* Small.)

21. *O. alyssoides* H. & A. Stems several from the base, stout, spreading, or often one, simple and erect, 4 to 21 in. high; herbage glabrous or sparingly puberulent; bark exfoliating in broad strips, white and shining; leaves narrow-ovate or lanceolate to narrow-obovate or oblanceolate, denticulate or entire,  $\frac{1}{2}$  to 4 in. long, attenuate into a very short petiole or the basal with petioles  $\frac{1}{4}$  to as long; flowers in spikes, the spikes densely many-flowered, nodding or coiled at tip, or erect; calyx-tube tubular but a little widened upward,  $1\frac{1}{2}$  to  $2\frac{1}{4}$  lines long; petals white, fading pink, obovate to round-ovate, very shortly clawed,  $1\frac{1}{2}$  lines long; capsule quadrangular, or sometimes terete, little attenuate upward, recurved-contorted, 5 to 8 lines long, crowded on the axis.—Sandy soil, 4000 to 5000 ft.:

Shasta, Siskiyou and Modoc Cos.; n. to Can., e. to Rocky Mts. (*Sphaerostigma alyssoides* Walp.) Var. *DECORTICANS* Jepson n. comb. Fig. 668. Herbage usually glabrous or glabrate; spikes mostly nodding; capsules stout, strongly attenuate upward, much thickened (1 line thick) at base.—Desert plains and dry mountain slopes, 500 to 5000 ft.: Colorado and Mohave deserts and bordering mountain slopes; San Antonio Mts.; Santa Barbara Co. to Monterey Co.; inner South Coast Range; Greenhorn Range; Inyo Co. (*O. gauraeflora* T. & G.) Var. *VILLOSA* Wats. More or less villous throughout.—Mono Co. and n. and e.

668. *Oenothera alyssoides* var. *decorticans* Jepson; fr. branch  $\times \frac{2}{3}$ .

22. *O. cardiophylla* Torr. Stem erect, freely branching, 1 to  $2\frac{1}{2}$  ft. high, mostly leafy on lower part; herbage villous-pubescent, or the leaves subglabrate; leaves round-ovate, cordate at base, dentate or denticulate,  $\frac{1}{2}$  to  $2\frac{1}{4}$  in. long, on petioles  $\frac{1}{2}$  to as long; flowers in dense terminal spikes, the spikes nodding at apex; calyx-tube 3 to 4 lines long; petals yellow, aging a lively brick red, 3 lines long; capsules strictly erect or ascending, 1 to  $1\frac{3}{4}$  in. long.—Desert cañons and gullies, 10 to 2000 ft.: Panamint Mts.; s. to the Colorado Desert; e. to Ariz. (*Chylismia cardiophylla* Small.) Var. *LONGITUBA* Jepson n. var. Calyx-tube 9 lines long; petals 6 lines long.—Along Colorado River (Needles, J. Grinnell, type).

23. *O. scapoidea* T. & G. Stems several from the base, erect, 9 to 14 in. high, with mostly basal leaves; herbage glabrous or nearly so; leaves oblong-lanceolate, or sometimes ovate, denticulate, dentate or lyrate-pinnatifid, with large terminal lobe and few small lateral ones, purple-veined,  $\frac{1}{2}$

to 6 in. long, on petioles  $\frac{1}{2}$  to nearly as long; flowers in a dense terminal spike coiled at tip, the inflorescence flowering unilaterally; calyx-tube 1 to 2 line long; petals white (rarely yellow), 2 to 3 lines long; stigma greenish; capsules linear-oblong, quadrangular, midnerve of the valves rounded, ridge-like, 4 to 10 lines long, on pedicels  $2\frac{1}{2}$  to 7 (or 9) lines long.—Sandy desert mesas, stony slopes and plains, 300 to 4000 ft.: Colorado and Mohave deserts; along e. side Sierra Nevada from Inyo Co. to Lassen Co.; n. to eastern Ore. (*Chylismia scapoidea* Small.) Var. *AURANTIACA* Wats. Petals bright rose-color or orange; capsule often puberulent.—Mohave Desert. (*O. claviformis* Torr.) Var. *PURPURASCENS* Wats. Petals white, changing to pinkish.—With the species in Cal. Var. *TORTILIS* Jepson n. var. Capsules 1 to  $1\frac{1}{4}$  in. long, straight or nearly straight but twisted.—Panamint Mts. (Wild Rose Cañon, Jepson 7131, type).

24. *O. brevipes* Gray. Fig. 669. Similar to no. 23; stems coarser, 4 to 22 in. high; herbage on lower parts villous; leaves ovate to lanceolate, subentire or denticulate or lyrate pinnatifid with few and small lateral lobes, 1 to 3 in. long, on petioles  $\frac{1}{4}$  to about as long; flowers in spikes, the spikes nodding in the bud; calyx-tube 1 to 2 lines long; petals golden-yellow, somewhat quadratish, truncatish or retuse, 2 to 6 lines long; capsule 1 to  $2\frac{3}{4}$  in. long, spreading or refracted, the pedicels commonly  $1\frac{1}{2}$  to 3 lines long.—Desert washes, 100 to 7000 ft.: Colorado and Mohave deserts; Inyo Co.; e. to Ariz. and southern Nev. (*Chylismia brevipes* Small.) Var. *MULTIJUGA* Jepson n. comb. Stem nearly naked, widely branched above; leaves nearly all basal, pinnately divided into many subequal lobes.—Inyo Co.; e. to southern Utah. (*O. multijuga* Wats.)

669. *Oenothera brevipes* Gray; a, fl. stem  $\times \frac{1}{2}$ ; b, leaf  $\times \frac{1}{2}$ ; c, fl.  $\times 1$ .

669. *Oenothera brevipes* Gray; a, fl. stem  $\times \frac{1}{2}$ ; b, leaf  $\times \frac{1}{2}$ ; c, fl.  $\times 1$ .

#### 9. *EÜLOBUS* Nutt.

Glabrous or glabrate annual herb. Leaves few, alternate. Flowers sessile along the virgate branches. Calyx-tube none or scarcely any, its limb 4-parted, reflexed. Petals 4, rhombic-ovate, light yellow, turning pink. Stamens 8, those alternate the petals with oblong anthers, those opposite with smaller globose anthers. Ovary 4-celled; stigma capitate. Capsule linear, quadrangular, imperfectly 4-celled, strongly refracted. Seeds naked. (Greek eu, well, and lobos, lobe.)

1. *E. californicus* Nutt. Stem stout, simple or with few virgate ascending branches,  $1\frac{1}{2}$  to 3 ft. high, the branches ending in few-flowered spikes; leaves lanceolate in outline, unequally dentate or pinnatifid, 1 to 3 in. long, mostly short-petioled, the cauline leaves very sparse and the upper much reduced, those of the basal rosette disappearing early; petals 3 to 5 lines long; capsules 2 to  $3\frac{3}{4}$  in. long.—Foothills and valleys, 1000 to 3000 ft., common: coastal S. Cal. from Santa Barbara to San Diego, e. through the Colorado Desert (but rare) to Ariz.

#### 10. *GAYOPHYTUM* Juss.

Slender erect annual herbs. Leaves alternate, or the lower opposite. Flowers borne in leafy racemes. Calyx 4-parted down to the ovary. Stamens 8, the alternate 4 short. Ovary 2-celled; stigma capitate. Capsule 4-valved, pedicled. Seeds numerous, in a single row in each cell, naked. (C. Gay, author of a Flora of Chile, and Greek phytos, plant.)

670. *Gayophytum diffusum* T. & G.; a, leafy sect. of stem  $\times \frac{1}{2}$ ; b, fl. branchlet  $\times \frac{1}{2}$ ; c, fl.  $\times 2$ .

ate; leaves linear or the lower linear-oblongate, glabrous or sparsely strigose, 5 to 8 lines long or the lower 1 to 2 in. long; flowers loosely disposed along the branchlets, strongly heliotropic; calyx-lobes ultimately reflexed in pairs; petals white, turning pink or rose-color, 2 small yellow dots at base, rhomboidal-ovate, ( $1\frac{1}{2}$  or) 2 to 3 lines long; ovary canescent to glabrous; style a little dilated above the middle, truncate at apex, the stigma discoid; capsule at maturity more or less shrunken-constricted about the seeds and thus torulose, borne on a filiform pedicel 1 to 3 lines long.—Dry open ridges or flats, 4500 to 7000 ft.: Sierra Nevada from Tulare Co. to Siskiyou Co., thence s. to Humboldt Co.

2. *G. ramosissimum* T. & G. Fig. 671. Similar in habit to no. 1; 6 to 20 in. high; herbage usually puberulent; flower-buds mostly apiculate; flowers tardily or weakly heliotropic; calyx-lobes reflexed-spreading, all distinct; petals sub-orbicular, white, obscurely greenish-yellow at base, in age turning brick-red,  $\frac{1}{2}$  to 1 line long; pedicels about  $\frac{1}{4}$  to as long as capsule.—Mountain flats or slopes, 5000 to 9000 ft.: mts. of S. Cal.: Sierra Nevada from Tulare Co. to Shasta Co.; thence s. to eastern Mendocino Co. Var. *obtusum* Jepson

Pedicels  $\frac{1}{4}$  to as long as the capsule; branches with scattered leaves; capsule clavate or oblong, mostly torulose, obscurely if at all flattened; seeds erect or suberect.

Style a little dilated upwards, truncate at apex, the stigma discoid; seeds glabrous, smooth or minutely roughened.

Corolla 4 to 5 lines broad; petals white, aging pink.....

1. *G. diffusum*.

Corolla  $1\frac{1}{2}$  to  $1\frac{3}{4}$  lines broad; petals white, aging brick-red...2. *G. ramosissimum*.

Style ending in a globose stigma; seeds covered with short sub-appressed hairs.

Herbage glabrous or nearly so; petals entire.....

3. *G. lasiospermum*.

Herbage grayish-puberulent; petals erosulate....4. *G. helleri*.

Pedicels almost none or very short; branches rather densely leafy; stigma capitate; seeds glabrous.

Capsule narrow-linear, more or less torulose; seeds erect or suberect..

5. *G. caesium*.

Capsule oblong, strongly flattened, not at all torulose; seeds obliquely ascending.....6. *G. humile*.

1. *G. diffusum* T. & G. Fig. 670.

Stems profusely branched from or above the base,  $\frac{1}{2}$  to 2 ft. high, glabrous or with scattered spreading hairs, more or less purplish; bark becoming papery and tending to exfoliate.

671. *Gayophytum ramosissimum* T. & G.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, fl.  $\times 2$ .

n. var. Plants 5 to 12 in. high; herbage glabrous; ultimate branchlets filiform, sparsely leafy; flower-buds minute, globose, obtuse; petals white, turning red,  $\frac{1}{4}$  line long, scarcely exceeding the calyx-lobes.—E. Lassen Co. (Beckwith Pass, Jepson 2755, type). Var. *PYGMÆUM* Jepson n. var. Dwarf in all its parts, 1 in. high.—Bullfrog Lake, Fresno Co., 11,000 ft. (Jepson 550a, type).

3. *G. lasiospermum* Greene. Similar to no. 1; petals rose-color, changing to purplish,  $\frac{1}{2}$  to  $\frac{3}{4}$  line long.—Mts. of S. Cal. and n. to the southern Sierra Nevada in Tulare Co. Var. *ERIOSPERMUM* Jepson n. comb. Petals 2 to 3 lines long.—Montane: mts. of S. Cal.; Sierra Nevada from Tulare Co. to Shasta Co. (*G. eriospermum* Cov.)

4. *G. helleri* Rydb. var. *erosulatum* Jepson n. var. Stems diffusely branching from the base, 6 to 8 in. high; herbage grayish, especially the leaves, with a somewhat dense cover of short spreading hairs, the young parts canescent; petals white, turning deep red, elliptic, erosulate all around,  $\frac{1}{4}$  to  $\frac{1}{3}$  line long; capsules  $2\frac{1}{2}$  to 3 lines long, contracted into a pedicel about half as long.—Dry sandy slopes, 4000 to 9700 ft., e. side of Sierra Nevada: Lassen Co. (Beckwith Pass, Jepson 7754, type); White Mts.

5. *G. caesium* T. & G. Stem subsimple or diffusely branching, 6 to 9 in. high; herbage soft-pubescent or glabrous; leaves linear to narrow-oblongate,  $\frac{1}{2}$  to  $\frac{3}{4}$  (or  $1\frac{1}{4}$ ) in. long; flowers very small ( $\frac{1}{3}$  to  $\frac{1}{2}$  line long); stigma globose, large; capsule pubescent, 5 to 6 lines long, the pedicel very short ( $\frac{1}{3}$  to 1 line long).—E. summits or e. side of the Sierra Nevada, 4000 to 5000 ft., from Lassen Co. to Modoc Co.; ne. Humboldt Co.; n. to Ore., e. to Col.

6. *G. humile* Juss. Stems erect, simple or with commonly simple ascending branches, 2 to 10 in. high, purplish; herbage glabrous; upper leaves numerous, crowded, usually rather strict, linear-lanceolate to oblanceolate, 6 to 10 lines long, the lower ones sparse, 12 lines long; flowers in the upper axils; petals white, turning pink, about  $\frac{1}{2}$  line long, not exceeding the calyx-lobes or scarcely; capsule glabrous, strongly flattened contrary to the partition, markedly furrowed on each side, glabrous, 4 to 5 lines long.—Dry slopes, coniferous forests, 3000 to 8000 ft.: San Jacinto Mts.; San Bernardino Mts.; Sierra Nevada from Tulare Co. to Shasta Co., thence sw. and s. to Humboldt Co. and n. Lake Co.; n. to Wash. and Ida.; Chile (*G. punilum* Wats.)

## 11. GÁURA L.

Herbs with alternate leaves. Flowers white or pink, turning red, borne in spikes or racemes. Calyx-tube above ovary narrow, the calyx-limb 4-cleft, the whole calyx deciduous. Petals 4, entire, with claws. Stamens 8. Ovary 4-celled; ovules 1 in each cell; style long. Fruit nut-like, obovoid, indehiscent or splitting at apex, 1 or 2-seeded. (Latin *gauros*, superb, some of the species with somewhat elegant flowers.)

Anthers all perfect; filaments with a scale-like appendage at base; stigma 4-lobed.

Anthers oval, attached at the middle; leaves 4 to 12 lines wide; fruit spindle-shaped, 4-ridged, glabrous. . . . . 1. *G. parviflora*.

Anthers linear, attached a little above the base; leaves  $\frac{1}{2}$  to 2 lines wide; fruit ovate, 4-angled, contracted to a cylindric base, pubescent. . . . . 2. *G. coccinea*.

Anthers attached at the base, those opposite the petals sterile; filaments without appendages; stigma entire. . . . . 3. *G. heterandra*.

1. *G. parviflora* Dougl. VELVET WEED. Stem erect with erect branches, 2 to 3 ft. high; herbage hirsute; leaves ovate-lanceolate, entire or obscurely denticulate, 2 to 3 in. long, sessile or nearly so, the lower ones spatulate-obovate, 3 to 4 in. long, gradually narrowed to a narrowly-winged petiole about  $\frac{1}{4}$  to  $\frac{1}{2}$  as long; flowers in a long somewhat dense leafless spike, 6 to 12 in. long; petals reddish, about 1 line long; fruits spindle-shaped, 4-ridged, 3 lines long.—Providence Mts. (rare in Cal.); Nev. to Wash., N. Dak., La. and Mex.

2. *G. coccinea* Nutt. Stems erect, several or many from the base, forming a bushy plant 8 to 12 in. high; herbage canescent; leaves linear, remotely denticulate or entire, sessile,  $\frac{1}{2}$  to 1 in. long; flowers in dense terminal

spikes; petals red, turning scarlet, 3 lines long; fruits short-ovate, strongly 4-angled, abruptly contracted to a cylindric base, 2 lines long.—E. Mohave Desert: Providence Mts.; New York Mts.; e. to Tex., thence n. to Mont.

3. *G. heterandra* Torr. Stems erect, branching, 1 to 1½ ft. high; herbage minutely puberulent; leaves oblong to lanceolate, 1 to 1½ in. long, on slender petioles; petals pink, 1½ to 2 lines long; fruit 1½ lines long.—Montane, 3000 to 4000 ft.: Sierra Nevada from Placer Co. to Kern Co.; s. to the San Bernardino Mts.; w. to Ft. Tejon.

## 12. CIRCAEA L. ENCHANTER'S NIGHTSHADE

Low slender perennials with thin opposite petioled leaves. Flowers small, white, in terminal and lateral racemes. Calyx-tube slightly produced beyond the ovary, the base nearly filled by a cup-shaped disk, deciduous; lobes 2, reflexed. Petals 2, obcordate. Stamens 2, alternate with the petals. Ovary 1 or 2-celled, each cell 1-ovuled. Fruit 1-celled, 1-seeded, indehiscent, pear-shaped and bristly with hooked hairs. (Circe, sea-nymph, daughter of the Sun and of Perse.)

1. *C. pacifica* Asch. & Mag. Stem from a short rootstock, usually simple, 6 to 14 in. high; herbage glabrous; leaves orbicular to mostly ovate, obtuse to cordate at base, acuminate, obscurely repand-denticulate or almost entire, 1 to 2 in. long, on petioles ¾ to 1 in. long; racemes bractless; flowers ½ line long; calyx white, with a very short tube; fruit ¾ to 1 line long.—Deep shade of woods: Sierra Nevada, 4000 to 7000 ft., from Tulare Co. to Siskiyou Co., thence s. in the Coast Ranges to Marin Co., descending to 200 ft.; infrequent. July.

## HALORAGAEAE. WATER-MILFOIL FAMILY

Perennial aquatic herbs, the leaves (in ours) in whorls. Flowers sessile in the axils of leaves or bracts, perfect or unisexual. Calyx-tube coherent with the ovary, the limb very short or obsolete. Petals small or none. Stamens 1, 4, or 8. Ovary 1 to 4-celled; stigmas 1 to 4. Fruit a 1-seeded indehiscent nutlet, or 4-lobed and splitting into 4 nutlets.

Leaves all entire; flowers perfect; stamen 1; ovary 1-celled. . . . . 1. HIPPURIS.  
Immersed leaves capillary-dissected; flowers polygamous; stamens 4 or 8; ovary 4-celled. . . . . 2. MYRIOPHYLLUM.

### 1. HIPPURIS L. MARE'S TAIL

Stems erect, unbranched. Leaves simple, entire. Flowers minute, usually perfect, sessile in the axils. Petals none. Calyx limb a narrow entire rim. Stamen 1, inserted on the anterior edge of the calyx. Style 1, filiform, stigmatic down one side. Ovary 1-celled, becoming a 1-seeded nutlet. (Greek hippos, a horse, and oura, a tail.)

1. *H. vulgaris* L. Stem simple, 1 to 2 ft. long (commonly emersed 4 to 7 in.); herbage glabrous; leaves about 7 to 10 in a whorl, linear, acute, 6 to 9 lines long; fruit nearly 1 line long.—Shallow margins of ponds and about springs, high mts. and along the coast, 10 to 7000 ft., infrequent but widely distributed in Cal.; N. Am., Eur., Asia, Patagonia. May-July.

### 2. MYRIOPHYLLUM L.

Emersed leaves entire or pectinate, those under water pinnately divided into capillary divisions. Flowers sessile in the axils of the opposite upper leaves or the whorls forming a terminal interrupted spike. Upper flowers generally staminate, the lowest pistillate, and the intermediate often perfect. Calyx of the pistillate flowers 4-toothed or the teeth none, of the staminate 4-lobed. Petals 4, or none. Stamens 4 or 8. Stigmas 4, recurved and plumose. Fruit splitting at maturity into 4 bony 1-seeded nutlets. (Greek murios, a thousand, and phullon, a leaf.)

Flowers in a terminal interrupted spike; petals fugacious; stamens 8. . . . .

Bracts entire or toothed, shorter than the flowers. . . . . 1. *M. spicatum*.

Bracts pectinate, longer or shorter than the flowers. . . . . 2. *M. verticillatum*.

Flowers in the axils of the emersed linear leaves; petals subpersistent; stamens 4. . . . . 3. *M. hippurioides*.

1. *M. spicatum* L. var. *exalbescens* Jepson n. comb. AMERICAN MILFOIL. Stems branching, 1 to 2 ft. long; leaves in whorls of 3 or 4, dissected into capillary divisions; whorls of flowers forming an interrupted spike 1 to 4 in. long, the bracts ovate, entire or serrate and usually shorter than the flowers; nutlets 1 line long, fully as thick, rounded on the back.—Lakes and ponds, collected at only a few widely scattered stations in Cal.: Bear Valley, San Bernardino Mts.; San Francisco; Camp Taylor, Marin Co.; Merrillville, Lassen Co.; n. to the arctic, e. to N. Eng. (*M. exalbescens* Fer.)

2. *M. verticillatum* L. MYRIAD-LEAF. Submersed leaves in crowded whorls of 30 and 40, the capillary divisions often finer than those of no. 1; floral leaves pectinate-pinnatifid; spike 2 to 6 in. long; petals of the staminate flower purplish; nutlets somewhat gibbous at base.—Clear Lake (rare in Cal.); Wash. to N. Y.; Eur., Asia, n. Afr.

3. *M. hippurioides* Nutt. WESTERN MILFOIL. Stems simple or branching, 1 to 2 ft. long; leaves in whorls of 4 or 5; emerged ones linear, about  $\frac{1}{2}$  line wide, conspicuously or obscurely serrate or the uppermost nearly entire, 3 to 5 lines long; submersed ones pinnately dissected into capillary divisions,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; flowers chiefly in the axils of the emerged leaves; petals white, obovate; nutlets less rounded than in no. 1. — Stockton: Mt. Hanna, Lake Co. (rare in Cal.); N. Am.

#### ABALIACEAE. ARALIA FAMILY

Ours perennial herbs. Closely allied to Umbelliferae, but the stems solid, the petals not inflexed and the ovary 2 to 5-celled. Petals, stamens and styles 5. Calyx-tube coherent with the ovary, its limb a mere rim with 5 salient teeth. Fruit berry-like, containing as many 1-seeded nuts as there are carpels.

##### 1. ARALIA L.

Leaves alternate, very large, compound. Flowers small, whitish, borne in panicle umbels, the pedicels pointed. Styles united to the middle. Embryo minute. (Derivation uncertain.)

1. *A. californica* Wats. ELK CLOVER. Fig. 672. Stems simple, stout, 6 to 10 ft. high, arising from a large rootstock with milky juice; herbage glabrous, subulate-scabrous on the main stem; leaves ternate, then pinnately 3 to 5-foliate, 1 to 5 ft. long; leaflets ovate, sometimes elliptic, serrate, acuminate, subcordate at base,  $\frac{1}{2}$  to 1 ft. long; flowers  $1\frac{1}{2}$  lines long, on pedicels  $\frac{1}{2}$  in. long; panicle 1 to  $1\frac{1}{2}$  ft. long; ovary red, becoming a globular black berry  $2\frac{1}{2}$  lines in diameter.—Shaded cañons in moist spots and along living mountain streams: Coast Ranges (except the inner ranges) from Humboldt and Trinity Co. s.; Sierra Nevada from Plumas Co. to Mariposa Co.; s. to coastal S. Cal.; n. to southwestern Ore. July.

672. *Aralia californica* Wats.; a, leaf  $\times \frac{1}{2}$ ; b, fl. branchlet  $\times \frac{1}{4}$ ; c, fl.  $\times 3$ ; d, fr.  $\times 1\frac{1}{2}$ .

#### UMBELLIFERAE. PARSLEY FAMILY

Herbs with commonly hollow stems and often dilated petioles. Leaves commonly alternate or basal, compound (sometimes simple), usually much incised or divided. Flowers small, in compound umbels, or the umbels some-

times simple or capitate. Umbels when compound with the peduncle divided at summit into a number of rays, each ray bearing a secondary umbel termed an umbellet. Umbellets commonly subtended by bractlets (forming an involucl); rays commonly subtended by bracts (forming an involucre). Calyx-tube wholly adnate to the ovary; calyx-teeth small, sometimes obsolete. Petals 5, usually with an inflexed tip. Stamens 5, inserted on an epigynous disk. Ovary inferior, 2-celled, one hanging ovule in each cell. Styles 2, united below and forming a swollen or cushion-like base (stylopodium). Fruit consisting of two carpels united by their faces (commissure), flattened laterally (i. e., flattened sidewise or contrary to the commissure), or flattened dorsally (i. e., each carpel flattened on the back or parallel with the commissure), or not flattened at all. Each carpel with 5 ribs or ridges, one down the back (dorsal rib), 2 on the edge near the commissure (lateral ribs), and 2 between the dorsal and lateral ribs (intermediate ribs). Between the ribs are the spaces called intervals:—the dorsal intervals are those next to the dorsal rib; the lateral intervals are those next to the lateral ribs. Beneath the intervals (in the tissue of the pericarp), as also on the commissural side, are oil-tubes. Carpels 1-seeded, splitting apart at maturity, each borne on a filiform division of the receptacle (or carpophore) which is prolonged between them. The “seed-face” is against the commissure. Embryo small; endosperm cartilaginous.—The inflorescence is frequently irregularly compound; in a few genera the fruit has no ribs, and in others no oil-tubes. The number of oil-tubes in a given species is, generally speaking, a reliable character but it should be noted that there is here, also, more or less variation. The character of the ribs and oil-tubes should be ascertained by examination of perfectly mature fruit. Many of the species are poisonous or have poisonous parts, although many others, such as Parsley, Carrot and Parsnip, have edible organs and are classed as food plants.

#### A. Fruit bearing prickles, bristles, scales or tubercles.

- Ribs none; oil-tubes none except in no. 2.  
 Fruit covered with hyaline scales; flowers greenish-white or blue, in dense heads; prickly perennial herbs.....1. *ERYNGIUM*.  
 Fruit bur-like, covered with hooked prickles.  
 Flowers yellow or purple, mostly in head-like clusters; perennials...2. *SANTICULA*.  
 Flowers white, in compound umbels; annuals.....3. *ANTHRISCUS*.  
 Ribs present; flowers white.  
 Oil-tubes none or obscure.  
 Fruit with an elongated beak several times longer than the muriculate body; annuals.....4. *SCANDIX*.  
 Fruit not beaked or with a short beak several times shorter than the smooth body; ribs bristly; perennials.....5. *OSMORRHIZA*.  
 Oil-tubes present, usually conspicuous.  
 Ribs armed with bristles.  
 Fruit somewhat flattened dorsally; spines barbed; calyx-teeth obsolete; umbel compound.....6. *DAUCUS*.  
 Fruit flattened laterally; bristles hooked; calyx-teeth obvious.  
 Umbels subcapitate, opposite the leaves; fruit prickly on one carpel, warty on the other.....7. *TORILIS*.  
 Umbels compound, terminal and lateral; fruit prickly on both carpels...8. *CAUCALIS*.  
 Ribs not armed, inconspicuous; fruit tuberculate-roughened; umbels irregularly compound.....9. *APIASTRUM*.

#### B. Fruit not prickly or tuberculate nor scaly (sometimes hairy).

- I. LEAVES SIMPLE; UMBELS SIMPLE OR PROLIFEROUS.  
 Leaves alternate or in a basal tuft; carpels with filiform ribs; stems creeping; perennials.  
 Oil-tubes none; leaves orbicular or peltate.....10. *HYDROCOTYLE*.  
 Oil-tubes solitary; leaves consisting of hollow cylindrical petioles.....24. *LILAEOPSIS*.  
 Leaves opposite; carpels without ribs; stems slender, weak; annuals.....11. *BOWLESIA*.  
 2. LEAVES PINNATELY OR TERNATELY COMPOUND OR DECOMPOUND; UMBELS COMPOUND.  
 a. Ribs of the fruit not winged; fruit not flattened dorsally, sometimes somewhat laterally flattened.  
 Flowers white, rarely pinkish, or at least not yellow.  
 Oil-tubes none.  
 Fruit linear or elongated ( $\frac{1}{2}$  to 1 in. long); stems not dotted...5. *OSMORRHIZA*.  
 Fruit ovate ( $1\frac{1}{2}$  lines long); stem purple-dotted.....12. *CONIUM*.  
 Oil-tubes present.  
 Oil-tubes solitary in the intervals (see also no. 17).  
 Petals conspicuously unequal; lower leaves with broad leaflets, the upper dissected.....13. *CORIANDRUM*.

- Petals equal or essentially so.  
 Umbels subsessile in the forks and terminal on the branches. 14. APIUM.  
 Umbels terminal on the branches.  
 Bracts 3-parted to the middle into filiform divisions, closely reflexed; upper leaves ternately decompound and dissected. 15. AMMI.  
 Bracts entire or merely toothed, spreading or rarely reflexed; leaves pinnate or bipinnate.  
 Leaflets entire; ribs filiform; plants of dry ground or moist meadows. 16. CARUM.  
 Leaflets serrate; plants of marshes or stream banks.  
 Ribs corky but distinct.  
 Styles short (about  $\frac{1}{2}$  or  $\frac{1}{3}$  as long as the fruit; fruit broadly ovate or roundish. 18. CICUTA.  
 Styles long (about  $\frac{1}{2}$  as long as the fruit); fruit subcylindric. 19. OENANTHE.  
 Ribs confluent, forming a continuous corky covering. 20. BERULA.  
 Oil-tubes 2 or more, at least in some of the intervals.  
 Ribs, or some of them, corky.  
 Leaves simply pinnate; stems leafy; ribs all corky; marsh or aquatic plants. 21. SIUM.  
 Leaves once or twice ternate, all basal; lateral ribs corky-thickened, the others slender; slopes towards the arid interior. 22. OROGENIA.  
 Ribs not corky-thickened.  
 Pedicels of the flowers equal or nearly so; calyx-teeth not rigid.  
 Leaves once to thrice ternate or pinnate; mostly tall plants.  
 Leaflets linear, mostly entire; ribs filiform. 17. EULOPHUS.  
 Leaflets ovate, incised; ribs strong, acute. 23. LIGUSTICUM.  
 Leaves pinnate or bipinnate, the divisions or leaflets oblong, entire; alpine dwarf. 25. PODISTERA.  
 Pedicels of the sterile flowers surpassing or equaling the fruit; sterile calyx-teeth rigid-subulate, very prominent. 26. OREONANA.  
 Flowers yellow.  
 Stems of medium height, the leaves mostly basal; leaflets broad. 27. VELARIA.  
 Stems very tall, leafy; leaves dissected into filiform segments. 28. FOENICULUM.  
*b. Some or all the ribs of the fruit winged.*  
 Lateral ribs winged, the dorsal and intermediate ribs filiform; fruit flattened dorsally.  
 Corollas of marginal flowers of umbel radiately enlarged; oil-tubes reaching only half way to base of fruit; tall coarse plants. 29. HERACLEUM.  
 Corollas all alike; oil-tubes as long as the fruit (except in no. 32).  
 Leaves and peduncles arising from the root-crown, or from only a very short proper stem.  
 Lateral wings of fruit corky-thickened; flowers commonly yellow; tall plants with large leaves. 30. LEPTOTAENIA.  
 Lateral wings thin; flowers yellow, white or purple; low plants with medium or small leaves. 31. LOMATUM.  
 Stems tall, leafy.  
 Dorsal and intermediate ribs 3; flowers yellow.  
 Leaves pinnate, the leaflets ovate, toothed. 32. PASTINACA.  
 Leaves ternately compound and dissected into filiform segments. 33. ANETHUM.  
 Dorsal and intermediate ribs apparently 5; leaves simply pinnate; flowers white. 34. OXYPOLIS.  
 Lateral, dorsal and intermediate ribs all winged or very prominent.  
 Tall plants with leafy stems; flowers white.  
 Umbellets not capitate.  
 Ribs not corky-thickened; fruit flattened dorsally; petioles not inflated.  
 Leaflets incised or deeply toothed; oil-tubes solitary in the intervals. 35. CONIOSELINUM.  
 Leaflets not incised, merely serrate or toothed or entire; oil-tubes 1 to 3 in the intervals. 36. ANGELICA.  
 Ribs very thick and corky; fruit slightly flattened laterally if at all; petioles inflated. 37. COELOPLEURUM.  
 Umbellets capitate; fruit cuneate-obovate, flattened dorsally, pubescent. 38. SPHENOSCIADIUM.  
 Mostly low plants, the leaves and peduncles all basal; oil-tubes several in the intervals; flowers white, yellow or purple; fruit flattened dorsally or not at all. 39. CYMOPTERUS.

### 1. *ERYNGIUM* L. BUTTON SNAKEROOT

Perennials with clustered coarse fibrous roots, often dichotomously branching stems, prickly involucres and often prickly leaves. Leaves opposite, or the upper sometimes alternate, commonly oblanceolate and spinulose-serrate or incised, or the basal, when growing in water, with fistulose petioles and the blade more or less obsolete. Flowers greenish-white or bluish, condensed in heads; heads terminal on the branches or on short peduncles in the forks;

bracts spinose, conspicuous; bractlets usually spinose-tipped. Calyx-lobes (or sepals) persistent on the fruit. Fruit covered with whitish thin scales; ribs obsolete. Oil-tubes none or obscure. (Greek name used by Dioscorides.)

Sepals entire.

Heads very blue.....1. *E. articulatum*.

Heads greenish, seldom blue.

Blades of lower cauline leaves about 1¼ in. long, the petioles several times as long.....2. *E. alismaefolium*.

Blades of lower cauline leaves little or not at all exceeded by the petioles.

Bracts mostly entire (sometimes with a pair of spiny teeth or bristles).

Styles in fruit little or not at all exerted beyond calyx-lobes; bracts and bractlets glabrous.

Stem diffusely branched from base; leaves serrate or incised; bracts callous-margined.....3. *E. armatum*.

Stem erect, simple below; leaves twice pinnately parted; bracts scarious-winged at base.....4. *E. pinnatisectum*.

Styles in fruit conspicuously exerted beyond calyx-lobes; bracts and bractlets puberulent.....5. *E. longistylum*.

Bracts more or less spiny-toothed or bristly.

Plants prostrate or low-diffuse.

Stems thickened, nearly simple, clustered at base; basal leaves pinnatifid.....6. *E. minimum*.

Stems slender, freely branched, not clustered at base; basal leaves oblanceolate, spinose-toothed.....7. *E. aristulatum*.

Plants erect.

Bractlets not spiny-toothed.....8. *E. jepsonii*.

Bractlets spiny-toothed.

Leaves merely spinose-toothed or somewhat incised; bracts and bractlets spiny-toothed only towards base.....9. *E. vaseyi*.

Leaves laciniately parted into remote spinulose-toothed segments; bracts and bractlets spiny-toothed except towards tip.....10. *E. castrense*.

Sepals pinnately 3 to 5-cuspidate.....11. *E. globosum*.

1. *E. articulatum* Hook. BEE-THISTLE. Stem erect, dichotomously branched above, usually with a pedunculate head in the forks, 2 to 3 ft. high; herbage with a strong disagreeable odor; lower leaves fistulous, elongated, jointed, with or without a lanceolate or ovate nearly parallel-veined entire to spinulose-laciniate blade; upper leaves sometimes opposite, more or less lacinate; heads ovoid, 4 to 8 lines high, blue; bracts narrowly linear-lanceolate, cuspidate-tipped, more or less spinulose-serrate, 6 to 10 lines long, deflexed; bractlets lanceolate, entire, or somewhat spiny-toothed, more or less scarious-margined, surpassing the sepals; sepals lanceolate, 1½ lines long, tapering into a short spine, equaled or surpassed by the styles.—River marshes and marshy meadows: lower San Joaquin River; Sacramento Valley; n. to Siskiyou and Modoc Cos.; Ore. to Ida. Var. *BAKERI* Jepson. Stem simple for more than half its length, then sparsely branched, 1 to 1½ ft. high; leaf blades of basal leaves ovate, 1¾ to 2 in. long, the petiole much elongated; heads ovate to globose, bluish, on longish peduncles, 4 to 5 lines high; bracts linear-lanceolate, pinnately spinescent, longer than the heads, spreading or often deflexed; bractlets with a pair of spinose teeth above the middle, scarious-margined at base, equaling or slightly exceeding the sepals; sepals ovate, ¾ line long, tapering rather abruptly into a short cusp, exceeded by the styles.—Modoc Co. This is an apparent intergrade to no. 2.

2. *E. alismaefolium* Greene. Main stem 1 to 2 in. high, then parted into 3 to 5 diffuse dichotomous branches, at first much shorter than the leaves, later often exceeding them; basal leaves ½ to 1¼ ft. long, consisting of elongated petioles with or without short (1¼ in. long) blades; petioles terete, jointed, passing above into flat spinose ones without joints; upper leaves similar but much smaller; heads usually pedunculate, nearly globose, 3 to 3½ lines high; bracts subulate-lanceolate, usually somewhat longer than the heads, 4 to 5 lines long, with or without a few spinose bristles, somewhat scarious-margined at base; bractlets subulate-lanceolate, a little exceeding the flowers, with conspicuous scarious margins below (broadening downward), with or without a few bristles; sepals ovate-oblong, scarious margined, ½ line long, tapering into a cuspidate-bristly tip; styles longer than the sepals.—Modoc Co.

3. *E. armatum* C. & R. COAST ERYNGO. Fig. 673. Stem diffusely branching, 3 to 5 or 10 in. long; leaves broadly oblanceolate, incised or merely

serrate, the teeth spinose; bracts and bractlets very prominent, broadly lanceolate, strongly spinose-tipped, with a callous margin, entire or with a pair of spinulose teeth below, sometimes scarious-winged at the very base, 3 to 7 lines long; sepals ovate,  $\frac{3}{4}$  line long, usually exceeding the styles, narrowed at apex into a sharp point or cusp less than half as long.—Lowlands near the coast from Monterey Co. to Humboldt Co.; often abundant.

4. *E. pinnatisectum* Jepson. Stem erect, branching above, 8 to 14 in. high; basal leaves 6 in. long, tapering into a flat winged petiole, pinnately parted into narrow rather remote segments, these spinulose-toothed or parted; upper leaves similar or merely spinose-toothed, the petiole short or lacking; heads  $3\frac{1}{2}$  to 4 lines high; bracts entire, 4 to 5 lines long, with wide scarious margin at base forming a lobe or tooth above; bractlets shorter, similar; sepals lanceolate, 1 line long, tapering into a spine about  $\frac{1}{2}$  as long; styles exceeded by sepals.—Sierra Nevada foothills in Tuolumne Co.

5. *E. longistylum* C. & R. Stem low (4 to 8 in. high), branching throughout and spreading; basal leaves narrow, pinnately cut into distant almost spine-like segments; heads globose, about  $1\frac{3}{4}$  lines high; bracts narrowly lanceolate, spreading, minutely puberulent, much longer than the heads,  $2\frac{3}{4}$  to  $3\frac{3}{4}$  lines long, mostly entire, scarious-margined at base; bractlets similar, but narrower, and with broader scarious margins at base; sepals lanceolate, scarious-margined,  $\frac{1}{2}$  line long, tapering above into a weak acuminate tip; styles very much longer than the sepals.—W. San Luis Obispo Co.

6. *E. minimum* C. & R. Low, depressed-tufted, the stems several to many, nearly simple, thickened toward the base and markedly retrocurved, 1 to 4 in. long; leaves mostly basal, 2 to 6 in. long, merely cleft and toothed to pinnately divided with cleft or toothed ovate-segments, the teeth and petioles more or less spinose; heads on very short peduncles, nearly globose,  $2\frac{1}{2}$  to  $3\frac{1}{2}$  lines high; bracts broadly lanceolate, equaling or slightly exceeding the heads, the lower  $\frac{2}{3}$  with spinose bristles; bractlets broadly linear-lanceolate, a little longer than the flowers, with a conspicuous scarious margin below, at the top of which and just above are a few bristles; sepals ovate, scarious-margined,  $\frac{1}{2}$  line long, with an abruptly cuspidate-bristly tip about as long; styles exceeding the sepals.—N. Sierra Nevada (Nevada Co. to Plumas Co.)

7. *E. aristulatum* Jepson. Stems prostrate or low-diffuse, very slender, 10 to 15 in. long, basal leaves tapering into a long petiole, 4 in. long (including the petiole), the short blade spinose-toothed and with a few lanceolate segments; cauline leaves opposite, sessile, spinulose-serrate; heads very numerous,  $2\frac{1}{2}$  to  $3\frac{1}{2}$  lines long; bracts exceeding the head, about  $4\frac{1}{2}$  lines long, densely spinose at base; bractlets spinose, the body narrowly lanceolate, inversely sagittate-winged from the base upward, the lobes of the wings thus forming sinuses, in each of which are borne 1 to 3 awns surpassing the breadth of the wing; sepals ovate-lanceolate, hyaline-margined, 1 line long, tapering into a cuspidate-bristly tip, exceeded by the long styles.—Dry lake beds, Lake Co.

673. *Eryngium armatum* C. & R.; a, leaf x  $\frac{1}{2}$ ; b, infl. x  $\frac{3}{4}$ ; c, bract x 4; d, fr. x 4; e, sect. carp. x 7.

674. *Eryngium vaseyi* C. & R.; a, plant  $\times \frac{1}{4}$ ; b, terete leaves  $\times \frac{1}{4}$ ; c, fr. branch  $\times \frac{1}{2}$ ; d, fr.  $\times 3$ ; e, sect. carpel  $\times 7$ ; f, bractlet  $\times 2$ .

the base and diffusely branching, the heads about  $2\frac{3}{4}$  lines high; bracts narrow and rigid, with a few spinose bristles and with or without a narrow scarious margin at base,  $3\frac{1}{2}$  to 6 lines long; bractlets similar but with a short broad scarious margin below, usually without bristles; sepals ovate,  $\frac{1}{2}$  line long, tapering above into a cuspidate-bristly tip.—Sandy ground, San Luis Obispo Co. to San Diego Co. and L. Cal. (*E. parishii* C. & R.)

9. *E. vaseyi* C. & R. COYOTE-THISTLE. Fig. 674. Plants growing in shallow vernal pools and showing two vegetative stages: earliest leaves all terete, jointed, and basal, disappearing with the drying up of the pools and succeeded by leafy stems; stems stout, erect, more or less branching, commonly 8 to 13 in. (or sometimes 2 ft.) high; lower leaves narrowly oblanceolate, spinulose, somewhat incised or bearing small lanceolate lobes below, 4 to 8 in. long, the upper much shorter; heads  $3\frac{1}{2}$  (or  $2\frac{1}{2}$  lines) high; bracts spinose, spinulose toward the base, 6 to 10 lines long, much surpassing the bractlets; bractlets similar, surpass-

8. *E. jepsonii* C. & R. BUTTON-THISTLE. Plants growing in shallow vernal pools, the earliest leaves all basal and consisting of terete hollow jointed petioles,  $\frac{1}{2}$  to  $1\frac{1}{2}$  ft. long, these disappearing with the drying up of the pools, and leafy stems arising; stems slender, freely branching,  $1\frac{1}{4}$  to  $1\frac{3}{4}$  ft. high; leaves oblanceolate, spinulose, sometimes incised, the lower narrowed at base to a slender spinulose petiole, the upper short-petioled or sessile; heads 3 to  $3\frac{1}{2}$  lines high, surpassed by the bracts; bracts rigid, 4 to 10 lines long, with few short bristles at base; bractlets lanceolate, with scarious margin at base, broader upwards, not spinulose; sepals oblong or lanceolate, 1 line long, narrowed abruptly into a spine less than half as long, exceeded by the long styles.—Low places in valley fields and flats in the hills, Napa Co. to Santa Clara Co. Var. *PARISHII* Jepson. Stems slender, erect or spreading, much branched at base,  $\frac{1}{3}$  to  $1\frac{1}{2}$  ft. high; basal leaves lacinate-toothed or parted into remote spinose-toothed segments, tapering into a long somewhat spiny-toothed petiole; inflorescence beginning near

675. *Eryngium castrense* Jepson; a, fr. branchlet  $\times \frac{1}{2}$ ; b, leaf  $\times \frac{1}{2}$ ; c, bractlet  $\times 1\frac{1}{2}$ ; d, fr.  $\times 5$ ; e, sect. carp.  $\times 12$ .

ing the flowers; fruit with abruptly cuspidate sepals longer than the short styles.—Low places in fields, Sacramento Valley, w. to Mendocino Co. and s. to Monterey Co. May-June.

10. *E. castrénse* Jepson. Fig. 675. Stem stout, very erect, simple below, branched above,  $1\frac{1}{2}$  to  $1\frac{3}{4}$  ft. high; cauline leaves laciniately divided into rather remote very narrow segments, these again cleft or toothed, the margin of the divisions and the ligulate rachis spinose; leaves at the upper forks bracteose-foliaceous, pinnately spinose-cleft, somewhat recurving,  $1\frac{1}{4}$  to  $1\frac{1}{2}$  in. long; heads mostly short-peduncled, 4 to 5 lines high, twice exceeded by the bractlets; bracts moderately rigid, pinnately spiny-toothed except toward tip, at base more or less scarious margined and densely spinose dorsally,  $\frac{3}{4}$  to 1 in. long; bractlets similar but with broadly scarious margined base which encloses the fruit; sepals about 1 line long, tapering into a short spine.—Sierra Nevada foothills from Tuolumne Co. to Butte Co. Var. *VALLICOLA* Jepson. Bracts and bractlets shorter and less markedly spinescent, in this character approaching no. 9.—Sierra Nevada foothills from Mariposa Co. to Butte Co.

11. *E. globosum* Jepson. Stems 1 to several from base, branching above, 14 to 20 in. high; basal leaves pinnately divided into narrow distant segments, these more or less spinose-toothed or cleft, the petioles spinose-winged and at base somewhat clasping, the entire leaf 5 in. long; cauline leaves similar but smaller with short spinosely winged petiole, the uppermost more or less bracteose, very spiny at base; heads remarkably globose, mostly on short stout peduncles, 5 lines in diameter, not exceeded by the bractlets except the terminal ones; bracts rigid, spine-tipped and pinnately spinose, somewhat scarious at base, 4 to  $5\frac{1}{2}$  lines long; bractlets pinnately 2 or 3-spinose, with broad scarious margin at base, the margin 1 or 2-spinose above; lateral bractlets equaling the flowers, the terminal ones much longer, all falling with the fruit; sepals ovate, 1 line long, pinnately 3 to 5 spiny-toothed (rarely entire), the apical spine  $\frac{1}{2}$  line long; styles scarcely exserted; fruit  $1\frac{1}{2}$  lines long.—Flats in and near the Sierra Nevada foothills in Tulare Co. Var. *MEDIUM* Jepson. Bractlets conspicuously exserted from the heads, in this respect approaching no. 9.—Cathay foothills, Mariposa Co.

## 2. *SANÍCULA* L. SNAKE-ROOT

Glabrous perennials with naked or few-leaved stems, usually much divided leaves, and irregularly compound, few-rayed umbels. Involucres of leaf-like toothed bracts. Involucels of small usually entire bractlets. Flowers greenish, yellow or purple, of two sorts, perfect (fertile) and staminate (sterile), both kinds in the same umbellet, the staminate often pediceled. Umbellets capitate and here called "heads." Calyx-teeth slightly foliaceous, persistent. Fruit subglobose or obovoid, without ribs, densely covered with tubercles which often end in hooked prickles. Oil-tubes many and irregularly distributed. (Diminutive, derived from Latin sanare, to heal; certain species used in medicine.)

676. *Sanicula arctopoides* H. & A.; a, habit x  $\frac{1}{4}$ ; b, head x 1; c, sterile fl. x 5; d, fruit x 5; e, cross sect. of carpel x 5.

**A. Fruit pediceled or stipitate; leaves palmately lobed or divided; stem or stems from a stoutish taproot.**

Bractlets conspicuous, much exceeding the heads; plants prostrate or decumbent. . . . . 1. *S. arctopoides*.

Bractlets inconspicuous, not exceeding the heads; plants erect.

Leaf divisions broad, not toothed to the very base; common. . . . . 2. *S. menziesii*.

Leaf divisions narrow, decurrent below into a conspicuously toothed rachis; rare. . . . . 3. *S. arguta*.

**B. Fruit neither pediceled nor stipitate.**

Stem or stems from the more or less thickened crown of a taproot.

Flowers purple (yellow in the vars.); leaves bipinnatifid, the main divisions decurrent on the toothed rachis. . . . . 4. *S. bipinnatifida*.

Flowers yellow.

Leaves entire or some 3-parted; S. F. Bay. . . . . 5. *S. maritima*.

Leaves not entire.

Leaves palmately cleft or divided, the main divisions confluent below; coast species. . . . . 6. *S. laciniata*.

Leaves ternate, the main divisions on distinct petiolules; Sierra Nevada, San Bernardino Mts.

Plants low, the spreading peduncles arising in a cluster from near the base. . . . . 7. *S. nevadensis*.

Plants erect, the peduncles arising singly along the stem. . . . . 8. *S. septentrionalis*.

Stems from a tuberous root.

Leaves twice or thrice pinnate, of distinct small leaflets; fruit tuberculate, the tubercles tipped with hooked bristles; tuber vertically elongated. . . . . 9. *S. bipinnata*.

Leaves twice or thrice ternate, then pinnately dissected.

Tuber globose; fruit tuberculate, not bristly; flowers yellow. . . . . 10. *S. tuberosa*.

Tuber elongated, fleshy, branched below; fruit with its upper tubercles tipped with hooked bristles; flowers salmon-color. . . . . 11. *S. saxatilis*.

1. *S. arctopoides* H. & A. FOOTSTEPS-OF-SPRING. Fig. 676. Prostrate or decumbent, the plants 4 to 8 in. broad, conspicuous because of the yellowish foliage; main stem from a taproot, very short, bearing a tuft of leaves and several divergent naked branches often longer than the leaves, each branch bearing an umbel of 1 to 4 rays; rays short or as much as 5 in. long; leaves 2 to 2½ in. broad, 2 to 4½ in. long, including the broadly margined petiole, palmately parted into 3 divisions which are again cleft, the whole margin

laciniately cut into slender unequal teeth, almost as if fringed, or again, the lanceolate spreading segments subentire; bracts similar; heads 3 lines in diameter, surrounded by conspicuous involuclers of 8 to 13 oblong entire bractlets 5 to 7 lines long, or 4 or 5 much shorter than the others; flowers yellow; fruit 1 to 1½ lines long, naked at base, with strong bristles above.—Open or brushy hills of the seaward Coast Ranges from Monterey to Humboldt Co.; n. to B. C. Also called Yellow Mats.

677. *Sanicula menziesii* H. & A.; a, leaf x ½; b, fr. branchlet x ½; c, fr. x 5; d, sect. carp. x 6.

2. *S. menziesii* H. & A. GAMBLE WEED. Fig. 677. Stem 1 to 3½ feet high, from a stoutish taproot, simple below, paniculately branching above; leaves round-cordate in outline, 1 to 3 in. broad, palmately and deeply 3 to 5-lobed, the broad segments sharply lobed or incised, with mucronate teeth; rays few, ¼ to 2 in. long; bracts small, leaf-like; bractlets 6 to 8, small, entire; flowers yellow, the sterile ones short-pediceled or nearly sessile; fruit covered with strong bristles, 1½ lines long, distinctly stipitate, 4 to 9 in each head, at length divergent.—Shady woods of the foothills: coastal S.

Cal.: Coast Ranges; Sierra Nevada; n. to B. C. Var. *NUDICAULIS* Jepson. Branches about 10, sub-basal, somewhat scapiform; leaves long-petioled, thinnish, less deeply parted, sinuses more nearly closed and the segments less lobed.—Coast Ranges; Amador Co. Var. *PEDATA* Jepson. Robust, 3 to 5 ft. high; leaves thickish, dark green, pedately divided into cuneate segments (especially the cauline), 3 to 4 in. broad, the teeth bristle-tipped.—Elk Mt., Lake Co.; Calistoga. Var. *FOLIACEA* Jepson. Low but very leafy, the bracteal leaves very large.—San Francisco Bay; Kelseyville, Lake Co.

3. *S. arguta* Greene. Stem sparingly branched, from the crown of a thickened taproot, 8 to 14 in. high; leaves mainly basal, 1 to 3 in. long, palmately 5- to 7-divided, the middle division largest and often distant, the lower pair of divisions smaller than the lateral pair, all more or less pinnately parted or cleft and toothed and each decurrent to the base, forming a broad toothed wing; ultimate segments 2 to 3 lines broad; midribs and upper side of petioles minutely glandular; petioles 2 to 5 in. long; cauline and bracteal leaves reduced or sometimes large; rays 3 to 5 in an umbel, 1 to 4 in. long; flowers yellow, the heads 2 or 3 lines broad; bractlets membranaceous, oblong, acute, not exceeding the heads; fruit prickly,  $2\frac{1}{2}$  lines long, stipitate.—Coastal S. Cal.

4. *S. bipinnatifida* Dougl. PURPLE SANICLE. Fig. 678. Plants  $\frac{1}{2}$  to 1 ft. high, the herbage disposed to be purplish; taproot deep-seated, its thickened multicapital crown bearing a cluster of leaves and several stems which are leafy mainly or wholly toward the base; leaves  $2\frac{1}{2}$  to 4 in. long, mostly triangular in outline, pinnately 3 to 7-parted, the divisions distant, decurrent on the rachis as a toothed wing, and cut into oblong or ovate unequally toothed or serrate lobes; flowers purple, the sterile pediceled, borne in dense heads  $2\frac{1}{2}$  to 4 lines in diameter; umbels irregular, with long or short rays, small leaf-like bracts and small lanceolate bractlets; fruit covered all over with bristles.—Grassy slopes in the hills: coastal S. Cal.; Coast Ranges; Sierra Nevada foothills; n. to B. C. May-June. Var. *FLAVA* Jepson. Leaves mostly light green with broad primary division ( $\frac{3}{4}$  to  $1\frac{1}{2}$  in. wide); flowers yellow.—Butte Co.; Plumas Co. Var. *NEMORALIS* Jepson. Winged rachis entire or sparsely denticulate; flowers yellow.—Sierra Nevada from Mariposa Co. to Nevada Co.

678. *Sanicula bipinnatifida* Dougl.; a, typical leaf  $\times \frac{1}{2}$ ; b, early leaf  $\times 3$ ; c, infl.  $\times \frac{1}{2}$ ; d, fr.  $\times 3$ ; e, sect. carp.  $\times 6$ .

5. *S. maritima* Kell. DOBIE SANICLE. Plants 10 to 12 in. high, the stout stem from a much-thickened root; basal leaves rather numerous, elliptical to orbicular, entire or slightly serrate, 1 to 2 in. long, on petioles 4 to 6 in. long; cauline leaves few, 3-parted into obovate or roundish divisions (as are sometimes the basal leaves), with sub-entire or coarsely toothed margins; peduncles few, elongated; umbel with 1 to 4 rays 1 to  $2\frac{1}{2}$  in. long; involucre of leaf-like bracts; involucre of many small lanceolate bractlets; flowers yellow, the sterile ones short-pedicel; fruit bristly, somewhat naked below,  $1\frac{1}{2}$  lines long; seed-face concave with a very prominent median longitudinal ridge.—Local species of low and wet adobe lands in the vicinity of salt-marshes bordering San Francisco Bay.

6. *S. laciniata* H. & A. COAST SANICLE. Plants 6 to 13 in. high; stem from a medium taproot, the branches few and disposed to diverge; leaves mainly basal, roundish in outline,  $\frac{1}{2}$  to 1 in. long, palmately 3-cleft or parted, the divisions incisely lobed or laciniate with spreading teeth, their petioles 1 to 2 in. long; upper leaves and foliaceous involucre similar but reduced; umbel with 2 to 5 unequal rays ( $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long) or 1 or 2 of the rays again umbellate; flowers yellow, subtended by an involucre of oblong-ovate or lanceolate bractlets 1 line long; sterile flowers long-pedicelled; fruit prickly, somewhat naked below,  $1\frac{1}{2}$  lines long.—Slopes of the coast hills from Humboldt Co. to Monterey Co. Apr. Var. *SERPENTINA* Jepson. Leaves 1 to  $1\frac{1}{2}$  in. long, palmately 3-parted, or divided, the lobes pinnately parted into often remote lanceolate segments, these entire or laciniately toothed.—Monterey Co. to Marin Co.

7. *S. nevadensis* Wats. SIERRA SANICLE. Low plants, with several spreading peduncles 1 to 6 (or 9) in. long arising basally or from the very short stem; leaves about 1 in. long, on petioles as long or twice as long, ternate, the divisions with distinct petiolules, oblong-ovate to roundish in outline, 3 to 5-lobed with the segments again lobed or toothed; rays 3 to 10 in an umbel, 1 line to 1 in. long, the bracts pinnatifid, leaf-like; bractlets small, oblong, acute, more or less united; flowers yellow, the sterile on pedicels 1 to  $1\frac{1}{2}$  lines long; fruit tuberculate, the tubercles ending in hooked bristles.—Middle altitudes in the mountains, 5000 to 6000 ft.: San Bernardino Mts. and n. through the Sierra Nevada to Modoc and Siskiyou Cos. May-June. Var. *GLAUCA* Jepson. Leaves glaucous, very finely divided.—Rocky slopes, Tulare and Kern Cos.

8. *S. septentrionalis* Greene. Plants erect, 6 to 12 in. high; peduncles few, divaricately spreading, scattered along the stem; leaves 1 to 2 in. long; fruit 2 lines long; otherwise like no. 7.—Montane, 5000 to 7000 ft.: Sierra Nevada (Tulare Co. to Siskiyou Co.); high North Coast Ranges; n. to B. C.

9. *S. bipinnata* H. & A. POISON SANICLE. Fig. 679. Stem from an elongated tuber-like root, erect, usually simple below,  $\frac{2}{3}$  to 2 ft. high; herbage with a strongly aromatic odor; leaves chiefly basal, 2 to 4 in. long, twice or thrice pinnate, the ultimate divisions obovate or oblong, 3 to 4 lines long, not decurrent; umbel with 3 or 4 rays and leaf-like bracts; flowers yellow, the heads 2 lines in diameter and subtended by several small more or less united bractlets; fruit tuberculate, the tubercles tipped with stout hooked bristles.—Shady woods in the low hills, Coast Ranges and Sierra Nevada. Apr.

10. *S. tuberosa* Torr. TURKEY PEA. Fig. 680. Stem from a globose tuber, 5 to 9 (or 14) in. high, simple or divided at or near the surface of the ground into 2 to 5 long peduncle-like often divergent branches, each irregularly di- or tri-chotomous, the divisions ending in 1 to 4-rayed umbels and commonly with pedicellate heads in the forks; leaves once or twice ternate, then pinnatifid, usually very finely dissected into acutish segments; involucre of leaf-like bracts; involucre of small ovate or lanceolate partially united bractlets; heads 2 to 3 lines broad; flowers yellow, the sterile on pedicels 1 to  $2\frac{1}{2}$  lines long; fruit flattened laterally,

679. *Sanicula bipinnata* H. & A.: a. leaf  $\times \frac{1}{2}$ ; b. root  $\times \frac{1}{2}$ ; c. fr. branchlet  $\times \frac{1}{2}$ ; d. fr.  $\times 4$ ; e. sect. carp.  $\times 7$ .

tuberculate but not at all bristly, 1 line long.—Rocky or gravelly slopes in the foothills, 500 to 2500 ft. and up to 5000 ft.: Coast Ranges; Sierra Nevada; s. to San Diego Co. and L. Cal.

11. *S. saxatilis* Greene. Stems several, branching and widely spreading from the base, 4 to 7 in. long; root a very thick and fleshy tuber, more or less elongated or irregular; ultimate leaf segments broad, coarsely toothed; flowering branches repeatedly dichotomous; flowers straw color; upper tubercles on the fruit tipped with a reduced subulate and somewhat hooked bristle; otherwise like no. 10. — Rocky crests, Mt. Diablo.

### 3. ANTHRISCUS Bernh.

Annual herb. Leaves bipinnate with bipinnatifid leaflets, the upper leaves reduced. Flowers white. Umbels compound, lateral, shortly peduncled or sessile. Rays few. Involucre none. Involucel of few lanceolate bractlets. Fruit somewhat laterally compressed, ovate, shortly beaked, curved with short hooked bristles. Ribs and oil-tubes none or obscure. (Greek anthriscus, its etymology unknown.)

680. *Sanicula tuberosa* Torr.; a, habit x  $\frac{1}{2}$ ; b, fr. x 7; c, sect. carp. x 10.

1. *A. vulgaris* (L.) Pers. BUR CHERVIL. Slender,  $1\frac{1}{2}$  to 3 ft. high; rays 3 to 6,  $\frac{1}{2}$  to 1 in. long; pedicels 1 to 3 lines long; fruit  $1\frac{3}{4}$  lines long.—Adventive European weed.

### 4. SCÁNDIX L.

Annuals with dissected compound leaves. Flowers white, polygamous, in compound umbels. Staminate flowers with stamens and green disk, and occasionally with short styles; pistillate flowers with long styles, purple disk and with or without stamens. Rays commonly 2, rarely 1 or 3. Involucre none or of one bract. Involucels of several bractlets. Petals unequal, the outer larger. Fruit linear, flattened laterally, muriculate, prolonged into a beak several times longer than the body. Ribs prominent. Oil-tubes none or obscure. Seed-face sulcate. (The Greek name.)

1. *S. pecten-veneris* L. SHEPHERD'S NEEDLE. Fig. 681. Erect, simple or branching, 5 to 16 in. high, somewhat hispidulous; leaves 2 or 3 times pinnately dissected into linear acute segments less than  $\frac{1}{2}$

681. *Scandix pecten-veneris* L.; a, fr. branchlet x  $\frac{1}{2}$ ; b, fr. x  $\frac{3}{4}$ ; c, carpel x  $\frac{3}{4}$ ; d, sect. carp. x 10.

line wide; bractlets 2 or 3-toothed at apex or entire; rays  $\frac{1}{2}$  to 1 in. long; pedicels very short; body of fruit 4 lines long, bearing a straight flattish beak  $1\frac{3}{4}$  in. long, its edges hispidulous.—San Francisco Bay region; nat. from Eur.

### 5. OSMORRHIZA Raf. SWEET CICELY

Perennials with thick aromatic roots. Leaves mostly basal, 2 to 3 times ternately compound. Flowers white, in compound umbels. Calyx teeth obsolete. Involucre reduced or obsolete. Involucels present or none. Fruit linear or linear-oblong, rather prominently attenuate at base, glabrous and smooth or bristly along the ribs; carpels pentagonal in cross section, with equal ribs. Oil-tubes none in mature fruit. Seed-face concave to very deeply sulcate. (Greek osme, odor, and rhiza, root.)

Fruit with bristly ribs; carpel long-attenuate at base (except no. 1).

Involucels of several bractlets.....1. *O. brachypoda*.

Involucels none.

Fruit beaked or constricted at apex.....2. *O. nuda*.

Fruit obtuse at apex.....3. *O. obtusa*.

Fruit ribs not bristly; carpel not attenuate (mostly obtuse) at base.

Fruiting rays usually erect, forming a compact cluster of fruits; leaflets oblong-lanceolate.....4. *O. occidentalis*.

Fruiting rays spreading, forming a loose umbel; leaflets ovate.....5. *O. bolanderi*.

1. *O. brachypoda* Torr. Erect,  $1\frac{1}{2}$  to  $1\frac{3}{4}$  ft. high, glabrous or strigosely puberulent; leaflets coarsely laciniate-cleft and serrate, mucronulate,  $\frac{3}{4}$  to 2 in. long; umbel 1 to 5-rayed, the fruiting rays 2 to 4 in. long; pedicels 1 line long; involucre mostly absent; involucels of linear acuminate bractlets; fruit 7 to 9 lines long, the ribs armed with bristles pointed upward; seed-face deeply concave or even involute.—Sierra Nevada, 3000 to 5000 ft., from Sierra Co. to Tulare Co.; South Coast Ranges from Santa Clara Co. to Santa Barbara Co.; cismontane S. Cal.

2. *O. nuda* Torr. Fig. 682. Stem glabrous,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  ft. high or less; leaves 5 to 11 in. long, the cauline much reduced; petioles with short stiff spreading hairs, the leaflets more or less hispidulous; leaflets ovate or elliptical, 3-lobed or -cleft and serrate, often narrowly or broadly cuneate at the entire base,  $\frac{1}{2}$  to  $2\frac{1}{2}$  in. long; rays 3 or 4 (to 6), 2 to 4 in. long; pedicels 3 to 8 lines long; involucels none; fruit 5 to 8 lines long, attenuate into a slender base  $\frac{1}{4}$  to  $\frac{1}{2}$  as long as the body, and at apex more or less contracted into a beak  $\frac{1}{2}$  to 1 line long; attenuate base of fruit very bristly, the body upwardly bristly on the ribs; seed-face sulcate.—Shady woods: cismontane S. Cal.; Coast Ranges mostly near the coast, 100 to 2000 ft.; Sierra Nevada, 4000 to 6000 ft., from Tulare Co. to Placer Co. The most common species of this genus. Var. *BRÉVIPES* Jepson. Leaflets puberulent or strigose; pedicels  $1\frac{1}{2}$  to 3 lines long.—Tuolumne Co. to Siskiyou Co. Var. *DIVARICATA* Jepson. Nearly glabrous, but variable in this respect and scarcely of varietal rank.—Placer Co. to Tehama Co. and n.

682. *Osmorrhiza nuda* Torr.; a, leaf  $\times \frac{1}{2}$ ;  
b, umbel  $\times \frac{1}{2}$ ; c, fr.  $\times 2\frac{1}{2}$ ;  
d, sect. carp.  $\times 18$ .

3. *O. obtusa* Fer. Resembles no. 2, but more slender, 1 to  $1\frac{1}{2}$  ft. high; herbage almost glabrous; rays

widely spreading or the lateral deflexed; fruiting pedicels 2 to 4, divaricate, 6 to 8 lines long; fruit 5 to 7½ lines long, obtuse or slightly pointed at the tip, less bristly.—Sierra Co.; e. to Rocky Mts.; n. to B. C.

4. *O. occidentalis* Torr. SIERRA SWEET CICELY. Plants 2 to 3½ ft. high; herbage minutely puberulent or nearly glabrous; leaflets oblong-lanceolate (or rarely ovate), serrate or sparingly incised, 1 to 1½ (or 2½) in. long, some of them obliquely lobed on one side by a deep incision toward the base; rays 5 to 12, in fruit erect (1 to 2¼ in. long) and forming a close or compact umbel; pedicels 1½ to 4 lines long; bracts 1 or 2 or none; stylopodium conical, about equaling the style; fruit 6 to 7 lines long, acutish at apex or obscurely short-beaked, with prominent acute not bristly ribs; seed-face very concave.—Sierra Nevada, 4000 to 8500 ft., from Madera Co. to Siskiyou Co., thence s. to Mendocino Co.; n. to Alb.

5. *O. bolanderi* (Gray) Jepson. Stems stout, 3 ft. high; herbage more or less puberulent, somewhat more pubescent at the nodes; leaflets broadly ovate, coarsely toothed, 1 to 2 in. long; fruiting rays spreading, 1½ to 3 in. long; fruit 8 to 9½ lines long, with a stout short beak; stylopodium flat, shorter than the style; seed-face deeply sulcate.—Mendocino Co. to Siskiyou Co.

#### 6. DAUCUS L.

Bristly or hispid annuals or biennials with dissected decompound leaves and white flowers. Umbels compound, concave, surrounded by cleft bracts and borne on long peduncles. Involucels of entire or toothed bractlets. Calyx-teeth obsolete. Fruit somewhat flattened dorsally. Primary ribs slender, bristly; secondary ribs with a single row of prominent barbed prickles. Oil-tubes as in *Caucalis*. (*Daukos*, the Greek name.)

Involucre divided into short linear or lanceolate segments; rays mostly 2 to 6 lines long... 1. *D. pusillus*.  
Involucre divided into elongated filiform segments; rays 1 to 2½ in. long... 2. *D. carota*.

1. *D. pusillus* Michx. RATTLESNAKE WEED. Annual, 4 to 7 (or 22) in. high; stems and peduncles retrorsely hispid; leaves finely dissected into linear segments; rays mostly 2 to 6 lines long, sometimes as much as 1 or 1½ in. long, somewhat unequal; pedicels very unequal, commonly 1 or 2 lines long or almost wanting; fruit 1½ to 2 lines long.—Throughout cismontane Cal. in the hill country; n. to B. C., e. to the Carolinas. Apr. The herbage is in rural repute as an antidote for the bite of the rattlesnake, whence "*Yerba del Vibora*" of the Spanish-Californians.

2. *D. carota* L. CARROT. Biennial; stems erect, branching, hispid, 2 to 3 ft. high; root fleshy, conical; leaves many times dissected into small linear or lanceolate segments; segments of the involucre linear-lanceolate or subulate; rays numerous, 1 to 2 in. long in fruit; umbels in fruit concave and like a bird's nest; fruit 2 lines long.—European cultivated plant, an escape from gardens, locally naturalized in valley lands.

#### 7. TÓRILIS L.

Erect slender annuals with hispidulose herbage, bipinnate leaves and white flowers in subcapitate umbels. Involucre and involucels of linear bracts. Fruit with the secondary ribs more prominent than the primary and bearing a row of bristles or tubercles; bristles rough, hooked at tip. Oil-tubes solitary, 2 on the commissure. (Derivation unknown.)

1. *T. nodosa* (L.) Gaertn. KNOTTED HEDGE PARSLEY. Erect, 7 to 13 in. high, the stems with few branches, retrorsely scabrous; leaves pinnate (lower 3 to 5 in. long including petiole, the upper successively shorter); leaflets bipinnately dissected; umbels scattered along the stems opposite the leaves, on very short peduncles (1 or 2 lines long), simple or with a supplementary short proliferous umbel; fruits 1½ to 2 lines long, those on the outside of the umbel with the exterior carpel densely covered with hooked bristles, the inner carpels as well as the inner fruits warty and without prickles.—Nat. from Eur., now widely spread and locally common on openly wooded hills.

683. *Caulocalis microcarpa* H. & A.; a, leaf x  $\frac{1}{2}$ ; b, umbel x  $\frac{1}{2}$ ; c, fr. x 6; d, sect. carp. x 7.

with dissected leaves. Flowers small, white, in irregularly compound umbels. Rays and pedicels unequal. Involucre and involucels none. Calyx-teeth wanting. Fruit somewhat laterally compressed, elliptic-cordate, more or less tuberculate. Oil-tubes solitary in the intervals, 2 on the commissure. Seed-face narrowly concave. (Apium, celery, and aster, Latin suffix meaning wild.)

1. *A. angustifolium* Nutt. Fig. 684. Erect, di- or tri-chotomously branched from the base, 4 to 8 (or 15) in. high; leaves opposite below, twice or thrice ternately dissected into linear segments  $\frac{1}{2}$  to 1 in. long; umbels sessile in the forks or opposite the upper leaves, consisting of 2 or 3 umbellets borne on unequal rays (1 in. long or less), and of 1 or 2 usually sessile or sometimes pediceled flowers in the center; umbellets 3 or 4-flowered, the pedicels unequal ( $4\frac{1}{2}$  lines long or less) or 1 flower sessile; fruit cordate, broader than high, less than 1 line long, papillate-roughened all over; ribs inconspicuous. —Dry mountain slopes or sandy valleys: Coast Ranges; Sierra Nevada; cismontane S. Cal.; L. Cal. Apr.-May.

684. *Apiastrum angustifolium* Nutt.; a, umbels x 1; b, fr. x 10; c, sect. carp. x 10.

## 8. CAUCALIS L.

Annuals with decompose leaves dissected into small segments. Flowers white. Umbels more or less irregularly compound. Calyx-teeth prominent. Fruit flattened laterally. Primary ribs 5, filiform, bristly; secondary ribs 4, prominent, winged, bearing barbed or hooked prickles. Oil-tubes solitary in the intervals, i. e., under the secondary ribs, 2 on the face. (Kaukalis, the Greek name.)

1. *C. microcarpa* H. & A. Fig. 683. Erect, slender, 6 to 12 in. high; leaves 2 or 3 times ternate and much dissected, slightly hispid; umbels unequally 3 to 5-rayed; rays 1 to  $3\frac{1}{4}$  in. long; pedicels 8 lines long or less; involucre of foliaceous dissected bracts; involucels of entire or somewhat divided bractlets; fruit oblong, 2 lines long, armed with rows of hooked prickles. —Coast Ranges, Sierra Nevada, coastal S. Cal., widely distributed but not common; s. to Mex., e. to Ariz., n. to Wash.

## 9. APIÁSTRUM Nutt.

Small branching glabrous annual

10. **HYDROCÓTYLE** L.

Perennial glabrous herbs, the peduncles and leaves from creeping stems or rootstocks. Leaves simple, round in outline, long-petioled. Flowers in a small simple umbel, or disposed in 2 or more umbels which are proliferous one above the other. Fruit flattened laterally, suborbicular, the dorsal rib prominently margined and with one or 2 filiform ribs on each side. Oil-tubes none. (Greek hudor, water, and cotule, a low vessel, the peltate leaves of some species being saucer-shaped.)

Leaves not peltate, 5 or 6-cleft; umbels simple.....1. *H. ranunculoides*.

Leaves peltate, more or less crenate.

Umbels simple, fruit notched at base and apex...2. *H. umbellata*.

Umbels proliferous, forming an interrupted spike.

Fruit not notched at base, sessile or on very short pedicels

3. *H. verticillata*.

Fruit notched at base, the pedicels  $1\frac{1}{2}$  to 7 lines long....

4. *H. prolifera*.

1. *H. ranunculoides* L. f. WATER PENNYWORT. Fig. 685. Stems floating or creeping in mud, rooting at the nodes; leaves orbicular, ( $\frac{3}{4}$  or) 1 to  $1\frac{3}{4}$  in. broad, 5 or 6-cleft, the lobes crenulate; petioles 3 to 5 (or 9) in. long; peduncles  $\frac{1}{2}$  to  $2\frac{1}{2}$  in. long, reflexed in fruit; pedicels  $\frac{1}{2}$  line long; fruit ovoid, 1 line broad; ribs obscure.—Pools or muddy shores, often floating in rather deep water: South Coast Ranges to S. Cal.; thence e. to the Atlantic.

2. *H. umbellata* L. Petioles and peduncles subequal,  $1\frac{1}{2}$  to 4 (or 6) in. high, arising from slender creeping rootstocks with descending branches bearing round tubers; leaves orbicular-peltate, crenate, 4 to 7 (or 14) lines broad; umbels many-flowered, simple (rarely slightly proliferous); bracts of involucre short, ovate; pedicels  $1\frac{3}{4}$  to 6 lines long; fruit  $\frac{3}{4}$  to 1 line long, strongly notched at base and apex; dorsal rib prominent but obtuse.—S. Cal.; s. to Mex., e. to the Atlantic.

3. *H. verticillata* Thunb. Similar in habit to no. 2; umbels forming an interrupted spike of 3 to 5 whorls; fruit shortly pediceled or sessile.—Sw. Colorado Desert; e. to the Atlantic. Var. *CUNEATA* Jepson. Fruits abruptly short-acute at base—Great Valley to S. Cal.

4. *H. prolifera* Kell. MARSH PENNYWORT. Peduncles and petioles subequal, 6 to 12 in. high; descending branches of the rootstock tuberous-enlarged; leaves orbicular-peltate, emarginate at base, slightly crenate,  $1\frac{1}{4}$  to  $1\frac{3}{4}$  in. broad; umbels proliferous, one above the other in 2 to 4 whorls; pedicels  $1\frac{1}{2}$  to 7 lines long; mature fruit 1 line long and slightly broader, slightly notched at base and apex.—Marshes of the lower Sacramento and San Joaquin rivers, thence w. to San Francisco and Sonoma Cos.

11. **BOWLESIA** R. & P.

Delicate annuals with stellate pubescence, opposite simple leaves and scarious lacerate stipules. Umbels simple, few-flowered, on short axillary peduncles. Flowers white, minute. Calyx-teeth prominent. Fruit ovate, somewhat flattened laterally, with narrow commissure; carpels turgid, becoming depressed on the back. Ribs and oil-tubes none. (Wm. Bowles, 1705-1780, Irish naturalist and traveler.)

1. *B. lobata* R. & P. Stems mostly branching at the base, weak and trailing,  $\frac{1}{2}$  to 2 ft. long, flowering from the base; leaves thin, mostly 5-lobed,

685. *Hydrocotyle ranunculoides* L. f.; a, habit x  $\frac{1}{2}$ ; b, fr. x 6; c, sect. carp. x 12.

686. *Conium maculatum* L.; a, leaf  $\times \frac{1}{4}$ ; b, umbel  $\times \frac{1}{2}$ ; c, fr.  $\times 6$ ; d, sect. carp.  $\times 10$ .

broader than long, usually heart-shaped at base, the lobes entire or some of them 1 or 2-toothed,  $\frac{1}{2}$  to 1 in. broad; petioles 1 to 3 in. long or the upper shorter; umbels 1 to 4-flowered; fruit 1 line long.—Shaded places in the hills: Coast Ranges; Sierra Nevada; S. Cal.; e. to Tex.

## 12. *CONIUM* L.

Tall branching biennial with dissected decomposed leaves. Flowers white, in compound umbels. Involucre and involucels small. Calyx-teeth obsolete. Fruit broadly ovate, somewhat laterally flattened. Ribs prominent. Oil-tubes none. (Greek name of the Hemlock.)

1. *C. maculatum* L. POISON HEMLOCK. Fig. 686. Tall (4 to 10 ft. high), the stem dotted with purple marks; herbage with a mouse-like odor; leaves 1 to 2 ft. long or more, the segments incised or pinnatifid; rays 10 to 16,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long; bractlets ovate-lanceolate, commonly 3; fruit  $1\frac{1}{2}$  lines long, shorter than the pedicels.—Native of Eur., naturalized in shady or moist ground. Widely distributed.

A poisonous plant, all parts toxic, although preparations from the leaves are sometimes inert.

## 13. *CORIANDRUM* L.

Slender glabrous strong-smelling annual with leafy stems. Lower leaves pinnate or bipinnate with broad leaflets; upper leaves finely dissected. Flowers white or rose-tinted, the petals conspicuously unequal. Umbels compound. Involucre none. Involucels of few narrow bractlets. Fruit subglobose, not constricted at the commissure; calyx-teeth conspicuous; ribs filiform or acutish; oil-tubes solitary in the intervals, a few on the commissure. (Ancient Latin name.)

1. *C. sativum* L. CORIANDER. One to  $2\frac{1}{2}$  ft. high; leaflets of lower leaves roundish or ovate, cleft and toothed,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long; divisions of upper leaves linear, 2 to 4 lines long; fruit  $1\frac{3}{4}$  lines long.—Garden plant from s. Eur., occasionally escaped from cultivation.

## 14. *APIUM* L.

Ours erect glabrous biennials with fibrous roots and pinnate leaves. Stems tri- or di-chotomously branched, forming a paniculate inflorescence, the compound umbels opposite the leaves, terminal on the branches or subsessile in the forks. Involucre and involucels small or none, or the former sometimes foliaceous. Flowers white. Calyx-teeth obsolete. Fruit elliptic-ovate or broader than long. Ribs prominent, obtuse, equal. Oil-tubes solitary in the intervals, 2 on the commissure. Seed-face plane. (Old Latin name of Celery.)

1. *A. graveolens* L. COMMON CELERY. Stems 2 to 4 ft. high; lower leaves long-petioled, the leaflets 5 (or 7 or 9), 1 to 3 in. long and as broad or broader, coarsely toothed and 3-cleft or even 3-divided; upper leaves on short petioles or sessile, the leaflets 3; rays 4 to 12 lines long; fruit  $\frac{1}{4}$  to  $\frac{1}{2}$  line long.—Garden plant from Eur., nat. in marshes or along streams, Sacramento Valley to S. Cal. July-Aug.

15. *AMMI* L.

Erect branching glabrous biennial with slightly fusiform roots and dissected decompound leaves. Flowers white, in compound umbels. Bracts parted into filiform segments, reflexed. Bractlets lanceolate, acuminate, spreading or reflexed. Calyx-teeth obsolete. Fruit ovoid, very slightly flattened laterally. Ribs filiform. Oil-tubes solitary in the intervals and 2 on the commissure. (Greek name of an umbelliferous plant.)

Leaf segments spatulate, serrate or lacinate; fruiting rays spreading. . . . . 1. *A. majus*.  
Leaf segments filiform or narrowly linear, entire; fruiting rays closely contracted. . . . . 2. *A. visnaga*.

1. *A. majus* L. BISHOP'S WEED. Stem slender, branching above,  $1\frac{1}{4}$  to  $2\frac{1}{2}$  ft. high; basal and lower leaves simply pinnate with 7 or 5 (or 3) obovate to oblong serrate leaflets  $\frac{3}{4}$  to 3 in. long; upper leaves biternate or ternate-pinnate, the divisions narrowly oblanceolate, acute, lacinate or serrulate, especially at apex, about  $\frac{1}{2}$  to 2 in. long; rays about 25 to 30, little unequal,  $\frac{3}{4}$  to 2 in. long; pedicels 1 to  $1\frac{1}{2}$  lines long; bracts linear below, parted above into 3 filiform divisions; bractlets lanceolate, acuminate, entire, scarious-margined at base; fruit less than 1 line long; carpels with concave face; oil-tubes solitary in the intervals, 2 on the commissure.—European weed, naturalized in Napa Valley; low places.

2. *A. visnaga* Lam. Stoutier,  $\frac{1}{3}$  to  $2\frac{3}{4}$  ft. high; leaves tri-ternately dissected into filiform segments 3 to 6 lines long; fruiting umbels and umbellets contracted; fruit about 1 line long.—European plant, naturalized in the Santa Clara Valley.

16. *CARUM* L.

Ours erect and slender glabrous biennials or perennials. Leaves simply pinnate with few linear entire leaflets. Flowers white, in compound umbels. Involucre of entire bracts or none. Involucels of entire bractlets. Calyx-teeth small. Stylopodium conical. Fruit ovate or oblong, somewhat laterally compressed, with filiform or salient ribs. Oil-tubes solitary in the intervals, 2 to 6 on the commissure. (Karon, Greek name of the Caraway.)

Leaflets linear; involucre none or of 1 or 2 small linear-setaceous bracts; ribs filiform.

Stems clustered, arising from a fascicle of coarse roots; involucre inconspicuous, of 1 or 2 small bracts or none; styles short. . . . . 1. *C. kelloggii*.

Stems solitary, arising from a tuber or cluster of tubers; styles long. Fruit about 1 line long; Sierra Nevada and coastal; common. 2. *C. gairdneri*.

Fruit  $1\frac{1}{2}$  to 2 lines long; Siskiyou Co.; rare. . . . . 3. *C. oreganum*.

Leaflets ovate to oblong; stem solitary, from a tuber or a cluster of tubers; bracts of the involucre about 12 to 15, lanceolate, at length reflexed; ribs salient. . . . . 4. *C. howellii*.

1. *C. kelloggii* Gray. Fig. 687. Stems several from a fascicle of coarse and hard fibrous roots, 3 to 5 ft. high; basal leaves 5 to 10 in. long, ternate, each division pinnate with narrowly linear divisions 3 to 4 in. long; cauline leaves similar but smaller; involucre bracts and involucel bractlets several, lanceolate or subulate; rays  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long; stylopodium very large, with short stout styles; carpels frequently unequal or only one maturing.—Dry

687. *Carum kelloggii* Gray; a, leaf  $\times \frac{1}{3}$ ; b, root  $\times \frac{1}{2}$ ; c, umbel  $\times \frac{1}{2}$ ; d, fr.  $\times 2\frac{1}{2}$ ; e, sect. carp.  $\times 7$ .

688. *Carum gairdneri* Gray; a, leaf  $\times \frac{1}{2}$ ; b, root  $\times \frac{1}{2}$ ; c, umbel  $\times \frac{1}{2}$ ; d, fr.  $\times 8$ ; e, sect. carp.  $\times 16$ .

open foothills, 100 to 500 ft.: Coast Ranges (Santa Clara Co. to Humboldt Co.); Sierra Nevada foothills (Tuolumne Co. to Butte Co.)

2. *C. gairdneri* Gray. SQUAW-ROOT. Fig. 688. Stem solitary, 1 to  $3\frac{1}{2}$  ft. high, from a tuberous root or a fascicle of such; leaves few, simply pinnate, the leaflets 3 to 7 (or 9), linear, 2 to 4 in. long; upper leaves mostly simple; flowering rays 3 to 6 lines long, in fruit about twice as long; involucre of 1 or 2 linear acute bracts or none; involucels of few linear acuminate bractlets; fruit broadly oblong to elliptic or ovate, 1 to  $1\frac{1}{2}$  (or 2) lines long; stylopodium low, with long slender styles. —Adobe flats or meadows or hills: Coast Ranges from Monterey Co. to Siskiyou Co.; Sierra Nevada from Tulare Co. to Butte Co., gregarious and often whitening moist meadows at 3000 to 7000 ft.

3. *C. oreganum* Wats. Resembling no. 2; leaves more divided with shorter leaflets; fruit  $1\frac{1}{2}$  to 2 lines long; seed sulcate beneath the oil-tubes. —Siskiyou Co.; n. to B. C.

4. *C. howellii* C. & R. Fig. 689.

Stem stoutish,  $2\frac{1}{2}$  to  $4\frac{1}{2}$  ft. high, arising from a heavy cluster of very stout very fibrous fusiform roots; leaves bipinnate, mostly lanceolate in outline; leaflets crowded, broadly oblong to ovate, acute, coarsely but sparingly serrate or sparingly incised,  $\frac{3}{4}$  to  $1\frac{3}{4}$  in. long; rays 16 to 40,  $\frac{3}{4}$  to  $2\frac{3}{4}$  in. long in fruit; pedicels 2 to 5 lines long; bracts several, narrowly lanceolate, reflexed, 8 to 12 lines long; bractlets similar, mostly reflexed, nearly as long as the pedicels, scarious-margined; fruit 2 lines long; ribs thick-based, acute. —Moist mountain meadows, 2000 to 3600 ft.: Mariposa Co. to Nevada Co.; Mendocino Co. to Siskiyou Co.; n. to Ore. Rare.

#### 17. *EULOPHUS* Nutt.

Glabrous erect perennials with deep-seated fascicled tubers, the leaves all basal or the cauline few and small. Leaves compound with the terminal segments or leaflets often differing markedly from the lateral ones; lateral leaflets linear and entire, rarely ovate or oblong and incised; terminal leaflets elongated, always entire and often caudate. Flowers white or pinkish. Umbels compound, long-peduncled. Bracts of involucre and bractlets of

689. *Carum howellii* C. & R.; a, leaf  $\times \frac{1}{2}$ ; b, umbel  $\times \frac{1}{2}$ ; c, fr.  $\times 3$ ; d, sect. carp.  $\times 8$ .

involucel similar, several, lanceolate to obovate, acuminate. Calyx-teeth prominent. Fruit ovate to linear-oblong, flattened laterally. Ribs filiform, equal. Stylopodium conical, with long strongly recurved or deflexed styles. Oil-tubes 1 to 5 in the intervals, 2 to 8 on the commissure. Seed-face broadly concave, with a central longitudinal ridge. (Greek eu, true, and lophus, crest, in reference to the salient terminal leaflet.)

Terminal leaflet commonly much longer than the lateral ones.

Rachis of the leaves not dilated.

Oil-tubes solitary in the intervals; fruit 3 to 4 lines long. . . . . 1. *E. californicus*.

Oil-tubes more than one in the intervals (as also in nos. 3 to 5); fruit 2 lines long. . . . . 2. *E. bolanderi*.

Rachis of the leaves dilated, the segments few and mostly short. . . . . 3. *E. pringlei*.

Terminal leaflet similar to the lateral ones; leaflets 1 to 3 in. long.

Bractlets narrowly lanceolate. . . . . 4. *E. parishii*.

Bractlets ovate, cuspidate. . . . . 5. *E. cuspidatus*.

1. *E. californicus* (Torr.) C. & R. Fig. 690. Stems generally 1 to 3, 3 to 5 ft. high; leaves basal, twice or thrice ternate, then pinnate or pinnately divided, the segments or leaflets ovate, 3 to 7 lines long, incised or serrate, the terminal leaflets linear-elongated, entire,  $\frac{1}{2}$  to 2 in. long; fruiting rays 1 to  $2\frac{3}{4}$  in. long; fruit linear-oblong, 3 to 4 lines long; oil-tubes large, solitary in the intervals, sometimes an extra one in one of the intervals, 2 to 4 on commissure.—Along streams, Sierra Nevada foothills from Stanislaus Co. to Mariposa Co.; Mt. Hamilton Range. Var. *SANCTORUM* Jepson. Lateral segments narrower, disposed to be unilaterally or unequally lobed.—S. Monterey Co.

2. *E. bolanderi* (Gray) C. & R. Plants 1 to 2 ft. high; tubers 1 to 8, obfusiform or oblong; herbage glabrous; leaves once, twice or thrice ternate, the ultimate lateral ones linear, the divisions 2 to 12 lines long, the ultimate central division 1 to 3 in. long; fruiting rays 4 to 10 lines long; pedicels  $1\frac{1}{2}$  to 2 lines long; bracts few, lanceolate, scarious, or none; bractlets several, narrowly to ovate-lanceolate, abruptly acuminate, scarious, rather shorter or sometimes longer than the pedicels; fruit oblong, 2 lines long; oil-tubes minute, 2 to 5 in the intervals, 6 on the commissure.—Sierra Nevada and Yollo Bolly Mts., 6000 to 9000 ft.; n. to Ida.

690. *Eulophus californicus* C. & R.; a, leaf x  $\frac{3}{8}$ ; b, umbel x  $\frac{3}{8}$ ; c, fr. x 5; d, sect. carp. x 9.

3. *E. pringlei* C. & R. Stem 1 to  $1\frac{1}{2}$  ft. high; leaves pinnately compound with broad inflated midrib, the primary divisions once or twice pinnately divided into few linear-filiform or linear-subulate segments 1 to 6 lines long, the terminal segment 2 to 10 lines long; rays 5 to 10,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; pedicels 1 to 2 lines long; involucre of 1 or 2 very small bracts; involucels of several subscarious lanceolate bractlets 1 to 2 lines long; fruit oblong, 2 to  $2\frac{1}{2}$  lines long; oil-tubes 3 to 5 in the intervals, 8 on the commissure.—Inner South Coast Ranges from San Luis Obispo Co. to n. Los Angeles Co.

4. *E. parishii* C. & R. Stem usually very slender,  $\frac{3}{8}$  to  $1\frac{1}{4}$  (or  $2\frac{1}{2}$ ) ft. high; tubers 1 to 3, fusiform; leaves ternate, sometimes biterminate; leaflets narrowly linear to narrowly lanceolate, 1 to 3 or  $4\frac{1}{2}$  in. long, the terminal sometimes distant; uppermost leaves simple, bract-like; rays 5 to 22, 4 to 7 or 11 lines long in fruit; pedicels 1 to 2 lines long; involucre none or scanty; bractlets 2 to 6, narrowly lanceolate, 2 lines long; fruit oblong to ovate

1 to 1½ lines long; oil-tubes 2 to 5 in the intervals, 6 on the commissure.—Bogs and meadows, 6000 to 8000 ft.: mts. of S. Cal. (not uncommon); Sierra Nevada from Tulare Co. to Nevada Co. (rare).

5. *E. cuspidatus* Jepson. Stem slender, 6 to 9 in. high, sparingly branched; leaves bipinnately divided into few linear divisions; rays 6 to 10, 2 to 5 lines long; pedicels 1 to 2 lines long; bracts 4 to 6, obovate, membranous, erosulate at the truncatish or obtuse apex, 2 lines long, tipped by a bristle 1 to 1½ lines long; fruit (immature) ovate, obscurely short-beaked, 1½ lines long.—Calaveras Co.

### 18. *CICUTA* L. WATER HEMLOCK

Tall branching glabrous perennials growing in marshes or by stream banks. Rootstocks short and erect, or horizontal and branching. Leaves at least partially twice or thrice pinnate. Flowers white, in compound umbels. Involucre present or none. Involucels of small bractlets. Calyx-teeth somewhat prominent. Styles somewhat short. Fruit flattened laterally, broadly ovate to roundish. Ribs corky, broad but low, the lateral in cross section larger than the intermediate and dorsal. Oil-tubes 2 on the commissure, solitary in the intervals. (Classical name of the Hemlock, which was given to criminals, and sometimes, when the Greeks had a superfluity, to philosophers, as a death-poison.)

Fruit with the intervals red-brown, contrasting with the corky ribs; intervals broad.

Plants of living streams.

Leaves simply pinnate or partially bipinnate below.....1. *C. californica*.

Leaves bi- to tri-pinnate.....2. *C. douglasii*.

Plants of salt-marshes.....3. *C. bolanderi*.

Fruit with intervals of much the same color as the ribs; intervals very narrow.....4. *C. vavans*.

1. *C. californica* Gray. CALIFORNIA WATER HEMLOCK. Stems about 3 ft. high; basal leaves pinnate or partly bipinnate below, 1 to 2½ ft. long, on long (½ to 1½ ft.) petioles; leaflets ovate-lanceolate or lanceolate, serrate, 3 to 5 in. long, often deeply 1-lobed on one side towards the base so as to make a supplementary leaflet; rays somewhat unequal, 1¼ to 2½ in. long; pedicels 2 to 4 lines long; involucre none, or merely 1 narrow bract; bract-

691. *Cicuta douglasii* C. & R.; a, leaf  $\times \frac{1}{2}$ ; b, umbel  $\times \frac{1}{4}$ ; c, fr.  $\times 5$ ; d, sect. carp.  $\times 10$ .

lets several, ovate, acuminate; fruit 1 to 1¼ lines long with narrow not depressed oil-tubes, those on the face approximate near the median line; ribs large and corky, rounded, yellowish, the intervals very narrow or lineate, dark red-brown. — Coast region from Mendocino and Lake Cos. to Monterey Co.

2. *C. douglasii* (DC.) C. & R. WESTERN WATER HEMLOCK. Fig. 691. Stems stout, glaucous, 3 to 4 ft. high; herbage often purplish; rootstocks short; leaves bipinnate; leaflets sessile or nearly so, lanceolate, 1½ to 4 in. long, coarsely incised-serrate to serrulate, sometimes falcate; involucre none or of a few lanceolate bracts; involucels consisting of 9 to 12 lanceolate-acuminate bractlets; rays 1½ to 2½ in. long; pedicels 2 lines long; fruit sub-orbicular, 1 to 2 lines long; ribs very broad and low; intervals narrow, red-brown, sharply defined from the light-colored ribs; oil-tubes small; seed not channeled under the oil-tubes. — Mountain streams, almost throughout Cal.; n. to Alas.

3. *C. boländeri* Wats. Stem 5 to 10 ft. high, branched above, with nearly or quite vertical rootstock and large basal and cauline bipinnate leaves  $\frac{3}{4}$  to 2 ft. long; leaflets lanceolate, serrate,  $1\frac{1}{4}$  to 3 in. long; bracts and bractlets lanceolate, the former often scarious-margined; rays 1 to  $1\frac{1}{2}$  in. long, subequal, pedicels 2 lines long; fruit  $1\frac{1}{2}$  to 2 lines long, prominently ribbed, the carpels when quite mature rather strongly concave on the commissure, thus appearing somewhat lunate; oil-tubes broad, depressed in the channeled seed.—Marshes about Suisun Bay.

4. *C. vāgans* Greene. Habit and appearance of no. 2; corky ribs low and broad, brownish, the intervals of the same color and not revealing the oil-tubes.—E. side of the northern Sierra Nevada in Nevada Co.; n. to Ida.

### 19. OENÁNTHE L.

Aquatic glabrous herbs with succulent stems from thick rootstocks. Leaves pinnately compound. Flowers white, in compound umbels terminating the branches. Involucre present or none. Involucels present. Calyx-teeth rather prominent. Styles

693. *Berula erecta* Cov.; a, leaf  $\times \frac{3}{8}$ ; b, fl. branchlet  $\times \frac{1}{2}$ ; c, fr.  $\times 12$ ; d, sect. carp.  $\times 15$ .

692. *Oenanthe sarmentosa* Presl; a, leaf  $\times \frac{1}{2}$ ; b, umbel  $\times \frac{1}{2}$ ; c, fr.  $\times 4$ ; d, sect. carp.  $\times 8$ .

slender, at length elongated. Fruit in ours cylindric, slightly flattened laterally. Ribs broad, obtuse, corky; commissural face also corky. Oil-tubes solitary in the intervals, 2 on the commissure, the seed furrowed beneath them. (Ancient Greek name of some thorny plant.)

1. *O. sarmentosa* Presl. Fig. 692. Stems 2 to 4 ft. high; leaves bipinnate, or the lowest ones elongated-pinnate (1 to 2 ft. long), or partially bipinnate towards the base; leaflets ovate, serrate, coarsely toothed or incised,  $\frac{3}{4}$  to  $1\frac{1}{2}$  (or  $2\frac{1}{2}$ ) in. long; rays  $\frac{3}{4}$  to 1 in. long; bracts few or none; bractlets lanceolate, acuminate; fruit 1 to 2 lines long, the ribs very corky and somewhat turgid.—Slow streams or shallow ponds, often filling them with dense masses: S. Cal.; Coast Ranges; n. Sierra Nevada; n. to B. C.

### 20. BÉRULA Hoffm.

Glabrous aquatic or marsh perennial. Leaves simply pinnate, the leaflets sharply and often somewhat saliently serrate. Involucre and involucels present, the bracts and bractlets narrow. Flowers white, in compound umbels. Calyx-teeth minute. Fruit

roundish, flattened laterally, obscurely notched at base. Carpels with very slender and inconspicuous ribs and thick corky pericarp. Oil-tubes numerous, contiguous, surrounding the seed. (Latin name of the Water Cress.)

1. *B. erecta* (Huds.) Cov. Fig. 693. Erect, corymbosely branching,  $\frac{1}{2}$  to 2 ft. high; leaflets 3 to 9 pairs, ovate to oblong, 1 to  $2\frac{1}{2}$  in. long; fruiting rays  $\frac{1}{2}$  to 1 in. long; pedicels  $1\frac{1}{2}$  to 2 lines long; fruit  $\frac{3}{4}$  line long.—Swamps and streams, coastal S. Cal.; n. through the deserts to Inyo Co. and along e. side of Sierra Nevada to Siskiyou Co.; N. Am., Eur., Asia.

## 21. *SIUM* L. WATER PARSNIP

Glabrous perennial marsh or aquatic herbs with leafy stems. Leaves simply pinnate. Flowers white, in compound umbels. Bracts and bractlets several to many. Calyx-teeth minute. Styles short. Stylopodium depressed. Fruit ovate or oblong, somewhat laterally compressed, with narrow commissure. Ribs corky, prominent or somewhat salient, with broad red-brown intervals. Oil-tubes 1 to 3 in the intervals, always 2 or 3 in at least one of the intervals, 2 to 6 on the commissure. (Sion, Greek name of some water plant.)

694. *Sium cicutaefolium* Gmel.; a, leaf x  $\frac{1}{2}$ ; b, umbels x  $\frac{1}{2}$ ; c, fr. x 6; d, sect. carp. x 12.

1. *S. cicutaefolium* Gmel. Fig. 694. Stem stout,  $2\frac{1}{2}$  to  $3\frac{1}{2}$  ft. high, from a cluster of fleshy-fibrous roots; leaves  $\frac{1}{2}$  to  $3\frac{1}{2}$  ft. long; leaflets 5 to 13, lanceolate, serrate, 2 to 4 in. long; bracts and bractlets ovate to lanceolate, the bracts reflexed, scarious-margined below; fruit ovoid,  $1\frac{1}{2}$  lines long, with acute ribs.—Sloughs and ponds from Siskiyou Co. to Lassen and Modoc Cos.; n. to B. C., e. to Va. Var. *HÉTÉROPHYLLUM* Jepson. Lowest leaves simple, on long fistulose petioles, or few-pinnate. — Marshes in the Great Valley: Suisun Marshes; Stockton.

## 22. *OROGENIA* Wats.

Dwarf glabrous perennial herbs with fleshy roots. Stem very short, mostly underground, sheathed by large scarious bracts. Leaves basal,

ternate or biternate, with linear segments. Involucre none. Involucels of few linear bractlets. Flowers white, in partly compound umbels, the rays very unequal. Fruit oblong, only slightly flattened laterally. Carpels flattened dorsally; dorsal and intermediate ribs filiform; lateral ribs strongly corky thickened, extended towards the companion carpel so as to leave a large central cavity which is divided longitudinally by a thick corky ridge from the middle of each face. Oil-tubes small, 3 in the intervals, 2 to 4 on the commissure. (Greek oros, mountain, and genos, race, referring to the habitat.)

1. *O. fusiformis* Wats. Plants 3 to 4 in. high, arising from a long fusiform root; leaf segments  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; umbels 2 to 10-rayed; fruit about 3 lines long.—Wet sandy soil, n. Sierra Nevada from Nevada Co. to Plumas Co.; n. to Ore.

## 23. *LIGÚSTICUM* L. LOVAGE

Perennial herbs with large aromatic roots. Herbage glabrous. Leaves bi- or tri-ternate in ours, with pinnate divisions. Flowers white or pinkish, in

many-rayed compound umbels. Involucre none. Involucels of narrow bractlets. Calyx-teeth small or obsolete. Fruit oblong or ovate, a little flattened laterally. Ribs prominent, acute or slightly winged, equal. Oil-tubes mostly 3 to 5 in the broad intervals, 6 to 10 on the commissure. (Name derived from Liguria, a province of Italy, where Lovage, *Ligusticum levisticum* L., is endemic.)

Stem more or less leafy; rays and leaf-margins scabrous; coastal.....

1. *L. apiodorum*.

Stem not leafy or with 1 reduced leaf; rays and leaf-margins not scabrous; montane.....

2. *L. grayi*.

1. *L. apiodorum* (Gray.) C. & R. Fig. 695. Stems more or less leafy, 2 to 3 (or 6) ft. high; rays and the margins of the leaflets and commonly the peduncles and the nerves of the leaflets scabrous; leaves uni-, bi- or partly tri-ternate, then the divisions pinnate with 3 or 5 leaflets; leaflets broadly ovate in outline, laciniately pinnatifid,  $\frac{1}{2}$  to 2 in. long; fruiting rays  $\frac{3}{4}$  to 1 (or  $1\frac{1}{2}$ ) in. long; bractlets linear-setaceous, few or none; fruit broadly oblong,  $1\frac{1}{2}$  to 2 lines long, the ribs very sharp; oil-tubes

695. *Ligusticum apiodorum* C. & R.; a, leaf x  $\frac{1}{2}$ ; b, fr. umbel x  $\frac{1}{2}$ ; c, fr. x 5; d, sect. carp. x 10.

4 or 5 in the dorsal intervals, 5 or 6 in the lateral ones, 6 to 8 on the commissure.—Rocky or brushy hills, San Francisco to Humboldt Co. June.

2. *L. grayi* C. & R. Fig. 696. Plants 1 to  $2\frac{1}{2}$  ft. high, glabrous, the stems 1 or 2 from a stout fibrous-coated caudex, not leafy or with one much reduced leaf; leaves basal, once or twice ternate, then pinnate with 5 or 7 leaflets, the leaflets ovate in outline, incised, parted or divided,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long; flowers white; bractlets linear-setaceous, few or none; fruiting rays 1 to  $2\frac{1}{2}$  in. long; pedicels 2 to 3 lines long; fruits 2 lines long, the ribs very narrowly winged; oil-tubes 3 to 6 in the intervals, 4 to 8 on the commissure.—Montane, 4000 to 10,200 ft.: Sierra Nevada (Tulare Co. to Modoc Co.); inner North Coast Range (Mendocino Co. to Siskiyou Co.).

#### 24. LILAEÓPSIS Greene

Small glabrous perennials. Stems fistulous, creeping and rooting in the mud, only the leaves and short peduncles erect. Leaves reduced to hollow cylindrical petioles jointed

696. *Ligusticum grayi* C. & R.; a, leaf x  $\frac{1}{2}$ ; b, umbels x  $\frac{1}{2}$ ; c, fr. x 5; d, sect. carp. x 9.

697. *Lilaeopsis lineata* var. *occidentalis* Jepson; a, habit  $\times \frac{1}{2}$ ; b, fr.  $\times 12$ ; c, sect. carp.  $\times 18$ .

bractlets. Flowers white or pinkish. Calyx-teeth prominent. Styles ribbon-like. Fruit flattened laterally, elliptic-ovate. Ribs slender. Oil-tubes 2 or 3 in the intervals, 6 on the commissure. (Greek podos, foot, and stereos, solid, referring to the compactly involved pedicels and involuclers.)

Leaves pinnately parted.....1. *P. nevadensis*.  
Leaves bipinnately parted.....2. *P. albensis*.

1. *P. nevadensis* (Gray) Wats. Peduncles arising from the short crowded branches,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. high; herbage obscurely puberulent; leaves pinnately parted, 4 to 9 lines long, the 5 to 7 segments narrowly oblong, acute, entire, 1 to 3 lines long, the petioles with membranous sheaths; flowers yellow; umbels very much condensed; fruit 1 to  $1\frac{1}{4}$  lines long.—Alpine, 11,600 to 13,000 ft., on high peaks of the Sierra Nevada in Tuolumne and Mono Cos.

2. *P. albensis* Jepson. Similar to no. 1; plants 1 to  $2\frac{1}{4}$  in. high; leaves bipinnatifid, the oblong segments 1 to 2 lines long.—Rocks, White Mts., Inyo Co., 7000 to 8000 ft.

## 26. OREONANA Jepson

Low tufted grayish plants, the peduncles and leaves from the root-crown of a stout taproot. Herbage woolly or roughish pubescent. Leaves ternately compound and finely dissected, the segments crowded, callous-margined and cuspidate. Flowers white, in compound umbels, the umbels much condensed or capitate. Rays

by transverse partitions. Flowers dull white or slightly tinged with pinkish brown, in a few-flowered simple umbel. Bracts of the involucre minute. Fruit subglobose. Dorsal ribs filiform, the lateral corky and thickened next to the commissure. Oil-tubes solitary rarely 2) in the intervals, 2, 4 or 6 on the commissure. (Named for its resemblance to *Lilaea*.)

1. *L. lineata* (Michx.) Greene var. *occidentalis* Jepson. Fig. 697. Leaves 1 to 8 in. long, 1 to 2 lines wide; peduncles 1 in. long or less; fruiting pedicels  $1\frac{1}{2}$  to 3 lines long; petals plane; fruit 1 line long. — Salt marshes or brackish mud flats along the coast from Marin Co. to Humboldt Co.; n. to Alas.

## 25. PODISTERA Wats.

Dwarf perennial, the stems short and shortly branched, forming a mat-like plant. Leaves once or twice pinnately parted. Umbels compound but very much condensed. Involucre none. Involucels of 3 to 5-cleft green

698. *Oreonana clementis* Jepson; a, habit  $\times \frac{1}{2}$ ; b, umbellet  $\times 2\frac{1}{2}$ ; c, fr.  $\times 4$ ; d, sect. carp.  $\times 12$ .

about 10 to 15. Calyx-teeth present, often conspicuous. Involucre none. Involucels unilateral. Fruit broadly elliptic or orbicular, somewhat laterally compressed, sessile. Ribs filiform. Sterile flowers on filament-like pedicels which are longer than the rays. Oil-tubes 3 to 5 in the intervals, 3 or 4 or 6 on the commissure. (Greek oreos, mountain, and nannos, dwarf, these plants very small as compared with the *Velaes* from which they are separated.)

Rays membranously winged and web-footed; sterile pedicels equaling or little exceeding the fruit; calyx-teeth of sterile flowers very conspicuous, star-like. . . . .

1. *O. clementis*.

Rays not winged; sterile pedicels greatly exceeding the fruit; calyx-teeth inconspicuous. . . . .

2. *O. vestita*.

1. *O. clementis* Jepson n. comb. Fig. 698. Plants 1 to 3 in. high; peduncles ascending, from the scaly winter-buds of the root-crown; blades, pedicels and fruits with a short stiff spreading pubescence, the plant otherwise glabrous; peduncles equaling or little exceeding the leaves; umbel globose-capitate; involucels 5-lobed, the lobes ovate-acuminate; rays membranously winged and web-footed at base, very short (1 to 2 lines long); fruit densely white-pubescent when young, grayish in age, sessile, globose, the calyx-teeth evident; pedicels of sterile flowers equaling or only slightly exceeding the fruit; oil-tubes 3 to 5 in the intervals, 4 (or 3) on the commissure; calyx-teeth of sterile flowers very conspicuous, star-like.—Upper Kern River basin, 6000 to 12,000 ft. (*Drudeophytum clementis* Jones.)

2. *O. vestita* Jepson. Plants 2 to 4 in. high, clothed with a dense soft-silky pubescence; umbels condensed but still umbellate in form, equaling or mostly raised above the leaves; involucels of lanceolate 3 to 5-lobed bractlets; rays 6 to 10 lines long, not winged; sterile pedicels 4 to 6 lines long, greatly exceeding the fruit; fruit sessile or nearly so, ovate-oblong, soft-pubescent, 2 lines long; oil-tubes 3 or 4 in the intervals, 3 on the commissure; calyx-teeth of sterile flowers evident but not conspicuous.—San Gabriel and San Bernardino mountains, 6500 to 10,000 ft., rare. (*Deweya vestita* Wats.)

## 27. VELAËA DC.

Subglabrous perennials with thick yellow elongated odoriferous taproots. Leaves mostly basal, pinnately or ternately compound. Ours usually without involucre, the involucels in our species of few small lanceolate bracts. Flowers yellow, in compound umbels. Fruit oblong or orbicular, somewhat laterally compressed, with acute or filiform equal ribs. Oil-tubes conspicuous, 3 to 6 in the intervals, 4 to 10 on the commissure. Seed-face strongly involute, inclosing a central cavity. (Sebastin Eugene Vela, student of the Umbelliferae.)

Leaves simply pinnate; ribs of carpel prominent.—Subgenus DEWEYA. . . . .

1. *V. arguta*.

Leaves ternate; ribs of carpel filiform, slender or inconspicuous. — Subgenus DRUDEOPHYTUM.

Ultimate leaf segments 1 to 2 in. long; bractlets conspicuous, often exceeding the umbellet; fruit 3 to 4 lines long. . . . .

2. *V. hartwegii*.

Ultimate leaf segments usually less than 1 in. long; bractlets inconspicuous, shorter than the umbellets.

Calyx teeth obsolete; fruit nearly orbicular, 1 to 2 lines long, as broad or nearly as broad. 3. *V. kelloggii*.

Calyx teeth evident; fruit oblong, 2 to 3 lines long. . . . .

4. *V. parishii*.

1. *V. arguta* (Nutt.) C. & R. Fig. 699. Plants 1 to 2½ ft. high, the

699. *Velaea arguta* C. & R.; a, leaf x ½; b, umbel x ½; c, fr. x 3; d, sect. carp. x 8.

700. *Velaea hartwegii* C. & R.; a, leaf  $\times \frac{1}{2}$ ; b, umbel  $\times \frac{1}{2}$ ; c, fr.  $\times 3$ ; d, sect. carp.  $\times 6$ .

leaves simply pinnate, 2 to 5 in. long, on petioles about  $1\frac{1}{2}$  times as long; leaflets 5 to 7, ovate, finely and sharply serrate, 1 to 2 in. long, the lowest often petiolulate; terminal and lowest leaflets often subcordate and often 3-lobed; rays 12 to 20,  $1\frac{1}{2}$  to 3 (or 5) in. long; pedicels 1 to 4 lines long; involucre mostly none; involucels of few linear acuminate bractlets; fruit oblong, 4 lines long; ribs acute, prominent; oil-tubes 3 to 5 in the intervals, 4 to 6 on the commissure.—Montane: coastal S. Cal.; L. Cal.

2. *V. hartwegii* (Gray) C. & R. Fig. 700. Plants mostly tufted, 1 to 3 ft. high, the peduncles and leaves from a shortly branched caudex; peduncles and petioles somewhat scabrous; leaves biternate, or partly triternate, the ultimate lateral divisions mostly 3-foliate, the ultimate middle divisions mostly 5 or 7-foliate; leaflets ovate or oblong, sparingly incised, serrate, mucronate,  $\frac{3}{4}$  to 2 in. long, or the leaflets often more or less confluent; petioles 2 to 6 in. long; rays about 15, 2 to 4 in.

long in fruit; bracts none; bractlets 3 to 6, unequal, linear-lanceolate long-pointed, exteriorly disposed, mostly surpassing the umbellets; fruit nearly orbicular, 3 to 4 lines long; ribs slender but rather prominent; oil-tubes 3 (or 4 to 6) in dorsal intervals, 3 or 4 (to 6) in laterals, 6 (in sets of 3) or 9 on the commissure.—Foothills: Sierra Nevada, 2000 to 5000 ft. from Tulare Co. to Butte Co.; South Coast Ranges from Ventura Co. to Contra Costa Co., mostly 1000 to 2000 ft. Apr. Widely distributed but somewhat rare locally.

3. *V. kellóggii* (Gray) C. & R. Plants erect,  $\frac{3}{4}$  to  $2\frac{3}{4}$  ft. high; flowering stems leafless or with a single leaf only; leaves basal, 1 to 2 or 3 times ternate; leaflets ovate or roundish, sharply serrate and more or less incised or lobed, mostly  $\frac{1}{2}$  to 1 in. long; fruiting rays 2 to 4 in. long, or in fruit 3 to 4 in. long; pedicels 2 to 4 lines long; fruit nearly orbicular, 1 to 2 lines long, nearly as long or a little broader, somewhat notched at base; ribs filiform; oil-tubes 3 in the dorsal intervals, 5 to 6 in the laterals, 8 to 10 on the commissure.—Cañons in the foothills: Coast Ranges from Humboldt Co. to Contra Costa Co., 500 to 1500 ft.; n. Sierra Nevada foothills from Sacramento Co. to Butte Co., 1000 to 3500 ft.; rather rare.

4. *V. parishii* C. & R. Plants erect, short ( $\frac{1}{2}$  to  $1\frac{1}{2}$  ft. high), with mostly basal leaves; herbage glabrous throughout; leaves  $\frac{1}{2}$  to  $\frac{3}{4}$  as long as flowering stems, thickish, bipinnate, the segments ovate, irregularly incised or cuspidate-toothed, 4 to 7 lines long; rays 14 to 20, 1 to  $2\frac{1}{4}$  in. long; pedicels 2 to 3 lines long; pedicels of sterile flowers often equaling the fruit; involucre none; involucels of a few setaceous bractlets; calyx-teeth prominent; fruit oblong, 2 to 3 lines long; oil-tubes 3 or 4 in the intervals, 4 or 5 on the commissure.—Mts. of S. Cal. and n. to the Sierra Nevada of Kern and Tulare Cos., 4000 to 8000 ft.

## 28. FOENÍCULUM Hill.

Stout glabrous perennial with dark green aromatic herbage. Leaves decomposed, dissected into numerous filiform segments. Flowers yellow, in large compound umbels. Involucre and involucels none. Calyx-teeth obsolete. Fruit oblong, the ribs prominent. Oil-tubes solitary in the intervals, 2 on the

commissure. (Diminutive of Latin *foenum*, hay, from its odor.)

1. **F. vulgare** (L.) Gaertn. SWEET FENNEL. Fig. 701. Stem striate, branching, 3 to 7 ft. high; herbage glaucous; rays  $\frac{1}{2}$  to  $2\frac{1}{2}$  in. long; fruit  $1\frac{1}{2}$  to 2 lines long.—Nat. from Eur., frequenting waste places on old farms and by country lanes; flowering in summer.

## 29. HERACLËUM L.

Tall perennials with stout stems from thick horizontal rootstocks. Leaves very large, ternately compound, with broad sheathing petioles. Flowers white, in a large many-rayed compound umbel. Involucre deciduous. Involucels of numerous bractlets. Petals obcordate, the marginal ones of the umbel much larger. Fruit almost round, strongly compressed. Lateral ribs with a thin wing; dorsal and intermediate ribs filiform. Oil-tubes 2 on the commissure, 1 in each interval, visible from the outside and reaching from the summit to about the middle of the carpels. (Named for Hercules, who, it is said, first used it in medicine.)

701. *Foeniculum vulgare* Gaertn.; a, leaf  $\times \frac{1}{4}$ ; b, umbel  $\times \frac{1}{4}$ ; c, fr.  $\times 5$ ; d, sect. carp.  $\times 10$ .

1. **H. lanatum** Michx. COW PARSNIP. Fig. 702. Plants 4 to 5 ft. high; leaflets 3, petiolulate, ovate or orbicular, sharply serrate and lobed, 3 to 6 in. broad; umbels 6 to 10 in. broad; fruit  $3\frac{1}{2}$  to 5 lines long.—Common in brushy cañons or on north slopes: high mts. of S. Cal.; Coast Ranges near the sea; middle altitudes in the Sierra Nevada; n. to Alas., e. to the Atlantic. Reputed poisonous to cattle.

702. *Heracleum lanatum* Michx.; a, leaf  $\times \frac{1}{6}$ ; b, umbel  $\times \frac{1}{4}$ ; c, carp.  $\times 2$ ; d, sect. carp.  $\times 3$ .

## 30. LEPTOTAËNIA Nutt.

Tall stoutish perennials, with thick fusiform roots and ternately or pinnately compound leaves. Flowers yellow or purple, in compound umbels. Involucre of few bracts or none. Involucels of several small bractlets or none. Fruit oblong to suborbicular, strongly compressed. Lateral ribs with broad corky-thickened wings coherent until maturity. Dorsal and intermediate ribs filiform and approximate. Oil-tubes 1 to 8 in the intervals, 2 to 10 on the commissure or obscure and apparently none. (Greek *leptos*, narrow, and *tainia*, vittae or oil-tubes.)

Stems leafy below; leaves large, the ultimate segments short.

Leaves glabrous; oil-tubes present. . . . . 1. *L. californica*.

Leaf margins and veins puberulent beneath; oil-tubes none. . . . . 2. *L. dissecta*.

Peduncles and leaves from the root-crown; leaves smaller, glabrous, the segments linear, elongated or grass-like.

Bracts obovate; wings thicker than the body of the fruit. . . . . 3. *L. anomala*.

Bracts lanceolate, entire; wings not so thick as the body of the fruit. . . . . 4. *L. humilis*.

1. *L. californica* Nutt. Fig. 703. Erect, 2 to 4 ft. high, glabrous, glaucous; leaves once or twice ternate, then pinnate; leaflets 1 to 2 in. long or more, cuneate-orbicular or obovate, 3-lobed or the terminal 3-parted, serrate above; peduncles at summit abruptly widened into a disk-like dilation; rays subequal, 2 to 3 in. long; bracts none; fruiting pedicels 3 to 9 lines long; bract-

703. *Leptotaenia californica* Nutt.; a, leaf  $\times \frac{1}{4}$ ; b, umbel  $\times \frac{1}{4}$ ; c, fr.  $\times 1\frac{1}{2}$ ; d, cross sect. of carp.  $\times 3$ .

lets few or none; fruit elliptical, narrowly winged, 4 to 6 lines long; oil-tubes 6 to 10 on the commissure (the lateral frequently anastomosing), 3 or 4 in the intervals or sometimes obscure.—Coast Ranges, 500 to 3000 ft., n. to Siskiyou Co. and southern Ore., s. to Santa Barbara and Kern Cos.

2. *L. dissecta* Nutt. Plants  $1\frac{1}{2}$  to  $2\frac{3}{4}$  ft. high, leafy at base; leaves broad, 2 or 3 times ternate and then once or twice pinnate, the segments incised-pinnatifid; ultimate segments linear-oblong, 1 to 2 lines long; peduncles 1 to 2 ft. long; fruiting rays 2 to  $4\frac{1}{2}$  in. long; involucre of few bracts or none; involucels of several lanceolate bractlets; flowers yellow or purplish; fruit oblong, 5 to 9 lines long, sessile or on pedicels 1 line (rarely to 3 lines) long; dorsal and intermediate ribs filiform or sometimes obscure; oil-tubes none or very obscure.—Open wooded slopes: Coast Ranges from Mendocino Co. to Siskiyou Co., thence s. in the Sierra Nevada to Mariposa Co.; n. to B. C. Apr.-June. Var. *MULTIFIDA* Jepson. Leaves dissected into linear segments 2 to 4 lines long; fruit-

ing pedicels 3 to 7 lines long; fruit 5 to  $7\frac{1}{2}$  lines long; seed face concave.—Montane, 3500 to 8000 ft.: Sierra Nevada from Nevada Co. to Kern Co.; s. to S. Cal.; e. to N. Mex., n. to Mont.

3. *L. anomala* C. & R. Plants 10 to 12 in. high, glabrous throughout; leaves all basal, ternate, then pinnate, the divisions few, distant, very narrowly linear,  $\frac{1}{2}$  to 3 in. long; peduncles arising from the root-crown, slender, 6 to 8 in. high; rays 3 to 6, unequal,  $1\frac{1}{4}$  to 3 in. long in fruit; pedicels about 1 line long, the umbellets in fruit forming a compact cluster; involucre none; involucels conspicuous, the bractlets prominent, obovate, scarious-margined, veiny, toothed near the apex, more or less united; fruit elliptic to oblong, 3 to 4 lines long, the lateral ribs corky-thickened (much thicker than the body), the others filiform; oil-tubes none or inconspicuous.—Sierra Nevada foothills in Amador Co. (Carbondale).

4. *L. humilis* C. & R. Like no. 3; bractlets linear to lanceolate, entire; wings of the fruit corky-thickened but not as thick as the body.—Butte Co., plains near Little Chico Creek. This simulates *Lomatium marginatum* C. & R. Var. *DENTICULATA* Jepson. Wings of the fruit with denticulate margins; intervals commonly with about 3 longitudinal striae.—Blue Ravine, Eldorado Co.

31. **LOMATIUM** Raf. HOG-FENNEL

Low perennials, mostly of dry ground, with thick roots. Stems usually several from the root-crown, naked or few-leaved. Leaves decomposed, often dissected, wholly basal or sometimes partly sub-basal. Flowers white or yellow, rarely purple, in compound umbels. Involucre none (a few species sometimes with 1 to 3 bracts). Involucels usually present. Fruit roundish to broadly or narrowly oblong, much compressed. Lateral ribs winged, the wings of the companion carpels coherent until maturity. Stylopodium wanting or not obvious in the fruit. Oil-tubes 1 to 4 in the intervals, 2 to 6 on the commissure. (From Greek loma, a border, referring to the winged fruit.)

I. **Stems from a taproot.**

## A. PEDUNCLES NOT ENLARGED AT SUMMIT.

- a. Fruit notched more or less deeply at each end, so that the wings on each side the body are more or less distinct; leaves with the leaflets more or less broad in outline.—Subgenus **EURYPTERA**.

Leaves ternate, leaflets entire or merely toothed; coastal S. Cal. .... 1. *L. lucidum*.  
Leaves bipinnate, the leaflets ovate in outline, but usually much incised; South Coast Ranges. .... 2. *L. parvifolium*.

- b. Fruit not notched or scarcely so, the wings more or less joined above and below the body of the seed.

Leaves decomposed, dissected into numerous very small segments.

Leaves ternate or quinate, broad or roundish in outline.—Subgenus **EULOMATIUM**.  
Bractlets present.

Bractlets broad, roundish, or obovate; leaves ternate, then pinnately dissected; flowers yellow; widely distributed species.

Oil-tubes none in the intervals or indistinct; wings of fruit narrower than body, thickish. .... 3. *L. caruifolium*.

Oil-tubes solitary in the intervals; wings of fruit thin.

Wings broader than body; body situated mostly above middle of fruit. .... 4. *L. vaseyi*.

Wings equaling the body in breadth or narrower than body; body situated about middle of fruit. .... 5. *L. utriculatum*.

Bractlets narrow, most often lanceolate.

Bractlets not scarious-margined, often more or less united and unilateral.

Fruit glabrous; corolla glabrous; widely distributed species. .... 6. *L. macrocarpum*.

Fruit pubescent; corolla with kinky white hairs.

Pedicels mostly  $\frac{1}{2}$  in. or more long; wings of the fruit broad, membranous, thinly pubescent; Coast Ranges. .... 7. *L. dasycarpum*.

Pedicels mostly less than  $\frac{1}{2}$  in. long; wings of the fruit narrower, somewhat thickened, tomentose.

Fruit large (6 to  $8\frac{1}{2}$  lines long), elliptic, the wings about as broad as the body; body broadly ovate, densely tomentose; Great Valley and Sierra foothills. .... 8. *L. tomentosum*.

Fruit smaller (3 to  $4\frac{1}{2}$  lines long), broadly elliptic to orbicular, the wings narrower than the body; body oblong-elliptic, the intervals very dark and the ribs white-hairy; interior deserts and bounding ranges. .... 9. *L. mohavense*.

Bractlets scarious margined.

Herbage glabrous save the ciliolate leaf-margins. .... 10. *L. ciliolatum*.

Herbage pubescent or puberulent; mostly summits and slopes towards the desert interior.

Flowers white or pale yellow.

Oil-tubes minute, 3 or more in the intervals; fruit ovate. .... 11. *L. nevadense*.

Oil-tubes broad, 1 to 3 in the intervals; fruit oblong or oblong-ovate. .... 12. *L. plummerae*.

Flowers purple; fruit elliptic; oil-tubes broad, 1 or 2 in the intervals. .... 13. *L. austinae*.

Bractlets none (rarely 1 or 2); fruit wings somewhat narrower than the body; petioles dilated into narrow sheaths their whole length; s. Sierra Nevada.

Leaves ternate-pinnate; flowers yellow; pedicels 1 to 2 lines long; oil-tubes solitary. .... 14. *L. torreyi*.

Leaves quinate-pinnate; flowers whitish; pedicels 3 to 4 lines long; oil-tubes indistinct. .... 15. *L. condonii*.

Leaves pinnate, linear-lanceolate in outline; desert ranges.—Subgenus **CYNOMARATHRUM**. .... 16. *L. parryi*.

Leaves with the divisions mostly few or at least not numerous, the leaflets narrow and much elongated.—Subgenus **LONCHOPHYLLUM**.

Fruit  $2\frac{1}{2}$  to  $5\frac{1}{2}$  lines long.

- Leaflets many,  $\frac{1}{4}$  to  $\frac{1}{2}$  line broad; n. Sierra foothills.  
 Oil-tubes very minute, forming a continuous chain on the dorsal side; bractlets few.....17. *L. marginatum*.  
 Oil-tubes solitary in the intervals; bractlets none.....18. *L. alatum*.  
 Leaflets few,  $\frac{1}{2}$  to  $1\frac{1}{2}$  lines broad; oil-tubes very broad, solitary in the intervals; higher n. Sierra Nevada.....19. *L. triternatum*.  
 Fruit 9 lines long; Mendocino Co.....20. *L. giganteum*.

B. PEDUNCLES ENLARGED AT SUMMIT.

- Leaves with few divisions and broad leaflets; fruits very narrowly winged; bractlets none; flowers yellow; n. Cal.—Subgenus CRASSIPEDUNCULATUM.....21. *L. nudicaule*.

II. Stems from a globose tuber; leaflets elongated; bractlets present; oil-tubes solitary in the intervals.—Subgenus COUS.

- Flowers yellow; fruit linear, the wings  $\frac{1}{4}$  to  $\frac{1}{2}$  as wide as the body; Modoc Co.....

22. *L. ambiguum*.

- Flowers white; fruit elliptic, the wings  $\frac{1}{2}$  as broad as body; Sierra Co. to Siskiyou Co....

23. *L. piperi*.

1. *L. lucidum* (Nutt.) Jepson. Fig. 704. Plants  $\frac{1}{2}$  to  $1\frac{1}{2}$  ft. high, glabrous, the stout peduncles from very short basal stems; leaves with 3 leaflets or the lowest ones ternate, each

704. *Lomatium lucidum* Jepson; a, habit  $\times \frac{1}{4}$ ; b, fr.  $\times 1\frac{1}{2}$ ; c, sect. fr.  $\times 3$ .

division with 3 leaflets; leaflets roundish to ovate, mucronate-toothed, not lobed or often 3-lobed or -parted,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long; rays 10 to 15, 1 to 3 in. long; pedicels 3 to 6 lines long; involucels of lanceolate bractlets; flowers yellow; fruit nearly orbicular, emarginate at each end, glabrous,  $4\frac{1}{2}$  to  $7\frac{1}{2}$  lines long, with wings more than twice as broad as the narrowly oblong body, and prominent obtuse dorsal and intermediate ribs; oil-tubes solitary in the intervals, 2 to 4 on the commissure.—Coastal S. Cal. Var. REPÖSTUM Jepson. Leaves ternate, each division with 3 leaflets, or the central division with 9; leaflets  $\frac{1}{2}$  to  $\frac{3}{4}$  in. long, finely toothed; body of carpel elliptic, the intervals often with secondary oil-tubes extending half the length.—Vaca Mts.

2. *L. parvifolium* (T. & G.) Jepson n. comb. Plants 7 to 12 (or 18) in. high, the peduncles arising from very short erect subterranean stems borne on the root-crown; leaves clustered near the base, bipinnate (but the upper leaflets confluent), 2 to 5 in. long; leaflets broad, irregularly incised and with broad strongly cuspidate teeth (3 or) 5 to 12 lines long; umbel 8 to 15-rayed, with involucels of linear or lanceolate acuminate bractlets; rays  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long; pedicels  $2\frac{1}{2}$  to  $3\frac{1}{2}$  lines long; flowers yellow; fruit broadly elliptical to orbicular,  $2\frac{1}{2}$  to 4 lines long, with wings broader than the body, and rather prominent dorsal and intermediate ribs; oil-tubes solitary in the intervals, 2 to 4 on the commissure.—Mountains, Santa Cruz Co. to San Luis Obispo Co. Var. PALLIDUM Jepson. Herbage very pale.—Santa Lucia Mts.

3. *L. caruifolium* (T. & G.) C. & R. ALKALI PARSNIP. Fig. 705. Peduncles 3 or 4, erect, 8 to 14 in. high, arising from the crown of a stout taproot; herbage glabrous or nearly so, or the foliage minutely pubescent; leaves ternately decompose, dissected into linear segments barely  $\frac{1}{2}$  line wide and 1 to  $4\frac{1}{2}$  lines long; bractlets distinct or nearly distinct, round-ovate to oblong, scarious-margined, entire or denticulate, usually acuminate, often shortly petiolate; fertile rays 6 to 11, 1 to  $1\frac{1}{2}$  in. long; pedicels in fruit  $1\frac{1}{4}$

to 3 lines long; fruits glabrous, sub-orbicular or elliptic,  $2\frac{1}{2}$  to  $4\frac{1}{2}$  lines long, the wings  $\frac{1}{2}$  to almost as wide as the body; oil-tubes none on the commissure, none in the intervals or indistinct, but often with 2 or 3 obscure or superficial minor ridges.—Low wet ground: Sacramento and San Joaquin valleys, South Coast Ranges, Sierra Nevada foothills. Var. *DENTICULATUM* Jepson. Stout, 13 to 16 in. high; leaf-segments broader; rays unequal, the fertile  $2\frac{1}{2}$  to  $5\frac{1}{2}$  in. long; wing-margins roughened or denticulate. — Exeter, Tulare Co. Var. *SOLANENSE* Jepson. Rachises and leaf-segments scabridulous-puberulent.—Solano Co. plains.

4. *L. vâseyi* C. & R. Peduncles ascending, 6 to 12 in. high, arising from the very short stems of the root-crown, naked or frequently with 1 or 2 leaves; foliage minutely puberulent, the plant otherwise mostly glabrous; leaves ternate-pinnate, the divisions pinnately cut into linear-oblong segments  $1\frac{1}{2}$  to 3 lines long and  $\frac{1}{2}$  to 1 line broad; petioles inflated,  $\frac{1}{2}$  to 1 in. long; rays 5 to 14, the fertile  $\frac{1}{2}$  to 2 in. long; pedicels 1 to 2 lines long; bractlets cuneate-obovate, lacinate-toothed at apex or abruptly acuminate; flowers yellow; fruit elliptic or slightly narrowed towards the base, 4 to 7 lines long, 3 to  $4\frac{1}{2}$  lines wide, the body situated mostly above the middle, only about 1 line wide and half as long as the fruit but contracted at base into a stipe-like process, and at apex into a beak-like process, the whole with broad wings broader than the body; dorsal and intermediate ribs obvious with broad solitary oil-tubes in the intervals, 4 on the commissure.—Dry mesas and mountain slopes, 1200 to 5500 ft.: San Diego Co.; San Bernardino Valley foothills; Inyo Co. ranges; Sierra Nevada from Tulare Co. n. to Siskiyou Co.; Napa Range.

5. *L. utrículatum* (T. & G.) C. & R. Plants 8 to 12 in. high, the peduncles from short stems or from the root crown, usually glabrous except the minutely puberulent leaves; leaves ternate, then pinnately decompose and dissected into linear segments 1 to 3 lines long; petioles conspicuously inflated, membranaceous, 3 to 7 lines broad; umbellets in flower hemispherical or only a little more than a hemisphere; rays 3 to 15, very unequal, the fruiting ones  $\frac{1}{2}$  to 2 (or 3) in. long; fruiting pedicels 2 to 6 lines long; involucre none or occasionally with 1 often foliaceous bract; bractlets round-obovate to oblanceolate, entire, toothed or lacinate, usually acuminate, short-petiolate, equaling the yellow flowers; fruits narrowly elliptic,  $2\frac{1}{4}$  to 4 (or  $5\frac{1}{2}$ ) lines long; wings as broad as or narrower than body; oil-tubes 4 to 6 on the commissure, 1 in each interval or with short accessory ones in the dorsal intervals.—Open grassy hills or plains, the most common species, frequent from S. Cal. n. through the Coast Ranges and Sierra Nevada foothills to Ore.

6. *L. macrocârpum* (Nutt.) C. & R. Plants 10 to 17 in. high, the peduncles several from a short scaly caudex; herbage thinly short-pubescent; leaves in a basal or sub-basal tuft, 2 to 5 in. long, or the earliest often as much as 1 ft. long, once or twice ternate, and twice pinnately divided, the segments linear, acute,  $\frac{1}{2}$  to  $2\frac{1}{2}$  lines long, the ultimate divisions of the rachis winged; fruiting rays about equal,  $\frac{1}{2}$  to 4 in. long; pedicels  $2\frac{1}{2}$  to  $4\frac{1}{2}$  lines

705. *Lomatium caruifolium* C. & R.; a, leaf  $\times \frac{1}{2}$ ; b, fr. umbel  $\times \frac{1}{2}$ ; c, fr.  $\times 3$ ; d, sect. carp.  $\times 5$ .

long; involucrel of many lanceolate bractlets mostly exceeding the umbellets, sometimes united at base and unilateral; flowers dull white or pale yellow; corolla glabrous; ovary glabrous or nearly so; fruit oblong to ovate, mostly narrow, but sometimes very broad and somewhat quadrangular,  $5\frac{1}{2}$  to 8 (or 10) lines long, 2 to  $3\frac{1}{2}$  lines wide, the ribs inconspicuous or almost obsolete; oil-tubes 1 to each interval, 2 to 6 on the commissure, the seed sharply channeled beneath those of the dorsal intervals; wings broader, sometimes narrower than the body.—Open stony hills, 2000 to 5000 ft.: Coast Ranges and Sierra Nevada; n. to B. C. A common and widely distributed species. The farinaceous roots were used as food by the northern Indians. Var. *DOUGLASHII* Jepson. Leaf-segments larger, as much as  $4\frac{1}{2}$  lines long and 1 line wide; umbel sometimes with a single bract.—Coast Ranges. Var. *ELLIPTICUM* Jepson. Caudex bearing short leafy branches; leaf-segments

oblong, cuspidate; fruit broadly elliptical, notched at base and apex,  $9\frac{1}{2}$  lines long and  $4\frac{1}{2}$  lines broad, the wings twice as wide as the body; dorsal and intermediate ribs obscure or filiform.—Feather River near Marysville; Pitt River.

706. *Lomatium dasycarpum* C. & R.; a, habit  $\times \frac{1}{4}$ ; b, pinna of leaf  $\times \frac{1}{2}$ ; c, fr.  $\times 1\frac{1}{2}$ ; d, sect. fr.  $\times 4$ .

7. *L. dasycarpum* (T. & G.) C. & R. Fig. 706. Plants 1 to  $1\frac{1}{2}$  ft. high, the peduncles arising from the root crown or from very short stems; herbage puberulent or pubescent, peduncles and wings of carpels often purplish; leaves ternately compound and dissected into oblong or linear segments, these 1 to 2 or 3 lines long; umbels somewhat equally 6 to 15-rayed; rays 1 to 2 in. long; bractlets linear to ovate, more or less tomentose; pedicels in fruit about  $\frac{1}{2}$  in. long, usually longer than the carpels; flowers white; fruit purplish or whitish, broadly elliptic to orbicular, with subcordate base,  $3\frac{1}{2}$  to 4 (or 7) lines long, the wings thin membranaceous, 2 to 3 times the width of the very narrow or somewhat spindle-shaped body; body commonly very woolly when young, more or less glabrate in age; oil-tubes usually 1 in the intervals (often a second one in the lateral

intervals), 2 to 4 on the commissure.—Hill slopes, 200 to 4000 ft., San Diego Co. to Contra Costa Co. Var. *MEDIUM* Jepson. Bractlets mostly broadly ovate; body of carpel broader, nearly equaling the wings in breadth; oil-tubes most commonly 2 or 3 in the intervals.—North Coast Ranges. Var. *DECORUM* Jepson. Procumbent peduncles with white flowers; erect peduncles with lilac-purple flowers.—San Carlos Range.

8. *L. tomentosum* (Benth.) C. & R. Plants 12 to 20 in. high, the peduncles arising from very short stems; herbage tomentulose; leaves ternately compound into filiform segments; umbels 10 to 20-rayed, the rays  $1\frac{1}{2}$  to  $2\frac{1}{2}$  in. long; pedicels mostly shorter than the carpels; flowers white; bractlets ovate, acuminate; ovaries heavily clothed in white wool; fruit large, elliptic, 6 to  $8\frac{1}{2}$  lines long, usually densely tomentose, the wings little if at all wider than the broadly ovate body; oil-tubes usually 2 or 3 in the intervals, 2 or 4 on the commissure.—Great Valley and Sierra Nevada foothills.

9. *L. mohavense* C. & R. Fig. 707. Low plants (7 to 10 in. high), the stout peduncles ascending from the root crown, not much exceeding the pinnately decomposed leaves, the segments crowded, obovate or oblong, the

whole plant hoary with short pubescence; umbel somewhat unequally 6 to 12 (or more)-rayed; involucels inconspicuous, consisting of small linear-lanceolate acuminate bractlets; umbellets very numerous; fruit broadly elliptic to almost orbicular, 3 to  $4\frac{1}{2}$  lines long, the wings not as broad as the body; oil-tubes usually 3 or 4 (sometimes 2 or 5) in the intervals with 4 to 8 on the commissure.—Colorado and Mohave deserts and their bordering ranges, n. to Inyo Co., 4000 to 11,000 ft.

10. *L. ciliolatum* Jepson. Peduncles and leaves from the crown of the tap-root; peduncles spreading,  $1\frac{1}{2}$  to 4 in. long; whole plant glabrous except the margins of the leaves which are finely and regularly ciliate; leaves ovate in outline,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long, simply pinnate, the leaflets  $\frac{1}{4}$  to  $\frac{3}{4}$  in. long, irregularly pinnatifid into ovate segments; rays 3 to 5, unequal,  $\frac{1}{4}$  to  $1\frac{1}{4}$  in. long; pedicels  $\frac{1}{2}$  to 1 line long; involucre none; involucels of several ovate bractlets with dark purple veins; fruit elliptic,  $3\frac{1}{2}$  to 4 lines long; lateral ribs with narrow wings (about  $\frac{1}{4}$  line wide); dorsal and intermediate ribs filiform, inconspicuous, the dorsal and lateral intervals with 3 or 4 striae; oil-tubes obscure, 4 or 5 in the intervals, 2 on the commissure.—Yollo Bolly Mts.

707. *Lomatium mohavense* C. & R.; a, habit x  $\frac{1}{4}$ ; b, fr. x 2; c, sect. carp. x 5.

11. *L. nevadense* (Wats.) C. & R. Plants 4 to 7 in. high, the peduncles ascending from very short erect stems rising from the root-crown; herbage, rays and pedicels minutely pubescent; leaves decompose, the ultimate division pinnately divided into acute segments 1 to 2 lines long; umbel unequally 5 to 11-rayed, the rays  $\frac{1}{2}$  to 4 in. long; bractlets ovate to linear-lanceolate, scarious-margined, distinct or united at base; pedicels  $1\frac{3}{4}$  to 4 lines long; flowers white with pubescent ovaries; fruit ovate, acute, minutely pubescent, 3 to 5 lines long, the wings narrower or almost as broad as the body; ribs on the back very fine or somewhat obscure, sometimes with supplementary striae in the intervals; oil-tubes 3 or 4 in the intervals, 4 to 6 on the commissure.—E. side of the Sierra Nevada from Mono Co. to Modoc Co.; se. Ore. to Nev. Var. *PARISHII* Jones. Ultimate leaf segments 2 to 4 lines long, or often elongated linear and up to 12 lines long; involucre unilateral, deeply toothed; pedicels  $\frac{1}{2}$  to 3 lines long; ovaries and fruit glabrous; fruit round-ovate to narrowly or broadly elliptic,  $3\frac{1}{2}$  to 5 lines long; wings usually narrower than the body; ribs filiform, often with 3 or 4 supplementary striae of the same size in the intervals; oil-tubes exceedingly small, several in the intervals.—Ranges in and bordering the Mohave Desert. Var. *HOLÓPTERUM* Jepson. Similar to the var. *parishii*; more finely puberulent; lateral wings of fruit broader (1 to  $1\frac{1}{4}$  lines broad, commonly almost as broad as the body), straw-color; intermediate and dorsal ribs filiform but more evident; oil-tubes showing markedly from the outside.—E. Mohave Desert; e. to southern Nev.

12. *L. plummerae* C. & R. Plants 8 to 12 in. high, the peduncles stoutish, widely spreading, arising from very short stems; herbage glabrous and somewhat glaucous; leaves ternately decompose, the numerous crowded ultimate segments very small, oblong, more or less confluent; umbel very unequally 6 to 12-rayed, with involucels of numerous lanceolate acuminate

bractlets; rays  $\frac{1}{4}$  to  $1\frac{1}{2}$  in. long; pedicels 1 to 4 lines long; flowers white; fruit oblong or oblong-ovate, usually acute at apex, glabrous,  $3\frac{1}{2}$  to 4 lines long,  $1\frac{3}{4}$  to  $2\frac{1}{4}$  lines broad, with wings half to as broad as the body, and indistinct dorsal and intermediate ribs; oil-tubes 1, 2 or 3 in the intervals, 4 to 6 on the commissure.—N. Sierra Nevada from Sierra Co. to Shasta Co. Var. *SÖNNEI* Jepson. Flowers yellow; oil-tubes 1 or 2 in the intervals.—E. Nevada Co.; thence to Washoe Co., Nev.

13. *L. áustinae* C. & R. Plants 9 in. high, the peduncles arising from short stems; herbage puberulent; ultimate leaf segments pinnately divided into narrow divisions; flowers purplish; fruit glabrous, 3 lines long,  $1\frac{1}{4}$  lines broad; oil-tubes very broad, solitary in the dorsal intervals, mostly 2 in the lateral, 4 on the commissure.—Sierra Nevada from Plumas Co. to Siskiyou Co., 3000 to 5000 ft. Not well known.

14. *L. tórreyi* C. & R. Plants 3 to 10 in. high, the peduncles slender, arising from the root-crown and densely clothed at base with old leaf-sheaths; herbage glabrous; leaves small, ternate-pinnate or -bipinnate, the ultimate segments linear, cuspidate, 1 to 3 lines long; umbel unequally few-rayed, the rays  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; involucre none; bractlets none, or 1 or 2 and small; pedicels 1 to 2 lines long; flowers yellow; calyx-teeth small or obsolete; fruit narrowly oblong to linear, truncatish at base, 4 to 5 lines long, with wings not half as broad as the body; oil-tubes solitary in the intervals.—Clefs of granite rocks, Sierra Nevada from Mariposa Co. to Tulare Co., 6000 to 7200 ft.

15. *L. congdonii* C. & R. Plant 6 to 9 in. high, the peduncles ascending from the basal tuft of leaves; herbage glabrous; leaves first palmately quaternate or quinate (1 or 2 of the divisions small), then bi- or tri-pinnate, the rachises more or less scaberulous; ultimate segments linear, acute; sheaths whitish, narrow, extending the full length of the petiole; fertile rays 6 to 8,  $\frac{3}{4}$  to 2 in. long; involucels none; flowers apparently white; pedicels spreading, 3 to 4 lines long; fruit nearly elliptical, slightly broader above, 4 to  $4\frac{1}{2}$  lines long, the wings slightly narrower than the body; dorsal and intermediate ribs filiform; oil-tubes very obscure, 1 or 2 (or perhaps more) in the intervals.—Mariposa Co., about 2000 ft.

16. *L. párryi* (Wats.) Jepson. Plants 6 to 10 in. high, the peduncles erect, arising from a caudex densely clothed with the fibrous sheaths of old leaves; herbage glabrous, foliage eventually grayish; leaves pinnate, linear-lanceolate in outline, 6 to 8 in. long, the pinnae distant, pinnately divided into linear cuspidate segments  $1\frac{1}{2}$  to 3 lines long; fruiting rays 1 to  $1\frac{1}{2}$  in. long, nearly equal; pedicels slender, 3 to 6 lines long; bractlets several, linear, acute, entire or cleft at apex, nearly equaling the pedicels in length; stylopodium more or less evident in fruit; fruit oblong, 6 lines long; dorsal and intermediate wings sharp, the lateral wings about as broad as the body; oil-tubes 1 or 2 in the dorsal intervals, 2 or 3 in the laterals, 4 to 7 on the commissure.—Rocky mountain slopes, 5000 to 8000 ft., e. Mohave Desert and Death Valley region; e. to Utah.

17. *L. marginátum* C. & R. Plants 12 to 20 in. high, the peduncles slender, erect, borne on very short stems (1 in. long) rising from the root crown; herbage glabrous or the rays sometimes puberulent; leaves large, 2 to 3 times ternate, then pinnately divided into narrowly linear to filiform segments; flowers whitish or yellowish; fruiting rays few, slender,  $1\frac{1}{2}$  to  $3\frac{1}{2}$  in. long; pedicels slender, 2 to 3 lines long; bractlets few, narrowly linear, elongated, acuminate, or sometimes none; fruit (immature) elliptic-oblong, glabrous,  $3\frac{1}{2}$  to 4 lines long, the wings as broad as the body; dorsal ribs fine or obscure.—Rocky slopes, n. Sierra Nevada foothills from Calaveras Co. to Butte Co., 1000 to 1500 ft.

18. *L. alátum* C. & R. Similar to no. 17; involucels none; oil-tubes solitary in the intervals.—Sierra foothills in Sacramento Co. Var. *PURPUREUM* Jepson. Flowers purple.—Conn Valley, Napa Range.

19. *L. triternátum* (Pursh) C. & R. Plants  $1\frac{1}{2}$  to 2 ft. high; herbage minutely puberulent; peduncles arising from the root crown or borne on stems 3 or 4 in. long, the parts at base sheathed by scale-like petioles; leaves

twice or thrice ternate, then pinnate, the leaflets narrowly linear, acute, 1 to 4 in. long; flowers bright yellow; fruiting rays very unequal, 1 to  $3\frac{1}{2}$  in. long; bractlets setaceous; fruiting pedicels  $\frac{1}{2}$  to  $2\frac{1}{2}$  lines long; fruit oblong, glabrous, 5 to  $5\frac{1}{2}$  lines long; dorsal and intermediate ribs prominent, the wings half the breadth of the body; oil-tubes large, broad, 1 in each interval, 2 on the commissure.—N. Sierra Nevada from Nevada Co. to Modoc Co., thence w. to northern Humboldt Co.; n. to B. C.

20. *L. gigantéum* C. & R. Plants  $1\frac{1}{4}$  to  $2\frac{1}{4}$  ft. high, finely pubescent throughout; leaves very large, ternately compound; leaflets linear-oblong, elongated,  $3\frac{1}{3}$  to  $4\frac{3}{4}$  in. in length, usually entire, very pale; rays about 11, very unequal, the longer ones 4 in. long; pedicels 1 to 2 lines long; involucre of linear bractlets; flowers yellow; ovary pubescent; fruit linear-oblong, 7 to 9 lines long, with wings much narrower than body, glabrous or nearly so.—Mendocino Co.

21. *L. nudicaule* (Pursh) C. & R. PESTLE PARSNIP. Fig. 708. Plants 8 to 20 in. high, glabrous; leaves  $3\frac{1}{4}$  to  $5\frac{3}{4}$  in. long, once or twice ternate, then pinnate with 5 to 9 leaflets; leaflets broadly ovate to lanceolate, entire or few-toothed at apex,  $\frac{3}{4}$  to  $2\frac{1}{4}$  in. long; peduncles stoutish, arising from the base, conspicuously enlarged at summit (pestle-like) and bearing 6 to 18 very unequal rays, the outer sometimes 2 to 4 times the length of the inner; rays in fruit dilated at apex, 1 to  $6\frac{1}{2}$  in. long; fruiting pedicels 1 to 3 lines long; bracts and bractlets none; flowers yellow; fruit oblong to elliptic, 5 to 7 lines long, 2 to 3 lines wide, the wings  $\frac{1}{2}$  the breadth of the body; oil-tubes broad, solitary in the dorsal intervals, 1 or 2 in the laterals, 4 to 6 on the commissure.—Low open foothills or rolling plains: Coast Ranges from Santa Clara Co. to Siskiyou Co.; Sierra Nevada from Amador Co. to Modoc Co.; n. to Wash. Var. *PUBÉRULUM* Jepson. Minutely pubescent.—Mendocino Co.

708. *Lomatium nudicaule* C. & R.; a, leaf  $\times \frac{1}{4}$ ; b, fr. umbel  $\times \frac{1}{4}$ ; c, fr.  $\times 2\frac{1}{2}$ ; d, sect. carp.  $\times 4$ .

22. *L. ambiguum* (Nutt.) C. & R. var. *leptocarpum* Jepson. Plants glabrous, 1 ft. high; peduncles ascending from the root-crown of the taproot which is tuberous below; leaves once or twice ternate, then pinnate, the ultimate segments linear, 5 to 10 lines long; rays few, very unequal, 1 line to 3 in. long; bractlets small, linear; flowers yellow; fruit nearly sessile, forming a dense cluster, linear or somewhat lanceolate, 4 to  $4\frac{1}{2}$  lines long, the wings very narrow ( $\frac{1}{4}$  to  $\frac{1}{3}$  as wide as the body); oil-tubes solitary in the intervals.—Lassen and Modoc Cos.; n. to Ida., e. to Col.

23. *L. piperi* C. & R. INDIAN BISCUIT. Plants  $1\frac{1}{3}$  to 5 in. high, the slender peduncles divaricate, borne on very short erect subterranean stems which rise from globose tubers 4 to 7 lines in diameter; herbage glabrous; leaves biternately divided into linear-lanceolate segments 4 to 12 lines long; umbel 2 to 4-rayed; flowers white; bractlets narrow-lanceolate; fruiting rays 3 to 10 lines long; fruiting pedicels  $\frac{1}{4}$  to 1 line long; fruit elliptic, 2 to 3 lines long, the wings  $\frac{1}{2}$  as broad as the body; oil-tubes minute, 2 or 3 in the intervals, 4 on the commissure.—Sierra Co. to Siskiyou Co.; n. to Wash.

32. *PASTINACA* L.

Tall branching biennial with angular or fluted leafy stems from thick roots. Leaves large, simply pinnate. Flowers yellow, in compound umbels. Involucre and involucels small or commonly none. Fruit oval, strongly compressed. Lateral ribs winged; dorsal and intermediate ribs filiform. Oil-tubes not quite as long as fruit, solitary in the intervals, 2 to 4 on the commissure. (Latin name of the Parsnip.)

1. *P. sativa* L. COMMON PARSNIP. Fig. 709. Erect, 3 to 4 ft. high; leaflets ovate, serrate or somewhat incised, lobed or even more or less 3 to 5-divided, 3 to 4 in. long; rays 10 to 20, 1 to 2½ in. long; fruit 2½ to 3 lines long; oil-tubes conspicuous. — Cultivated European species, escaped from gardens and now locally naturalized.

33. *ANETHUM* L.

Slender annuals with leafy stems and finely dissected leaves. Flowers yellow, in compound umbels. Involucre and involucels none. Fruit

709. *Pastinaca sativa* L.; a, leaf x ¼; b, fr. umbel x ¼; c, carpel x 3; d, sect. carp. x 4.

ribs narrowly winged. Oil-tubes solitary in the intervals. (Ancient Greek name of the dill.)

1. *A. graveolens* L. DILL. Plants usually branching, 1 to 3 ft. high. — Garden plant from Eur., locally naturalized in S. Cal.

34. *OXYPOLIS* Raf.

Glabrous erect aquatic herbs with fascicled tubers. Leaves ternate or (in ours) pinnate. Umbels compound. Involucre and involucels present. Flowers white. Calyx-teeth evident. Fruit flattened dorsally, ovate to obovate; dorsal and intermediate ribs filiform; lateral ribs broadly winged, the wings closely contiguous to those of the companion carpel and strongly nerved next to the body (thus giving the appearance of 5 dorsal ribs). Stylopodium short-conical. Oil-tubes solitary in the intervals, 2 to 6 on the commissure. (Greek oxys, sharp, and polis, city, application uncertain, possibly referring to the many acute leaflets.)

1. *O. occidentalis* C. & R. Fig. 710. Plants 2 to 3¼ ft. high; fascicled roots fusiform-fleshy; leaves

710. *Oxypolis occidentalis* C. & R.; a, leaf x ½; b, umbel x ½; c, fr. x 4; d, sect. carp. x 12.

simply pinnate, long petioled, the lower 12 to 20 in. long; leaflets 5 to 13, broadly ovate to linear-acuminate, serrate,  $1\frac{1}{4}$  to 4 in. long; fruiting rays 1 to 3 in. long; fruits elliptic-obovate,  $2\frac{1}{2}$  to 3 lines long.—Sierra Nevada, 5000 to 9000 ft., from Tuolumne Co. to Tulare Co.

### 35. *CONIOSELINUM* Hoffm.

Tall branching perennials with leafy stems, glabrous herbage and ternately decomposed leaves. Flowers white, in compound umbels. Involucre of few bracts. Involucels of many bractlets. Fruit oblong to obovate, flattened dorsally, with rather prominent stylopodium. Ribs narrowly winged, the lateral usually broadest. Oil-tubes solitary in the intervals, or sometimes 2 in the lateral one, 2 to 4 on the commissure. (Greek *koneion*, the hemlock, and *selinon*, parsley.)

1. *C. pacificum* (Wats.) C. & R. Stems stout, 3 to 5 ft. high; leaves ternate, then pinnate, the 5 or 7 divisions or leaflets ovate in outline, acute, deeply pinnatifid and more or less toothed,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long; umbels on stout peduncles; rays 15 to 26, 1 to  $1\frac{1}{2}$  in. long in fruit; bracts 2 to 4; involucels of several narrowly linear bractlets; fruiting pedicels slender, 3 to 4 lines long; fruit oblong, 3 lines long; wings thickish and corky, rather narrow; oil-tubes conspicuous, 2 on the commissure, solitary in the intervals, sunk in the body of the seed, especially the dorsal ones.—Brushy flats, very rare: Long Valley, Mendocino Co.; Indianola, Humboldt Bay.

711. *Angelica hendersonii* C. & R.; a, leaf  $\times \frac{1}{4}$ ; b, umbel  $\times \frac{1}{4}$ ; c, fr.  $\times 3$ ; d, sect. carp.  $\times 4$ .

### 36. *ANGÉLICA* L.

Stout perennials with leafy stems and ternately or pinnately compound leaves. Flowers white, in large terminal compound umbels. Involucre none or scanty. Involucels of few small bractlets or none. Calyx-teeth mostly obsolete. Fruit strongly compressed, elliptic-oblong in outline. Ribs prominent, the lateral broadly winged, the others often narrowly winged. Oil-tubes 1 to 3 in the intervals, 2 to 4 on the commissure. (Latin *angelica*, angelic, on account of its medicinal properties.)

Maritime species; rays subequal; herbage more or less tomentose; ovary tomentose. . . . . 1. *A. hendersonii*.

Montane species; rays more or less unequal.

Herbage puberulent or eventually glabrous; ovary tomentulose; Coast Ranges and coastal S. Cal. . . . . 2. *A. tomentosa*.

Herbage glabrous.

Leaflets not linear.

Ovary pubescent; leaflets narrow-lanceolate to ovate-lanceolate; central and n. Sierra Nevada. . . . . 3. *A. breweri*.

Ovary glabrous; leaflets ovate-lanceolate; Siskiyou Co. . . . . 4. *A. lyallii*.

Leaflets narrowly linear; s. Sierra Nevada. . . . . 5. *A. lineariloba*.

1. *A. hendersonii* C. & R. Fig. 711. Very stout, 2 to 3 ft. high; herbage more or less tomentose, especially on the inflorescence and under surface of the leaves; leaves quinate or ternate, then pinnate; leaflets tending to be crowded, thick, broadly ovate,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  in. long, obtuse (or rarely acute), serrate; umbels rather condensed; rays in flower subequal; fruiting rays  $\frac{3}{4}$  to  $2\frac{1}{4}$  in. long; umbellets dense, as if capitate; pedicels 1 line long or less;

bractlets 1 or 2, linear-acuminate; fruit broadly oblong, slightly pubescent, 3 to 4 lines long; lateral wings thick and corky, as broad as the body; oil-tubes solitary in the intervals; seed deeply sulcate beneath the oil-tubes.—Along the coast, mostly on or near the sea-bluffs: San Mateo Co. to Humboldt Co.; n. to Wash.

2. *A. tomentosa* Wats. Stout, 2 to 5 ft. high, the stems and especially the leaves puberulent, or sometimes nearly glabrous; leaves bipinnate or ternate or quinate and then pinnate; leaflets ovate, acute, acutish or often long-pointed, sometimes varying to lanceolate or roundish, irregularly serrate, obliquely 2-lobed, or not lobed and merely oblique,  $1\frac{1}{2}$  to 3 (or 6) in. long; petioles strongly dilated at base; fruiting rays 1 to 5 in. long; fruiting pedicels 2 to 3 lines long; ovary tomentulose; fruit oblong or elliptic, glabrous, 3 to  $4\frac{1}{2}$  lines long; dorsal and intermediate ribs small and acutish; lateral wings nearly equaling the body in breadth; oil-tubes 1 in the intervals, or sometimes 2 in the lateral intervals, mostly 2 on the commissure; seed somewhat sulcate beneath the oil-tubes.—Coastal S. Cal.; n. through the Coast Ranges to Humboldt Co. Var. *CALIFORNICA* Jepson. Rays very unequal ( $1\frac{1}{4}$  to  $5\frac{1}{4}$  in. long), scaberulous at the ends; oil-tubes 2 (or 3) in the intervals, mostly 4 in lateral pairs on the commissure. — Vaca Mts.

3. *A. breweri* Gray. Stems 3 to 5 ft. high; herbage glabrous; leaves ternate, or quinate, then pinnate; leaflets lanceolate to oblong or occasionally ovate-lanceolate, acuminate, sharply serrate,  $1\frac{1}{2}$  to 4 in. long; rays many,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  in. long in fruit; pedicels 2 to  $3\frac{1}{2}$  lines long; rays and pedicels not "web-footed" or very obscurely so; pedicels and ovaries whitish-puberulent; fruit oblong or somewhat narrowed below, pubescent or becoming glabrous, 3 to  $4\frac{1}{2}$  lines long; dorsal and intermediate ribs more or less prominent; lateral wings as wide as the body; oil-tubes 1 or 2 in the intervals.—Sierra Nevada, 4500 to 8000 ft., from Mariposa Co. to Nevada Co.

4. *A. lyallii* Wats. Plants 2 to 4 ft. high; herbage and inflorescence glabrous; leaves biternate, then pinnate; leaflets ovate-lanceolate, serrate,  $1\frac{1}{2}$  to  $3\frac{1}{2}$  or 5 in. long; fruiting rays  $1\frac{1}{2}$  to  $2\frac{1}{2}$  in. long, the outer row somewhat coalescent at base so as to be web-footed; outer row of pedicels similarly coalescent; fruit broadly oblong to obovate, 3 to  $3\frac{1}{2}$  lines long; dorsal and intermediate ribs sharply salient, equal; lateral wings about as broad as the body; oil-tubes solitary in the intervals.—Siskiyou Co.; n. to Alb.

5. *A. lineariloba* Gray. Stout, glabrous, 2 to 3 ft. high; leaves 2 or 3 times ternate, then pinnate with about 5 (3 to 9) leaflets; leaflets linear or linear-lanceolate, 1 to 3 in. long, 1 to 2 lines wide, entire or often with a pair of coarse teeth towards the base, frequently decurrent on the rachis; fruiting rays 1 to 2 or  $3\frac{1}{4}$  in. long; involucre and involucels none; fruit oval-oblong, glabrous, 4 to 6 lines long; dorsal and intermediate ribs filiform; lateral wings thickish, a little narrower than the body; oil-tubes solitary in the dorsal intervals, in pairs in the laterals.—Montane, 6400 to 9500 ft., Sierra Nevada from Mariposa Co. to Tulare Co. Var. *CULBERTSONII* Jepson n. var. Leaf-segments 4 to  $4\frac{1}{2}$  lines wide.—Little Kern River (Culbertson 4276, type).

### 37. *COELOPLEURUM* Ledeb.

Very stout perennial herb of the sea-coast with glabrous herbage. Leaves uni-, bi- or tri-ternate, with very large inflated petioles. Flowers greenish-white, in many-rayed umbels. Involucre of few narrow bracts, sometimes foliaceous. Involucel of many linear-lanceolate bractlets. Fruit elliptic-oblong, not flattened dorsally. Ribs very thick and corky, becoming hollow, equal or the lateral ones a little broader. Oil-tubes small, 1 in the intervals, 1 or 2 under each rib, 2 to 4 on the commissure. (Greek *koilos*, hollow, and *pleuron*, rib, referring to the cavity made by the intruded ribs.)

1. *C. maritimum* C. & R. Stems corymbosely branched, 2 to 3 ft. high; leaflets roundish to ovate, crenate,  $1\frac{1}{4}$  to 4 in. long; rays 1 to  $1\frac{3}{4}$  in. long; fruits  $2\frac{1}{2}$  to 3 lines long, the lateral ribs twice as broad as the others.—Central Humboldt Co. coast; n. to Wash.

### 38. SPHENOSCIADIUM Gray

Perennials with thick roots. Stems stout, tall, nearly simple, glabrous. Leaves once or twice pinnate with bladdery dilated petioles. Flowers white (or sometimes purplish), sessile on enlarged receptacles and forming compact heads, the heads borne on tomentose rays in a medium-sized umbel. Involucre none. Involucels of many linear-setaceous bractlets. Calyx-teeth none. Fruit cuneate-obovate, flattened, subglabrous. Ribs prominent, winged above, the dorsal and intermediate ones narrow, the lateral broader. Oil-tubes solitary in the intervals, 2 on the commissure. Seed face plane. (Greek sphenos, a wedge and sciadion, an umbrella, referring to the umbel.)

1. *S. capitellatum* Gray. Fig. 712. Stems very stout, 3 to 5 ft. high; leaves large, glabrous; leaflets or segments linear-lanceolate to oblong or oblong-ovate, serrate or coarsely and saliently few-toothed above, more or less entire below; rays 4 to 8 (or 14), subequal, 1 to 2 (or 4) in. long; flowers pubescent; involucels of a few deciduous bractlets; fruit cuneate-obovate, 3 lines long. — Montane, 3500 to 10,000 ft.: San Bernardino Mts.; White Mts.; Sierra Nevada from Kern Co. to Modoc Co., thence w. to Siskiyou Co. Var. *SCABRUM* Jepson. Almost as tall as in the species; leaves scabrous, in shape similar to the species. — Sierra Nevada to the San Jacinto Mts., 8000 to 10,000 ft. Foliage often paler than in the species. Var. *VALIDUM* Jepson n. comb. Plant markedly puberulent in all its parts with large leaves and ovate leaflets. — Mariposa Co., 3500 to 4500 ft. (*S. validum* Congdon.) Var. *ERYNGIIFOLIUM* Jepson n. comb. More or less condensed plants; leaves more or less scabrous, finely dissected, the segments somewhat divaricate, about 1 line wide; fruits 4 lines long, sparingly hairy. — High montane, 8000 to 10,000 ft., Mariposa Co. Foliage often paler than in the species. (*S. eryngiifolium* Greene.)

712. *Sphenosciadium capitellatum* Gray; a, leaf  $\times \frac{1}{2}$ ; b, umbel  $\times \frac{1}{2}$ ; c, fr.  $\times 3$ ; d, sect. carp.  $\times 5$ .

### 39. CYMÓPTERUS Raf.

Perennial herbs with basal leaves. Herbage glabrous (except in no. 6). Leaves usually ternate, then once to thrice pinnate and much dissected or incised. Involucre usually lacking. Involucels always present. Flowers yellow, white or purple, in compound umbels. Calyx-teeth usually evident. Fruit oblong to orbicular, mostly dorsally flattened, the carpels 3 to 5-winged. Stylopodium wanting. Oil-tubes several in the intervals, 2 to many on the commissure. Seed flat to very slightly or not at all dorsally flattened. (Greek kuma, wave, and pteron, wing, the ribs in some species with undulate wings.)

Wings of carpels thin, undulate-criped (except in the var.); tall plants; Sierra Nevada and mts. of n. Cal. .... 1. *C. terebinthinus*.  
Wings of carpels commonly thickened or corky at insertion, sometimes corky throughout. Small plants of the deserts and desert slopes of mountain ranges.  
Flowers in umbels; wings of carpels entire.  
Leaves light green, the ultimate segments lanceolate or oblong, 1 to 2 lines long; involucre none or of a few small bracts. . 2. *C. panamintensis*.

- Leaves grayish, the ultimate divisions ovate, 4 to 6 lines long, crenate or incised; involucre very conspicuous.....3. *C. utahensis*.  
 Flowers in dense globose heads.  
 Wings of carpels with shredded margins; foliage glabrous...4. *C. deserticola*.  
 Wings of carpels entire; foliage minutely pubescent.....5. *C. cinerarius*.  
 Low plants of sandy sea-shores; umbellets capitate.....6. *C. littoralis*.

1. *C. terebinthinus* (Hook.) T. & G. Fig. 713. Plants  $\frac{1}{2}$  to  $1\frac{1}{2}$  ft. high, the leaves all basal; peduncles about twice as long as the leaves, arising from

713. *Cymopterus terebinthinus* T. & G.; a, leaf  $\times \frac{1}{2}$ ; b, fr. umbel  $\times \frac{1}{2}$ ; c, fr.  $\times 3$ ; d, sect. carp.  $\times 5$ .

the shortly branched caudex which is clothed with persistent leaf sheaths; leaves 2 to 6 in. long, on petioles about as long, usually ternate, then 1 to 3 times pinnate and pinnately dissected into short linear segments about 1 line long; umbels with unequal rays, no involucre and involucels of linear acuminate bractlets; flowers yellow; fruiting rays 1 to 3 in. long; fruiting pedicels 3 to 5 lines long; fruit broadly oblong to nearly orbicular, 4 to 6 lines long; carpels with 3 to 5 broad thin undulate crisped wings, or one carpel with broad wings (especially the lateral wings) and the companion carpel with wings narrow and much reduced; oil-tubes very small, 4 to 9 in the intervals, 8 to 16 (or 20) on the commissure side.—Montane, 5000 to 9000 ft.: Sierra Nevada from Tulare Co. to Lassen Co.; n. to Wash. Var. *CALIFÓRNICUS* Jepson n. comb. Wings of carpels not undulate-crisped; leaves with ultimate divisions ovate to almost linear; involucels of small linear bractlets; fruit oblong, 3 to 4 lines long; intermediate and dorsal wings sometimes reduced in breadth; oil-tubes 3 to 5 in

the intervals, 6 on the commissure.—N. Sierra Nevada, 1500 to 5000 ft., from Nevada Co. to Lassen Co., thence w. to Siskiyou Co. (*Pteryxia californica* C. & R.)

2. *C. panamintensis* C. & R. Plants low (3 to 10 in. high); peduncles purplish, arising from a short caudex sheathed with old leaf bases; leaves 2 to  $2\frac{3}{4}$  in. long, on petioles about as long, ternate, then once or twice pinnate, the pinnae finely dissected; ultimate segments 1 to  $1\frac{1}{2}$  lines long, tipped with a slender bristle-like apiculation; rays in fruit 1 to  $1\frac{1}{2}$  in. long; pedicels short; involucre none; involucels small, gamophyllous, somewhat one-sided, purplish, cleft into ovate acuminate segments; flowers greenish-yellow; fruit  $4\frac{1}{2}$  lines long, glabrous, each carpel with 5 broad wings, the wings very thick at insertion; oil-tubes 3 or 4 in the intervals, 4 or 5 on the commissure; seed face deeply concave.—E. Mohave Desert; Death Valley region.

3. *C. utahensis* Jones. Plants 3 to 5 in. high, the peduncles equaling or exceeding the leaves; leaves gray-pallid, ternate, then bipinnatifid; ultimate segments ovate in outline, 4 to 6 lines long, crenate or incised; umbels more or less compacted; involucres of conspicuous hyaline bracts with prominent green or purplish nerves; involucels resembling the involucres; flowers purple; fruit orbicular, 4 to 6 lines long, its body oblong; ribs with broad membranous wings (often corky-thickened next the body of the carpel); carpels flattened with 5 broad thin wings; oil-tubes 2 in the intervals, 4 on the commissure.—E. Mohave Desert; e. to Utah and N. Mex.

4. *C. deserticola* Bdg. Plants 4 to 6 in. high, the peduncles and leaves rising from among the old petioles of the root-crown, peduncles ascending, a little exceeding the leaves; leaves glabrous, triangular in outline, 2 in. long, bi- or tri-ternate, then pinnately parted; segments with acute bristle-tipped lobes; petioles  $2\frac{1}{2}$  to  $3\frac{1}{2}$  in. long; involucre with short linear bracts; flowers dark purple, crowded in a globose head  $\frac{1}{2}$  to  $\frac{3}{4}$  in. in diameter; fruits 2 lines long, sessile; lateral wings thick, corky, narrow, pubescent, with the margins shredded; oil-tubes minute and numerous, forming a continuous chain.—Mohave Desert.

5. *C. cinerarius* Gray. Plants 2 in. high, the peduncles and leaves from a short more or less horizontal subterranean caudex; leaves (in outline) somewhat cordate, bipinnate, with pinnately divided segments, glaucous and cinereous with a very minute harsh pubescence; rays few, short or almost none; involucels of numerous united somewhat membranous long-acuminate segments; flowers purplish; fruit  $2\frac{1}{2}$  lines long, the 5 wings of each carpel rather narrow and thick at insertion; oil-tubes 3 in the intervals, several on the commissure; seed face with narrow and deep concavity.—High e. slope of the Sierra Nevada in the Mono Lake region; also White Mts., Inyo Co.

6. *C. littoralis* Gray. Peduncles and leaves spreading or prostrate, arising from very short stems; leaves simply ternate, 4 to 9 in. long, longer than the peduncles, densely white-tomentose beneath; petioles 2 to 4 in. long; leaflets ovate or roundish in outline, 1 to  $2\frac{1}{2}$  in. long, either the terminal or lateral or all 3 leaflets often 3-parted or -divided, their margins callous-serrate or -dentate; umbel compact, hemispherical, resting on the sand; rays  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long; umbellets capitate; flowers white, bracts and bractlets subulate; fruit dorsally flattened, each carpel bearing 5 equal broad corky wings  $1\frac{1}{2}$  to 2 lines wide, the fruit therefore subglobose in outline, 4 to 5 lines in diameter; oil-tubes 2 or 3 in the intervals, 4 or 6 on the commissure; seed face somewhat concave.—Sandy sea-beaches, Mendocino Co. to Del Norte Co.; n. to Alas.

#### GARRYACEAE. SILK TASSEL FAMILY

Shrubs or small trees with quadrangular branchlets. Leaves simple, opposite, with short petioles. Flowers dioecious, apetalous, borne along a pendulous catkin-like axis, 1 (in case of the pistillate) or a cyme of 3 (in case of the staminate) in the axil of each of the decussately connate bracts. Staminate flower:—calyx 4-parted into linear valvate sepals; stamens 4; filaments distinct. Pistillate flower:—calyx with a shortly 2-lobed or obsolete limb; ovary inferior, 1-celled, with 2 pendulous ovules; styles 2, stigmatic on the inner side, persistent. Fruit a berry; epicarp at maturity dry and brittle, free from the pulpy portion and dehiscing irregularly, or sometimes circumscissile. Seeds with thin testa and horny endosperm, the minute embryo at one end.

#### 1. *GARRYA* Dougl.

The only genus. (Nicholas Garry, of the Hudson Bay Co., friend of David Douglas, botanical explorer of Pacific North America, 1825-1832.)

Pubescence of tangled curly hairs forming a close felt on under surface of the leaves; leaves glabrous above.

Leaves decidedly undulate-margined, more or less pubescent beneath; Coast Ranges. . .

1. *G. elliptica*.

Leaves plane, felty-pubescent beneath; Sierra Nevada and S. Cal. . . . . 2. *G. veatchii*.  
Pubescence of straight silky hairs or almost glabrous; leaves plane.

Leaves bright green above, glabrous above and also below or nearly so; fruit glabrous or mostly so; North Coast Ranges and Sierra Nevada. . . . . 3. *G. fremontii*.

Leaves glaucous-gray above, white-silky beneath; fruit silky-pubescent; Sierra Nevada and S. Cal. . . . . 4. *G. flavescens*.

1. *G. elliptica* Dougl. SILK TASSEL BUSH. Fig. 714. Commonly a shrub 5 to 8, or rarely a small tree up to 20 ft. high; leaves elliptical or narrower, the margin undulate and more or less revolute, glabrous above, tomentose beneath with short curly or wavy hairs,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  in. long; catkins solitary or clustered, the staminate 4 to 7 in. long, with truncate or acute silky bracts and the calyx-segments cohering at tip, the pistillate shorter, 2 to 4 in. long.

714. *Garrya elliptica* Dougl.; a, staminate branchlet  $\times \frac{1}{2}$ ; b, pistillate catkin  $\times \frac{1}{2}$ ; c, staminate fl.  $\times 2$ ; d, pistillate fl.  $\times 2$ ; e, capsule  $\times 1$ .

with acute or acuminate bracts; ovary sessile; fruit globose, 3 to 5 lines in diameter, densely white-tomentose, in extreme age glabrate; seed oval, 2 lines long.—Common, Coast Ranges, especially the seaward ranges, from Monterey Co. to Humboldt Co., 100 to 2500 ft. Feb. Foliage suggestive of *Quercus agrifolia*.

2. *G. veatchii* Kell. Shrub 6 to 8 ft. high; leaves oval, 1 to 2 in. long, slightly undulate, short-acuminate or almost aristate, short-petioled, smooth and shining above, densely tomentose below with short very fine closely curled hairs; fruit densely pubescent,  $2\frac{1}{2}$  to 4 lines in diameter.—Dry slopes, 800 to 5000 ft.: coastal S. Cal.; n. to Santa Cruz Mts. and to Eldorado Co.

3. *G. fremontii* Torr. BEAR BRUSH. Shrub 5 to 7 (or 10) ft. high; leaves elliptical, varying to oblong, tapering to each end, glabrous and shining above, gray-puberulent or white-tomentose beneath, in age often very glabrous and yellow, particularly on the under surface, not undulate,  $1\frac{1}{4}$  to  $2\frac{1}{2}$  in. long, on petioles 6 lines long; catkins solitary or in clusters of 2 to 6, with acute somewhat silky

bracts; staminate catkins 2 to 3 in. long; pistillate catkins about  $1\frac{1}{2}$  in. long, the ovary and young fruit very silky; fruiting catkins  $1\frac{1}{2}$  to  $3\frac{1}{2}$  in. long; mature fruit purple to black, glabrous, 3 lines long, short-pedicelled; seeds subglobose or oval,  $1\frac{1}{2}$  lines long.—Dry ridges and slopes, 2500 to 7000 ft.: North Coast Ranges; Sierra Nevada; coastal S. Cal. Mostly in the dry inner ranges and a member of the chaparral. Feb. In the s. Sierra Nevada there are intergrades to no. 4.

4. *G. flavescens* Wats. Large spreading shrub 6 to 12 ft. high; herbage more or less pubescent with closely appressed straight silky hairs and with a glaucous gray color over entire plant; leaves oval to elliptic, entire, acute at each end and recurved-mucronulate at apex, lower surface more or less densely pubescent, upper with scattered irregularly appressed hairs or glabrous,  $1\frac{1}{2}$  to 3 in. long; catkins solitary or clustered, the fertile short and thick; fruit globose, densely pubescent, almost sessile, 3 lines in diameter.—Arid mts., 4750 to 7000 ft.: coastal S. Cal., n. to San Benito Co. and to Tulare Co.; e. to Utah. (*G. pallida* Eastw.) Var. *buxifolia* Jepson n. comb. Low shrub 2 to 5 ft. high; leaves small, elliptic-ovate, 1 to  $1\frac{1}{2}$  in. long, glossy or green and glabrous above, silky-tomentose beneath.—Lake and Mendocino Cos. to Del Norte Co.; sw. Ore. (*G. buxifolia* Gray.) Var. *venosa* Jepson n. var. Leaves elliptic, acute, 1 to 3 in. long, very white-silky beneath, green and strigose above, purple-veined, tipped with a cuspidate point  $\frac{1}{2}$  line long.—Foothills of the Yollo Bolly Mts., w. Tehama Co. (Jepson 178f, type).

#### CORNACEAE. DOGWOOD FAMILY

Deciduous trees or shrubs, or some species low and merely suffrutescent. Leaves opposite, simple, entire. Flowers perfect, regular, in cymes or heads. Calyx-tube coherent with the ovary, its limb represented by 4 small teeth at the summit or none. Petals 4, epigynous, valvate in bud. Stamens 4, alternate with the petals. Ovary 2-celled with a single pendulous ovule in each

cell; style 1, filiform; stigma simple. Fruit a drupe, the stone 2-celled with 1 seed in each cell. Embryo minute.

1. **CÓRNUS** L. CORNEL. DOGWOOD

Flowers greenish or white. (Latin cornu, a horn, on account of the hardness of the wood.)

Flowers appearing after the leaves, borne in cymes, the cymes not involucre.

Leaves lighter color beneath, minutely puberulent; style glabrous; drupe commonly white. . . . .

1. *C. californica*.

Leaves green, alike on both faces, nearly glabrous; style slightly pubescent; drupe bluish or pale. . . . . 2. *C. glabrata*.

Flowers appearing before or with the leaves, the inflorescence involucre.

Flowers yellowish, in sessile umbels with an involucre of 4 small caducous bracts; drupe black. . . . . 3. *C. sessilis*.

Flowers greenish, in heads, with a conspicuous involucre of 4 to 6 white petal-like bracts; drupe red.

Tree or shrub. . . . . 4. *C. nuttallii*.

Herb-like with creeping rootstock. . . . . 5. *C. canadensis*.

1. **C. californica** C. A. Mey. CREEK DOGWOOD. Fig. 715. Shrub 5 to 15 ft. high with smooth purplish branches

and branchlets; leaves commonly ovate, varying to elliptical, acute, thinly puberulent, 2 to 4 in. long; cymes  $1\frac{1}{2}$  to 2 in. broad; petals oblong, acute, 2 lines long; styles glabrous; drupe white, subglobose, 3 lines in diameter; stone mostly oblique, somewhat flattened, with furrowed edges, each side

716. *Cornus glabrata* Benth.; a, fl. branchlet; b, fr. branchlet.  $\times \frac{1}{2}$ .

715. *Cornus californica* C. A. Mey.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, fl.  $\times 2$ ; c, fr. cluster  $\times \frac{1}{2}$ .

with 4 less obvious or shallower channels. — Stream banks in cañons and along rivers in the valleys, 10 to 6000 ft.: coastal S. Cal. (rare); Coast Ranges; Great Valley; Sierra Nevada foothills (*C. pubescens* var. *californica* C. & E.). Var. **PUBÉSCENS** (Nutt.) Mcbr. Inflorescence shaggy-pubescent. — Tulare Co.; Mendocino Co.; n. to Ore. (*C. pubescens* Nutt.). Var. **NEVADÉNSIS** Jepson n. var. Inflorescence scantily puberulent; drupe blue. — Sierra Nevada, 3000 to 4000 ft. (Rich Pt., Middle Fork Feather River, Jepson 10,629, type).

2. **C. glabrata** Benth. Fig. 716. Shrub 5 to 12 (or 18) ft. high, with nearly or quite glabrous twigs; leaves ovate or oblong, acute at each end or shortly pointed at apex,  $1\frac{1}{4}$  to 2 in. long, green on both faces, obscurely pubescent with short scattered appressed hairs; petioles 3 lines long or less; flowers dull white, many in small cymes; style slightly pubescent; drupe globose, the flesh whitish or bluish; stone little compressed and not at all or obscurely furrowed. — Common along the bases of low

hills, often forming thickets, and also along streams or borders of swamps from Mendocino Co. and Tulare Co. s. to San Diego Co.

3. *C. séssilis* Torr. Clumpy shrubs or small trees, 5 to 9 (or 13) ft. high; leaves obovatish, acute, 2 to 3½ in. long, shortly petioled; flowers yellowish, in small sessile umbellate clusters subtended by 4 small caducous bracts; pedicels 2 to 3 lines long; drupe oblong, at first greenish-white, then yellow, then red, maturing purple-black, shining, 5 to 6 lines long, on a pedicel as long. — Foothills, commonly forming stream-bank thickets, 1800 to 3500 ft.: Sierra Nevada from Amador Co. to Tehama Co., thence to Trinity and Humboldt Cos.

717. *Cornus nuttallii* Aud.; a, fl. branchlet x ½; b, fl. x 3; c, fr. cluster x ½.

4. *C. nuttallii* Aud. MOUNTAIN DOGWOOD. Fig. 717. Tree 10 to 30 (or 45) ft. high; leaves narrow- or elliptic-obovate or even orbicular, with rounded or shortly acute apex 3 to 5 in. long, on petioles 2 to 3 lines long; flowers crowded in a head on a thick convex receptacle and surrounded by a conspicuous petal-like involucre; bracts of the involucre commonly 6, white, sometimes tinged with red, obovate to oblong, 1½ to 3 in. long, abruptly acute or acuminate; heads ½ to 1 in. broad, very dense, borne on peduncles 1 to 1¼ in. long; drupe 5 to 6 lines long, scarlet. — Mountain woods, 1500 to 5100 ft.: cismontane Cal.; n. to B. C.

5. *C. canadensis* L. BUNCH-BERRY. Herb-like; stem 3 to 9 in. high with a whorl of 4 to 6 leaves at summit and a pair of leaves about the middle; involucre petal-like, its bracts broadly ovate, 5 to 8 lines long. — Swamps, Mendocino Co.; Ore. to Alas. and N. Eng.

### SYMPETALAE

Calyx usually present. Petals more or less united below, commonly tubular. Stamens inserted on corolla. Pistil 1 and compound (except Asclepiadaceae and Apocynaceae).

### LENNOACEAE. LENNOA FAMILY

Root-parasitic brown herbs with fleshy stems and scale-like leaves. Flowers perfect, in spikes or heads. Calyx parted into linear nearly distinct segments. Corolla tubular, the border 5 to 7-lobed. Stamens as many as the corolla-lobes, inserted on the throat. Ovary fleshy, 6 to 14-celled, each 2 cells representing one true cell divided by a false partition; style 1; stigma crenulate or obscurely lobed. Fruit concealed in the persistent calyx and corolla, finally splitting into 12 to 28 1-seeded nutlets.

Flowers in a spike; calyx glabrous. . . . . 1. PHOLISMA.  
Flowers in a saucer-shaped head; calyx hairy. . . . . 2. AMMOBROMA.

#### 1. PHOLISMA Nutt.

Stem simple, ending in a simple or compactly branched dense spike. Sepals 5, 6 or 7, naked. Corolla border undulate-plicate, spreading, shallowly 5, 6 or 7-lobed, each lobe emarginate. (Greek pholis, a scale, referring to the scaly stem.)

1. *P. arenarium* Nutt. Plant 6 to 10 in. high; spikes oblong, rarely capitate, 1 to 5 in. long; corolla purplish with white border, 2 lines broad. — Sandy soil, Mohave and Colorado deserts and w. to the coast: Barstow; Coyote Holes; Borrego Sprs.; Santa Monica; Manhattan Beach; San Diego.

On roots of *Hymenoclea salsola*, *Ericameria ericoides*, *Chrysothamnus nauseosus* var. *graveolens*, *Eriodictyon tomentosum*, *Abronia umbellata* and *Eriogonum parvifolium*.

## 2. AMMOBRÔMA Torr. SAND FOOD

Stem simple, ending above in a saucer-shaped head thickly clothed with flowers. Sepals 6 to 10, filiform, plumosely hairy, as long as the corolla or somewhat longer. Corolla purple, tubular, 6-lobed, the lobes very short, emarginate. (Greek ammos, sand, and broma, food.)

1. *A. sonôra* Torr. SAND FOOD. Plant 4 to 16 in. long, buried in the sand up to the very woolly head.—Sand hills: Colorado Desert (Ogilby near Hedges Mine); s. to Sonora, Mex. The stems and tubers are boiled or roasted by the Gulf Indians and taste like sweet potatoes.

## ERICACEAE. HEATH FAMILY

Trees, shrubs or perennial herbs. Leaves simple, alternate in all our genera except three, mostly evergreen and stiff and coriaceous. Flowers white or red, regular and symmetrical, with the parts in 5s, rarely in 4s. Stamens free from the corolla, as many or commonly twice as many as its lobes or petals and distinct from them; anthers 2-celled, opening by a terminal pore or sometimes longitudinally, frequently bearing two awn-like appendages. Ovary superior or inferior, 4 to 10 (rarely 1, 2 or 3)-celled, with usually axile placentae bearing numerous ovules. Style 1; stigma 1, entire or merely lobed. Corolla in most cases sympetalous but sometimes choripetalous. *Rhododendron* has a slightly irregular corolla. Calyx persistent. Flowers often pendulous. Leaves opposite in *Chimaphila*, *Kalmia* and *Cassiope*.

*A. Herbs or herb-like plants; corolla choripetalous (except nos. 7 to 9); anthers without awns (except no. 7); ovary superior.*

Plants with evergreen leaves (one species leafless); corolla choripetalous.—Subfamily PIROLACEAE.

Stems leafy; flowers corymbose or umbellate; filaments with a roundish dilation at the middle; style short.....1. CHIMAPHILA.

Stems leafy at base only; filaments not dilated; style commonly elongated.

Flowers solitary; stigma with 5 radiating lobes.....2. MONESES.

Flowers racemose; stigma 5-lobed or -toothed.....3. PIROLA.

Humus plants or saprophytes without green leaves.—Subfamily MONOTROPACEAE.

Ovary 4 to 7-celled.

Corolla none; stems streaked red and white.....4. ALLOTROPA.

Corolla present.

Corolla choripetalous; ovary seated on an 8 to 12-toothed disk, the teeth deflexed.

Stems 1-flowered.....5. MONOTROPA.

Stems several-flowered.....6. HYPOPHYTIS.

Corolla sympetalous; disk none.

Anthers awned; corolla 2½ lines long.....7. PTEROSPORA.

Anthers not awned; corolla 6 to 9 lines long.....8. SARCODES.

Ovary 1-celled.

Corolla sympetalous; filaments hairy.....9. NEWBERRYA.

Corolla with distinct petals; filaments glabrous.....10. PLEURICOSPORA.

*B. Shrubs or trees (often small or diminutive shrubs); corolla sympetalous (except no. 11).*

Ovary wholly superior.—Subfamily ERICINEAE.

Fruit a dry capsule.

Anthers awnless; capsule septicidal.

Corolla with distinct petals; leaves resin-dotted beneath.....11. LEDUM

Corolla sympetalous (as in all the following).

Large shrubs with broad leaves; leaf-buds scaly.

Corolla funnelform, 5-lobed; calyx not ciliate.....12. RHODODENDRON

Corolla cylindric-urnshaped, 4-lobed; calyx bristly-ciliate.....13. MENZIESIA.

Diminutive alpine shrubs with narrow small leaves; no scaly leaf-buds.

Corolla saucer-shaped with 10 pockets holding the anthers.....14. KALMIA

Corolla open-campanulate, without pockets.....15. PHYLLODOCE

Anthers awned or mucronate; capsule loculicidal.

Corolla cup-shaped; anthers awned; leaves scale-like, imbricated, sessile....

16. CASSIOPE.

Corolla ovate with narrow orifice; anthers not awned, merely mucronate;

leaves broad, petioled.....17. LEUCOTHOR.

- Fruit a berry or drupe.  
 Calyx tubular, becoming fleshy in fruit and enclosing the capsule; anthers awned or awnless; flowers in a raceme.....18. GAULTHERIA.  
 Calyx with distinct sepals, dry, persistent in fruit but insignificant; anthers awned; fruit a berry or berry-like.  
 Surface of fruit granular.  
 Flowers in a panicle; calyx glabrous.....19. ARBUTUS.  
 Flowers in a raceme; calyx tomentose.....20. COMAROSTAPHYLIS.  
 Surface of fruit smooth or merely glandular; flowers in a panicle, rarely in a raceme.....21. ARCTOSTAPHYLOS.  
 Ovary wholly inferior.—Subfamily VACCINIACEAE.....22. VACCINIUM.

### 1. CHIMAPHILA Pursh. PIPSISSEWA

Low perennial evergreen suffrutescent plants. Leaves alternate or in irregular whorls, serrulate. Flowers white, waxy, in a terminal naked corymb. Calyx 5-parted. Corolla rotate, choripetalous; petals 5, orbicular, concave. Stamens 10; filaments dilated and hairy in the middle. Stigma orbicular-peltate, crowning the very short style which is concealed in the umbilicate summit of the ovary. Capsule 5-celled, dehiscent from above downwards. (Greek cheima, winter, and phileo, to love, the plants evergreen.)

Leaves oblanceolate, many; peduncles 3 to 6-flowered.....1. *C. umbellata*.  
 Leaves ovate, few; peduncles 1 to 3-flowered.....2. *C. menziesii*.

1. *C. umbellata* Nutt. PRINCE'S PINE. Stem often simple, 6 to 10 or 12 in. high, bearing several clusters or whorls of leaves and 3 to 6-flowered peduncles; leaves oblanceolate, varying to oblong, sharply serrate from near the base,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  in. long; flowers 3 lines broad, pinkish or flesh-color; filaments with a roundish dilation at base which is hairy on the margin only.—Pine woods, 1000 to 6000 ft., rather common: San Jacinto and San Bernardino mountains; Sierra Nevada; Coast Ranges; N. Am.; Eur., Asia.

2. *C. menziesii* Spreng. More or less branched from the base, 3 to 6 in. high; leaves ovate, mostly acute, serrulate or entire,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long; peduncles 1 to 3-flowered; filaments with a roundish dilation at the middle which is covered with short hairs.—Pine woods, 3500 to 6500 ft., infrequent: Cuyamaca, San Jacinto, San Bernardino and San Gabriel mountains; Sierra Nevada; North Coast Ranges; n. to B. C.

### 2. MONÈSES Salisb.

Perennial herbs with a solitary white or pink flower drooping at the summit of a slender scape. Leaves thin, opposite or whorled, clustered at the ascending ends of underground shoots. Calyx 5- (or 4)-parted. Petals 5 (or 4), rotate, distinct. Stamens 10 or 8. Stigma peltate, with 5 narrow radiating lobes. Capsule 4 or 5-celled, loculicidal from the summit, its valves not cobwebby. (Greek monos, single, and esis delight, the plant one-flowered.)

1. *M. uniflora* Gray. Scape 2 to 5 in. high; leaves roundish-ovate, serrate-dentate, reticulately veined, 4 to 8 lines broad; flower fragrant, 6 to 8 lines broad.—Cool forests, Siskiyou Co., very rare with us; Ore. to Alas., e. to Lab.; Eur., Asia.

### 3. PIROLA L. WINTERGREEN

Perennial herbs with slender rootstocks, basal evergreen leaves (rarely leafless), and leafless scapes. Flowers 5-merous, in a terminal raceme. Calyx 5-parted. Petals 5, distinct, concave or incurved, more or less converging. Stamens 10; filaments subulate, naked. Stigma 5-lobed or -toothed, on an elongated style. Capsule 5-celled, depressed-globose and 5-lobed, umbilicate at apex and base, dehiscent from the base upward; edges of the valves cobwebby when opening, persistent on the axis. Embryo minute. (Diminutive of Pirus, classical name of the Pear Tree, on account of resemblance in the leaves of one species.)

- Stigma peltate, without ring or collar.  
 Obviously 5-lobed; style included.....1. *P. minor*.  
 Obscurely 5-lobed; style exerted a little.....2. *P. secunda*.  
 Stigma 5-lobed, subtended by a distinct ring or collar.  
 Stigma close to ring.  
 Stigma deeply lobed.  
 Stigma with narrow erect or spoke-like lobes.....3. *P. picta*.

- Stigma short-oblong, sometimes much reduced.....4. *P. dentata*.  
 Stigma shallowly lobed.....5. *P. aphylla*.  
 Stigma lifted high above ring.....6. *P. asarifolia*.

1. *P. minor* L. Scapes 5 to 8 in. high; leaves roundish, 8 to 11 (or 15) lines long, the margined petiole mostly shorter than the blade; flowers white or rose-color, crowded; corolla globose.—High montane, 8000 to 10,000 ft., rare in Cal.: San Jacinto and San Bernardino mountains; Sierra Nevada from Tulare Co. to Modoc Co.; N. Am.; Eur., Asia.

2. *P. secunda* L. Scapes 4 to 7 in. high; leaves ovate, serrulate, thin and greenish,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long; flowers white, in a one-sided dense raceme; petals with two tubercles at base inside.—Montane, 4500 to 7800 ft.: San Jacinto and San Bernardino mountains; Sierra Nevada from Fresno Co. to Modoc Co.; Humboldt Co. to Siskiyou Co.; n. to Alas., e. to N. Eng.; Eur., Asia.

3. *P. picta* Sm. WHITE-VEINED SHIN-LEAF. Fig. 718. Scapes 8 to 15 in. high; leaves ovate to elliptic, very coriaceous, mottled or veined with white, entire or serrulate, 1 to  $2\frac{1}{4}$  in. long, the petiole narrowly winged; calyx lobes broadly ovate, usually acute; corolla greenish-white or brownish flesh-color.—Pine forests, 4000 to 6000 ft.: San Jacinto and San Bernardino mountains; Sierra Nevada; Mendocino Co. to Mt. Shasta; n. to B. C., e. to Wyo.

4. *P. dentata* Sm. Similar to no. 3; leaves obovatish, serrulate, 1 to  $1\frac{1}{2}$  in. long; petals cream-color; style sometimes nearly straight. — Mendocino coast; n. to B. C. Var. *INTEGRA* Gray. Leaves ovate, entire, glaucous, not white-veined.—Montane, 5000 to 7000 ft.: San Gabriel and San Bernardino mountains; Sierra Nevada from Fresno Co. to Modoc Co., thence w. to Siskiyou and Humboldt Cos.; n. to Wash. (*P. pallida* Greene.)

5. *P. aphylla* Sm. Leafless parasite; scapes red, often many and clustered, from a scaly-bracted rootstock, 6 to 9 (or 16) in. high; calyx red, its lobes triangular-ovate,  $\frac{1}{4}$  the length of the obovate or elliptic whitish or flesh-colored petals; capsule 3 lines broad, its sutures somewhat cobwebby in dehiscence.—Wooded mts., 1500 to 6000 ft., throughout Cal., widely dispersed but infrequent; n. to B. C. June-July.

6. *P. asarifolia* Michx. var. *incarnata* Fer. Scapes 9 to 18 in. high, a single scaly bract borne at the middle; leaves thin, cordate to rounded at base, rounded at apex or rarely subacute, 1 to  $3\frac{1}{4}$  in. long, the petioles as long; flowers nodding in a loose scaly-bracted raceme; corolla white or nearly so, drying rose-purple.—Pine woods: San Bernardino Mts. (8000 ft.); Sierra Nevada (4000 to 8000 ft.): North Coast Ranges (1000 to 4000 ft.)

#### 4. ALLÓTropa T. & G.

Saprophytic herb. Stems bright red with longitudinal white stripes in sharp contrast, densely clothed with scales at base and with scattered scales above. Flowers brownish-red in a dense spike-like raceme. Sepals 5. Petals none. Stamens 10, or at summit of spike 8; anthers short and thick, somewhat 2-lobed, apiculate at apex, turned inward and downward on the apex of the filament and thus pendulous, each cell opening by a chink on back which reaches from the base to the middle. Ovary globose, 5-celled; style short;

718. *Pirola picta* Sm.; a, habit  $\times \frac{3}{8}$ ; b, stamen  $\times 2\frac{1}{2}$ ; c, pistil  $\times 2$ .

stigma peltate-capitate, shallowly 5-lobed. (Greek allos, different, and tropos, turned, the raceme not nodding as in *Monotropa*.)

1. *A. virgata* T. & G. SUGAR STICK. Plants 7 to 13 (or 18) in. high; raceme virgate, mostly 6 to 9 in. long; scales of the stem often bluish white; flowers  $2\frac{1}{2}$  to 3 lines long, on pedicels 1 line long; sepals rhomboidal or ovate, thin, whitish, shorter than the purple-black stamens; ovary dark red or purple-black, the style white.—Montane, under pines or firs, 6000 to 8000 ft., infrequent: Sierra Nevada; North Coast Ranges; n. to Wash.

### 5. *MONÓTROPA* L.

Glabrous waxy-white herbs which turn black on drying. Stems scape-like, scaly, springing in a cluster from a ball of matted roots and ending in a solitary nodding flower. Sepals 2 to 4, scale-like or bract-like, deciduous. Petals 5 or 6, oblong, dilated a little at apex, erect, tardily deciduous. Stamens twice as many as the petals; anthers somewhat reniform, opening at first by two transverse chinks, at length 2-valved, the valves almost equal and spreading. Ovary 10-grooved, 5-celled; style short, thick; stigma funnel-form, naked, obscurely crenate. Seeds innumerable, minute. (Greek mono, one, and tropos, turned, the flower drooping.)

1. *M. uniflora* L. INDIAN PIPE. Stem 4 to 7 in. high; petals saccate at base.—Dark damp woods, very rare in Cal.: Del Norte Co.; N. Am., Asia.

### 6. *HYPÓPITYS* Hill

White, yellowish or reddish saprophytic herbs with scaly simple stems arising from a ball-like cluster of matted fibrous roots. Raceme several to many-flowered, at first nodding, soon erect. Flowers yellowish-white or red, mostly 3 or 4-merous, the terminal usually 5-merous. Sepals 2 to 4. Petals 3, 4 or 5, distinct, bearing a gibbous nectary on each side. Stamens 6 to 10; filaments hairy; anthers reniform, the cells confluent, opening by 2 valves. Ovary 4 to 7-celled; style columnar, expanding at summit into an umbilicate stigma. Capsule ovate-globose, the placentae covered with innumerable minute seeds. (Greek hypo, beneath, and pitus, fir, on account of the habitat.)

Bracts and sepals mostly entire.....1. *H. lanuginosa*.  
Bracts and sepals mostly fimbriate.....2. *H. fimbriata*.

1. *H. lanuginosa* Nutt. PINE-SAP. Stem fleshy white or yellowish red, minutely pubescent, 4 to 10 in. high; scales and bracts ovate-lanceolate, entire or slightly erose, imbricated below, scattered above; raceme rather dense; calyx and corolla hairy inside; style hairy; ovary 4 or 5-celled.—Forests, Siskiyou Co.; Ore. to B. C. and around the northern hemisphere.

2. *H. fimbriata* Howell. Stem white-fleshy, turning reddish-brown, 3 to 11 in. high; bracts ovate or obovate-cuneate, these and the spatulate sepals with lacinate-fimbriate margins or merely erose; flowers white; sepals 2 and lateral or with a third one in front, or a fourth behind, all except the lateral hairy; petals 3 to 5, spatulate-oblong; ovary 6 to 7-celled, perhaps also 4 or 5-celled.—Coniferous or oak woods: Humboldt Co.; n. to Ore. June-July. Perhaps better understood as a var. of no. 1.

### 7. *PTERÓSPORA* Nutt. PINE DROPS

Reddish brown saprophytic herb with a single tall scape arising from a thick ball of matted fibrous roots and ending above in a many-flowered raceme. Calyx deeply 5-parted, persistent, about  $\frac{1}{2}$  as long as the corolla. Corolla white, globular-urnshaped, with 5 short recurved lobes, withering-persistent. Stamens 10; anthers 2-awned on the back near the base, longitudinally dehiscent. Ovary 5-celled. Stigma 5-lobed. Capsule depressed-globose, 5-lobed. Seeds innumerable, broadly winged from the apex. (Greek pteron, a wing, and spora, a seed.)

1. *P. andromedea* Nutt. Fig. 719. Stems stout, fleshy, 1 to 3 (or 4) ft. high, glandular-pubescent throughout, bearing numerous lanceolate or linear scales; raceme virgate, dense at first; pedicels slender, spreading, soon

recurved; corolla white,  $2\frac{1}{2}$  to  $3\frac{1}{2}$  lines long. —Rich humus beneath pines, 4000 to 7500 ft., common: San Jacinto, San Bernardino and San Gabriel mountains; Sierra Nevada; North Coast Ranges from Lake Co. to Siskiyou Co.; n. to B. C., e. to Pa. The plant dies after flowering.

### 8. *SARCODES* Torr.

Bright red or crimson saprophytic herb with a single fleshy scaly stem arising from a thick ball of brittle roots and ending in a raceme of fleshy crimson flowers. Calyx of 5 distinct sepals, nearly equaling the corolla, glandular. Corolla red, campanulate, 5-lobed, glabrous. Stamens 10; anthers muticous but not awned, opening by terminal pores. Ovary low-conical, 5-celled, 10-lobed; style rather long; stigma capitate, somewhat 5-lobed. Capsule depressed, many-seeded, surrounded by the persistent calyx and corolla, the cells loculicidally dehiscent from top to bottom, the slit widest below and permitting the seed to fall out at the bottom. (Greek sarx, flesh, and oides, resembling.)

1. *S. sanguinea* Torr. SNOW PLANT. Fig. 720. Stems 6 to 15 in. high; scales ovate, the upper strap-shaped; corolla 6 to 9 lines long. —Pine woods, 4000 to 8000 ft., common: Trinity and Siskiyou Cos.; Sierra Nevada from Lassen Co. to Tulare Co.; San Gabriel, San Bernardino, San Jacinto and Santa Rosa mountains; L. Cal.; w. Nev.; s. Ore. June-July.

720. *Sarcodes sanguinea* Torr.; a, habit x  $\frac{1}{4}$ ; b, long. sect. of fl. x  $1\frac{1}{2}$ ; c, cross sect. of ovary x 2.

719. *Pterospora andromedea* Nutt.; a, fl. stem x  $\frac{1}{3}$ ; b, fl. x 2; c, stamens x  $4\frac{1}{2}$ ; d, cross sect. of ovary x 5; e, capsule x  $1\frac{1}{2}$ .

### 9. *NEWBERRYA* Torr.

Saprophytic herb. Stem white, scaly, short and often subterranean. Inflorescence flesh-pink, capitate, dense, composed of short 2 to 5-flowered cymose spikelets. Sepals bract-like, 2 in the lateral flowers, mostly 4 in the terminal ones, hairy within, less so externally. Corolla tubular-campanulate (or slightly urn-shaped), very white-hairy within, slightly so outside, deeply 4-lobed in the lateral flowers, mostly 5 or 6-lobed on the terminal ones, withering-persistent. Stamens 6 to 11, mostly 8 or 10; filaments long-hairy at and above the middle; anther-cells 2, opening lengthwise. Ovary ovoid, 1-celled, hairy; style short, long-hairy, the hairs appearing as a sort of collar beneath the stigma; stigma strongly annular-umbilicate; placentae 4 to 10, sometimes with a placenta 2-lamellate. (Dr. J. S. Newberry, botanist of one of the Pacific Railroad surveys in 1855, and author of a memoir on the forest trees of northern California and Oregon.)

1. *N. congesta* Torr. Corolla 4 to 7

721. *Pleuricospora fimbriolata* Gray;  
a, fl. stem  $\times \frac{1}{2}$ ; b, fl.  $\times 1$ ; c, pistil  
 $\times 2$ ; d, cross sect. of ovary  $\times 4$ .

Sierra Nevada, 4000 to 8300 ft., from Tulare Co. to Butte Co.; Santa Cruz Mts. to Siskiyou Co., 1500 to 4000 ft.

#### 11. *LÈDUM* L. LABRADOR TEA

Evergreen shrubs with fragrant herbage. Leaves alternate, entire, the margin disposed to be revolute. Flowers white, small, in terminal umbel-like corymbs from large scaly buds. Pedicels slender. Sepals 5, almost distinct, very small. Petals 5, distinct, obovate, spreading. Stamens 5 to 10. Capsule 5-celled, dehiscent from the base upward, many-seeded; placentae borne on the summit of the axis of the fruit. (Greek *Ledon*, ancient name of the *Cistus*.)

1. *L. glandulosum* Nutt. Fig. 722. Low, 2 to 5 ft. high; leaves thickly clothing the stems, oblong, acute at each end, mucronate at apex, 1 to  $2\frac{1}{2}$  in. long, green and glabrous on both sides, or light-colored beneath with a gland-dotted felt; petals elliptic-ovate,  $2\frac{1}{2}$  to 3 lines long; stamens 10; filaments ciliate toward the base; capsule oval, 2 lines long.—Colonizing borders of wet meadows or marshy places: Sierra Nevada, 4000 to 10,000 ft.; along the coast, 20 to 500 ft., from the Santa Cruz Mts. to Pt. Reyes and Ft. Bragg; n. to Ore. and thence e. to the Rocky Mts. Poisonous to sheep.

722. *Ledum glandulosum* Nutt.; fl. branchlet  $\times 1$ .

#### 12. *RHODODÈNDRON* L.

Ours shrubs with alternate entire leaves crowded on the flowering branches. Flowers in umbels or corymbs, from terminal buds with thin deciduous scales. Calyx very small. Corolla funnelform to campanulate, cleft, often somewhat

lines long, the linear or oblanceolate sepals as long or longer; stigma conspicuous, forming a yellow eye to the flower.—Very rarely seen, Redwood Belt: Monterey Co. to Mendocino and Humboldt Cos.; n. to Wash. (*N. subterranea* Eastw. *Hemitomes congestum* Gray. *H. pumilum* Greene.)

#### 10. *PLEURICÓSPORA* Gray

Whitish or light brown saprophytic herb with imbricated scales. Stems simple, arising in clusters from a thick ball of fibres and terminating in a dense spike. Flower parts all glabrous. Sepals 4 or 5 (or 6), scale-like, the margins remotely fimbriate. Petals 4 or 5 (or to 8), distinct. Stamens 8 or 10; filaments filiform, glabrous. Ovary ovate, 1-celled, the 4 to 7 parietal placentae large, or 1 or 2 of them small. Style columnar; stigma umbilicate-capitate. Fruit a watery berry. (Greek *pleuricos*, at the side, and *spora*, seed, the placentae parietal.)

1. *P. fimbriolata* Gray. Fig. 721. Stems 2 to 8 in. high; corolla whitish, 5 to 8 lines long; sepals involute, the petals nearly plane; stamens in 2 equal sets, the stamens of each set more approximate on one side than on the other; fruit whitish or at length blue-black.—Deep forest humus:

irregular. Stamens 5 or 10. Style filiform; stigma capitate or somewhat lobed. Fruit a septicidal 5-celled capsule, the valves separating from the columella. (Greek rhodos, rose, and dendron, a tree.)

Deciduous; flowers commonly white; stamens 5.....1. *R. occidentale*.  
Evergreen; flowers rose-purple; stamens 10.  
2. *R. californicum*.

1. *R. occidentale* Gray. WESTERN AZALEA. Fig. 723. Loosely or widely branching shrub 3 to 8 or 14 ft. high; leaves thin, narrowly or broadly obovate, 1 to 4 in. long, ciliate, otherwise nearly glabrous; calyx 5-parted, its lobes ovate or oval, 1 line long; corolla white or sometimes pink,  $1\frac{1}{2}$  to  $1\frac{3}{4}$  in. long, 5-cleft, slightly irregular, the upper lobe with a large yellow splotch, the tube funnelform, glandular-viscid outside; stamens 5, exserted; ovary densely pubescent with whitish gland-tipped hairs.—Stream banks or moist flats, rarely on open slopes, rather common: Coast Ranges (excepting the inner ranges) from the Santa Cruz Mts. to Marin, Sonoma and Shasta Cos., 50 to 3500 ft.; Sierra Nevada, 3500 to 7500 ft.; San Jacinto, Palomar and Cuyamaca mountains, 5000 to 6000 ft. May-July. Feared by sheepmen as poisonous. Var. PALUDOSUM Jepson n. var. Flowers pink to white and yellow; calyx-lobes linear-oblong, 4 to 5 lines long.—Sedgy bogs,

723. *Rhododendron occidentale* Gray; a, fl. branchlet  $\times \frac{1}{4}$ ; b, capsule  $\times \frac{2}{3}$ .

724. *Rhododendron californicum* Hook.; a, fl. branchlet  $\times \frac{1}{4}$ ; b, fl.  $\times \frac{1}{2}$ ; c, capsule  $\times \frac{2}{3}$ .

Humboldt coast (Fortuna, Jepson 1916, type.)

2. *R. californicum* Hook. CALIFORNIA ROSE BAY. Fig. 724. Rather closely erect shrub 4 to 8 ft. high, or in the northern Redwoods a small tree up to 26 ft. high; leaves coriaceous and evergreen, oblong or elliptic, shortly acute, green above, rusty or lighter beneath,  $2\frac{1}{2}$  to  $5\frac{1}{2}$  in. long; calyx 5-lobed, its lobes low, obtuse,  $\frac{1}{2}$  line long; corolla turbinate-campanulate, rose-purple,  $1\frac{1}{4}$  in. long, its broad lobes undulate, the upper lobe greenish-dotted within; stamens 10, not exserted; ovary densely red-silky.—Along the coast: Malpaso Creek; Waddell Creek; Pescadero; Mt. Tamalpais; abundant on the Mendocino and Humboldt coasts; w. Siskiyou Co.; n. to Wash. Reported poisonous to sheep.

### 13. MENZIESIA Sm.

Shrubs with alternate deciduous leaves. Flowers greenish-purple, developed with the leaves from strigose-chaffy terminal buds and borne in clusters on nodding pedicels. Calyx small, flattish, bristly-ciliate, usually

4-lobed, rarely 5-lobed. Corolla cylindric-urnshaped, 4-toothed or -lobed. Stamens 8. Anthers opening by a terminal pore or chink. Style filiform; stigma 4-lobed. Capsule ovoid, woody, 4-celled, 4-valved, many-seeded. Seeds slender. (Archibald Menzies, surgeon and botanist of the Vancouver Expedition.)

1. *M. ferruginea* Sm. RUSTYLEAF. Slender shrub 6 to 15 ft. high; leaves thin, obovate, acutish, serrulate, strigose above with scattered rusty hairs on the upper side, 2 to 3 in. long, shortly petioled; pedicels glandular-pubescent, 10 to 13 lines long; corolla 3 to 4 lines long; capsules  $3\frac{1}{2}$  lines long, on erect pedicels.—Humboldt Co. (Freshwater Creek and head of Prairie Creek); n. to Alas. June.

#### 14. *KÁLMIA* L. AMERICAN LAUREL

Ours low subalpine or diminutive alpine shrubs with glabrous herbage. Leaves opposite, coriaceous, evergreen. Flowers in umbels terminating the branches. Calyx deeply 5-parted. Corolla saucer-shaped, 5 lobed, with 10 pouches below the lobes and sinuses. Stamens 10, each pouch of the corolla holding an anther. Ovary 5-celled, the placentae borne at the summit of the cells. Capsule septicidally 5-valved from above.—The expansion of the corolla curves the filaments outward and backward, so that irritation or jostling of the stamens or corolla, as by an insect, causes the elastic filaments to release the anthers with considerable violence, thus scattering the pollen. (Peter Kalm, early North American explorer, Knight of the Order of Vasa and a pupil of Linnaeus.)

725. *Kalmia polifolia*  
var. *microphylla*  
Rehder; fl. branchlet  
x 1.

1. *K. polifolia* Wang. PALE LAUREL. Erect, 1 to 2 ft. high; leaves elliptic-oblong to oblong, shining green above, glaucous or whitish beneath, revolute-margined,  $\frac{1}{2}$  to 1 in. long; sepals ovate; corolla bright pink or rose-purple, 6 to 9 lines broad; valves of the capsule pouch-shaped, splitting half-way down the back but closed in front below, the opening above corresponding to a placenta; placentae persisting on the summit of the axis.—Modoc Co.; n. to Alas., e. to Newf. Var. *MICROPHYLLA* Rehd. Alpine Laurel. Fig. 725. Two to 3 in. high; leaves often seemingly linear on account of the strongly revolute edges, 3 to 7 lines long; corolla 5 to 7 lines broad.—Edges of wet meadows or swamps,

7000 to 12,000 ft.: Sierra Nevada from Tulare Co. to Nevada Co., and n. to Mt. Shasta, thence w. to Trinity Summit; n. to B. C., e. to Col.

#### 15. *PHYLLÓDOCE* Maxim.

Diminutive alpine heath-like shrubs. Leaves evergreen, alternate, crowded, linear, with revolute margins, articulated with the stem and leaving behind a raised scar when falling away. Flowers in ours rose-color, racemose-crowded at the summit of the branches and therefore appearing umbellate. Pedicels glandular, each with 2 bracts at base. Sepals commonly 5. Corolla open-campanulate, 5-lobed. Stamens 7 to 10; anthers opening by an oblique terminal chink. Capsule globose, septicidally 5-valved from the summit. (Greek Phyllodoce, a sea nymph mentioned by Virgil.)

Stamens exserted; corolla 5-cleft to the middle.....1. *P. breweri*.  
Stamens included; corolla merely 5-lobed.....2. *P. empetriformis*.

1. *P. breweri* (Gray) Hel. RED HEATHER. Stems rigid, 4 to 12 in. high; leaves 3 to 7 lines long, smooth; sepals mostly glabrous; corolla deeply saucer-shaped or bowl-shaped, 4 to 6 lines broad, 5-cleft nearly or quite to the middle, the lobes recurving from the tip; stamens exserted; style exserted.—Alpine, 7000 to 12,000 ft.: San Bernardino Mts.; Sierra Nevada from Tulare Co. to Lassen Co., thence w. to Mt. Shasta and Marble Mt. July-Aug. (*Bryanthus breweri* Gray.)

2. *P. émpetrifórmis* (Sm.) Don. Stems 6 to 10 in. high; leaves roughish on the edges; sepals mostly ciliate; corolla campanulate, 2 to 3 lines long, the lobes much shorter than the tube; stamens included; style included or exserted.—High mts. of our northern borders, 7500 to 9000 ft.: Marble Mt.; Mt. Shasta; n. to Alas., e. to Wyo.

#### 16. *CASSIOPE* Don

Diminutive alpine shrubs with heath-like stems. Leaves evergreen, opposite (in ours), densely imbricated, small, entire. Flowers solitary, nodding on slender naked peduncles. Sepals 4 or 5, ovate. Corolla broadly campanulate, in ours 5-lobed. Stamens 10 or 8; filaments subulate; anthers tipped with a pair of recurved awns. Capsule globose, 4 or 5-celled, loculicidal, the valves soon 2-cleft. (*Cassiope*, wife of Cepheus and mother of Andromeda.)

1. *C. merténsiana* Don. Fig. 726. Tufted, 2 to 12 in. high, the stems covered throughout with thick leaves crowded in 4 ranks; leaves ovate, keeled on the back, 1 line long; peduncles lateral; corolla white, 3 lines long.—Granite rocks and clefts, high montane, 8000 to 10,000 ft.: Sierra Nevada from Fresno Co. to Placer Co.; n. to Alas.

726. *Cassiope mertensiana* Don;  
fl. branchlet x 1.

#### 17. *LEUCÓTHOE* Don

Shrubs with coriaceous alternate leaves. Flowers white, in terminal or subterminal racemes, thus forming a naked panicle. Bracts and bractlets in ours small, scarious or whitish. Sepals distinct. Corolla ovate, with a narrow opening. Stamens 10; anthers oblong, obtuse, awnless but with each cell 2-mucronate. Ovary 5-celled; stigma 5-lobed. Capsule somewhat depressed, loculicidal; placentae borne on the upper part of the central axis or columella. (*Leucothoe*, daughter of Orchamur, King of Babylon, and Eurynome.)

1. *L. davisiae* Torr. Two to 5 ft. high; leaves evergreen, oblong, obscurely serrulate or entire, 1 to 3 in. long; racemes erect, 2 to 4 in. long; flowers pendulous, 3 to 3½ lines long.—Springy ground, montane, 6000 to 8000 ft.: Poison Mdw., Sievel Mt., Madera Co.; Wawona road summit from Mariposa; Merced Grove; Frog Lake, Nevada Co.; Eureka, Nevada Co.; Brush Creek, Butte Co.; Whiskey Butte, Siskiyou Co.; Coffee Creek, Salmon Mts., Trinity Co.

#### 18. *GAULTHERIA* L.

Shrubs or fruticulose plants. Leaves broad, evergreen, shining above. Flowers white or pink. Calyx 5-cleft. Corolla 5-toothed or -lobed. Stamens 10; filaments dilated at base. Ovary depressed, 5-lobed, 5-celled, seated on a thin narrow undulate-toothed disk; stigma entire. Calyx becoming fleshy and at length enclosing the pod, forming a berry-like fruit. (Dr. Gaultier, Canadian physician and botanist.)

Flowers in racemes; filaments hairy on back; anthers with a pair of spreading awns from the summit of each cell.....1. *G. shallon*.  
Flowers solitary; filaments glabrous; anthers not awned.....2. *G. humifusa*.

1. *G. shallon* Pursh. *SALAL*. Fig. 727. Slender shrub with erect or spreading stems 1 to 6 ft. high; leaves ovate or orbicular, slightly cordate at base, finely serrate, 2 to 4 in. long; petioles 1 to 2 lines long; racemes axillary or terminal, 3 to 6 in. long, pubescent (as also calyx and corolla) with short glandular hairs; bracts scaly, ovate, concave, often reddish; pedicels declined, bearing 2 bractlets below the middle; calyx reddish; corolla white or pinkish, oval-urnshaped, 5-toothed at the narrow orifice, 4 to 5 lines long; fruit globose, black.—Woods along the coast, especially in the Redwood belt: Santa Inez Mts.; Santa Lucia Mts.; Santa Cruz Mts. to Del Norte Co.; n. to B. C. Mar-May. In Mendocino and Humboldt Cos. commonly abundant and covering thickly the forest floor.

727. *Gaultheria shallon* Pursh; a, fl. branchlet  $\times \frac{1}{2}$ ; b, long. sect. of fl.  $\times 2$ ; c, stamen  $\times 4\frac{1}{2}$ ; d, cross sect. of ovary  $\times 4$ .

disk, 5 or rarely 4-celled. Fruit a many-seeded berry with granular surface. (Latin name of the Arbutus tree under which, says Horace, idle men delight to lie.)

1. *A. menziesii* Pursh. MADROÑO. Fig. 728. Widely branching tree 20 to 125 ft. high; bark polished, crimson or terra cotta, or on old trunks dark brown and fissured into small scales; leaves narrowly elliptic or ovate, glabrous, dark green and polished above, glaucous beneath, entire, or on vigorous shoots, finely serrate, 3 to 6 in. long; flowers white; corolla 3 lines long, with 5 very small lobes recurving from the small opening, and 10 semi-transparent glands in a circle at base; berry somewhat depressed-globose, 4 to 5 lines in diameter, fleshy but rather dry, red or orange color.—Foothills and mts., 300 to 4000 ft.: local in S. Cal. (Palomar, San Bernardino, San Gabriel and Santa Inez mountains); Coast Ranges from Monterey Co. to Del Norte Co.; Sierra Nevada from Tuolumne Co. to Shasta Co.; n. to B. C.

## 20. CÔMAROSTÁPHYLIS Zucc.

Evergreen shrub or small tree with alternate coriaceous leaves. Flowers white, in structure like *Arctostaphylos*, borne in racemes. Racemes solitary or clustered, from terminal buds. Ovary 5-celled, one ovule in each cell. Fruit red, berry-like, consisting of a solid stone densely covered with pulpy clavate or somewhat obovoid granules attached at base; stone 3 to 5-celled. (Greek komaros, the *Arbutus*, and staphule, a grape, referring to the clusters of edible fruit.)

1. *C. diversifolia* Greene. Shrub, 6 to 15 or 20 ft. high; leaves oblong-ovate to ovate or linear-oblong, spinu-

2. *G. humifusa* (Graham) Rydb. Stems procumbent, 2 to 8 in. long, forming a loose mat; leaves orbicular or oval, 3 to 11 lines long; stems, pedicels and calyx sparingly pilose; flowers solitary and axillary, on short pedicels with 3 to 5 bractlets; corolla white, depressed-campanulate, 5-parted; anthers not awned, obscurely 4-pointed at apex; fruit scarlet.—High montane forests, rare in Cal.: Granite Basin, Kings River; Scales Diggings, Sierra Co.; head of Redwood Creek, Humboldt Co.; Kelsey trail near Preston Peak; n. to B. C., e. to Rocky Mts. (*G. myrsinites* Hook.)

## 19. ARBUTUS L. ARBUTE TREE

Evergreen trees or shrubs with glossy leathery leaves. Flowers in a terminal panicle of dense racemes. Calyx small, 5-parted. Corolla globular or ovate, 5-lobed at apex. Stamens twice as many as the corolla-lobes, included; filaments soft-hairy; anthers with a pair of reflexed awns on the back. Ovary on a hypogynous

728. *Arbutus menziesii* Pursh; a, fr. branchlet  $\times \frac{1}{4}$ ; b, long. sect. fl.  $\times 1\frac{1}{4}$

lose-serrate, mostly acute at base and apex, glabrous, green and shining above, whitish-pubescent beneath,  $1\frac{1}{2}$  to 3 in. long; racemes 2 to 5 in. long; rachis, pedicels and calyx tomentose; pedicels 2 to 6 lines long; calyx-lobes subulate; ovary densely hairy; berry red, subglobose, 2 to  $2\frac{1}{2}$  lines long, often tipped with the persistent style.—Coast region, Santa Monica Mts. to w. San Diego Co.; Santa Cruz, Santa Rosa and Santa Catalina Isls.; s. to L. Cal.

## 21. ARCTOSTÁPHYLOS Adans. MANZANITA

Evergreen shrubs with very crooked branches, the bark dark red or chocolate-color, smooth and polished. Leaves entire (rarely serrate), more or less vertical by twisting of the petiole. Flowers white or pink, in a terminal usually subglobose nodding cluster or panicle composed of few to several short racemes. Flower parts usually in 5s. Bracts commonly scaly. Sepals distinct. Corolla urn-shaped. Stamens twice as many as the corolla-lobes; anthers with a pair of reflexed awns on the back; filaments more or less hairy, dilated toward the base. Ovary seated on a hypogynous disk, 4 to 10-celled, with one ovule in each cell, maturing into a dry brown berry-like fruit with an outer pulp covering several stony 1-seeded nutlets. Surface of the berry smooth, the pulp at first fleshy, at maturity usually mealy or powdery. Nutlets distinct, or irregularly united in 2s or 3s, or sometimes consolidated into a single stone.—Wood hard but brash, warping and cracking excessively in seasoning. (Greek arktos, a bear, and staphule, a grape; bears feed on the berries.)

### A. LEAVES PLANE OR NEARLY SO, OFTEN MORE OR LESS VERTICAL.

1. *Ovary glabrous (except in no. 3); leaves and branchlets glabrous or essentially so.*  
 Erect robust shrubs 4 to 8 (or 14) ft. high.  
 Pedicels glandular; foliage very white-glaucous.  
 Berry with solid stone; pedicels viscid-glandular, sometimes glandular-pubescent;  
 S. Cal. and South Coast Ranges.....1. *A. glauca*.  
 Berry with separate nutlets; pedicels glandular-hairy; branchlets and peduncles  
 very glaucous; Sierra Nevada foothills chiefly.  
 Ovary glabrous; branchlets and peduncles very glabrous.....2. *A. viscida*.  
 Ovary glandular hairy; branchlets and peduncles glandular-hairy.....  
 3. *A. mariposa*.  
 Pedicels not glandular or only obscurely or minutely so; berry not glandular (except  
 in *A. elegans*).  
 Panicles very dense; peduncles and rachises minutely glandular, not pubescent;  
 leaves dark green; higher forest belt, chiefly Sierra Nevada.4. *A. patula*.  
 Panicles more open; peduncles and rachises not glandular.  
 Branches disposed to be erect and straightish; peduncles and rachises gla-  
 brous or nearly so; leaves bright green.  
 Berry not glandular; Napa Range n. to Lake and Mendocino Cos.....  
 5. *A. stanfordiana*.  
 Berry all over glandular; Lake Co.....6. *A. elegans*.  
 Branches crooked, spreading widely.  
 Leaves abruptly acute, mucronate, less than 1 in. long; mts. of S. Cal..  
 7. *A. pungens*.  
 Leaves obtuse or acute, more than 1 in. long; mts. of cent. and n. Cal.  
 Peduncles and rachises canescently puberulent; panicles drooping;  
 leaves light green; North Coast Ranges and n. Sierra  
 Nevada foothills.....8. *A. manzanita*.  
 Peduncles and rachises glabrous or minutely puberulent; panicles  
 erect or only half-drooping; leaves pale or whitish; Sierra  
 Nevada.....9. *A. pastillosa*.  
 Dwarf or procumbent or low shrubs; pedicels glabrous or nearly so.  
 High Sierra species; plants forming a rough mat.....10. *A. nevadensis*.  
 Coastal or seashore species.  
 Leaves ovate or obovate, shortly acute at apex, both sides alike...11. *A. hookeri*.  
 Leaves mostly obovate, rounded or obtuse at apex.  
 Leaves both sides alike; berry mostly pink or red.....12. *A. uva-ursi*.  
 Leaves green above, paler beneath; berry brown.....13. *A. pumila*.  
 2. *Ovary pubescent; leaves and branchlets pubescent or usually so.*  
 Bracts brown or herbaceous; Coast Ranges (except no. 15), mostly near the coast.  
 Nutlets distinct or united into sets of 2 or 3.  
 Calyx with entire sepals.  
 Leaves mostly 4 to 7 lines long; berry glabrous; nutlets thin-shelled.  
 Low or procumbent shrubs; apex of leaves plane.  
 Apex of leaves obtuse or bluntish; Mendocino coast.....  
 14. *A. nummularia*.  
 Apex of leaves acute, mucronate; Amador Co. foothills.....  
 15. *A. myrtifolia*.

- Slender erect shrub; apex of leaves abruptly short-acute, curved or deflexed; cent. coast region.....16. *A. sensitiva*.  
 Leaves mostly 1 to 1½ (or 2) in. long; nutlets thick-shelled; berry minutely short-hairy.  
 Leaves rarely cordate, short-petioled.  
 Branchlets not hispid; ovary densely white hairy, not glandular...17. *A. canescens*.  
 Branchlets or some of them more or less hispid; ovary white-hairy.  
 Stems several from a heavy woody basal platform.  
 Main stems with smooth bark; ovary hairs glandular; berry glandular.....18. *A. glandulosa*.  
 Main stems with shreddy bark; ovary hairs not glandular; berry not glandular.....19. *A. tomentosa*.  
 Stems single, not swollen at the ground into a woody base; hairs not glandular; berry not glandular.....20. *A. columbiana*.  
 Leaves mostly cordate, thickly clothing the branchlets, sessile.....21. *A. andersonii*.  
 Calyx with fimbriate edge to sepals; Santa Barbara Isls.....22. *A. insularis*.  
 Nutlets united into a solid stone; Tehachapi Mts. to San Gabriel Mts.....23. *A. parryana*.  
 Bracts pink, petal-like; stone solid; S. Cal.....24. *A. drupacea*.

B. LEAVES STRONGLY REVOLUTE, NOT AT ALL VERTICAL.

- Stone solid; S. Cal. coast.....25. *A. bicolor*.

1. *A. glauca* Lindl. GREAT-BERRIED MANZANITA. Shrub 6 to 8 ft. high, or almost arborescent and 15 ft. high with a trunk 6 to 13 in. in diameter; leaves glaucous and glabrous, roundish or elliptical to broadly ovate, obtuse or acute at apex, obtuse, truncate or subcordate at base, 1¼ to 1¾ in. long; petioles 3 to 7 lines long; panicle broader than high, frequently very compact; rachis glabrous, sometimes a little glaucous; pedicels glandular; flowers white, rather large; berry rather densely covered with minute glands and very viscid, globose, 5 to 8 lines broad; pulp scanty; stone solid, smooth.—Cismontane S. Cal., ranging n. to Monterey Co. and Mt. Diablo. Var. EREMÍCOLA Jepson. Leaves purple-veined; berry elliptic in outline.—Piñon Well Mts., n. Colorado Desert.

2. *A. viscida* Parry. WHITE-LEAF MANZANITA. Shrub 4 to 10 ft. high, with very striking contrast between the white foliage and deep red crooked branches; branchlets and peduncles glaucous and very glabrous, usually reddish, the rachis of the raceme or panicle glandular; leaves very white-glaucous, glabrous, elliptic, varying to orbicular or round-ovate, obtuse or abruptly acute, rounded at base, ¾ or 1 to 1½ (or 2) in. long; flowers in simple or forked racemes; pedicels 4 to 6 lines long, with short spreading glandular hairs; bracts small, ovate-lanceolate, acuminate; calyx-lobes reflexed over summit of pedicels; corolla light pink; berry deep red, globose, 3 to 4 lines broad, the surface very glandular, cohering in sticky masses when gathered, or often non-glandular; nutlets distinct or 2 or 3 united.—Foothills of the Sierra Nevada (often the only manzanita in the upper portion of the chaparral belt): Tulare Co.; Calaveras Co. to Butte Co.; and extending around the head of the Sacramento Valley into the inner North Coast Ranges and s. to the Napa Range. Remarkable for its white-glaucous branchlets and peduncles. The shrubs kill completely under chaparral fire and do not crown-sprout.

3. *A. mariposa* Dudley. Shrub 4 to 8 ft. high with spreading branches and very white-glaucous foliage; branchlets and inflorescence glandular-pubescent or puberulent, the hairs mostly spreading; leaves glabrous or nearly so, very rigid, oval to elliptic, shortly acute or at least mucronulate, 1 to 1¾ in. long; panicle many-flowered, small, compact; pedicels with glandular hairs; ovary glandular-hairy; berry bright red, glandular-viscid, sometimes covered with minute stipitate glands.—Sierra Nevada, higher foothill region from Tuolumne Co. s. to Fresno Co. Very closely allied to no. 2 and sometimes difficult to distinguish from it. Var. BIVÍSA Jepson. Leaves dark green, 1½ to 2½ in. long; branchlets glandular-hairy and somewhat dusky; berry whitish or somewhat lucent.—Hetch-Hetchy to Wawona.

4. *A. pátula* Greene. GREEN MANZANITA. Widely or diffusely branching shrub 3 to 5 (or 8) ft. high; peduncles and rachis of inflorescence, and commonly the branchlets, minutely glandular-puberulent; leaves bright green, glabrous, typically orbicular or broadly elliptic, mostly rounded at apex, or obscurely acutish, rounded or subcordate at base, 1 to 1½ (or 2¼) in. long;

panicle corymbose, very dense; bracts ovate, abruptly attenuate; pedicels glabrous, 2 to 3 lines long; sepal tips white-scarious; corolla deep pink; berry commonly dark or black when half-grown, when mature globose or commonly depressed, glabrous, often very hard, 4 to 5 lines broad; nutlets smooth on sides and back, not channeled.—Open pine woods, 4500 to 9000 ft. or 2500 to 5000 ft. at the north: Sierra Nevada from Shasta Co. to Tulare Co.; high North Coast Ranges from the Siskiyou Mts. and Mt. Shasta s. to Mt. Hull; San Gabriel, San Bernardino and San Jacinto mountains; w. Nev.; Ore. It is the dominant and usually the only species in its area in the Sierra Nevada. The stem forms a globose or tuber-like body at or near the surface of the ground, which crown-sprouts after fire. The panicle is commonly broad and flattish and its glandular-puberulent rachis is often dark, while the bracts are commonly ovate-attenuate. The berries when three-fourths grown are sometimes rather hard with the nutlets and pulp as if concreted.

5. *A. stánfordiána* Parry. Erect shrub 3 to 6 ft. high with slender dark red stems; leaves glabrous, bright green on both faces, narrowly ovate to oblanceolate, most frequently acute at both ends, 1 to 1½ in. long, very erect; branchlets, peduncles and rachis glabrous or obscurely or minutely glandular-puberulent; flowers light pink to lilac; corolla 2 to 3 lines long, very frequently with an obscure constriction just below the middle; berry very small, usually much depressed and commonly unsymmetrical or irregular, or sometimes globose, glabrous, usually a bright apple-red when first mature, about 1½ lines high and twice as broad; nutlets broader than high.—Mountain summits and ridges, Mendocino and Lake Cos., s. to the Napa Range. Apr.-June. The plant body is killed outright under chaparral fire.

6. *A. élegans* Jepson. Similar to no. 5; inflorescence nearly glabrous; flowers unknown; berry all over minutely stipitate-glandular.—Mt. Konocti, Lake Co.

7. *A. púngens* H.B.K. Shrub (2 or) 3 to 8 ft. high; branchlets canescent or white-tomentulose; leaves oblong to elliptic, abruptly or somewhat obscurely short-acute, mucronate, finely pubescent or minutely tomentulose, eventually glabrate or often rather glossy, 8 to 10 lines (rarely to 1¼ in.) long; pedicels glabrous; panicles small; berries usually somewhat depressed-globose and 3 to 4 lines broad, but variable in size and sometimes eccentric in shape, glabrous, dark-brown or terra-cotta, shining.—San Bernardino and San Jacinto mountains, 5000 to 6000 ft., n. in the inner Coast Ranges to San Benito Co., thence to Mt. Tamalpais, about 1600 to 2200 ft.; e. to Ariz., s. to Mex. When decumbent branches lie along the ground they root on the under side.

8. *A. manzanita* Parry. PARRY MANZANITA. Fig. 729. Shrub 6 to 12 ft. high, commonly very erect, sometimes widely branched from the base with long straggling crooked branches, sometimes becoming almost elephantine in its proportions and up to 22 ft. high; branchlets, peduncles, and rachis finely and somewhat canescently puberulent; pedicels glabrous; leaves pale green, thick, glabrous or minutely puberulent, elliptic or oblong, acute or subacute at apex, acute or obtuse at base, 1 to 1½ in. long; panicles drooping; flowers white, sometimes pink-tinged; bracts triangular-acute, small and dry; berry dull white in early summer, becoming deep reddish brown in late summer and autumn, smooth and glabrous, 4 to 5 lines in diameter; nutlets irregularly coalescent or separate, keeled or ridged and roughened on back, and often with 2 small lateral ridges.—North Coast Ranges (only or mostly

729. *Arctostaphylos manzanita* Parry; fl. branchlet x ½; b, long. sect. fl. x 1¼; c, fr. x ¾.

the middle and inner ranges), n. to Tehama Co., thence s. in the Sierra Nevada foothills to Tuolumne Co.; also on Mt. Diablo. The shrubs kill completely under chaparral fire and do not sprout from the root-crown.

9. *A. pastillōsa* Jepson. Shrub 3 to 6 ft. high; leaves and pedicels glabrous, the peduncles and rachises glabrous or minutely puberulent; foliage light-green; leaves elliptic-oblong, or -obovate, varying to oblong-lanceolate and somewhat willow-like, mostly acute, glabrous and glaucous, 1 to  $1\frac{3}{4}$  or  $2\frac{1}{2}$  in. long; pedicels glabrous; panicles loose, erect or only half-drooping; ovary depressed, roughened but glabrous; berry elevated-globose or globose, dull white or later light brown, 4 to 6 or 8 lines broad; nutlets 4 or 5, or sometimes coalescing into one channeled or ribbed stone, the stone forming tardily.—Sierra Nevada, higher foothills, 2500 to 4500 ft., chiefly in a belt between *A. viscida* and *A. patula*.

10. *A. nevadēnsis* Gray. PINE-MAT MANZANITA. Plants gregarious and roughly carpeting the forest floor, the main stems creeping or trailing, rooting, the erect branches 3 to 6 or 9 in. high; leaves obovate or oblong-oblan-ceolate, obtuse and mucronate, or abruptly acute, glabrous or minutely puberulent, reticulate with dark veins, 7 to 12 lines long; pedicels glabrous, 1 to 2 lines long; berry dark carmine, smooth, glabrous, 2 to 3 lines in diameter.—Open pine woods, 7000 to 9000 ft.: Sierra Nevada from Tulare Co. to Shasta Co.; n. Lake Co. to Siskiyou Co.

11. *A. hoōkeri* Don. Procumbent or low shrub  $\frac{1}{2}$  to 2 ft. high; branchlets and peduncles puberulent or minutely canescent; leaves bright green, shining, thinnish, glabrous or nearly so, ovate or elliptic, shortly acute, mucronate, 7 to 12 lines long; flower-clusters small; pedicels glabrous; corolla  $1\frac{1}{2}$  lines long; berry globose or depressed, glabrous, 2 to  $2\frac{1}{2}$  lines broad.—Forming small colonies on sand-dunes or in open woods near the coast: San Francisco; Pajaro Hills; Monterey; San Simeon. Mar.

12. *A. uva-ursi* Spreng. RED BEAR-BERRY. SAND-BERRY. Stems several, trailing, prostrate or buried beneath the sand (all from a single main root), giving rise to erect branching stems 4 to 6 in. high; bark dark brown or somewhat reddish, becoming roughish; leaves oval or obovate, rounded at apex, rarely retuse or subacute, often reticulate-veiny, puberulent or nearly glabrous, especially in age,  $\frac{1}{2}$  to 1 in. long; corolla ovoid, white or pinkish,  $2\frac{1}{2}$  to 3 lines long; berry typically brilliant red or pink, smooth and glabrous, 3 to  $4\frac{1}{2}$  lines in diameter; nutlets 1 or sometimes 3-nerved on the back, obscurely roughened or reticulate on the sides.—Sand-dunes along the ocean shore: Mendocino Co.; Humboldt Bay; n. to B. C. and Alas., thence round the earth in northern regions.

13. *A. pūmila* Nutt. Stems prostrate with ascending branches 4 to 8 in. high, forming somewhat coarse or rough mats 2 to 5 ft. broad; branchlets and leaves finely pubescent or downy, or the leaves above quite glabrate; leaves dull green, obovate, acutish, 5 to 9 lines long; pedicels nearly glabrous; corolla  $1\frac{1}{2}$  lines long; ovary somewhat 5-lobed, seated in a saucer-shaped disk; berries reddish or red-brown, globose or globose-oblong, smooth, glabrous, 2 to 3 lines in diameter.—Sand hills and mesas e. of Monterey near the shores of Monterey Bay.

14. *A. nummulāria* Gray. Dwarf bush  $\frac{1}{2}$  to 1 ft. high, the stems ascending or diffuse; branchlets pilose-pubescent; leaves thickly clothing the branches, elliptic to ovate or oblong, glossy, veiny below, glabrous, or the margins ciliate, 4 to 7 (or 9) lines long, on petioles  $\frac{1}{2}$  to 1 line long; corolla white, 1 to 2 lines long.—Mendocino coastal plain.

15. *A. myrtifōlia* Parry. Low diffuse shrub  $\frac{3}{4}$  to  $1\frac{1}{4}$  ft. high, the decumbent or spreading stems vertically thickened and ribbon-like, mostly  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. wide and 2 to 5 lines thick, much contorted or twisted; bark of branchlets shreddy; leaves narrowly ovate, sometimes elliptic or oval, mostly obtuse at base, acute (or rarely obtuse) and mucronate at apex, 3 to 6 (or 9) lines long; otherwise like no. 14.—Sierra Nevada foothills in Amador Co. Feb. (*A. nummularia* var. *myrtifolia* Jepson.)

16. *A. sensitiva* Jepson. Fig. 730. Erect shrub 2 to 5 ft. high; branchlets and petioles puberulent and bristly-hirsute; leaves roundish, abruptly acute

or apiculate, finely reticulate-veiny beneath, nearly glabrous or sparingly bristly-ciliate, 5 to 7 (or 10) lines long, on petioles  $\frac{1}{2}$  to 1 line long; flowers 2 lines long; ovary pubescent; berry oblong, 2 lines long.—Mt. Tamalpais; Santa Cruz Mts.; distribution restricted but locally abundant. The shrubs are killed outright by chaparral fires.

17. *A. canescens* Eastw. Shrub 3 to 6 ft. high; leaves ovate, rounded at apex or obscurely acute,  $\frac{3}{4}$  to 3 in. long; branchlets, peduncles and leaves minutely and closely white-pubescent or canescent; pedicels more or less densely short-hairy and somewhat glandular, 2 to 4 lines long; bracts lanceolate, small, or sometimes large (3 to 6 lines long); ovary densely woolly; berry depressed-globose, 4 lines broad, faintly pubescent with very short spreading hairs.—Humboldt Co. s. to the Santa Cruz and Santa Lucia mountains, and far s. to the San Gabriel Mts. Commonly not in the immediate vicinity of the coast, nor reported thus far from the inner Coast Ranges. This shrub forms heavy root-crowns, from which new shoots arise after chaparral fires.

18. *A. glandulosa* Eastw. EASTWOOD MANZANITA. Small or medium-sized shrub 2 to 3 (or 7) ft. high with many stems arising from a widely spreading root-crown; branchlets, peduncles and pedicels with a dusky more or less glandular indument or tomentum, the branchlets bearing also scattered and usually short bristles which are more or less glandular; leaves ovate to elliptic or oblong, mostly acute, rounded or subcordate at base, dark or yellowish green and often somewhat glandular, most commonly glabrous or apparently so, or sometimes with a fine pubescence, 1 to  $1\frac{3}{4}$  in. long; pedicels glandular-hairy, the hairs not dense, often scattered; flowers in rather small compact clusters, white or pinkish; bracts lanceolate, the lower foliaceous; anther awns red; ovary hairy with glandular hairs, usually densely so; berry globose or more commonly depressed, glabrate or under a lens usually showing very short very scattered white hairs.—On broken sandstone: San Diego Co. and San Gabriel Mts., n. to the Oakland hills and Marin and Mendocino Cos. The most abundant species on the e. and s. slopes of Mt. Tamalpais. At other stations it is commonly less or scarcely at all glandular. The root-crown develops broad woody platforms, from which numerous shoots arise after chaparral fires. Var. *virgata* Jepson. Leaves thin, somewhat willow-like, ovate to broadly lanceolate, mostly acute, serrulate or rough-edged,  $1\frac{1}{2}$  to 2 in. long.—Mt. Tamalpais n. to Tomales Bay.

730. *Arctostaphylos sensitiva* Jepson; fl. branchlet  $\times \frac{3}{2}$ .

19. *A. tomentosa* (Pursh) Lindl. Shrub 3 to 4 ft. high, the erect stems several or many from a broad woody root-crown; branchlets pubescent and hirsute; leaves oblong-ovate, mostly acute, mostly truncatish at base, green and glabrous above, a fine tomentum or close felt-like pubescence beneath, 1 to  $1\frac{1}{2}$  in. long; berry depressed-globose, 4 lines broad.—Low hills near the coast, Santa Cruz Co. to Monterey Co. (*A. vestita* Eastw. *A. glandulosa* var. *vestita* Jepson.) It apparently intergrades to *A. glandulosa*. The stems form thick woody root-crowns at the surface of the ground, from which crown-sprouts arise after fires. Var. *CRASSIFOLIA* Jepson n. comb. Leaves elliptic, thick, 8 to 12 lines long.—San Diego coast. (*A. glandulosa* var. *crassifolia* Jepson.)

20. *A. columbiانا* Piper. HAIRY MANZANITA. Shrub 4 to 8 ft. high; branchlets very leafy; branchlets and petioles with two kinds of pubescence, long spreading bristly hairs arising from a fine tomentum, usually glandular; leaves sparingly pubescent or nearly glabrous, green or pale, ovate

to narrowly or broadly oblong, acute, obtuse to subcordate at base, entire or rarely spinulose-serrulate, 1 to 2 in. long, typically on very short petioles; bracts linear-lanceolate, the lower or all foliaceous,  $\frac{1}{4}$  to 1 in. long; pedicels glandular-puberulent; flowers white, in compact clusters; berry depressed, 3 to 4 lines in diameter, minutely and sparingly white-hairy under a lens; nutlets distinct or more or less united.—Immediate neighborhood of the coast from Marin Co. to Humboldt Co.; n. to Wash. Extending s. to the Santa Cruz Mts. and San Luis Obispo Co., though apparently not in typical form. (*A. tomentosa* of Cal. auth. in small part.) The shrubs are killed completely by chaparral fires and never crown-sprout.

21. *A. anderssonii* Gray. Fig. 731. Four to 8 (or 14) ft. high; branchlets with copious straight spreading hairs or bristles and with glandular indu-

731. *Arctostaphylos anderssonii* Gray; a, fl. branchlet  $\times 1\frac{1}{2}$ ; b, long. sect. fl.  $\times 2$ ; c, stamen  $\times 3$ .

ment; leaves crowded or almost imbricated on the branchlets, oblong or ovate, cordate at base or even auriculate, serrulate below the middle, puberulent or densely tomentulose, or becoming glabrous, 1 to  $2\frac{1}{2}$  in. long, commonly sessile, or sometimes with a petiole 1 to 2 or 3 lines long; bracts mostly foliaceous, 2 to 6 lines long; pedicels glandular-puberulent; corolla 3 lines long, truncatish at base; filaments glabrous; anther awns white; berry viscid-pubescent.—Antioch and Mt. Diablo to the Oakland Hills, Santa Cruz Mts. and Santa Lucia Mts. The main stem or trunk does not thicken at the ground, has not the capacity to crown-sprout, and in consequence the shrubs are killed outright by chaparral fires. Var. *AURICULATA* Jepson. Leaves usually canescent.—Mt. Diablo. Var. *PECHOENSIS* Jepson. Pedicels mostly glabrous.—San Luis Obispo Co.

22. *A. insularis* Greene. Shrub 4 to 7 ft. high; branchlets glandular-puberulent and with short spreading glandular bristles; leaves ovate, bright green, nearly glabrous,  $\frac{3}{4}$  to 2 in. long; peduncles and rachises puberulent, the pedicels not puberulent but rather densely clothed with spreading glandular hairs; flowers in a large panicle of elongated racemes, leafy-bracteate at base; sepals with fimbriate margins; corolla white; berry yellowish-brown, nearly glabrous, 3 to 6 lines broad, 2 to 3 lines high.—Santa Cruz and Santa Rosa Isls.

23. *A. parryana* Lemmon. Shrub 3 to 5 ft. high; leaves ovate to elliptic, thickish, minutely purple-veined, and microscopically glandular,  $\frac{3}{4}$  to  $1\frac{1}{8}$  in. long; branchlets and rachis canescently puberulent; bractlets deltoid-acute, the upper half deciduous; flowers not seen; pedicels glabrous; berry glabrous or nearly so, the stone solid, obscurely about 6-ridged or -angled.—Tehachapi Mts. and s. to the San Gabriel Mts.

24. *A. drupacea* Mebr. Diffuse shrub 3 to 9 (or 15) ft. high; leaves elliptic, obtuse but abruptly mucronate, glaucous, minutely pubescent or subglabrous,  $1\frac{1}{4}$  to  $2\frac{1}{4}$  in. long; branchlets and inflorescence glandular short-pilose and pubescent; pedicels and bracts pink; pedicels 6 to 7 lines long; bracts membranous, lanceolate, 2 to 4 lines long, deciduous; sepals whitish, glandular-ciliate; berry red, oval, 3 lines long, the surface rugose and glandular short-hairy; stone solid.—Mts. and mesas of S. Cal. from the San Bernardino Mts. to the Cuyamaca Mts., 2000 to 7500 ft.; s. to L. Cal. (*A. pringlei* var. *drupacea* Parry.)

25. *A. bicolor* (Nutt.) Gray. Shrub 3 to 6 (or 10) ft. high; leaves coriaceous, brittle, oblong or elliptic, tapering to base and apex, tending to be

revolute, dark green, shining and glabrous above, white-tomentose or felt-like beneath, 1 to  $2\frac{1}{2}$  in. long; pedicels and calyx at first densely tomentose; calyx dark red; corolla rose-color, 4 lines long; ovary a little hairy at summit; berry reddish, eventually with smooth highly polished dark red or almost black surface, 3 to  $3\frac{1}{2}$  lines broad; style-base persistent as a sort of short beak or papilla; stone solid, smooth.—W. San Diego Co.; Santa Catalina Isl.; L. Cal. (*A. clevelandii* Gray. *Xylococcus bicolor* Nutt.)

## 22. VACCINIUM L.

Shrubs or bushes, or on high mountain peaks or ridges, dwarfish or depressed woody plants. Leaves alternate. Flowers small (1 to 3 lines long). Calyx-tube adnate to the ovary, the limb 5-parted or -lobed, or entire. Corolla globular or urn-shaped to oblong-cylindric, 5 (or 4)-toothed. Stamens 10 (or 8); anthers (except in *V. ovatum*) bearing on the back two upwardly curved awns, each cell prolonged at apex into a tube-like appendage opening at the tip by a pore. Ovary 4 or 5-celled, the cells several to many-seeded. Fruit a berry, crowned with the vestiges of the calyx-teeth. (Classical Latin name of the bilberry.)

Evergreen; flowers in racemes; filaments hairy; anthers awnless.—Subgenus *VITIS-IDAEA*.

1. *V. ovatum*.

Deciduous; flowers solitary (sometimes 2 in a cluster in no. 2); filaments glabrous; anthers awned.—Subgenus *EUVACCINIUM*.

Calyx 5-lobed or -parted; leaves entire, only slightly veiny.

Branchlets not angled; berry blue or black, with a bloom; Sierra Nevada.....

2. *V. occidentale*.

Branchlets strongly angled; berry red; Redwood region.....

3. *V. parvifolium*.

Calyx entire, as if truncate; leaves serrulate, reticulate-veiny.

Plants 2 to 4 ft. high; leaves 1 to 2 in. long; berry black (or at first red).....

4. *V. membranaceum*.

Plants low or dwarfish; leaves less than 1 in. long.

Branches sharply angled; berry red.....

5. *V. myrtillus*.

Branches not angled; berry black.....

6. *V. caespitosum*.

1. *V. ovatum* Pursh. CALIFORNIA HUCKLEBERRY. Fig. 732. Erect evergreen shrub 4 to 8 ft. high; leaves coriaceous, shining above, oblong-ovate, serrate,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long, short-petioled; racemes 4 to 9-flowered, shorter than the leaves; pedicels 2 to 3 lines long; corolla pink, broadly bell-shaped, 3 to  $3\frac{1}{2}$  lines long; berry black, without bloom, globose-ovoid, 3 to 4 lines long.—N. slopes of hills near the coast: Purisima Hills, Santa Barbara Co.; Monterey Co. to Del Norte Co.; n. to B. C. Often the dominant under-shrub in extensive areas in the Redwood region. Var. *SAPOROSUM* Jepson n. var. Berry glaucous.—Mendocino coast (Gualala, Robt. Brandt, type). The berry ripens earlier than in the species and has a better flavor.

2. *V. occidentale* Gray. WESTERN BLUEBERRY. Fig. 733. Low shrub ( $1\frac{1}{2}$  to 2 ft. high), with stoutish stems and numerous clustered and erect branchlets; leaves obovate or obovate-oblong, glaucous on the under surface, entire,  $\frac{1}{2}$  to  $\frac{3}{4}$  in. long; pedicels 1 to 4 lines long; flowers solitary or in clusters of 2; calyx 5-parted; corolla white, oblong-cylindric, 2 lines long, mostly 4-toothed; berry blue-black with a bloom, elliptic to oblong,  $2\frac{1}{2}$  to 4 lines in diameter; pedicel pendulous.—Swamps, 5000 to 8000 ft.: Sierra Nevada from Mariposa Co. to Siskiyou and Modoc Cos.; n. to Wash., e. to Utah.

3. *V. parvifolium* Sm. RED BILBERRY. Shrub, 3 to 12 or 18 ft. high; branches and branchlets slender, very sharply angled, green, articulated; leaves thin, mostly oval, pale beneath, entire, 5 to 8 or 12 lines long; pedicels

732. *Vaccinium ovatum* Pursh; fr. branchlet x  $\frac{3}{4}$ .

733. *Vaccinium occidentale* Gray; *a*,  
fr. branchlet  $\times \frac{1}{2}$ ; *b*, fl.  $\times 3$ ;  
*c*, fr.  $\times 2$ .

2 to 4 lines long, deflexed in fruit or sometimes curved; calyx slightly 5-lobed; corolla globular, greenish; berry bright red, 3 to 4 lines in diameter, pleasant flavored. — Redwood region from the Santa Cruz Mts. to Humboldt Co.; Sierra Nevada, 4500 ft., from Mariposa Co. to Shasta Co. but rare; n. to Alas.

4. *V. membranaceum* Dougl. THIN-LEAF HUCKLEBERRY. Shrub 1 to  $2\frac{1}{2}$  ft. high, with widely spreading branches; branchlets slightly angled, those of the season bearing 3 to 5 (not crowded) leaves; leaves ovate or obovate to oval, mostly acute or acuminate, finely serrulate, membranous, both sides nearly alike, reticulate-veiny, 1 to  $1\frac{1}{2}$  (or 2) in. long; pedicels 3 to 5 lines long; calyx entire; corolla depressed-globose, greenish-white, 2 lines broad; pedicels erect in fruit; berry black (or garnet color, at least at first). — Montane, 5000 to 6000 ft.: Humboldt and Siskiyou Cos.; n. to B. C.

5. *V. myrtillosum* L. Stems freely branched, 3 to 10 in. high; branchlets angled, green, rather straight and disposed to be somewhat fastigiate; leaves obovate to ovate,  $\frac{1}{2}$  to  $\frac{3}{4}$  in. long, serrulate or almost entire; pedicels very short, 1 line or less long; calyx-lobes entire; corolla ovoid or subglobose, its lobes more or less crenulate; berry red. — Montane, 7000 ft.: Marble Mt., Siskiyou Co. (rare in Cal.); n. to Alas. June. Var. *MICROPHYLLUM* Hook. Diminutive form; leaves 2 to 4 lines long; corolla 1 line long. — Sierra Nevada acc. Syn. Fl.

6. *V. caespitosum* Michx. DWARF BILBERRY. Dwarfish, depressed, 2 to 4 (or 9) in. high; branchlets not angled; leaves obovate, mostly acute, usually cuneate at base, finely serrulate,  $\frac{1}{2}$  to  $\frac{3}{4}$  (or 1) in. long; pedicels 1 line long or less; calyx rim a wavy border or entire; corolla pendulous, pink or white, ovoid, mostly 5-toothed; berry blue with a bloom, globose,  $2\frac{1}{2}$  to  $3\frac{1}{2}$  lines in diameter, on a curved pedicel. — Sierra Nevada, 6500 to 11,600 ft., from Tulare Co. to Lassen Co.; North Coast Ranges, 100 to 7000 ft., from Humboldt Co. to Mt. Shasta and w. Siskiyou Co.; n. to Alas., e. to Col. and N. Eng.

## EMPETRACEAE. CROWBERRY FAMILY

Small evergreen shrubs. Leaves linear with a deep groove on the under side. Flowers dioecious, 3-merous. Ovary superior, 6 to 9-celled; ovules erect. Fruit a drupe.

### 1. *EMPETRUM* L.

Flowers inconspicuous, solitary in the axils, scaly-bracted. Sepals and petals mostly 3. Staminate flower with 3 stamens. Pistillate flowers with the stigma 6 to 9-parted into radiating lobes. Drupe black, berry-like, containing 6 to 9 nutlets. (Greek en, upon, and petros, a rock.)

1. *E. nigrum* L. BLACK CROWBERRY. Stems 6 to 15 in. long, procumbent, with numerous branchlets, crowded with leaves, forming dense beds; leaves  $1\frac{1}{2}$  to  $2\frac{1}{2}$  lines long; drupe 3 to 4 lines long. — Sea-shore, Crescent City, Del Norte Co.; Ore. to arctic Am. and N. Eng.; Eur., Asia.

## PRIMULACEAE. PRIMROSE FAMILY

Herbs with simple undivided leaves. Flowers perfect, regular and symmetrical, 4 to 8-merous, commonly 5-merous, axillary and solitary, or in terminal racemes or umbels. Stamens opposite the lobes of the corolla and inserted on its tube at base. Ovary 1-celled, with a single style and stigma, superior, except in *Samolus*, where it is attached to the base of the calyx; ovules on a free central placenta. Fruit a capsule.

Ovary superior (wholly free); flowers not in racemes.

Stems scape-like, the leaves all basal; flowers in umbels.

Corolla-lobes reflexed; stamen filaments monadelphous.....1. DODECATHEON.

Corolla-lobes erect or spreading; stamen filaments distinct (as in all the following).

Flowers large; corolla open at the throat, its lobes emarginate.....

2. PRIMULA.

Flowers very small; corolla constricted at the throat, its lobes entire.....

3. ANDROSACE.

Stems leafy; flowers axillary and solitary (or in no. 4 often seemingly clustered).

Stems with the leaves in a single whorl at summit.....4. TRIENTALIS.

Stems leafy throughout.

Leaves opposite.

Corolla none.....5. GLAUX.

Corolla present, red.....6. ANAGALLIS.

Leaves alternate; corolla pinkish, minute.....7. CENTUNCULUS.

Ovary adnate to base of the calyx; flowers in racemes.....8. SAMOLUS.

## 1. DODECATHEON L. SHOOTING STAR

Low perennial herbs with basal leaves and a naked scape bearing an umbel of few or many flowers. Corolla 5-parted, with very short tube and dilated thickened throat, the long and narrow divisions reflexed in flower (as also the calyx-lobes). Stamens on the throat of the corolla; filaments short and flat, monadelphous, but at length separable above. Style filiform, exserted. Fruit a capsule with columnar placenta, surrounded at base by the now erect calyx. (Greek dodeka, 12, and theos, god, the Primrose being under the care of the deities. Singular flowers similar to those of the cultivated Cyclamen.)

Filaments distinct to the base.

Capsule elliptic to broadly oblong, valvate from the very apex; high montane or alpine species.

Herbage wholly glabrous; leaves 1 to 4 in. long; style not glandular.....

1. *D. alpinum*.

Stems and pedicels minutely glandular; leaves mostly 6 to 14 in. long; style

usually glandular towards the base.....2. *D. jeffreyi*.

Capsule circumscissile just around the enlarged styler base; capsule cylindric.....

3. *D. glastifolium*.

Filaments united into a short tube; capsule circumscissile at the apex, valvate only below this lid; lowland or foothill species.

Modoc region; herbage wholly glabrous.....4. *D. conjugens*.

Cismontane Cal.

Root-crown without rice-grain bulblets at flowering time.

Scapes and pedicels minutely glandular; anthers 2 lines long, the connectives strongly rugose.....5. *D. clevelandii*.

Herbage wholly glabrous; anthers 1 line long, the connectives delicately rugulose.....6. *D. patulum*.

Root-crown with rice-grain bulblets; herbage glabrous, the summit of the scape and the pedicels rarely microscopically glandular....7. *D. hendersonii*.

1. *D. alpinum* Greene. ALPINE SHOOTING STAR. Fig. 734. Scapes slender, 3 to 13 in. high; leaves narrowly spatulate or linear-oblongate, 1 to 4 (or 5) in. long; flowers mostly 4-merous; petals purple, the base whitish with a yellow zone edged beneath by a purple band; anthers 3 to 4 lines long; capsule exceeding the calyx, valvate from the very apex.—High montane, 7000 to 10,000 ft.: San Bernardino and San Jacinto mountains; Sierra Nevada; high North Coast Ranges from n. Humboldt Co. to Siskiyou Co.; n. to Ore. July.

2. *D. jeffreyi* Moore. SIERRA SHOOTING STAR. Scapes 12 to 21 in. high; leaves oblong-oblongate, gradually narrowed below to a winged petiole, mostly 4 or 6 to 15 in. long; peduncles, pedicels and calyx short-pubescent and somewhat viscid-glandular; flowers mostly 4-merous; corolla 8 to 12 lines long, the petals pink-crimson, a yellow zone at base edged below by a purple band; anthers 4 lines long; capsule broadly oblong; shorter than, rarely exceeding the calyx, valvate-dehiscent from very apex, or from a

734. *Dodecatheon alpinum* Greene; *a*, base of plant  $\times \frac{1}{2}$ ; *b*, fl. stem  $\times \frac{1}{2}$ ; *c*, stamen circle with exserted style  $\times 2$ ; *d*, long. sect. of ovary  $\times 2$ .

4. *D. conjugens* Greene. Scapes 4 to 7 in. high; leaves oblong or often widest at the middle and tapering to each end, 1 to  $1\frac{1}{2}$  in. long; flowers 5-merous; corolla white or rose-purple, 6 to 7 lines long; anthers distinct, the connective rugulose.—Modoc Co.; Ore. to Mont. Too little known.

5. *D. clevelandii* Greene. Scapes 1 to 2 ft. high; root-crown not producing rice-grain bulblets at flowering time; scapes, pedicels and calyces minutely glandular; leaves obovate, irregularly and sometimes saliently erose-dentate or entire,  $1\frac{1}{2}$  to  $2\frac{1}{4}$  in. long, shortly petioled; flowers 5-merous; corolla bright purple to white, 6 to 11 lines long; connective of the anthers transversely much folded; capsule 4 to 5 lines long, twice as long as the calyx, dehiscent in a circle beneath the enlarged base of the style, then valvate-dehiscent below this; seeds reddish brown.—Dry hills and mesas, coastal S. Cal.

6. *D. patulum* Greene. LOWLAND SHOOTING STAR. Fig. 735. Scapes only 3 to 5 in. high; leaves obovate, obtuse,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long, gradually narrowed to a broad petiole about  $\frac{1}{2}$  as long; corolla white, pale cream-color or rarely pinkish; anthers short and broad (1 line long), truncate or obscurely retuse at apex; filaments purple, the connective usually with a yellow or white spot above the purple base; capsule short-oblong or subglobose, circumscissile near the summit.—Slightly alkaline areas, Sacramento, San Joaquin and the South Coast Range valleys and their bordering foothills, mostly toward the interior. Mar. Var.

circle just below the enlarged base of the style.—High montane, 8000 to 10,000 ft.: San Bernardino and San Jacinto mountains; Sierra Nevada; White Mts.; North Coast Ranges from the Yollo Bolly Mts. to Siskiyou Co. The leaves are somewhat suggestive of those of *Rumex occidentalis*. Var. *TETRANDRUM* Jepson n. comb. Habit of the species but all the parts glabrous; flowers 4 (or 5)-merous.—Salmon Mts.; Lassen Creek, Modoc Co.; n. to Wash. (*D. tetrandrum* Suksdorf.) Var. *RÉDOLENS* Hall. Herbage odorous; flowers mostly 5-merous; corolla not so closely reflexed, covering the base of the anthers, purple band at base absent.—San Jacinto Mts.; Sierra Nevada from Tulare Co. to Mariposa Co.; w. Nev.

3. *D. glastifolium* Greene. Scapes 6 to 13 in. high; leaves obovate to oblong-lanceolate, acute; umbels 1 to 3-flowered, very long-pedicelled; corolla lilac-purple; stamens 4, distinct; capsule cylindric, 6 to 8 lines long, valvate below the circumscissile stylar base, sometime splitting up to and through the lower part of the style.—Modoc Co. Flowers not known to us.

735. *Dodecatheon patulum* Greene; habit  $\times \frac{1}{2}$ .

*LAETIFLORUM* Jepson n. comb. Scapes 6 to 10 in. high; flowers white.—Hills bordering or near the Santa Clara Valley. (*D. laetiflorum* Greene.)

7. *D. hendersonii* Gray. MOSQUITO BILLS. SAILOR CAPS. Scapes red or reddish, 9 to 14 in. high, from a strong cluster of fleshy-fibrous roots; leaves roundish obovate to elliptic, the margin more or less crisped, 1 to 2½ in. long, on petioles ½ to 2 times as long; umbels 3 to 13-flowered, the pedicels ½ to 3½ in. long; flowers 5- or sometimes 4-merous; calyx cleft into ovate-lanceolate lobes; corolla-lobes oblong, 6 to 7 lines long, ¾ to 1½ (or 2) lines wide, purple with a transverse yellow zone at base, which is edged above by white and bounded below by a black-purple band; filaments black-purple; anthers linear or clavate, 2 lines long; capsule oblong or short-cylindric, circumscissile well below the summit, then valvate.—Low slopes to high ridges in the foothills, the most common species: Coast Ranges from Monterey Co. to Siskiyou Co., thence s. in the Sierra Nevada foothills to Tulare Co. Feb.-Apr. Var. *BERNALIANUM* Jepson n. comb. Petals rose-purple with a white zone below, this bordering the dark purple band of the united base of the corolla-segments; anthers oblong, 1½ lines long, retuse.—Open ridges, San Mateo Co. and San Francisco Co. The corolla-tube is closely reflexed, whereas in the species and in *D. patulum* its base is slightly folded over the base of the anthers. (*D. patulum* var. *bernalium* Greene.) Var. *GRACILE* Jepson n. comb. Corolla white; petals twisted (ex char.).—Santa Cruz Mts. (*D. patulum* var. *gracile* Greene.)

## 2. PRÍMULA L.

Perennial herbs with basal leaves and scape-like stems bearing involucrate umbels. Calyx 5-toothed. Corolla salverform, its lobes obcordate or emarginate. Stamens 5, included, the filaments short. Capsule 5-valved at the top, many-seeded. (Latin *primus*, first, because of the early flowering.)

1. *P. suffrutescens* Gray. SIERRA PRIMROSE. Scape 2 to 4 in. long, bearing an umbel of several flowers; leaves thickly crowded on creeping stems, cuneate-spatulate, toothed at apex, ¾ to 1¼ in. long; corolla red, its tube surpassing the calyx, its limb ½ in. broad with spreading lobes.—Crevices of rocks, alpine, 8000 to 12,800 ft., Sierra Nevada from Nevada Co. to Tulare Co. July.

## 3. ANDRÓSACE L.

Ours small annual herbs, with rosulate basal leaves and few to several scapes bearing an involucrate umbel of small white or pink-tinted flowers. Calyx-lobes 5. Corolla somewhat salverform, its lobes 5 (or 4), its tube shorter than the calyx, its throat constricted; stamens short and inserted low down upon the tube. Style mostly short. Capsule subglobose, dehiscent by valves. (Androsakes, Greek name of a now unknown sea-plant.)

Bracts linear, acute; scapes numerous; pedicels ascending, shorter than the scapes; alpine.

Bracts ovate-lanceolate, the tip attenuate-caudate; scapes about 2 or 3; pedicels stiffly ascending or divergent, often longer than the scapes; foothills. 1. *A. septentrionalis*. 2. *A. occidentalis*.

1. *A. septentrionalis* L. var. *subumbellata* A. Nels. Plants very much condensed, ½ to 1 in. high, the pedicels many from the dense tuft of basal leaves; leaves linear, obtuse, sometimes remotely denticulate, 2 to 6 lines long; umbels 3 to 7-flowered, the pedicels 1 to 5 lines long, shorter than the scapes; corolla very slightly exceeding calyx-lobes.—Alpine, 11,400 to 12,700 ft.: Mt. San Geronio; White Mts.; Mt. Dana; Siskiyou Co.

2. *A. occidentalis* Pursh var. *acuta* Jepson n. comb. Plants ¾ to 2 in. high; leaves linear-lanceolate, 3 to 5 lines long; scapes spreading, ½ to 1¼ in. long; umbels 3 to 7-flowered, the pedicels very unequal, some often longer than the scape, ½ to 1¾ in. long; calyx-lobes mostly shorter than the tube; corolla white, 1 line long, scarcely exerted from calyx-tube.—Hill-tops, 1500 to 2000 ft.: S. Cal. (Warners Hot Sprs., San Bernardino); South Coast Ranges (mostly towards the interior, Alcalde, Mt. Diablo, Berkeley Hills). (*A. acuta* Greene.)

736. *Trientalis europaea* var. *latifolia* Torr.; a, habit x  $\frac{1}{2}$ ; b, fl. x 1.

#### 4. TRIENTALIS L.

Low and glabrous perennials. Rootstocks tuberous, sometimes stoloniferous. Stem simple, bearing scales or small leaves below and a whorl of large leaves above, from the center of which the filiform peduncles arise. Flowers commonly 6 (5 or 7)-merous. Corolla rotate, deeply parted. Filaments long and filiform, united at base into a very short ring. Style filiform. Capsule valves 5, revolute. (Latin *trientalis*, containing one-third of a foot, in allusion to the height of the plants.)

1. *T. europaea* L. var. *latifolia* Torr. STAR-FLOWER. Fig. 736. Stems 4 to 6 in. high, from tubers  $\frac{1}{2}$  to nearly 1 in. long; leaves of the involucral whorl 3 to 6, 1 to 2 in. long, broadly obovate, abruptly acute, drawn down to a very short petiole; peduncles  $\frac{3}{4}$  to 2 in. long; corolla white or rose-red, 4 to 8 lines broad, its divisions abruptly acuminate and prolonged into a slender point; calyx-lobes narrowly linear-

lanceolate, mucronate, exceeding the capsule.—Woods, 100 to 4000 ft.: Coast Ranges (mostly in the seaward and middle ranges) from Monterey Co. to Del Norte Co.; Sierra Nevada from Mariposa Co. to Shasta Co.; n. to B. C.

#### 5. GLAUX L.

Somewhat succulent perennial with opposite leaves, distinguished from all other genera of the order by the absence of a corolla. Calyx purplish or white, campanulate, 5-lobed, assuming the appearance of a corolla, the stamens alternating with its lobes. Capsule 5-valved at apex. Seed $\delta$  few, immersed in the tissue of the placenta. (Greek *glaukos*, sea-green.)

1. *G. maritima* L. SEA MILKWORT. Stems 8 to 11 in. high, erect or ascending, simple or eventually branching, arising from slender running rootstocks; leaves oblong, 4 to 9 lines long; flowers 2 lines long, solitary in the axils, almost sessile; calyx-segments elliptic; capsule globose, a little over 1 line long.—Marshy shores of bays: San Francisco Bay to Humboldt Bay; sea-coasts of north temperate and arctic lands.

#### 6. ANAGALLIS L. PIMPERNEL

Low annuals with opposite or sometimes ternate entire leaves. Flowers axillary, on slender pedicels. Calyx deeply 5-cleft into narrow segments. Corolla rotate, deeply 5-parted, the rounded lobes convolute in the bud. Stamens 5; filaments hirsute or pubescent. Capsule circumscissile. (Greek, meaning delightful.)

1. *A. arvensis* L. POOR MAN'S WEATHER-GLASS. Fig. 737. Stems 1 ft. long, procumbent or ascending; leaves ovate or deltoid-ovate, acute, sessile, 4 lines long, shorter than the pedicels; flowers opening only under a clear sky; sepals lanceolate, acuminate, scarious-margined toward the base, nearly distinct; corolla vermillion, 4 to 5 lines broad, the petals lightly joined at base, minutely glandular-ciliate at apex;

737. *Anagallis arvensis* L.; a, habit x  $\frac{1}{4}$ ; b, fl. x  $1\frac{1}{2}$ ; c, stamen x  $2\frac{3}{4}$ ; d, capsule x  $1\frac{1}{2}$ .

capsules on recurved pedicels; seeds  $\frac{1}{2}$  line long, triangular, the surface pitted.—Weed, nat. from Eur., mostly near the coast. Var. *COERTLEA* Ledeb. Corolla blue.—Mt. Diablo.

### 7. CENTUNCULUS L.

Very small annuals with alternate entire leaves and minute solitary flowers in their axils. Calyx 4 (or 5)-parted, the narrow lobes linear-lanceolate, acuminate. Corolla 4 (or 5)-cleft, the tube subglobose and lobes acute. Stamens 4 or 5, inserted on the throat of the corolla. Capsule globose, circumscissile. Seeds many. (Meaning of name obscure.)

1. *C. minimus* L. CHAFFWEED. Fig. 738. Slender, glabrous, 1 to 5 in. high; leaves obovate, sessile or short-petioled, 1 to 2 (or 3) lines long; flowers sessile or very nearly so, shorter than the leaves, mostly 4-merous; filaments much dilated at base.—Moist ground: San Diego; Ramona; Upland; Berkeley Hills; Antioch; Burson, Calaveras Co.; Suisun; Alton, Humboldt Co.; n. to Wash., e. to Ill. and Fla. May.

### 8. SAMOLUS L. BROOKWEED

Glabrous perennial herbs with alternate leaves. Flowers small, white, 5-merous, in terminal racemes. Calyx adherent to the base of the ovary, campanulate. Corolla nearly campanulate. Stamens 5, borne on the tube of the corolla, their filaments short; a second series of stamens represented by 5 sterile filaments or staminodia inserted in the sinuses of the corolla and alternating with the anther-bearing stamens. Capsule opening at the apex by 5 valves. (Celtic name.)

1. *S. floribundus* H.B.K. WATER PIMPERNEL. Stem commonly solitary, erect, simple or branching above into 2 or 3 racemes, or paniculate, 6 to 10 in. high; basal leaves rosette-like, round-obovate to oblong-spatulate, obtuse or almost truncate, narrowed toward the base into a broad short petiole,  $1\frac{1}{2}$  in. long; cauline leaves similar, the uppermost varying to elliptic, 3 lines long or more; pedicels slender, bractless, but bearing minute bractlets at their middle; calyx-teeth short, broadly triangular; corolla very small, white.—Brooks and marshes, rare: Suisun Marshes; Antioch; San Gabriel Mts.; San Bernardino Mts.; Riverside; Ramona; e. to the Atlantic, n. to B. C.; S. Am.

## PLUMBAGINACEAE. THRIFT FAMILY

Maritime perennial herbs with hard or coriaceous scapes and basal leaves. Flowers regular, perfect, 5-merous throughout. Calyx tubular or funnelform, plaited. Petals with long claws barely united into a ring at base. Stamens opposite the petals, adnate to the base of the claw. Ovary superior, 5-angled at summit, containing a single ovule which hangs from an elongated funiculus arising from the base of the cell. Styles 5. Fruit a utricle or achene, borne in the base of the persistent calyx. Seed with endosperm; embryo straight.

Leaves narrowly linear; inflorescence head-like.....1. *STATICE*.  
Leaves broad; inflorescence paniculate.....2. *LIMONIUM*.

### 1. STÁTICE L. THRIFT

Scape naked, terminating in a globose head of flowers. Leaves narrowly linear, sedge-like, in a close tuft. Heads composed of numerous crowded clusters, each cluster subtended by a scarious bract, the outer bracts form-

738. *Centunculus minimus* L.; a, habit x 1; b, fl. x 8; c, corolla spread open x 8; d, capsule x 5.

ing an involucre, the two outermost united and forming a reversed sheath to the summit of the scape. Flowers pediceled or subsessile, subtended by bractlets. Calyx scarious, funnelform. Corolla of 5 apparently distinct long-clawed petals, each with a stamen on its base. Styles filiform, united at the very base. (Greek statike, astringent.)

1. *S. ártica* Blake var. *califórnica* Blake. SEA-PINK. Scares few or solitary, 7 to 20 in. high; leaves involute-channeled,  $\frac{1}{2}$  to 1 line wide, bluntish at tip, ( $1\frac{1}{2}$  or) 4 to 8 in. long; flowers dull pink or flesh-color; calyx-tube 10-nerved, the nerves densely hispid; calyx-limb more or less erose.—Sea-beaches or sandy fields along the ocean, Monterey Co. to Del Norte Co. Apr.-June. (*Armeria vulgaris* Fl. W. Mid. Cal.)

## 2. LIMÓNÍUM Hill. MARSH ROSEMARY

Leaves broad, fleshy, in a basal tuft. Flowers second, in short spikes or clusters terminating the many branchlets of a branching scape. Calyx hairy on the angles below. Styles wholly distinct. (Greek name of the wild beet.)

1. *L. commune* S. F. Gray var. *califórnicum* (Gray) Greene. Scares  $\frac{2}{3}$  to  $1\frac{1}{2}$  (or 2) ft. high, loosely paniculate, the root  $\frac{1}{2}$  to 1 in. thick, reddish, woody; leaves obovate- to oblong-spatulate, obtuse or sometimes retuse, tapering below into a rather long petiole, 4 to 9 in. long; calyx-lobes membranous at tip; corolla violet-purple; petals oblong, narrowed towards the base, 2 to  $2\frac{1}{2}$  lines long.—Salt marshes and sea-beaches along the coast, Los Angeles Co. to Humboldt Co. July-Dec. (*L. califórnicum* Hel. *Statice limonium* var. *californica* Gray.)

## STYRACACEAE. STORAX FAMILY

Shrubs or trees with alternate simple leaves. Flowers regular and perfect, the calyx in ours slightly adherent to the base of the ovary; petals 4 to 8, united or connivent at base into a short tube; stamens at least twice the number of petals. Ovary 2 to 5-celled; style 1.

### 1. STÝRAX L. STORAX

Corolla white, seated in a campanulate calyx whose truncate border is denticulate, irregularly toothed or split down one side. Stamens 10 to 16, their filaments united for nearly their whole length into a tube, the lower portion of which is adherent to the base of the corolla. Ovary 1-celled through imperfect partitions but 3-celled at base. Style slender. Fruit globose, 1-celled, commonly splitting into 3 valves, with a single large nut-like or bony seed. (Ancient Greek name, used by Theophrastus, for the species which produces storax.)

1. *S. officinális* L. var. *califórnica* M. & J. SNOW-DROP BUSH. Fig. 739. Deciduous shrub 5 to 10 ft. high; leaves orbicular to ovate (or somewhat rhomboidal), entire, minutely stellate or rusty-pubescent beneath, or in age glabrate, 1 to  $2\frac{1}{2}$  in. long, on tomentose petioles 2 to 4 lines long; flowers a little resembling orange blossoms, 2 or 3 (to 5) in a terminal corymbose raceme, the cluster borne on a very short peduncle; pedicels somewhat clavate; petals commonly 6 and stamens 12; petals oblong or somewhat narrowed towards the base, 6 to 7 lines long; stamen-tube pubescent with short soft hairs within; seeds 6 lines in diameter.—Dry slopes in the foothills, 500 to 2300 ft.: Lake Co. to Tehama Co.; Sierra Nevada foothills from Shasta Co. to Tulare Co.; San Bernardino Mts.; Santa Ana Mts. Also called Bitter Nut. Apr.-July. In Santa

739. *Styrox officinalis* L. var. *californica* M. & J.; a, branchlet x 1; b, fr. x  $\frac{1}{2}$ .

Barbara Co. replaced by the var. *FULVESCENS* (Eastw.) M. & J. Petioles rusty-tomentose; leaves often cordate at base; calyx-border more strongly denticulate.—Painted Cave Ranch, Santa Inez Mts.

### OLEACEAE. ASH FAMILY

Trees or shrubs. Leaves opposite or sometimes alternate. Flowers small, commonly in compact panicles or clusters, mostly unisexual, sometimes perfect. Corolla sympetalous, choripetalous or none. Stamens few (1 to 4). Ovary superior, 2-celled; style 1. Fruit a samara, capsule or drupe.—This family includes Forsythia, Lilac, Olive and Privet of the gardens.

Leaves compound, opposite; fruit a samara.....1. *FRAXINUS*.  
Leaves simple; fruit not a samara.

Fruit a drupe; leaves opposite.....2. *FORESTIERA*.

Fruit a circumscissile capsule; leaves mostly alternate, entire.....3. *MENODORA*.

#### 1. *FRAXINUS* L. ASH

Trees or shrubs. Leaves deciduous, pinnately compound. Flowers dioecious, perfect or polygamous, borne in small crowded panicles, appearing just before the leaves and from separate buds. Calyx small, truncate, with toothed border. Corolla with 2 equal petals or none. Stamens 2 (rarely 1 or 3). Ovules 2 in each cell. Fruit a 1-seeded samara, with terminal wing. (The Latin name of the ash.)

Trees; corolla none; style conspicuously 2-lobed.

Flowers dioecious; leaves pinnate; leaflets 2 in. long or more; branchlets terete.

Leaflets oblong to oval, the lateral commonly sessile; mostly cismontane.....

1. *F. oregona*.

Leaflets lanceolate, the lateral on petioles  $\frac{1}{8}$  to  $\frac{1}{2}$  in. long; desert ranges.....

2. *F. velutina*.

Flowers polygamous; leaves simple, rarely with 2 or 3 leaflets; branchlets of the season 4-sided; desert area.....

3. *F. anomala*.

Shrub; corolla present; flowers perfect; style obscurely lobed; leaflets mostly stalked, less than 2 in. long; branchlets of the season 4-sided; cismontane.....

4. *F. dipetala*.

1. *F. oregona* Nutt. OREGON ASH. Fig. 740. Tree 30 to 80 ft. high; leaves 6 to 12 in. long; leaflets 5 to 7, oblong to oval, or often broadest toward the apex and abruptly short-pointed, usually sessile except the terminal one, entire or toothed above the middle, 2 to  $5\frac{1}{2}$  in. long; stamens 2 (sometimes 1 or 3); samara oblong-lanceolate,  $1\frac{1}{4}$  to 2 in. long, including the wing, the body clavate and  $\frac{1}{2}$  to  $\frac{3}{4}$  in. long.—Along streams or in valley or lake bottoms, 10 to 4000 ft.: throughout cismontane Cal.; n. base San Bernardino Mts.; Modoc Co.; Siskiyou Co.; n. to B. C.

2. *F. velutina* Torr. ARIZONA ASH. Tree 15 to 30 ft. high; leaflets 5, lanceolate to narrowly ovate, acute or less commonly attenuate, 2 to 4 in. long; samaras 1 in. long, the wing  $1\frac{1}{4}$  to 2 lines wide.—Along desert streams or borders of lakes or springs: Owens Lake; Panamint Range; sw. base Mt. San Jacinto; between Campo and Jacumba; e. to Tex. Var. *CORIACEA*

Rehd. Leather-leaf Ash. Leaflets narrowly or broadly ovate, more or less abruptly acute or attenuate.—Same range in Cal.; e. to Utah.

3. *F. anomala* Wats. DWARF ASH. Tree 15 to 20 ft. high, or a low spreading shrub; leaves simple, roundish or broadly ovate,  $1\frac{1}{2}$  to 2 in. long, or compound with 2 or 3 similar leaflets; flowers perfect and pistillate; samaras 8 to 9 lines long, with a rounded wing which surrounds the body and is 4 to 5 lines broad.—Desert ranges, Panamint and Providence mountains; e. to Col. and Tex.

4. *F. dipetala* H. & A. FOOTHILL ASH. Shrub 5 to 15 ft. high; leaves 2 to 6 in. long; leaflets 3 to 9, serrate above the middle,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long;

740. *Fraxinus oregona* Nutt.; a, leaf  $\times \frac{1}{4}$ ; b, fr.  $\times 1$ .

741. *Forestiera neo-mexicana* Gray; fr. branchlet  
x  $\frac{3}{4}$ .

petals 2, white, about 3 lines long; samaras 1 to  $1\frac{1}{4}$  in. long, the wing frequently notched at tip.—Cañons or mountain slopes, 600 to 4000 ft.: Sierra Nevada; Coast Ranges; coastal S. Cal. Also called Mountain Ash and Flowering Ash.

## 2. *FORESTIÈRA* Poir.

Shrubs with opposite simple leaves. Flowers inconspicuous, dioecious or polygamous, few in a small panicle. Calyx minute or obsolete. Corolla none, or rarely 1 or 2 small petals. Stamens 2 to 4. Ovules 2 in each cell; style slender. Drupe 1-seeded. (M. Forestier, a French physician.)

1. *F. neo-mexicana* Gray. Fig. 741. Glabrous shrub with spiny branchlets, 5 to 10 ft. high; bark smooth, light gray or yellowish; leaves often fasciated, ovate, acute, serrulate above the cuneate base or entire,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long including the short petiole; flowers in sessile clusters; drupe blue-black, ovoid, 3 to 4 lines long.—Valley flats or mountain cañons, 500 to 5500 ft.: San Jacinto Mts.; Mohave Desert and bordering mountain slopes; n. to the Salinas River and Gabilan Range; Owens Valley; e. to Col. and Tex.

## 3. *MENODORA* H. & B.

Low desert shrubs with simple leaves, the upper alternate, the lower often opposite. Flowers perfect. Calyx deeply cleft into 5 to 10 linear or subulate lobes. Corolla 5 (or 6)-lobed. Stamens 2. Ovules 4 in each cell; style slender. Fruit deeply 2-parted, each lobe splitting around the middle horizontally (the upper part falling as a lid) or sometimes splitting irregularly; seeds usually 2 in each cell. (Greek *menos*, force, and *doron*, gift.)

Corolla-lobes  $\frac{1}{2}$  or  $\frac{3}{4}$  as long as the tube; flowers shortly peduncled or subsessile, solitary or somewhat fasciated on the short branchlets. .... 1. *M. spinescens*.

Corolla-lobes longer than the tube; flowers few in a terminal corymb.

Herbage glabrous. .... 2. *M. scoparia*.

Herbage minutely scabrous-puberulent. .... 3. *M. scabra*.

1. *M. spinescens* Gray. Fig. 742. Shrub with very divaricate branches and short stout spiny branchlets,  $\frac{1}{2}$  to 2, rarely 3 ft. high; branches minutely puberulent; leaves alternate, linear to spatulate-oblong, 3 to 6 lines long on the flowering branchlets, fasciated and often reduced to mere scales on the main stems; flowers solitary or clustered, on peduncles 1 to 6 lines long; calyx-lobes 5 and equal (or 6 or 7 and more or less unequal); corolla white, brown-purple tinged outside, funnelform, 3 to 7 lines long, the limb 3 to 4 lines broad and with short broad lobes

742. *Menodora spinescens* Gray; a, fl. branchlet x  $\frac{2}{3}$ ; b, long. sect. fl. x  $1\frac{1}{2}$ .

$1\frac{1}{2}$  to  $1\frac{1}{4}$  as long as the tube; capsule yellowish, its lobes globose, 3 lines in diameter, diverging and, indeed, almost separate.—E. Mohave Desert (Ord Mts., Calico Mts., Providence Mts.), and n. to Inyo Co.; s. Nev.

2. *M. scopària* Engelm. Branches of the season slender, elongated, erect, more or less clustered, from a woody base, 10 to 15 in. high, not spinescent, sparsely leafy except at base; leaves linear or lanceolate, or the lower obovate; calyx-lobes 7 or 8; corolla yellow, almost rotate, 4 to 6 lines long, its lobes ovate, exceeding the tube; lobes of the capsule globose, not diverging.—Colorado Desert (Jacumba); e. to Tex., s. to Mex.

3. *M. scàbra* Gray. Near no. 2; stems erect, numerous from a woody base or crown, 5 to 12 in. high; leaves oblong to linear, 4 to 7 lines long; calyx-lobes 10; corolla bright yellow, 4 to 5 lines long.—Providence Mts.; e. to Tex., s. to Mex.

### GENTIANACEAE. GENTIAN FAMILY

Glabrous herbs with a colorless bitter juice. Leaves opposite, simple, sessile and entire (3-foliolate and basal in *Menyanthes*). Flowers perfect, regular. Calyx persistent, 4 or 5-toothed or -parted. Corolla four or five-lobed or -parted, usually withering-persistent, its lobes commonly convolute in the bud. Stamens on the tube or throat of the corolla, as many as its lobes. Ovary superior, 1-celled, with 2 parietal placentae; style 1 or none; stigmas 2. Fruit a 2-valved septicidal capsule, the incurved edges bearing the seeds.—*Eustoma* is rarely 6-merous.

Leaves simple, entire, sessile except some basal ones.

Corolla without glands.

Corolla salverform; annuals.

Flowers yellow; anthers unchanged after anthesis.....1. *MICROCALA*.

Flowers red or pink; anthers twisting spirally after shedding pollen.....

2. *CENTAURIUM*.

Corolla campanulate to funnelform, blue or white.

Style filiform; stamens inserted in the corolla throat.....3. *EUSTOMA*.

Style stout, short or none; stamens inserted in the corolla tube. 4. *GENTIANA*.

Corolla-lobes with conspicuous fringed glands.....5. *SWERTIA*.

Leaves 3-foliolate; corolla-lobes bearded with white filaments.....6. *MENYANTHES*.

#### 1. *MICRÓCALA* Hoffm. & Link

Almost minute annual. Stem simple, or with peduncle-like branches terminating in a 4-merous yellow flower. Calyx 4-toothed. Corolla short-salverform, the 4 short stamens inserted on its throat. Anthers cordate-ovate. Stigma of 2 fan-shaped lobes which at length separate. (Greek mikros, small, and kalos, beautiful.)

1. *M. quadrángulàris* (Lam.) Griseb. Stem commonly 1 to 2 in. high, with 1 to 3 pairs of oval or oblong leaves below, these  $1\frac{1}{2}$  to 3 lines long; peduncle naked, quadrangular; calyx short, strongly quadrangular, and seeming as if truncate at base and apex, especially in fruit, when it is 2 to  $2\frac{1}{2}$  lines long; corolla deep yellow, the lower half membranous, twice as long as the calyx, open under a sunny sky, closing in afternoon.—Level or moist country in the neighborhood of low hills, or in open woods, mostly of the outer Coast Ranges: Shasta and Mendocino Cos. to Alameda Co. and San Francisco.

#### 2. *CENTAÚRIUM* Hill. CANCHALAGUA

Low erect leafy annuals. Flowers red or pink, 5 or sometimes 4-merous, in cymes. Calyx deeply parted, its lobes narrow, carinate. Corolla salverform. Stamens commonly 5 (or 4); filaments slender, inserted on the corolla throat; anthers oblong or linear, twisting spirally after shedding their pollen and commonly exserted. Style filiform, deciduous; stigmas oblong to fan-shaped. Capsule oblong-ovate to fusiform, 1-celled, but the seed-bearing edges of the valves more or less approximate in the center. Seeds oblong or spherical, reticulate-pitted. (Latin centum, a hundred, and aurium, gold piece, certain species valued medicinally.) *ERYTHRAEA* L. C. Rich.

Anthers oblong; flowers small; corolla-lobes  $\frac{1}{2}$  to  $\frac{1}{4}$  as long as the tube.

Flowers all on slender pedicels.....1. *C. exaltatum*.

Flowers in the forks sessile or subsessile, the others sessile or shortly pediceled.....

2. *C. muhlenbergii*

Anthers linear; flowers large; corolla-lobes  $\frac{3}{4}$  to nearly as long as the tube; flowers pediceled to subsessile.

Stigmas spatulate-fan-shaped; S. Cal. and Sierra Nevada.....3. *C. venustum*.  
Stigmas short, not spatulate; Coast Ranges.....4. *C. trichanthum*.

1. *C. exaltatum* (Griseb.) Wight. Stem very slender, very strict, (3 or) 8 to 14 in. high; flowers on elongated ( $\frac{1}{2}$  to  $2\frac{1}{4}$  in. long) pedicels in a loose cyme; corolla pale pink, its lobes 2 to  $2\frac{1}{2}$  lines long,  $\frac{1}{3}$  as long as the tube.—S. Cal. and n. through the desert region east of the Sierra Nevada; n. to Wash., e. to Utah. Var. *DAVYI* Jepson n. var. Plants smaller, 2 to 6 in. high, with usually simpler stems, larger corolla lobes, and fan-shaped or almost kidney-shaped stigmas.—Coast Ranges from San Luis Obispo Co. to Mendocino Co. (West Berkeley, Davy 596, type).

2. *C. muhlenbergii* (Griseb.) Wight. Stem much branched from the base to nearly simple, 2 to 9 in. (rarely 1 to 2 ft.) high; leaves narrowly oblong to ovate-lanceolate; flowers sessile or nearly so, in the forks, the lateral ones shortly pediceled or subsessile; corolla-lobes oval to oblong or ovate-lanceolate, obtuse or retuse,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  lines long,  $\frac{1}{3}$  as long as the tube; anthers oblong.—Santa Clara Co. e. to Tuolumne Co., n. to Siskiyou Co.; far n. to Wash.

743. *Centaurium venustum* Rob.; a, habit  $\times \frac{1}{2}$ ; b, long. sect. of corolla  $\times 1\frac{1}{2}$ ; c, pistil  $\times 1\frac{1}{2}$ ; d, cross sect. of ovary  $\times 8$ .

3. *C. venustum* (Gray) Rob. Fig. 743. Stem 4 to 8 in. high, almost simple and with few flowers to corymbosely branched with numerous flowers; calyx-lobes reaching to or nearly to corolla throat; corolla vermilion or rose-color, the throat white, marked with 5 red spots or crescents; corolla-lobes elliptic to oblong, obtusish or acute, often denticulate at apex, 5 lines long, nearly as long as the tube; anthers linear; stigmas spatulate fan-shaped or spoon-shaped.—Common in S. Cal.; n. through the Sierra Nevada to Butte Co.

4. *C. trichanthum* (Griseb.) Rob. Very near to no. 3; stem corymbosely and rather densely branched with numerous flowers; corolla-lobes oblong, acute,  $\frac{3}{4}$  as long as the tube; flowers sessile in the forks, and sessile along the branches or shortly pediceled; stigmas short, transversely oblong without a stalk-like base.—Dry often alkaline ground,

Santa Cruz Mts. to Napa Co., thence n. to the Yollo Bolly Mts. and Siskiyou Co.

### 3. *EUSTOMA* Salisb.

Ours a glaucous perennial herb. Flowers blue or white, long-peduncled, axillary and terminal, 5 or 6-merous. Calyx-lobes long-acuminate, keeled. Corolla campanulate-funnelform, its lobes more or less erose-denticulate. Stamens inserted on the throat of the corolla; anthers straight or recurving in age. Style filiform. Capsule oval or oblong. (Greek eu, good, and stoma, mouth, the corolla throat large.)

1. *E. silenifolium* Salisb. Erect, 1 to  $2\frac{1}{2}$  ft. high; leaves broadly oblong,  $1\frac{1}{2}$  to 3 in. long, thickish, subcordately clasping; corolla-lobes obovate or oblong, 9 to 10 lines long, twice length of tube.—Valleys, 500 to 1500 ft., S. Cal.: Santa Ana Cañon near Olive; Riverside; San Bernardino; Palm Sprs. of Mt. San Jacinto; s. to L. Cal., e. to Fla. Aug.

## 4. GENTIANA L. GENTIAN

Herbs with opposite sessile leaves and showy usually blue flowers. Calyx 4 or 5-cleft. Corolla campanulate or funnelform, the lobes 4 or 5 and often with teeth or plaited folds in their sinuses. Stamens inserted on the tube of the corolla, included. Style short and persistent, or none; stigmas 2. Capsule oblong, enclosed in the withering-persistent corolla; seeds small, very numerous with a loose cellular or winged coat. (Gentius, king of Illyria, who discovered the tonic properties of these herbs.)

Annuals; calyx-tube without an inner membrane; anthers versatile.

Corolla without teeth or lobes in the sinuses; leaves not white-margined.

Flowers solitary; corolla-lobes without a crown at base.

Stems several from the base; flowers long-peduncled. . . . . 1. *G. holopetala*.

Stems simple; flowers short-peduncled. . . . . 2. *G. simplex*.

Flowers clustered; corolla-lobes with a fimbriate crown at base. . . . . 3. *G. amarélla*.

Corolla with toothed lobes in the sinuses; flowers solitary; leaves white-margined. . . . . 4. *G. humilis*.

Perennials; calyx-tube with an inner membrane which projects slightly above the insertion of the lobes; anthers erect; leaves (at least the lower cauline) with connate sheaths at base 1 to 3 lines long.

Alpine dwarf,  $1\frac{1}{4}$  to 2 in. high. . . . . 5. *G. newberryi*.

Stems  $\frac{1}{2}$  to 2 ft. high, leafy.

Uppermost pair of leaves forming an involucre about the terminal 1 to 5-flowered cluster; sinus appendages lacerate.

Involucrate leaves united below; corolla-lobes apiculate; North Coast Ranges. . . . . 6. *G. setigera*.

Involucrate leaves scarcely united; corolla-lobes obtuse; Sierra Nevada. . . . . 7. *G. calycosa*.

Uppermost pair of leaves often approximating the flowers but quite distinct.

Sinuses of the corolla with teeth or lobes.

Calyx-lobes oblong to ovate-lanceolate, subequal. . . . . 8. *G. oregana*.

Calyx-lobes linear to narrow-lanceolate, unequal. . . . . 9. *G. affinis*.

Sinuses of the corolla without lobes or appendages. . . . . 10. *G. sceptrum*.

1. *G. holopétala* Holm. Fig. 744.

Stems several from the base, 4 to 14 in. high, leafy below and ending above in a long naked, 1-flowered peduncle; basal leaves obovate, the cauline linear-oblancoate, acute,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; calyx  $\frac{1}{2}$  to  $\frac{3}{4}$  as long as the corolla, cleft to the middle or below into lanceolate-subulate lobes; corolla  $1\frac{1}{2}$  (or 2) in. long, its lobes broad and short (obovatifish), entire or erose-denticulate; seeds scaly-roughened.—Montane, 6000 to 11,000 ft.: Sierra Nevada from Mariposa Co. to Tulare Co.; San Bernardino Mts. July. (*G. serrata* var. *holopetala* Gray.)

2. *G. simplex* Gray. Fig. 745. Stems always simple, 3 to 12 in. high, bearing 2 to 4 (or 5) pairs of leaves and ending in a single peduncled flower; leaves linear-oblong to lanceolate, 4 to 8 lines long; calyx  $\frac{1}{2}$  to  $\frac{3}{4}$  as long as the corolla, cleft to the middle or below, its lobes lanceolate but not subulate-tipped; corolla 1 to  $1\frac{1}{4}$  in. long, its lobes obovatish, rounded, finely toothed all around or subentire; capsule stipitate; seeds striate longitudinally, roughened at each end.—Wet meadows, 4000 to 9500 ft.: San Bernardino Mts.; Sierra Nevada; n. to southern Ore.

3. *G. amarélla* L. var. *acúta* Herder. Fig. 746. Stem slender, strictly and sparingly branched, 1 to  $1\frac{1}{2}$  ft. high; flowers 1 to 3 in the axils or terminal, on pedicels 3 to 11 lines long; calyx about half as long as the corolla, deeply lobed; corolla tubular, 4 to 6 lines long, its lobes about  $\frac{1}{4}$  as long as the

744. *Gentiana holopetala* Holm; habit  
x  $\frac{1}{2}$ .

tube, bearing below the middle inside a series of slender fimbriae.—Montane, 6200 to 8000 ft.: San Bernardino Mts.; Sierra Nevada; Trinity Mts.; n. to Alas., e. to N. Mex. and Lab.

4. *G. humilis* Stev. Stems erect, simple or several from the base,  $1\frac{1}{2}$  to 3 in. high, leafy throughout and bearing a single terminal flower; herbage yellowish-green; leaves white-margined, 2 to 3 lines long, the basal round-ovate, the cauline oblong, connate at base; calyx-lobes short; corolla tubular, "salverform in anthesis," dull white, 4 to 5 lines long, its tube little exceeding the calyx; sinus appendages toothed; capsule protruded at maturity, when open becoming trumpet-shaped, 2 lines wide, its valves remaining somewhat united below.—Boggy meadows, San Bernardino Mts.; Rocky Mts.; Asia. (*G. fremontii* Torr. *G. viridula* Parish.)

746. *Gentiana amarella* L. var. *acuta* Herder; infl. x 1.

5. *G. newberryi* Gray. Fig. 747. Alpine dwarf, the one-flowered stems  $\frac{1}{4}$  to 2 (or 4) in. long; leaves mostly round-obovoid to oblanceolate; calyx-tube turbinate, its lobes linear or lanceolate, equaling or longer than the tube; corolla blue, white inside and greenish-dotted, 1 to  $1\frac{1}{4}$  in. long, commonly twice as long as the calyx, its lobes erect, ovate, acute, very short, with a longitudinal slate-brown band outside; sinus appendages broad, with 1 or 2 teeth.—High montane, 6600 to 12,000 ft.: Sierra Nevada from Mt. Whitney to Lassen Peak; n. to southern Ore.

745. *Gentiana simplex* Gray; fl. stem x 1.

6. *G. setigera* Gray. Stems several from the root-crown, ascending, 10 to 12 in. long, bearing terminally one or several flowers; leaves roundish to ovate, obtusish, 1 to  $1\frac{1}{2}$  in. long, the uppermost pairs covering the bases of the flowers; calyx-lobes ovate, about as long as the tube; corolla subcampanulate,  $1\frac{1}{2}$  to  $1\frac{3}{4}$  in. long, the lobes erosulate, apiculate, nearly as broad as long, the sinus appendages produced into 2 to 6 capillary bristles nearly as long as the lobes; seeds winged. — Mendocino

747. *Gentiana newberryi* Gray; habit x  $\frac{2}{3}$ .

Co. to Siskiyou Co.

7. *G. calycosa* Griseb. Fig. 748. Stems several from a stoutish root-crown, 6 to 12 in. high; leaves ovate, acute,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; flowers one and terminal or commonly few and shortly pediceled in the uppermost axils, thus forming a close terminal cluster, rarely with one or few supplementary flowers on long pedicels from the axils below; calyx-tube membranous, broadly oblong, 2 to 3 lines long, its lobes ovate, contracted at base, unequal, about

as long as the tube and inserted just below its truncate border; corolla  $1\frac{1}{4}$  to  $1\frac{1}{2}$  in. long, its lobes short and roundish, obtuse, yellowish-dotted,  $\frac{1}{4}$  as long as the tube; sinus appendages triangular-subulate, prominent; corolla-tube with 2 greenish-dotted elongated areas beneath each lobe; seeds wingless.—Montane, 6000 to 8000 ft.: Sierra Nevada from Tulare Co. to Siskiyou Co.; n. to B. C. and Mont.

8. *G. oregana* Engelm. Stems erect, several from a stout taproot, 1 to 2 ft. high; leaves ovate or oblong-ovate,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long; flowers few to several at summit; calyx-lobes oblong to ovate-lanceolate, as long as tube; corolla broadly funnel-form,  $1\frac{1}{4}$  to  $1\frac{3}{8}$  in. long, its border light blue, the spreading lobes roundish-ovate, not narrowed at base; sinus appendages conspicuous, subulate or toothed; capsule more or less stipitate; seeds winged.—Near the coast, open grassy or sandy lands, Marin Co. to Humboldt Co., thence e. to Shasta Co.; n. to B. C. Very close to no. 7.

9. *G. affinis* Griseb. Stems several from a root-crown,  $\frac{1}{2}$  to  $1\frac{1}{2}$  ft. high; leaves "lanceolate-oblong" to ovate,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long; bracts rather narrow; flowers several, congested on short pedicels in the upper axils; calyx-tube with obsolete inner rim, its lobes linear to subulate, very unequal, the 3 longest 2 to 3 lines long (sometimes nearly equaling the tube), the other 2 much shorter, or reduced to mere teeth, or obsolete; corolla purple, its lobes short, rounded but with a short point; sinus appendages acute, sparingly toothed, or sometimes sparingly laciniate; seeds obliquely elliptic in outline, winged all around.—Warner Mts., Modoc Co.; n. to B. C., e. to Minn. and N. Mex.

10. *G. scéptrum* Griseb. Stems very upright,  $\frac{3}{4}$  to 2 ft. high, several from a cluster of cord-like roots, mostly simple, leafy to the top, bearing 1 to several flowers; leaves oblong to ovate-lanceolate,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long, thinner than in no. 8; calyx  $\frac{1}{2}$  to  $\frac{1}{2}$  as long as the corolla, lobed about to the middle; corolla broadly funnel-form,  $1\frac{1}{2}$  to  $1\frac{3}{4}$  in. long, its throat and border clear deep blue, commonly greenish-dotted, its lobes short, roundish, 3 to 4 lines broad; sinus membrane truncate and entire or obscurely toothed, not prolonged into appendages; seeds narrow-oblong, wingless.—Boggy spots, or sphagnum swamps, Mendocino and Humboldt Cos.; n. to B. C.

748. *Gentiana calycosa* Griseb.; fl. stem x  $\frac{2}{3}$ .

##### 5. SWÉRTIA L. FRASERA

Ours perennial herbs with erect stems from a thick bitter root. Leaves opposite or whorled. Flowers borne in a panicle. Corolla dull white, bluish-tinged or yellowish, commonly with dark dots, rotate, deeply 4 or 5-parted, each lobe bearing 1 or 2 fringed glands. Stamens inserted on the base of the corolla. Style persistent. Capsule coriaceous, more or less flattened, surrounded by the persistent dry corolla. (Emanuel Sweet, Dutch botanist, 16th century.)

Flowers 5-merous, 1 or 2 in an axil. . . . . 1. *S. perennis*.  
Flowers 4-merous.

Stem leaves in opposite pairs; glands single.

Flowers in a narrow spike-like interrupted panicle; glands not lobed.

Glands linear or oblong; leaves white-margined.

Herbage glabrous; scales between filaments entire or laciniate. . . . . 2. *S. nitida*.

Herbage finely pubescent; scales between filaments setiform-dissected. . . . . 3. *S. albicaulis*.

Glands quadrate; leaves not white-margined. . . . . 4. *S. neglecta*.

Flowers in a broad branching panicle.

Glands elongated-oblong, forked at summit; leaves with silvery-white margins. . . . . 5. *S. albomarginata*

Glands like an inverted yoke or horse-shoe; leaves not white-margined. . . .

6. *S. parryi*.

Stem leaves in whorls of 3 to 7; flowers in a wand-like panicle.

Glands one to each corolla-lobe, covered by an elongated 2-lobed tube; leaves white-margined. . . . 7. *S. tubulosa*.

Glands a pair to each corolla-lobe, not covered by a tube; leaves not white-margined. . . . 8. *S. radiata*.

1. *S. perennis* L. var. *obtusa* Griseb. Fig. 749. Stems solitary, arising from short root-stocks, 5 to 18 in. high; basal leaves obovate or elliptic, 1 to 2½ in. long, contracted to a ligulate petiole ½ to 1½ times as long; stem leaves few and mostly smaller; flowers solitary or in 2s in the axils of the reduced upper leaves or bracts, on pedicels ¼ to 1 in. long; corolla greenish-white, veined or suffused with bluish-purple, its lobes oblong-ovate, 4 to 5 lines long; glands 2 on the base of each lobe, elliptic, fringed all around; capsule elliptic, flattened, 5 lines long.—High montane, 8500 to 10,300 ft.: s. Sierra Nevada in Fresno and Tulare Cos.; Ore. to Col. and Alas.; Asia, Eur. (*S. covillei* Greene.)

749. *S. perennis* var. *obtusa* Griseb.; cor.-lob. x 4.

2. *S. nitida* Jepson n. comb. Fig. 750. Stems slender, 10 to 18 in. high; herbage glabrous; leaves linear-oblancoate, 3 to 7 or 9 in. long; flowers in dense cymes in the axils of the reduced upper leaves or bracts, thus forming a very narrow interrupted thyrsus; cymes sessile or the lower peduncled; corolla pale bluish, purple-dotted inside, 3½ lines long; corolla-lobes ovate, shortly and often abruptly acute, each with a single greenish gland; gland linear or oblong, nearly naked above; scales between the filaments thin, obovate, acuminate, entire or lacinate, rather longer than the ovary; capsule elliptic, flattened, 4 to 6 lines long.—Gravelly soil, often on brushy slopes, 800 to 5500 ft.: Lake Co. to Siskiyou Co.; Plumas Co. to Modoc Co.; n. to Ore. (*Frasera nitida* Benth.)

3. *S. albicaulis* Dougl. Similar to no. 2; herbage minutely pruinose-puberulent; corolla-lobes ovate-lanceolate, acuminate; scales between the filaments setiform-dissected. — Interior plateau region: Modoc Co.; n. to eastern Wash. and western Mont. (*Frasera albicaulis* Griseb.)

750. *Swertia nitida* Jepson; a, b, habit x ½; c, cor.-lob. x 2½; d, e, scales x 2½.

4. *S. neglecta* Jepson n. comb. Stems slender, several from the branching crown of a taproot, 1 to 1½ ft. high; leaves narrowly linear to narrowly oblanceolate, acute, 3 to 5 or 8 in. long; flowers in dense whorl-like cymes forming an interrupted spike-like panicle, the cymes sessile or the lower peduncled; corolla greenish-white with purple veins, its lobes obovate, abruptly acute, 4 to 5 lines long; gland quadrate, partly covered at base and on the sides, fringed all around, produced downward as a tube within the tissue of the petal.—Desert slopes of the San Bernardino, San Gabriel and San Emigdio ranges, 5900 to 7600 ft. (*Frasera neglecta* Hall.)

5. *S. albomarginata* (Wats.) Ktze. Fig. 751. Stems solitary from a perennial taproot, 8 to 15 in. high; herbage glabrous or minutely pubescent; leaves spatulate or oblanceolate, dis-

751. *Swertia albomarginata* Ktze.; corolla-lobe x 4.

posed to be conduplicate,  $1\frac{1}{2}$  to 3 in. long, ornamented with a bright-silvery margin; flowers in a rather broad branching panicle; corolla-lobes greenish-white, dark-dotted, 4 to 5 lines long; gland single, elongated-oblong, produced below into the basal tissue of the petal and thus hooded at base, the dilated summit obcordate and fringed-margined, the sides with a free laciniate border. —Gravelly or stony places: e. Mohave Desert; Inyo Co.; e. through the southern desert region of the Great Basin to Utah. (*Frasera albomarginata* Wats.) Var. *PURPUSII* Jepson n. var. Gland small, elliptic, not obcordate at summit. —Cottonwood Creek Cañon, Inyo Co. (Purpus 3065, type).

6. *S. parryi* (Torr.) Ktze.

Fig. 752. Stem single, stout, arising from the crown of a taproot,  $2\frac{1}{2}$  ft. high; herbage glabrous; leaves white-margined, the basal oblanceolate and drawn down to a narrow base, 4 to 8 in. long, the stem leaves lanceolate, sessile by a broad base, 2 to 6 in. long; panicle broad, 6 to 12 in. long, its flowers on pedicels  $\frac{1}{2}$  to 1 in. long; corolla greenish-white, black-dotted about gland, 6 to 8 lines long, its lobes ovate; glands yoke- or horseshoe-shaped, fringed all around; capsule terete-lanceolate, 7 to 8 lines long—Coastal S. Cal., 2000 to 5500 ft. (*Frasera parryi* Torr.)

752. *Swertia parryi* Ktze.; corolla-lobe x 4.

7. *S. tubulosa* Jepson n. comb.

Fig. 753. Stems stout, erect, glaucous, arising from a deep seated taproot, 1 to  $2\frac{1}{4}$  ft. high; herbage glabrous; leaves mainly basal, spatulate, white-margined, tending to be conduplicate,  $1\frac{1}{2}$  to 3 in. long; inflorescence a virgate or spike-like panicle, very dense, or interrupted below; corolla pale white with bluish veins, 4 to 6 lines long, its lobes oblong-obovate, acuminate, each bearing at base a gland covered by an elongated tube which is deeply 2-lobed with the lobes fringed or laciniate; capsule elliptic, flattened, 4 lines long. —Montane, 8500 to 9300 ft., s. Sierra Nevada from Kearsage Pass to Olancha Peak. (*Frasera tubulosa* Cov.)

753. *Swertia tubulosa* Jepson; corolla-lobe x 4.

8. *S. radiata* (Kell.) Ktze. DEER'S

TONGUE. Fig. 754. Stem very stout, erect, simple below the panicle, 2 to 5 ft. high, from a stout taproot; herbage very minutely puberulent; leaves oblong-ob lanceolate (or narrowly oblong or obovate), acute, 9 to 13-nerved, 5 to 11 (or 15) in. long; panicle narrow, 1 to 2 ft. high; flowers on pedicels 1 to  $2\frac{1}{2}$  in. long; corolla greenish-white, purple-dotted, its lobes ovate, acute, each with fringed or laciniate appendages at base; glands 2 to each lobe, narrowly oblong, long-fringed all around, the crown at the base of the lobes cut into setaceous segments which reach to the middle or summit of the glands; capsule 8 to 9 lines long, ovate, flattened contrary to the valves, which are boat-shaped. —Open coniferous woods, 7000 to 9000 ft.: Sierra Nevada from Tulare Co. to Siskiyou Co., thence s. to northern Humboldt Co.; n. to Wash., e. to the Rocky Mts. It is widely distributed but the individuals are mostly solitary. (*Frasera speciosa* Dougl.)

754. *S. radiata* Ktze.; cor. lob. x 4.

6. **MENYANTHES** Tourn.

Perennial herbs with creeping rootstocks. Leaves all basal and the inflorescence raised on a naked scape. Calyx 5-parted. Corolla white or pink, short-funnelform, 5-cleft, the lobes spreading, copiously white-bearded on the inside. Stamens 5. Capsule inclined to burst irregularly. (Greek men, mouth, and anthos, flower, blooming about that long.)

1. **M. trifoliata** L. BUCKBEAN. Glabrous plant 8 to 15 in. high; leaves long-petioled, 3-foliolate; leaflets oval or obovate, 1 to 3½ in. long; flowers in a raceme; corolla white, 5 to 6 lines long.—Bogs and shallow lake shores, 6600 to 9500 ft.: Sierra Nevada from Fresno Co. to Lassen Peak; n. to Alas. and all northern regions round the earth.

**APOCYNACEAE. DOGBANE FAMILY**

Ours perennial herbs with milky juice. Leaves simple, entire and opposite. Flowers complete, regular, 5-merous except the pistils which are 2. Calyx free or nearly free from the ovaries, imbricated in the bud and persistent. Corolla-lobes convolute in the bud. Stamens borne on the corolla alternate with its lobes; anthers produced at base into a sterile appendage, connivent around the stigma. Ovaries 2 and distinct (though their styles and stigmas are united into one), developing into follicles. Embryo large, straight, in scanty albumen. A family closely allied to the milkweeds.

Stamens borne on the summit of the corolla-tube; anthers free from the stigma; buds sinistrorsely convolute; seeds not comose.

Leaves alternate; flowers without glands.....1. **AMSONIA**.

Leaves opposite; flowers with 2 glands alternate with the carpels.....2. **VINCA**.

Stamens borne on the base of the corolla-tube; anther-cells produced at base into sterile appendages connivent around the stigma and adnate to it by a point at the base of the fertile portion; follicles not torulose; seeds comose.

Style very short, not appendaged; corolla-tube with 5 small appendages alternate with the stamens; buds dextrorsely convolute.....3. **APOCYNUM**.

Style filiform, bearing a conspicuous annular membrane; corolla-tube with a minute appendage behind each stamen; buds not convolute.....4. **CYCLADENIA**.

1. **AMSONIA** Walt.

Leaves numerous. Flowers in a terminal compound cyme. Corolla in ours dilated upwards, constricted at the mouth; tube within below the stamens beset with reflexed hairs. Anthers free from the stigma. Stigmas subtended by a globose thickening (in ours). Follicles slender, torulose. (Charles Amson of South Carolina.)

1. **A. brevifolia** Gray. Stems many from the crown of a stout taproot, 8 to 10 in. high; herbage glabrous; leaves ovate to lanceolate, acuminate, nearly sessile, 1 to 2 in. long; corolla-tube slender below, dilated above and constricted at the throat, its lanceolate lobes primly reflexed, half as long as the tube; follicles inclined to break into one-seeded joints.—Desert flats and cañons: n. side Colorado Desert; e. Mohave Desert; Inyo Co.; e. to Utah. Var. **TOMENTOSA** Jepson n. comb. Stems 10 to 15 in. high; herbage cinerous-tomentose.—Sandy plains: n. side Colorado Desert; e. Mohave Desert; e. to Utah. (*A. tomentosa* Torr. & Frem.)

2. **VINCA** L.

Flowers solitary and axillary. Corolla with a callous constriction at the throat, its lobes broad. Stigma annular, bordered below by a reflexed membranous wing or cup, and above by a truncate upper portion. Follicles narrow, terete. (Ancient Latin name.)

1. **V. major** L. Sterile stems trailing, the flowering ones erect; corolla blue, 1 to 1¼ in. broad.—Native of Eur., escaped from gardens into protected areas along water-courses in cañons about San Francisco Bay.

3. **APÓCYNUM** L. INDIAN HEMP

Flowers small, in terminal cymes. Calyx small, deeply 5-cleft, its tube by means of a disk adnate to the back of the ovaries below. Corolla campanulate, 5-lobed, bearing 5 small triangular-subulate appendages alternate with the stamens. Stamens borne at base of corolla; filaments short and broad; anthers sagittate, acute. Style very short or hardly any; stigma ovoid,

Jepson, Manual, pp. 385-768, April 14, 1925.

755. *Apocynum androsaemifolium* L. var. *pumilum* Gray; a, fl. branchlet  $\times \frac{1}{2}$ ; b, fl.  $\times 1\frac{1}{2}$ ; c, long. sect. of fl.  $\times 4\frac{1}{2}$ .

obscurely 2-lobed. Follicles 2 to 7 in. long, slender, pointed, terete. Seeds numerous, flattish. (Greek apo, from, and kuon, dog, ancient name of the Dogbane.)

Low herb; leaves greenish above; corolla rose-purple to white.

1. *A. androsaemifolium*.  
Tall herb; leaves yellowish; corolla greenish.

2. *A. cannabinum*.

1. *A. androsaemifolium* L. var. *pumilum* Gray. MOUNTAIN HEMP. Fig. 755. Diffusely branched, 5 to 8 (or 14) in. high, glabrous to finely pubescent; leaves roundish to oblong-ovate, or some lowermost orbicular, varying from obtuse to cordate at base, usually mucronate, dark green above, pale beneath,  $\frac{3}{4}$  to  $1\frac{1}{4}$  ( $2\frac{1}{4}$ ) in. long, on short petioles; flowers in short cymose clusters at the ends of the branches, or a few solitary in the upper axils; corolla red-purple or pink to nearly white, subcylindric, 2 to 3 lines long, its lobes broadly oblong, its tube much exceeding the ovate or lanceolate calyx-lobes. — Mostly loamy slopes in the mts., 4000 to 9000 ft., towards the coast descending to 300 ft. June-July. Var. *NEVADENSE* Jepson n. var.

Flowers pink with deeper pink longitudinal lines.—Tuolumne to Fresno and Mono Cos. (Huntington Lake, A. L. Grant 1124, type).

2. *A. cannabinum* L. INDIAN HEMP. Stems erect, rather strict, simple below, 2 to 4 ft. high; herbage of a light almost yellowish green, glabrous; leaves oval to oblong-ovate or lanceolate,  $2\frac{1}{2}$  to 4 in. long; sessile or short-petioled; corolla greenish,  $1\frac{1}{2}$  lines long or less, its segments not surpassing the calyx-lobes.—Stream and river-banks, widely distributed in Cal., more common toward the interior; far e. and n. Poisonous to cattle. May-July.

#### 4. CYCLADÈNIA Benth.

Stems simple, one to many from a large fleshy root, bearing 2 or 3 pairs of leaves and 2 or 3 axillary peduncles with 2 or 3 rose-purple flowers on slender pedicels. Calyx parted into 5 slender lobes. Corolla funnelliform with 5 broadly oblong or roundish lobes and 5 minute appendages alternate with the lobes, one behind each stamen. Stamens borne on the tube towards the base. Style long and filiform, with a conspicuous membranous reflexed collar under the stigma. Disk an entire cup surrounding the base of the ovaries. (Greek kuklos, a ring, and aden, a gland, referring to the disk.)

1. *C. humilis* Benth. Stems ascending or diffuse, 3 to 6 in. high; herbage glabrous; leaves thickish, ovate or roundish, obtuse to cordate at base,  $1\frac{1}{4}$  to  $2\frac{1}{2}$  in. long, on petioles  $\frac{1}{4}$  to 1 in. long; corolla 7 to 10 lines long, bearing a narrow band of reflexed hairs at the insertion of the stamens, the filaments also clothed with similar hairs; pedicels 7 to 10 lines long; follicles 3 in. long.—Montane or gravelly ridges, 5800 to 8500 ft.: Coast Ranges; Sierra Nevada; San Gabriel Mts. Var. *TOMENTOSA* Gray. Herbage densely tomentose-pubescent; calyx hirsute.—Plumas Co. to Siskiyou Co. (*C. tomentosa* Gray.)

#### ASCLEPIADACEAE. MILKWEED FAMILY

Perennial herbs with milky juice. Leaves opposite or whorled. Flowers regular. Calyx 5-parted. Corolla 5-lobed. Pistils 2, with distinct superior ovaries; styles distinct below but united above into a short-cylindric stylar

disk. Stamens 5, inserted on the base of the corolla and united into a tube which is blended above with the styler column, the united filaments (filament-column) and united anthers (anther-column) being here called the stamen-column and commonly bearing hoods (or appendages). Anthers tipped with a scarious membrane inflexed on the summit of the styler disk; between the anthers, on the sides of the styler organ, are cloven glands or elevated ridges slit longitudinally. Pollen grains in each anther-cell united into waxy pear-shaped masses which are stalked and suspended in pairs from the summit of the cloven glands, each pair of stalks deriving its pollen-masses, not from the cells of one anther, but from contiguous anther-cells of different anthers. Pollination entomophilous; the foot of the insect is caught in the cloven gland or slit, and when drawn upward, drags out and bears away the pollen-masses; in walking over other flowers, the insect's foot is again drawn through a slit, and the pollen-masses are left behind on the stigma, which is concealed beneath the cloven structure. Fruit of 2 follicles. Seeds with a silky tuft of hairs at the micropyle.

Stems twining.

Stamen-column without appendages; corolla-lobes cucullate.....1. *ASTEPHANUS*.

Stamen-column with appendages; corolla-lobes plane.

Appendages of the stamen-column attached at base, scale-like....2. *PHILIBERTIA*.

Appendages plate-like, uniting the stamen-column with a corolla-like crown.....

3. *GONOLOBUS*.

Stems never twining; stamen-column with appendages.

Corolla-lobes reflexed; hoods distinct, adnate to the stamen-column above the base.

Stems strongly flattened, prostrate.....4. *SOLANOA*.

Stems terete, commonly strictly erect, rarely decumbent.....5. *ASCLEPIAS*.

Corolla-lobes rotate; hoods inserted at base of stamen-column, joined to each other by a lobed disk.....6. *ASCLEPIADORA*.

### 1. *ASTEPHANUS* R. Br.

Stems in ours slender, twining. Flowers small, in axillary umbels. Corolla short-campanulate, shortly 5-cleft, glabrous. Appendages of the corolla or stamen-column none. (Greek *astephanos*, crownless.)

1. *A. utahensis* Engelm. Fig. 756. Stems many from the crown of a taproot, diffuse or ascending, 9 to 15 in. long; herbage nearly glabrous; leaves narrowly linear, acuminate,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long, spreading or often reflexed; umbels 7 to 16-flowered, the pedicels 2 to 3 lines long; flowers ochre-colored, 1 to  $1\frac{1}{4}$  lines broad; calyx-lobes subulate or lanceolate; corolla glabrous, sub-campanulate, shallowly cleft, its short lobes cucullate with the points inflexed, so that the throat is almost closed; stamen appendages none.

—Gravelly valleys, Colorado Desert: Coyote Holes; San Felipe; e. to Ariz. and Utah.

756. *A. utahensis* Engelm.; fl. x 11.

### 2. *PHILIBERTIA* H.B.K.

Stems in ours twining. Flowers small, dull purplish or yellowish, borne in axillary umbels. Calyx and corolla 5-parted or -cleft. Corolla deeply lobed, with a membranous ring adnate to it at base, pubescent on the outside. Stamen-column short, with 5 scales at base. (J. C. Philibert, editor of a French dictionary of botany, 1804.)

Stamen appendages globose-ovate, broader than long, free from the corolla-crown; corolla purplish.....1. *P. heterophylla*.

Stamen appendages ovate or oblong, longer than broad, contracted below into a sort of pedicel which is joined to a narrow wing-like disk or crown on the base of the corolla-lobes; corolla greenish-yellow.....2. *P. hirtella*.

1. *P. heterophylla* Jepson n. comb. Fig. 757. Stems 2 to 4 or 8 ft. long, climbing freely; herbage green, thinly puberulent or glabrous; leaves commonly linear (1 line wide), varying to lanceolate (5 lines wide), obtuse, acute or auriculate lobed at base, 1 to 2 in. long, shortly petioled; pedicels 3 to 6 lines long; flowers 4 to 5 lines broad; calyx-lobes ovate-lanceolate, very acute; corolla purplish, its lobes elliptic-ovate, purple-veined, 2 lines long; base of corolla bearing a narrow but distinct wing-like crown; stamen

757. *Philibertia heterophylla* Jepson; fl. seen from above  $\times 3$ .

appendages roundish-ovate, as broad or broader than long.—Interior valleys of coastal S. Cal.; e. to the Colorado Desert and Ariz. (*Sarcostemma heterophyllum* Engelm. *Philibertia linearis* var. *heterophylla* Gray.)

2. *P. hirtella* Parish. Fig. 758. Stems running widely over the ground, often twining a little, 3 to 10 ft. long; herbage canescently puberulent; leaves linear to linear-lanceolate, acute or acutish at both ends, 1 to 3 in. long, 1 to 3 lines wide, shortly petioled; flowers greenish-yellow,  $2\frac{1}{2}$  lines broad; calyx-lobes linear-lanceolate; corolla-lobes ovate, 1 to  $1\frac{1}{4}$  lines long; stamen appendages oblong to narrow-ovate, obtuse, longer than broad, abruptly contracted into a pedicel-like structure which is joined to a narrow wing-like disk on the base of the stamens.—Desert washes: Colorado Desert; e. Mohave Desert; Inyo Co.; e. to Ariz. and southern Nev. (*Philibertia linearis* var. *hirtella* Gray.)

### 3. GONÓLOBUS Michx.

Ours twining herbs with opposite leaves. Flowers similar to *Philibertia*, in axillary umbels or in ours commonly solitary. Base of corolla (in ours) bearing a cup-like crown attached to the stamen-column by thin plates. Anthers (in ours) with thin scarious appendages inflexed over the summit of the stylar disk. (Greek *gonia*, angle, and *lobos*, pod, one of the early species with angled fruits.)

1. *G. californicus* Jepson n. sp. Stems much branched, freely twining, 8 to 14 in. long; herbage puberulent; leaves cordate-sagittate, tapering-acuminate, 3 to 5 lines long, on petioles  $\frac{1}{2}$  to  $\frac{3}{4}$  as long; flowers 1 or rarely 2 in the axils, on pedicels  $\frac{1}{4}$  to  $\frac{1}{2}$  line long; peduncles none; flowers dull greenish, 2 lines long; calyx-lobes narrowly lanceolate, obtusish; corolla subrotate, deeply parted into oblong or short-lanceolate lobes, pubescent on the inside; sinuses of the corolla with short but distinct processes downwardly produced; corolla-tube bearing at base a 5-lobed corolla-like crown which is united to the stamen-column by 5 thin vertical lamellae, the crown thus, as it were, 5-celled and nearly equaling the stamen-column.—Sw. Colorado Desert (Ironwood Well, T. Brandegee, type). Apr. Possibly the lobes of the organ here called corolla-crown can be interpreted as hoods but the structure, in any case, is as described.

758. *Philibertia hirtella* Parish; fl.  $\times 6$ .

### 4. SOLÁNOA Greene

Stems strongly flattened. Umbels small, terminal, globose, densely many-flowered, the peduncles longer than the pedicels. Flowers purplish-red outside, flesh-color within. Hoods cleft dorsally from top to bottom, the ventral side adnate to the stamen-column. Horns none. (The Indian chief, Solano, of the Suisunes.)

1. *S. purpurascens* (Gray) Greene. Stems 2 or 3 from a stout taproot, about 1 ft. long, prostrate, flexuous, purplish and purple-dotted; herbage canescently-puberulent; leaves thick, the lowermost elliptic-ovate, the upper broadly cordate-ovate, 1 to 2 in. long; umbels 2; flowers purplish-red outside, flesh-color within, about 2 lines long; follicles 2 in. long, about 5 lines in diameter at the widest part.—Montane dry or rocky slopes: North Coast Ranges from the Mayacamas Range to the Yollo Bolly Mts. (*Gomphocarpus purpurascens* Gray.)

### 5. ASCLÉPIAS L. MILKWEED

Herbs with stems commonly erect, arising from thick deep-seated roots. Bracts of the involucre usually subulate. Calyx and corolla divisions re-

flexed, those of the former small, persistent, those of the latter deciduous. Filament-column bearing a circle of 5 hoods, each containing an incurved horn, or hornless. Anther wings (forming the sides of the cloven gland) widened towards the truncatish base. Follicles ovate or lanceolate, one often abortive, erect or ascending, or pendulous or descending in *A. subulata*. Seeds anatropus, flat, margined, imbricated on the large placenta. Embryo large, with broad foliaceous cotyledons in thin endosperm. (Greek name of the European swallow-wort, a plant of this family.)

Horns present.

Hoods equaling or shorter than the anther-column; stems erect.

Leaves broad; filament-column very short or almost none; follicles erect or ascending, on deflexed pedicels.

Lateral umbels sessile, the terminal one peduncled; hoods truncatish, a pair of slender teeth inserted between them on the stamen-column; horns wing-like, attached by their whole length to the dorsal side of the hoods within, not exerted.....1. *A. vestita*.

Umbels peduncled; herbage woolly; hoods more or less truncate, sometimes obliquely so, no teeth-like processes between them.

Umbels on peduncles longer than the pedicels; horns crest-like, attached dorsally all the way to the summit of the hood, the acute or sickle-shaped apex barely projecting or included; anthers sessile or nearly so.....2. *A. eriocarpa*.

Umbels on peduncles shorter than the pedicels; horns attached below the middle of the hood, well exerted.

Horns attached below middle of hood, strongly exerted from the hood, curving over the disk of the stigma; filament-column obvious.....3. *A. erosa*.

Horns attached at base of hoods, only a little exerted from the hood, ending in a subulate point; filament-column very short.....4. *A. fremontii*.

Leaves narrow; follicles erect, on erect pedicels.

Stems very leafy; herbage glabrous; hoods rounded at apex, the horns much exerted; filament-column about as long as the anther-column....5. *A. mexicana*.

Stems naked at flowering time, the leaves early deciduous; hoods truncate at apex, the horns scarcely exerted; filament-column shorter than the anther-column.....6. *A. albicans*.

Hoods twice or thrice as long as the anther-column; filament-column very short or none; pedicels deflexed in fruit.

Hoods open, long-lanceolate above the broad base, very conspicuous.....7. *A. speciosa*.

Hoods with the sides closely appressed, the horn a wing-like crest attached towards the apex.

Leaves broad; stems decumbent.....8. *A. nyctaginifolia*.

Leaves narrow or none; stems erect, rush-like.....9. *A. subulata*.

No horns to the hoods; pedicels deflexed in fruit.

Hoods rounded, cleft half-way down the back, shorter than the anther-column; filament-column long; herbage white-tomentose.....10. *A. californica*.

Hoods conical, open down the front, a little exceeding the anther-column; filament-column short; herbage glabrous.....11. *A. cordifolia*.

1. *A. vestita* H. & A. Fig. 759. Stems ascending, 2½ to 3 ft. high; herbage white-woolly, the wool at length largely deciduous; leaves opposite, ovate or mostly oblong-lanceolate, often subcordate at base, 2 to 6 in. long, the upper more acuminate, all short-petioled or the upper sessile; umbels 1 to 4, the lateral sessile, the terminal peduncled; corolla yellowish white or purplish, tomentose on the outside, its lobes 3 lines long; hoods truncate at summit and entire, auriculate-lobed or acute at the inner angle and open down the front, not exceeding the stamen-column: cloven glands with a pair of linear teeth inserted beneath them on the stamen-column; horn or crest blunt, not exerted, attached to the back of the hood from the base to the summit, produced upward and forward into a short blunt point.—Dry valleys: Mohave Desert; n. to Inyo, San Joaquin and Monterey Cos. Var. *PARISHII* Jepson n. var. Leaves narrower, very acuminate glabrate; corolla purple; teeth beneath the cloven glands much reduced.—Desert side of the San Bernardino Mts. (Cajon Pass, Jepson 6116, type; Rabbit Sprs., S. B. Parish).

2. *A. ériocárpa* Benth. Stem 1½ to 3 ft. high, more or less sharply angled below; herbage hoary-tomentose, in age more or less deciduous; some of the leaves in whorls of 3 or 4, all broadly oblong with truncate or subcordate base, rounded or

759. *Asclepias vestita* H. & A.; fl. x 1¼.

acute at apex, 4 to 7 (or 9) in. long, very short-petioled; umbels few or several, mostly corymbose-clustered toward the summit, on peduncles equaling or rather longer than the pedicels; flowers  $3\frac{1}{2}$  lines long; corolla creamy-white; hoods pink or purplish tinged, shorter than the stamen-column, roundish, truncatish at top, as if closed, but with a narrow slit which often extends a short distance down the back; horn broad-based, attached behind by its entire base to the hood, at apex acute or sickle-shaped, projecting forward but little protruded from between the acute teeth of the hood.—Dry barren valleys, 100 to 2000 ft., or up to 5500 ft. southward: Coast Ranges; Sierra Nevada foothills; s. to coastal S. Cal. and L. Cal. July-Aug. It is said to poison sheep.

3. *A. erōsa* Torr. DESERT MILKWEED. Stems 2 to  $3\frac{1}{2}$  ft. high; herbage finely white-woolly, eventually more or less glabrate; leaves in opposite pairs, ovate-lanceolate, 5 to 7 in. long; pedicels 1 to  $1\frac{1}{4}$  in. long, exceeding the peduncles; flowers very pale cream-color or greenish; hoods when outspread orbicular-obovate with rounded entire or truncatish summit, scarcely exceeding the stamen-column; horns broadly falcate, attached below the middle, exserted from the hood and incurving over the central disk.—Dry hills: Kern and Inyo Cos. through the Mohave Desert and s. to San Diego Co.; e. to Utah. Horns shaped much like an inverted Lupine keel.

4. *A. fremóntii* Torr. KOTOLO. Stems  $\frac{1}{2}$  to 2 ft. high; herbage woolly with a felt-like tomentum, more or less glabrate; umbels 1 or 2 to several, all peduncled; peduncles not longer than the pedicels; corolla whitish or pink-tinged; hoods yellowish, nearly erect, equaling the stamen-column, evenly truncate, or somewhat obliquely truncate (and thus making a notch behind), open down the front; horn or crest broad, with the inner angle produced into a subulate apex, attached to the hood below the middle, obviously exserted.—Marysville Buttes; Lake Co. It is too little known.

5. *A. mexicāna* Cav. NARROW-LEAF MILKWEED. Fig. 760. Stem slender, 2 (sometimes to 5) ft. high; herbage glabrous; leaves linear to linear-lanceolate, in whorls of 3 to 6, or the lower and uppermost opposite,  $2\frac{1}{2}$  to 6 in. long, 2 to 6 lines broad, short-petioled; umbels many, often in whorls or corymbose, densely many-flowered, on peduncles longer than the pedicels; flowers small, greenish-white or tinged with purple; corolla-lobes oblong, 2 lines long; hoods about equaling the stamen-column; horns slender, subulate, exserted and incurved over the summit of the disk; follicles 3 to 4 in. long, about 4 lines thick at the widest part; seeds  $3\frac{1}{2}$  lines long.—Forming colonies in dry ground, valleys and foothills almost throughout Cal., but not on the immediate coast n.; Ore. to Nev., Ariz. and Mex.

760. *Asclepias mexicana* Cav.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, hoods and stamen-column seen from above  $\times 2$ ; c, fl.  $\times 2$ .

6. *A. albicans* Wats. Stems 3 to 6 ft. high; herbage glabrate, the pedicels pubescent; leaves in 3s, narrowly linear, early deciduous; peduncles  $\frac{1}{2}$  to 1 in. long; pedicels 6 to 7 lines long; corolla greenish-brown; hoods yellowish, shorter than the anthers, truncate, acutish at the inner angle, the subulate upcurved horn scarcely exserted; pedicels and follicles erect, the latter 4 in. long.—Colorado Desert: Pinto Mts.; Agua Caliente, e. San Diego Co.; s. to L. Cal.

7. *A. speciosa* Torr. Stem stout, 2 to  $4\frac{1}{2}$  ft. high, leafy to the top; herbage soft-tomentose, or rarely glabrate in age; leaves opposite, oval to ovate or oblong, transversely veined, acute or obtuse. 4 to 6 in. long; petioles

3 to 5 lines long; peduncle longer than the woolly pedicels; lower umbels with 6 to 10 flowers, the upper with 18 to 55; corolla pink or reddish-purple; hoods yellowish with a broad involute base, above this abruptly contracted into a nearly flat lanceolate portion, the whole fully twice as long as the stamen-column; horns much exserted, incurved over the central disk; follicles soft-spiny, at least toward the apex.—Valley flats and along streams, 150 to 4500 ft.: Coast Ranges from Alameda Co. to Siskiyou Co.; Sierra Nevada foothills from Fresno Co. to Plumas Co.; Inyo Co.; e. to Ark., n. to Wash.

8. *A. nyctaginifolia* Gray. Stems several from the base, decumbent or ascending, 6 to 8 in. long; herbage green, finely puberulent; leaves ovate, acute, 2 to 4 in. long on petioles  $\frac{1}{2}$  to 1 in. long; umbels subsessile; corolla thinnish, greenish; hoods narrowly oblong, over twice as long as the stamen-column, the sides closely appressed; horn wing-like, attached towards the apex and produced into a subulate exserted point; follicles narrowly ovate, attenuate, 2 to  $2\frac{1}{2}$  in. long.—E. Mohave Desert (Providence and New York mountains); e. to Ariz.

9. *A. subulata* Dec. Stems in clusters, erect, straight, rush-like, leafless or with a few filiform leaves, 3 to 5 ft. high; herbage glabrous; flowers dull yellowish-white; hoods elongated, twice the length of the stamen-column, the 2 sides pressed together like a lupine keel and somewhat scimitar-shaped in outline; horn a thin wing, borne above the middle, its short sharp point scarcely exserted from the folded hood; follicles slender, long-acuminate, 2 to  $5\frac{1}{4}$  in. long.—Desert washes or low depressions: e. Mohave Desert; n. Colorado Desert (especially along Colorado River); s. to L. Cal., n. to southern Nev.

10. *A. californica* Greene. Vegetative aspect of no. 1; stems 12 to 22 in. high, the stems persistently white-tomentose, the tomentum on the leaves largely deciduous; leaves opposite, oval to ovate or oblong-lanceolate, sharply acuminate,  $1\frac{1}{2}$  to 3 in., the lower to 6 in. long; umbels nearly sessile, about 6 to 9-flowered; corolla purplish; hoods dark maroon, semi-orbicular, laterally compressed, centrally attached and reaching nearly to the middle of the anthers, 2-cleft half-way down the back and destitute of horn.—South Coast Ranges; Sierra Nevada in Tulare Co.; s. to San Diego Co.; L. Cal. (*Gomphocarpus tomentosus* Gray.)

761. *Asclepias cordifolia*  
Jepson; fl. x 2.

11. *A. cordifolia* (Benth.) Jepson. PURPLE MILK-WEED. Fig. 761. Stems  $1\frac{1}{2}$  to  $2\frac{1}{2}$  ft. high; herbage green and more or less purplish, perfectly glabrous; leaves mostly opposite, rarely in 3s, ovate-lanceolate, with the lower round or elliptic-ovate, the upper ovate to ovate-lanceolate, all with cordate-clasping base, 2 to 4 in. long; umbels loosely many-flowered, the filiform pedicels equaling or shorter than the peduncles; corolla dark red-purple, its lobes 3 to 4 lines long; hood purplish, oblong, the summit obliquely truncate dorsally and produced at the ventral margins into an ascending cusp, the fissure down the front narrow; follicles glabrous, 2 to 5 in. long, often long-attenuate.—Open slopes, from the foothills (500 ft.) up to 5000 ft.: North Coast Ranges; Sierra Nevada as far s. as Mariposa Co.; w. Nev. (*Gomphocarpus cordifolius* Gray.)

#### 6. *ASCLEPIADORA* Gray

Stems low and stout. Leaves alternate. Corolla rotate, the ovate lobes greenish, rotate-spreading. Hoods inserted at base of the stamen-column, narrow and elongated, the sides involute-approximate so as to form a sort of tubular process which is incurved at apex and somewhat hooded, the apical cavity bearing a deltoid crest or wing ending in a short acute point; bases of hoods joined to each other by a disk or ring of undulate lobes opposite the glandular slits. Anther wings widest at the middle. (Greek Asklepios, and doron, gift, the gift of Aesculapius.)

1. **A. decumbens** Gray. Stems decumbent or ascending; herbage green, scabrous-puberulent; leaves elongated linear-lanceolate, (3 or) 4 to 6 in. long, short-petioled; corolla 5 lines broad; hoods purplish, overtopping the stamen-column.—Providence Mts., e. Mohave Desert; e. to Ark.

### CONVOLVULACEAE. MORNING-GLORY FAMILY

Chiefly twining or trailing herbs. Leaves alternate, or the plants leafless parasites. Flowers complete and perfect. Sepals 5, distinct or nearly so, imbricated, persistent, often unequal. Corolla regular, usually showy, more or less campanulate, mostly shallowly 5-lobed, commonly folded longitudinally and twisted in the bud. Stamens 5, borne on the corolla, included. Pistil 1; ovary superior, 2 (rarely 1) -celled, with 2 ovules (rarely 1) in each cell. Styles 1 or 2. Fruit most frequently a capsule, 1 to 4 (or 6) -seeded. Embryo with folded cotyledons. The embryo of *Cuscuta* is filamentous and sometimes destitute of cotyledons.

Ovary deeply 2-parted; styles 2, distinct or united at base only; creeping herbs; corolla-lobes imbricate in the bud.....1. *DICHONDRA*.

Ovary entire.

Style 1, entire or cleft at the apex only; corolla plicate and twisted in the bud; prostrate or twining herbs, one species woody.

Stigma filiform or ovate.....2. *CONVOLVULUS*.

Stigma capitate.....3. *IPOMOEAE*.

Style 2, distinct; corolla-lobes imbricate in the bud.

Erect non-twining leafy herb.....4. *CRESSA*.

Leafless twining parasites.....5. *CUSCUTA*.

#### 1. *DICHONDRA* Forst.

Perennial herbs with slender creeping stems and very small obscure flowers near the surface of the ground. Leaves reniform, entire, with very short 1-flowered peduncles in the axils. Calyx deeply 5-parted. Corolla 5-cleft, the lobes imbricated in the bud. Stamens short. Ovary deeply 2-lobed, separating when ripe into 2 one-seeded utricles which sometimes break open irregularly. Styles 2, in ours distinctly united at base. (Greek, di, double, and chondra, grain, on account of the deeply parted and twin fruit.)

1. **D. repens** Forst. Stems whitish-pubescent, rooting freely; leaves green and mostly glabrous,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. wide, on long peduncles with 2 small bracts at base; calyx thinnish, 1 to  $1\frac{1}{2}$  lines long; corolla purple, edged with white, or about the same length; ovary densely white-hairy; styles united at base.—Nat. from the tropics and found in scattered localities: Eldorado Co. foothills; San Francisco; Del Mar; San Diego.

#### 2. *CONVOLVULUS* L. BINDWEED. MORNING-GLORY

Twining or prostrate herbs, ours perennial except one. Corolla funnelliform to campanulate. Style entire, or cleft at the apex only. Stigmas ovate to linear. Capsule globose with 4 seeds in 2 cells (or by abortion 1-celled), mostly 2 to 4-valved. (Latin *convolvere*, to entwine.)

Flowers showy, ( $\frac{3}{4}$  or) 1 to  $2\frac{1}{2}$  in. long; leaves commonly sagittate except in no. 1; perennial.

Calyx subtended by a pair of bracts; bracts large, ovate to orbicular, embracing and commonly enclosing the calyx.

Flowers pink, purple or lavender,  $1\frac{3}{4}$  to  $2\frac{1}{2}$  in. long.

Leaves broadly reniform,  $\frac{3}{4}$  to 2 in. broad; slightly succulent seaside herbs.

1. *C. soldanella*.

Leaves long triangular-sagittate,  $2\frac{1}{2}$  to  $3\frac{1}{2}$  in. long; minutely puberulent climber of swampy or boggy places.....2. *C. sepium*.

Flowers white or cream color (sometimes pink or purple in no. 4).

Leaves usually triangular-hastate to ovate-lanceolate; herbage glabrous or nearly so.

Leaves as broad or broader than long, broadly triangular; corolla  $1\frac{1}{2}$  to 2 in. long; coastal islands.....3. *C. macrostegius*.

Leaves longer than broad, almost lanceolate-sagittate; corolla  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; along the south coast.....4. *C. occidentalis*.

Leaves ovoid-deltoid, sagittate to almost truncate at base.

Herbage glabrous; corolla  $1\frac{1}{2}$  in. long; low herbaceous plant; n. Cal...

5. *C. atriplicifolius*.

Herbage more or less pubescent.

Leaves thin, slightly hairy; corolla  $1\frac{3}{4}$  to 2 in. long; low tufted plants, the leaves and peduncles basal; cent. Coast Ranges.....6. *C. subacaulis*.

- Leaves thick, almost felty, covered with a dense villous to almost tomentose pubescence; corolla small, 1 to 1½ in. long.  
 Low trailing plants of Coast Ranges and Sierra Nevada foothills; leaves small, triangular-deltoid, ½ to 1 in. long; bracts white-tomentose. . . . . 7. *C. villosus*.  
 Coarse climbing plants of the Sierra Nevada at middle altitudes; leaves large, orbicular-deltoid; bracts tawny. . . . . 8. *C. chartaceus*.  
 Calyx with the bracts more or less distant.  
 Bracts sagittate (like the leaves), inserted about ¼ to ½ in. below the calyx; corolla 1 to 1½ in. long, white; slender erect plants, slightly pubescent throughout. . . . . 9. *C. fulcratus*.  
 Bracts narrowly ovate to lanceolate (without basal lobes as in the leaves).  
 Bracts inserted less than their length below the calyx.  
 Low herbaceous plants; herbage minutely puberulent; leaves ½ to 1 in. long; corolla yellowish, 1 in. long. . . . . 10. *C. polymorphus*.  
 Large woody climbers; herbage glabrous or nearly so; leaves 1 to 3 in. long; corolla white or purple, 1 to 2 in. long. . . . . 11. *C. luteolus*.  
 Bracts distant twice or at least more than their length below the calyx; leaves ½ to 2 in. long.  
 Stems erect and feebly twining; leaves linear-hastate; corolla white, 1 in. long. . . . . 12. *C. longipes*.  
 Stems prostrate; leaves elliptic or oblong-sagittate, very obtuse; corolla purplish, 8 to 10 lines long. . . . . 13. *C. arrensis*.  
 Flowers small, 3 lines long; leaves linear- to oblong-oblancheolate, not sagittate; annual. . . . . 14. *C. pentapetaloides*.

1. *C. soldanella* L. SHORE MORNING-GLORY. Stems prostrate, ½ to 1½ ft. long; herbage glabrous and slightly succulent; leaves thick, decidedly reniform, deep green and shining, ¾ to 1 or 2 in. broad, mostly broader than long, the petioles stout, as long to twice as long; calyx enclosed in broad membranous bracts 4 to 6 lines long, and about as broad as long; corolla broadly funnelform, 1½ to 2½ in. broad and about half as long as broad, pinkish or pale purple.—Sandy sea-beaches along the coast of Cal. and most Pacific shores.

2. *C. sépium* L. HEDGE BINDWEED. Stems from a slender horizontal rootstock, often several ft. long, climbing on herbaceous plants or trailing; herbage densely soft-puberulent; leaves large, 2½ to 3½ in. long, ovate-lanceolate, acuminate at apex, hastate at base, on slender petioles shorter than the blade; peduncles often longer than the leaves, 1-flowered; bracts ½ to ¾ in. long, ovate, acuminate at apex, cordate at base, completely enclosing the calyx; corolla pink, 2 to 2½ in. long.—Native of Europe, introduced in swampy land at Los Angeles and San Bernardino; rarely collected.

3. *C. macrostégus* Greene. Suffrutescent with long trailing stems 6 to 15 ft. long; herbage glabrous throughout; leaves broadly triangular, hastate, 1 to 2 or 3 in. long, rather longer than or about equaling the petioles; peduncles 3 to 8 in. long, 1 to 7-flowered; buds enclosed in a pair of large membranous bracts ½ to ¾ in. long, the lateral flowers each similarly bracted within the outer bracts; corolla pale yellow, 1½ to 2 in. long.—Santa Cruz, San Clemente and Guadalupe Isls.

4. *C. occidentális* Gray. Stems freely twining, often several feet long; herbage glabrous or nearly so; leaves very variable in shape, ¾ to 1½ in. long, the blade about twice as long as the slender petiole, usually triangular-ovate, acuminate at apex and cordate-sagittate to hastate at base, the basal lobes often 1 or 2-toothed; peduncles elongated, 2 to 3 or 4 in. long, greatly surpassing the leaves, 1 or often 2 or 3-flowered; involucre bracts long-ovate, acuminate, ½ to ¾ in. long; corolla white or pinkish, ½ to 1½ in. long and about as broad.—Dry hills, 20 to 2000 ft., coastal S. Cal. Var. *TENUFSSIMUS* Gray. Leaves very narrow, lanceolate-sagittate; peduncles 1 or 2-flowered; bracts 4 to 6 lines long, barely if at all exceeding the calyx.—Coastal S. Cal. Var. *CYCLOSTEGIUS* Jepson n. comb. Bracts orbicular, mucronulate, purplish.—Coast form, San Francisco Bay region to San Diego Co. (*C. cyclostegius* House.)

5. *C. atriplicifolius* House. Low, herbaceous, the stems 1 ft. or less long, arising from a fleshy slender rhizome; herbage glabrous; leaves broadly triangular-hastate, 1 to 1½ in. long and about as broad, abruptly acute at apex and with an abruptly diverging hastate lobe on either side of the cuneately tapering base; flowers few, in the axils of the lower leaves;

762. *Convolvulus subacaulis* Greene; a, habit  $\times \frac{1}{2}$ ; b, d, stamens  $\times 1$ ; c, pistil  $\times 1$ .

peduncles  $\frac{7}{8}$  to  $1\frac{1}{2}$  in. long, about equaling the petioles; involueral bracts oval, obtuse or almost truncate, about 6 lines long, slightly exceeding or equaling the obtuse and mucronate sepals; corolla  $1\frac{1}{2}$  in. long, white or pinkish.—Lake Co.; Butte Co.; n. to Wash.

6. *C. subacaulis* Greene. Fig. 762. Stems 1 to 15 in. long, when short, erect, when longer, trailing, or frequently acaulescent; leaves thin, more or less hairy with somewhat appressed hairs, ovoid or roundish-deltoid, truncate or sometimes slightly cuneate or subcordate at base and either with or without divergent hastate lobes at the angles, mostly  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long; petioles elongated, mostly 2 to 3 times as long as the leaves; peduncles 1-flowered,  $\frac{1}{4}$  to 1 in. long; bracts ovate, obtuse,  $\frac{1}{4}$  to  $\frac{1}{2}$  in. long, embracing but not enclosing the calyx; corolla campanulate-funnelform, angularly 5-lobed,  $1\frac{1}{2}$  to  $2\frac{1}{4}$  in. long, white or cream-color with a purplish exterior.—Dry hills, 100 to 1500 ft., San Luis Obispo Co. to Solano Co. Var.

*DOLDSUS* Jepson n. var. Fig. 762d. In habit and in flower like the species in every way save that the filaments bear a pair of teeth near the middle; filaments sparingly glandular short-hairy at base.—Berkeley Hills (Jepson 9719a, type).

7. *C. villosus* Gray. WOOLLY MORNING-GLORY. Fig. 763. Stems herbaceous, ascending or trailing, 3 in. to 1 ft. long, from fleshy but slender rootstocks; herbage very hoary with a dense velvety or plushy pubescence; leaves triangular-hastate,  $\frac{1}{2}$  to 1 in. long and as broad as long; petioles, except basal ones, usually but not always shorter than the leaves; peduncles 1-flowered, short on the trailing branches, long ones at base, often flexuous or curved, especially in age; involueral bracts enclosing the calyx, triangular-ovate, 6 lines long; corolla funnelform, 1 to  $1\frac{1}{2}$  in. long, cream-color.—Dry slopes and ridges, 1000 to 5500 ft.: Coast Ranges; Sierra Nevada. (*C. malacophyllus* Greene.) Var. *PÉDICELLATUS* Jepson n. var. Trailing; leaves more narrowly acuminate; flowers long-pediceled.—Santa Lucia Mts.; Santa Paula (Cobb 138, type).

763. *Convolvulus villosus* Gray; a, habit  $\times \frac{1}{2}$ ; b, leaf  $\times \frac{1}{2}$ ; c, pistil  $\times 1$ .

8. *C. chartaceus* Jepson n. sp. Stems coarsely herbaceous, ascending or trailing, 1 to  $1\frac{1}{2}$  ft. long;

herbage hoary throughout with a dense velvety or plush-like pubescence; leaves large, orbicular-deltoid to broadly reniform, obtuse or slightly mucronate at the broad apex, 1 to 2 in. long and twice as broad, little or not at all lobed at base; lower petioles elongated, often twice as long as the leaves, upper ones usually shorter than the leaves; axils of the middle and lower leaves bearing a flexuous or recurved one-flowered peduncle; involucre large, papery and conspicuous, tawny or straw-color in age, entirely enclosing the calyx, triangular-ovate to almost orbicular, 8 to 9 lines long and 4 to 6 lines broad; sepals narrowly ovate-acuminate, 3 to 6 lines long; corolla creamy white to pale yellow, 1 to  $1\frac{1}{2}$  in. long, broadly funnelform. —Middle altitudes, 4500 to 6500 ft.: Sierra Nevada from Nevada Co. to Tulare Co. (Toll House to Hazel Green, Mariposa Co., Jepson, type.)

9. *C. fulcratus* Greene. Slender plants with fibrous roots; stems 10 to 18 in. high, not twining except feebly at the sterile leafy summit above the flowers; herbage minutely puberulent to almost villous throughout; leaves  $\frac{1}{2}$  to 1 in. long, triangular-sagittate, the moderately divergent lobes often more than half as large as the main blade, the slender petioles  $\frac{1}{4}$  to  $\frac{3}{4}$  in. long; axils of the middle leaves each bearing an elongated filiform 1-flowered peduncle  $1\frac{1}{2}$  to  $2\frac{1}{2}$  in. long, this with a single pair of sagittate leaves (like the ordinary ones but smaller) about  $\frac{1}{4}$  to  $\frac{1}{2}$  in. below the calyx; sepals unequal, broad, truncate, obtuse or mucronate, pubescent; corolla 1 to  $1\frac{1}{2}$  in. long, white or cream-color. —Sierra Nevada foothills, 1000 to 2000 ft., from Mariposa Co. to Tulare Co.; s. to San Diego Co. Var. *DELTOIDEUS* Jepson n. comb. Leaves short and sharply deltoid, 3 to 6 lines long, about twice as broad as long, densely villous throughout. —Tehachapi and San Emigdio ranges. (*C. deltoideus* Greene.) Var. *BERRYI* Jepson n. comb. Plants coarser throughout; leaves large, triangular-sagittate, 1 to 2 in. long, much broader than in the species, as broad as long, densely villous, the basal lobes often scarcely at all developed. —Marble Fork, Kaweah River. (*C. berryi* Eastw.)

10. *C. polymorphus* Greene. Stems slender, erect or trailing, 1 to 2 ft. high, usually wholly herbaceous; sometimes feebly twining from the sterile leafy tips; herbage pale and puberulent throughout; leaves reniform-hastate to narrowly subsagittate, mucronate,  $\frac{1}{2}$  to 1 in. long; axils of the middle leaves bearing short peduncles; peduncles 1-flowered, equaling or somewhat exceeding the leaves; calyx subtended by a pair of narrowly elliptic bracts at a short distance below it, their tips enclosing the bases of the sepals; sepals very unequal, the outer often broadly ovate and truncate; corolla 1 to  $1\frac{1}{4}$  in. long, white. —Siskiyou Co., e. to Modoc Co., s. to Lake Co.; n. to southern Ore.

764. *Convolvulus luteolus* Gray; a, sect. of fl. stem  $\times \frac{1}{2}$ ; b, stamen  $\times 1$ ; c, pistil  $\times 1$ ; d, diagrammatic cross sect. of corolla in the bud  $\times 1\frac{1}{2}$ .

11. *C. luteolus* Gray. Fig. 764. Stems woody below, 2 or 5 to 20 ft. high, climbing over trees and shrubs; leaves glabrous and glaucous, or soft-pubescent beneath, 1 to 2 or 3 in. long, sagittate at base, the upper portion or terminal lobe varying from triangular to narrowly lanceolate; basal lobes large, very variable, sometimes nearly as large as the terminal lobe, angular, shallowly 2-lobed, or somewhat saliently and acutely lobed; petioles usually about the length of the leaves; axils of the

middle leaves bearing the peduncles, these filiform, 1 to 2 or 5 in. long, commonly 1 to 3 (or sometimes 5)-flowered; bracts subulate, lanceolate or oblong, acute, 2 to 5 lines long, distant their length to  $\frac{1}{2}$  their length from the calyx; sepals obtuse, unequal, coriaceous, the two outer ones short; corolla open-funnelform, usually white, exposed portion of the folds purplish, 1 to  $1\frac{1}{2}$  (or 2) in. long; limb not lobed, scarcely angular.—Along wooded streams or brushy slopes, 10 to 3500 ft.: Coast Ranges from Monterey Co. to Siskiyou Co.; Sierra Nevada foothills from Tulare Co. to Shasta Co. Var. *SAXICOLA* Jepson n. comb. Leaves reniform-orbicular; pedicels usually short.—Coast form at Bodega. (*C. saxicola* Eastw.) Var. *PURPURATUS* Greene. Corolla purple.—San Francisco Bay region.

12. *C. longipes* Wats. Stems erect, much branched, feebly twining, 1 to 3 ft. high; herbage glabrous throughout; leaves small, linear-hastate,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long and 1 to 2 lines wide, lower leaves with well developed hastate lobes, upper leaves gradually reduced to linear bractlets, these occurring as bracts on the peduncle about  $\frac{1}{4}$  to  $\frac{1}{2}$  in. below the flower; peduncles elongated, mostly 1-flowered sepals ovate, obtuse, often mucronate, the outer two shorter, giving the appearance of bracts; corolla 1 in. long, broadly funnelform, white or cream-color.—Arid or desert slopes, San Diego Co. to San Luis Obispo Co., thence e. to the southern Sierra Nevada; s. Nev.

13. *C. arvensis* L. BINDWEED. ORCHARD MORNING-GLORY. Fig. 765. Stems prostrate, 1 to 3 or more ft. long, from perennial roots which descend to great depth; herbage minutely villous-pubescent or almost glabrous; leaves elliptic to oblong-sagittate, very obtuse, rarely acutish,  $\frac{1}{2}$  to 1 (or sometimes 2) in. long on petioles half as long; peduncles 1 to 2 in. long, commonly 1 (sometimes 2 or 3)-flowered, with a pair of subulate or narrowly spatulate bracts (1 to 2 lines long) near the middle; corolla white, purplish outside (8 or) 9 to 10 lines long, open-funnelform and neither lobed nor angled. — The most troublesome orchard and garden weed yet naturalized in Cal., especially obnoxious in the richest lands and moistest alluvial loams. Native of Eur. May-Oct.

14. *C. pentapétaloides* L. Diffusely branching annual, the branches 6 to 18 in. long; herbage minutely puberulent to almost hairy; leaves linear- or oblong-oblancoate, obtuse at apex, narrowed to a petiole below,  $\frac{3}{4}$  to  $1\frac{1}{2}$  (or  $3\frac{1}{2}$ ) in. long; peduncles shorter than the leaves,  $\frac{1}{4}$  to  $\frac{3}{4}$  in. long, 1-flowered, with a pair of small spatulate or subulate bracts 1 to 2 lines below the flower, retrocurved in fruit; sepals more or less hairy with subscarios margin; corolla purplish, 3 lines long, deeply 5-cleft.—Grainfields, lower San Joaquin Valley to San Diego Co.; nat. from Eur.

765. *Convolvulus arvensis* L.; a, fl. stem  $\times \frac{1}{2}$ ; b, another leaf form  $\times \frac{1}{2}$ ; c, long. sect. of fl.  $\times 1$ ; d, long. sect. of ovary  $\times 5$ .

### 3. IPOMOEA L. MORNING-GLORY

Twining or trailing herbs similar to *Convolvulus*. Calyx not subtended by bracts but the outer sepals commonly larger. Style entire; stigma capitate. (Greek *ip*, bindweed, says Linnaeus, and *omoios*, similar.)

1. *I. hirsutula* Jacq. Annual; stems twining or trailing; herbage pubescent; leaves broadly ovate-cordate,  $1\frac{1}{2}$  to 3 in. long; peduncles 1 to 5-flowered; sepals narrow-oblong, acute, hirsute on lower half; corolla blue, purple or whitish,  $1\frac{1}{4}$  to  $2\frac{1}{4}$  in. long; ovary 3- rarely 2-celled.—Garden plant from trop. Am., nat. in coastal S. Cal.: Los Angeles; Riverside; San Diego.

4. *CRÈSSA* L.

Low canescent perennial herb with erect or diffuse non-twining stems. Corolla white, its tube oblong-campanulate, equaling the sepals; limb 5-parted. Filaments subulate, exerted from the throat of the corolla. Ovary 2-celled, 4-ovuled. Styles 2, distinct; stigmas capitate. Capsule by abortion often 1-seeded. (Greek Kressa, a Cretan woman.)

1. *C. crética* L. ALKALI WEED. Commonly densely branched from the base, forming low tufted plants 3 to 10 in. high; leaves oblong-ovate, 2 to 4 or 5 lines long, almost sessile; flowers short-pediceled in the axils; sepals oblong-ovate, acute, 2 lines long; corolla 3 lines long, its lobes oblong-ovate, about 1 line long, hairy outside; summit of ovary long-hairy.—Alkaline lands, Sacramento Valley to S. Cal.; e. to Ariz.; especially common in the San Joaquin Valley, often covering thousands of acres; sometimes broad areas of it do not flower or rarely. Distributed around the earth in warm regions.

5. *CÚSCUTA* L. DODDER

Annual leafless parasites, destitute of green color, with twining filiform stems. Flowers small, in lateral heads or clusters. Calyx colored like the corolla, deeply 5-cleft. Corolla campanulate or somewhat urn-shaped to short-tubular, with 5 lobes imbricated in the bud, and as many small scales or appendages inserted in the tube below the stamens, or none. Ovary globular, 2-celled, 4-ovuled. Styles 2, in ours distinct, persistent; stigma globose. Capsule 1 to 4-seeded, ours indehiscent. Embryo devoid of cotyledons. The germinating seed produces a twining stem; this becomes parasitic by means of suckers which penetrate the bark of the host. (Derivation doubtful.)

Capsule pointed or conical; scales present.

Scales dentate; flowers less than 1 line long; stems very fine or capillary; dry desert areas.....1. *C. denticulata*.

Scales deeply fringed; flowers 1 to 2 (or 3) lines long; stems usually coarse, sometimes slender.

Corolla-lobes about half as long as the cylindrical tube; flowers  $2\frac{1}{2}$  to 3 lines long; common in dense thickets; Coast Ranges and Sierra Nevada....

2. *C. subinclusa*.

Corolla-lobes about as long as or longer than the tube.

Calyx-lobes ovate-lanceolate, as long the corolla-tube; flowers  $1\frac{1}{2}$  to 2 lines long; abundant in saline marshes.....3. *C. salina*.

Calyx-lobes shorter than the corolla-tube; alfalfa fields.

Corolla 1 line long, broadly campanulate; calyx-lobes broadly lanceolate.

4. *C. indecora*.

Corolla  $1\frac{1}{2}$  to 2 lines long, narrow campanulate; calyx-lobes broadly ovate.....5. *C. racemosa*.

Capsule depressed-globose.

Scales present, deeply fringed; flowers usually less than 1 line long, merely enclosing the base of the conspicuous globose capsule; moist or wet places.....

6. *C. arvensis*.

Scales absent; flowers usually  $1\frac{1}{2}$  to 2 lines long (except in var.) and entirely enclosing the mature capsule; dry sandy ridges.....7. *C. californica*.

1. *C. denticulata* Engelm. Stems hairlike; flowers small, less than a line long, short-pediceled in small umbel-like clusters; tube of the short campanulate almost urn-shaped corolla included in the rounded denticulate lobes of the calyx; anthers oval, on very short filaments; scales narrow, reaching to the base of the stamens, denticulate at the rounded tip; capsule pointed, covered by the withered corolla, 1 or 2-seeded.—Mohave Desert and neighboring ranges; desert regions e. of the Sierra Nevada; e. to Utah.

2. *C. subinclusa* D. & H. Stems commonly stout; flowers  $2\frac{1}{2}$  to 3 lines long, sessile or short-pediceled, at length in large dense clusters  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. thick; calyx-lobes overlapping, ovate-lanceolate, about  $\frac{1}{2}$  the length of the cylindrical corolla-tube; lobes of the corolla ovate-lanceolate, minutely crenulate, scarcely more than  $\frac{1}{2}$  the length of the tube; anthers oblong or oval, nearly sessile; scales narrow, fimbriate, opposite the stamens but reaching only to the middle of the tube; styles slender, mostly longer than the ovary; ovary capped by the withered corolla.—Common almost throughout Cal. on species of *Rhus* and other plants, including *Aesculus californica*, *Sambucus glauca*, *Eriogonum nudum*.

3. *C. salina* Engelm. MARSH DODDER. Stems slender; flowers  $1\frac{1}{2}$  lines long; calyx-lobes ovate-lanceolate, as long as the shallow-campanulate tube of the

corolla and as the corolla-lobes; these ovate, denticulate, overlapping; filaments about as long as the oval anthers; scales fringed, mostly shorter than the tube, sometimes much reduced and on the base of the tube; styles equaling or shorter than the ovary; capsule surrounded by the withered corolla, mostly 1-seeded.—Very abundant on *Salicornia* and other saline herbs, entangling them with its webs of thread-like stems, which in spring color the salt marshes with small patches of gold: coastal S. Cal. to the Sacramento Valley and Humboldt Co.; n. to B. C., e. to Ariz. and Utah.

4. *C. indécora* Choisy. Stems rather stout, turning dark in age; flowers 1 line long or less, pediceled in loose cymes, more or less papillose; calyx-lobes ovate-lanceolate, acute, mostly shorter than the broadly campanulate corolla-tube; corolla-lobes triangular, minutely crenulate, spreading, about as long as the tube, their tips inflexed; scales ovate, erect, fringed; stamens slightly exserted, anthers and stigma often purple; capsule oblong, acute, enveloped by the withering corolla; seeds 2 to 4.—Low moist places; on Leguminosae and Compositae.

5. *C. racemosa* Martius var. *chiliæna* Engelm. Stems slender, straw-color; flowers of thin texture,  $1\frac{1}{2}$  to 2 lines long, borne in loose racemose panicles; calyx very short, forming a shallowly lobed cup at base of corolla, the lobes broadly triangular-ovate, more or less acute; tube of corolla gradually widening upwards, deeply campanulate, lobes short, shorter than the tube, erect or slightly spreading, with inflexed acute tips; scales large, fringed; stamens always included; anthers not purple; capsule ovate or obovate, thickened at the apex and somewhat pointed.—Introduced in early days with seed of *Medicago sativa*, thus becoming a local pest in alfalfa fields; native of Chile.

6. *C. arvensis* Beyrich. Stems pale; flowers small, sessile or nearly so in dense globose clusters  $\frac{1}{2}$  in. thick; calyx-lobes obtuse, broad, about equaling tube of the corolla; corolla 1 line long, with acuminate lobes and short broad tube, in age remaining at base of capsule; scales often exceeding the tube and deeply fringed; capsule depressed-globose; seeds 2 or 4.—Mostly moist or wet stations, widely distributed on *Xanthium canadense*, *Trifolium pratense*, etc.

7. *C. californica* Choisy. Stems capillary; flowers small, 1 to  $1\frac{1}{2}$  lines long, in loose cymes; pedicels frequently much thickened below the flower; calyx-lobes with short-attenuate spreading tips; corolla-lobes lanceolate-subulate, equaling or longer than the campanulate tube, mostly reflexed in anthesis; scales none, sometimes represented by inverted arches or V-shaped thickenings alternating with the stamens, but situated near the base of the tube; anthers linear-oblong, nearly or quite equaled by the filaments; styles slender, mostly longer than the ovary; capsule depressed-globose, mostly 2 or 3-seeded.—Widely distributed in Cal., most frequent in S. Cal. on *Eriogonum* and *Adenostoma*. Var. *BRACHYCALYX* Yuncker. Flowers very small, 1 line long or less; calyx very short, less than half the length of the broadly campanulate corolla-tube.—Solano Co. to Humboldt Co., on *Eriogonum* and *Ceanothus*.

#### POLEMONIACEAE. GILIA FAMILY

Herbs, or a few species somewhat woody at base. Leaves alternate or opposite, entire, lobed or divided, or pinnately compound. Flowers complete, 5-merous, either solitary, in loose clusters, capitate, racemose, corymbose or paniculate. Calyx persistent, regular or irregular. Corolla sympetalous, regular, its lobes convolute in the bud. Stamens 5, inserted on corolla, alternate with its lobes, often unequal in length. Ovary superior, 3-celled; style 3-cleft or with 3 stigmas. Capsule loculicidally 3-valved.—*Langloisia* has an irregular corolla. Some species of *Navarretia* have a 1-celled capsule, a 4-valved capsule or a 4-merous corolla. The seed-coats sometimes emit spiracles or become mucilaginous when wetted.

Plants with foliage leaves.

Corolla regular.

Calyx not ruptured by the growing capsule, growing as the capsule grows.

Calyx wholly herbaceous, the sinuses not distended; leaves pinnately compound; ours perennials, one species annual. . . . 1. *POLEMONIUM*.

- Calyx with membranous intervals between the angles or ribs, the sinuses distended into a revolute lobe; leaves simple (entire, cleft or pinnatifid); annuals.....2. *COLLOMIA*.  
 Calyx more or less distended by the capsule and usually ruptured by it; calyx scarious in the intervals between the ribs (except sometimes in no. 8).  
 Corolla strictly salverform, the tube distinctly contracted at the throat; leaves opposite (sometimes alternate above), entire.....3. *PHLOX*.  
 Corolla funnelform to salverform or campanulate, the throat open.  
 Calyx-lobes unequal and pungent; leaves all alternate, rarely some lower opposite, the lobes commonly pungent or spinescent.  
 Anthers oval; bracts green or chartaceous or coriaceous, hairy or glabrous; annuals, mostly of summer or late spring in dry ground.....4. *NAVARETTIA*.  
 Anthers sagittate; bracts embedded in white wool and nearly concealed; perennials or annuals.....5. *HUGELIA*.  
 Calyx-lobes equal, rarely pungent.  
 Leaves, at least the upper, alternate, entire to cleft, pinnatifid or pinnately or bi-pinnately lobed, parted or divided; annuals (or, in ours, 2 species perennials), mostly of spring.....6. *GILIA*.  
 Leaves opposite and palmately parted, or sometimes simple and opposite.  
 Slender annuals, mostly low hills or valleys, mostly of spring; calyx scarious in the intervals below the sinuses....  
 7. *LINANTHUS*.  
 Perennials, often woody-based with pungent leaves; mostly montane; calyx below sinuses scarious or not scarious.....8. *LEPTODACTYLON*.  
 Corolla markedly 2-lipped or the 5 equal lobes somewhat obscurely disposed in 2-lipped fashion; low annuals, the leaves with long bristles; deserts.....  
 9. *LANGLOISIA*.  
 Plants without proper foliage leaves, the simple stem bearing persistent cotyledons and a whorl of involucreal leaves connate at base; diminutive annuals.....  
 10. *GYMNOSTERIS*.

### 1. *POLEMONIUM* L. JACOB'S LADDER

Herbs. Leaves alternate, pinnate, the leaflets sessile. Flowers showy, blue, pink or white, in racemes, cymes or panicles. Calyx herbaceous throughout, not scarious below the sinuses, more or less accrescent and loosely investing the capsule. Corolla from tubular-funnelform to nearly rotate. Filaments equally inserted, more or less declined and hairy at base. Seeds few or several in each cell, becoming mucilaginous when moistened. (Greek name used by Dioscorides, from polemos, war, the application not obvious.)

#### KEY TO THE SPECIES BY H. L. MASON

- Annuals; corolla equaling or shorter than the calyx; sepals spreading....1. *P. micranthum*.  
 Perennials; corolla longer than the calyx; sepals erect.  
 Flowers in a raceme or panicle; corolla-lobes equaling or longer than the tube; leaflets entire.  
 Style longer than the corolla; corolla 4 to 7½ lines long, blue; montane.  
 Herbage glandular throughout; stems short, several from a caespitose base.  
 2. *P. pulcherrimum*.  
 Herbage glabrous at the base, glandular in the inflorescence; stems tall, mostly solitary from a horizontal rootstock.....3. *P. occidentale*.  
 Style shorter than the corolla; corolla 8 to 10 lines long, pink; along coast.....  
 4. *P. carneum*.  
 Flowers in capitate congested heads; corolla-lobes shorter than the tube; leaflets palmately cleft or divided.  
 Style equaling the calyx in length; stamens not exserted; var. eximium of.....  
 5. *P. confertum*.  
 Style longer than the calyx; stamens exserted.....6. *P. chartaceum*.

1. *P. micranthum* Benth. Stems 1 to numerous from the base, commonly branched, erect or ascending, 4 to 8 in. high; herbage viscid-puberulent to glabrous; leaves about 1 to 2 in. long; leaflets 5 to 15, elliptic to linear or lanceolate, 1 to 2 lines long; flowers solitary, opposite the leaves, the inflorescence thus a loose false raceme; pedicels slender, 3 to 10 lines long; corolla white, subrotate, shorter than or not exceeding the calyx; calyx 2½ to 3½ lines long, nearly twice as large in fruit and becoming chartaceous, the lobes tending to spread; style very short; cells of the ovary 2 or 3-ovuled. —Dry open ground, 2000 to 4500 ft.: Tehachapi Mts.; Siskiyou and Modoc Cos.; n. to Wash.

2. *P. pulcherrimum* Hook. Stems few to many, erect or ascending, 3 to 10 in. high, arising from the crown of a running rootstock; herbage viscid-pubescent or pilose; leaves basal and cauline, 1 to 6 in. long; leaflets 11 to 21

(the cauline with fewer leaflets), oblong or elliptic, 4 to 8 lines long; flowers in close racemose cymes; corolla pale blue or purple with a yellow or white throat, cleft to below the middle,  $2\frac{1}{2}$  to 5 lines long,  $1\frac{1}{4}$  to 2 times as long as the calyx; calyx little accrescent; stamens included, the filaments hairy at base; style slightly exserted; cells of the capsule 1 to 3-seeded.—Moist shaded places in the mts., often in pine woods, 6000 to 10,000 ft.: Fresno Co. to Siskiyou Co.; n. to Wash., e. to Rocky Mts. Var. *PARVIFOLIUM* Nels. Leaves tending to be glabrous and firmer in texture, 1 to 2 in. long; leaflets ovate or oblong-ovate, 1 to 3 lines long; inflorescence looser.—High montane, 6000 to 10,800 ft.: Mariposa Co. to Siskiyou and Trinity Cos. (*P. parvifolium* Nutt.)

3. *P. occidentale* Greene. Stem erect, simple, solitary from a running rootstock,  $1\frac{1}{4}$  to  $3\frac{1}{4}$  ft. high; herbage glabrous below, glandular towards the inflorescence; leaves nearly all cauline, long-petioled, 3 to 10 in. long; leaflets 11 to 25, ovate-oblong or lanceolate, 5 to 15 lines long; flowers in a thyrsoid or corymbose cluster; corolla blue or purple, sub-campanulate, cleft to below the middle, 6 to 10 lines broad, about twice as long as the calyx, its tube white or yellowish, very hairy at insertion of stamens; calyx scarcely accrescent, remaining firm, becoming 4 lines long; cells of the capsule 6 to 12-seeded; style much exceeding the corolla.—Wet ground in the mts., 4000 to 10,500 ft.: San Bernardino Mts.; Sierra Nevada from Tulare Co. to Siskiyou Co.; n. to Wash., e. to the Rocky Mts. (*P. coeruleum* Auth.)

4. *P. carneum* Gray. Stem erect, ascending or climbing, solitary from a rootstock, 1 to 4 ft. high, usually widely branched above; herbage subglabrous or thinly pubescent; leaves all cauline, 3 to 8 in. long; leaflets 12 to 19, ovate or oblong-lanceolate, thin,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; flowers in loose terminal corymbose or subumbellate few-flowered clusters; calyx greatly accrescent in fruit, becoming chartaceous and 5 to 8 lines long; corolla pink to purple, broadly funnelform, cleft a little below middle, 7 to 12 lines long, 2 to 3 times as long as the calyx; stamens included, the filaments hairy at base; style included; ovary-cells 3 or 4-ovuled; style included.—Moist shaded ground near the coast, 50 to 1500 (or 3000) ft., uncommon: San Mateo Co. to Del Norte Co., thence e. to western Siskiyou Co.; s. Ore.

5. *P. confertum* Gray var. *eximium* Jepson n. comb. Stems several, tufted on the branched root-crown, simple, erect, 2 to 9 in. high, bearing 1 or 2 reduced leaves and a dense capitate cluster of blue flowers; leaves in a dense basal tuft, glandular-viscid and musk-scented, linear in outline, 1 to 5 in. long; leaflets numerous, usually approximate or imbricate, palmately divided into 2 to 5 segments; corolla salverform, the tube about twice as long as the calyx and much longer than the limb; cells of ovary with 3 to 5 ovules; style included.—Rocky ledges, 11,000 to 13,000 ft.: Sierra Nevada from Tulare Co. to Mariposa Co. (*P. eximium* Greene.)

6. *P. chartaceum* Mason n. sp. Stems several, erect, from a tufted densely leafy base; herbage villous or somewhat glandular-pubescent; leaves 2 to 6 in. long; petioles with a broad sheathing chartaceous base, not rigid in age; leaflets and corollas as in no. 5; calyx turbinate, the tube twice as long as the lobes, equaling the corolla-lobes; corolla deep blue, funnelform, 5 to  $7\frac{1}{2}$  lines long, the tube twice as long as the lobes; stamens exserted, the filaments hairy at base; style equaling or much exceeding the corolla-lobes.—White Mts., e. Inyo Co. (White Mountain Peak, 14,230 ft., Jepson 7383, type.)

## 2. COLLÔMIA Nutt.

Herbs with alternate leaves. Flowers in ours in dense clusters with foliaceous bracts. Calyx turbinate, in age obpyramidal or cup-shaped, its teeth or lobes equal, entire, erect, the sinuses in age distended into a recurved lobe. Corolla narrowly funnelform or salverform, salmon-yellow, reddish, purple, or white. Stamens unequal, unequally or equally inserted on the tube of the corolla, mostly straight. Cells 1 to 3-seeded; seed-coat often developing spiral threads when wet. Capsule oval to obovoid. (Greek kolla, glue, on account of the mucilaginous seeds.)

Annuals; seeds becoming mucilaginous when wetted.

Leaves variously lobed, toothed or pinnately parted; capsule-valves campanulately recurved from apex on dehiscence.....1. *C. heterophylla*.

Leaves entire; capsule-valves curved backward from each side on dehiscence.

Stamens equally inserted in the corolla-throat but of unequal length.....

2. *C. tinctoria*.

Stamens unequally inserted on the corolla-tube.

Corolla 4 to 9 lines long, twice as long as calyx.....3. *C. linearis*.

Corolla 1 in. long, 3 to 4 times as long as calyx.....4. *C. grandiflora*.

Perennials; seeds not becoming mucilaginous when wetted.

Plants tall, erect; corolla yellow, 1 to 1 1/4 in. long.....5. *C. rawsoniana*.

Plants low, ascending from deep underground stems; corolla blue, 7 to 8 lines long.,

6. *C. larsenii*.

1. *C. heterophylla* Hook. Stem diffusely branching from the base, 3 to 11 (or 20) in. high; herbage more or less glandular or viscid-pubescent; leaves pinnately cleft or pinnately divided, the segments laciniately cleft, varying greatly in shape and size (1 to 7 lines long), the petioles 1/2 to as long as the blade; upper leaves, or sometimes all, ovate or oblong, incised, few-toothed or even entire, 5 to 11 lines long; flowers in small bracted clusters at the ends of the branches; calyx 1/2 as long as corolla; corolla red-purple, tubular-funnelform, 4 to 6 lines long, the lobes 1/2 to 1 line long; capsule ellipsoid, seeds 2 or 3 in each cell.—Shady places in the foothills, 500 to 2000 ft.: San Bernardino foothills; Coast Ranges from Santa Cruz Co. to Siskiyou Co.; Sierra Nevada from Tulare Co. to Shasta Co.; n. to B. C. Mar.-Apr.

2. *C. tinctoria* Kell. Stem diffusely branched, or sometimes simple, 3 to 6 in. high; herbage glandular-villous; leaves linear or lanceolate, entire, 1/2 to 1 3/4 in. long; flowers in capitate clusters at the ends of the branches or solitary or in 2s or 3s in the leaf axils; calyx in age campanulate; corolla yellow, slender-funnelform, the tube almost filiform, 4 1/2 to 5 lines long, 1 1/2 to 2 times as long as the calyx; stamens equally, rarely slightly unequally, inserted on the corolla, unequal in length, the longer exserted; style equaling the corolla-tube; cells of the capsule one-seeded.—Montane, 1000 to 6500 ft.: Sierra Nevada from Nevada Co. to Plumas and Lassen Cos.; North Coast Ranges from Lake Co. to Siskiyou Co.; n. to eastern Ore. June-July. (*Gilia aristella* Gray.)

3. *C. linearis* Nutt. Stem simple and erect, branched from the base and diffuse, 4 to 11 (or 15) in. high; herbage puberulent, often glandular; leaves linear to linear-lanceolate, entire, 1/2 to 2 in. long; flowers in a terminal capitate cluster, or some in lateral 1 to few-flowered clusters; corolla red-purple or pink, slender-funnelform, minutely puberulent, 4 to 5 or 9 lines long, 1 1/2 to 2 times as long as the calyx; stamens unequally inserted, included in the corolla-tube; style included; cells of the capsule 1-seeded.—Dry flats and slopes in the mts., 1000 to 8500 ft.: San Bernardino Mts.; Sierra Nevada from Tulare Co. to Modoc Co.; then w. to Humboldt Co.; n. to B. C. and Man., e. to Col.

766. *Collomia grandiflora* Dougl.; a, fl. stem x 1/2; b, fl. x 1; c, fr. calyx x 2; d, capsule x 2.

4. *C. grandiflora* Dougl. Fig. 766.

Stem erect, simple (or rarely branched), 2 1/2 to 3 ft. high; leaves linear or oblong-lanceolate, entire, sessile, 1 to 3 in. long; flowers crowded in head-like clusters at the ends of the stems and leafy-bracted, or some often borne below, either singly in the axils or in small clusters on short branchlets; calyx-tube obconical; corolla pale salmon-color, narrowly funnelform, 10 to 12 lines

long, its tube thrice as long as the calyx, its lobes broadly oblong.—Openly wooded or open slopes, 1000 to 8000 ft.: Palomar Mt.; San Jacinto Mts.; San Bernardino Mts.; Coast Ranges; Sierra Nevada; n. to B. C. and Ida.; e. to Nev. July.

5. *C. rawsoniana* Greene. Stem simple or with a few short branches above, very leafy, 1 to 2 ft. high, arising from a slender horizontal rootstock; leaves all cauline, ovate to oblong-lanceolate, coarsely and incisely serrate or entire towards the base, rather thin, viscid-pubescent,  $1\frac{1}{2}$  to 4 in. long, tapering below to a petiole 2 to 10 lines long; flowers in terminal clusters; calyx 4 to  $4\frac{1}{2}$  lines long, its lobes narrowly lanceolate, longer than the tube; corolla orange, turning pinkish on drying, narrowly funnelform, 1 to  $1\frac{1}{4}$  in. long, 4 times as long as the calyx; filaments exserted and evidently declined, inserted equally on the corolla; seeds not becoming mucilaginous, one in each cell.—Montane, 3000 to 5000 ft., Northfork, Madera Co.; extremely local.

6. *C. larsenii* (Gray) Payson. Stem simple or branched from base, 1 to 6 in. high, arising from a slender rootstock; leaves all cauline, crowded above, orbicular or ovate, entire or deeply parted, thickish, viscid-puberulent, 10 to 15 lines long, petioled; flowers in a loose terminal cluster; corolla blue or violet, narrowly funnelform, 7 to 8 lines long, about 2 times as long as the calyx; stamens unequal, equally inserted on the corolla, the longer equaling the corolla; style equaling corolla; cells of the ovary one-ovuled.—Loose rocks: Lassen Peak (rare in Cal.); n. to Wash. (*Gilia larsenii* Gray.)

### 3. PHLOX L.

Low herbs, or sometimes slightly woody at base. Leaves opposite, entire. Flowers in cymes, blue to lavender, pink, red or white. Calyx narrow, scarious between the lobes. Corolla strictly salverform, the lobes entire or bifid, the tube slender, the throat constricted. Stamens very short, unequally inserted, included. Ovules 1 or few in each cell of the ovary. Capsule finally rupturing the persistent calyx. Seed-coats not changed when wetted. (Greek phlox, flame, the ancient name for *Lychnis*, transferred by Linnaeus to these plants.)

#### KEY TO THE SPECIES BY H. L. MASON

Perennial; corolla-limb 4 to 10 lines broad.

Leaves narrowly linear to linear-lanceolate; corolla-tube glabrous outside.

Style longer than calyx, equaling corolla-tube.

Corolla-tube 3 to 4 times longer than calyx.....1. *P. superba*.

Corolla-tube 1 to 2 times as long as calyx.....2. *P. dolichantha*.

Style equaling or shorter than calyx, about  $\frac{1}{2}$  as long as corolla-tube.

Flowers sessile or nearly so; style about equaling calyx.....3. *P. douglasii*.

Flowers pedicel; style much shorter than calyx.

Style longer than stigma; petals entire; pedicels shorter than calyx...

4. *P. hirsuta*.

Style shorter than stigma; petals notched; pedicels equaling or longer

than calyx.....5. *P. speciosa*.

Leaves ovate or elliptic; corolla-tube minutely glandular-puberulent...6. *P. adsurgens*.

Annual; corolla-limb 1 to  $1\frac{1}{4}$  lines broad.....7. *P. gracilis*.

1. *P. superba* Brand. Stems erect or ascending, 5 to 10 in. high; herbage thinly puberulent or glabrate, the inflorescence glandular-pubescent; leaves linear-lanceolate to lanceolate,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; flowers solitary in the uppermost axils, the pedicels as long as the calyx; calyx  $\frac{1}{3}$  to  $\frac{1}{4}$  as long as the corolla, the lobes equaling or shorter than the calyx-tube; corolla whitish or rose-purple, glabrous,  $1\frac{1}{2}$  to  $2\frac{1}{4}$  in. long, 3 to 4 times longer than the calyx, its lobes obovate; stamens unequally inserted, the upper pair somewhat exserted; style equaling the corolla-tube or slightly exceeding it.—Montane, 4000 to 6000 ft.: San Bernardino Mts.; ne. to southern Nev. (*P. bernardina* M. & J.)

2. *P. dolichantha* Gray. Stems several, erect from a woody base, 3 to 10 in. high; herbage canescent; leaves linear or linear-lanceolate, thick,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long; flowers in a terminal corymbose cyme; calyx 4 to  $4\frac{1}{2}$  lines long, the lobes broadly subulate,  $\frac{2}{3}$  as long as tube, the sinuses broadly replicate; corolla pink-red, its tube 7 lines long with a hairy ring at base inside, its lobes broadly obovate, emarginate or retuse, about half as long

as the tube; stamens unequal, the upper slightly exserted; style longer than calyx, nearly as long as corolla-tube; ovary-cells 1-ovuled.—Desert mesas, 4000 ft.: e. Mohave Desert (New York Mts.); Lassen and Modoc Cos.; n. to Wash., e. to Utah and N. Mex. (*P. stansburyi* Hel.)

3. *P. douglásii* Hook. Root-crown divided into several or many prostrate branches, the ultimate branchlets ascending or erect, forming a low or tufted mat 3 to 10 in. broad; herbage subglabrous or scantily puberulent; leaves linear, 3 to 5 lines long with similar leaves fascicled in the axils; flowers solitary in the upper axils, sessile or subsessile; calyx 4 to 5 lines long, the acerose teeth equaling or shorter than the puberulent tube; corolla white, whitish-lavender or lilac, 7 to 11 lines long, its lobes obovate,  $\frac{1}{2}$  length of tube; stamens unequal, included, the filaments shorter than the anthers; style shorter than calyx.—Rocky ledges or granite-sand slopes, montane, 4700 to 10,300 ft.: Mt. Pinos; Sierra Nevada from Fresno Co. to Modoc Co.; n. to Wash., e. to Nev. Var. *CAESPITOSA* Mason n. comb. Plants very closely and densely caespitose, the branchlets not over  $\frac{1}{4}$  to 1 in. high; leaves closely imbricate, the edges revolute.—Alpine summits, 10,000 to 12,500 ft.: White Mts.; Parker Pass; Mono Pass; Mt. Dana; n. to Wash., e. to Rocky Mts. (*P. caespitosa* Nutt.) Var. *AUSTROMONTANA* Jepson & Mason n. comb. Leaves long (8 to 12 lines), the edges usually not recurved; calyx plicate in the sinuses.—Mts. of S. Cal.: San Gabriel, San Bernardino, San Jacinto and Cuyamaca mountains. (*P. austromontana* Cov.). Var. *CANESCENS* Mason n. comb. Herbage densely white-floccose.—Modoc Co.; e. to Rocky Mts. (*P. canescens* T. & G.)

4. *P. hirsuta* E. Nels. Stems many, erect, from the branched root-crowns,  $1\frac{1}{2}$  to 2 in. high; herbage glandular-pilose; leaves ovate to oblong, acute, 3 to 6 lines long; calyx-lobes subulate, somewhat spreading, about as long as the tube, about equaling the corolla-tube; corolla white or pinkish, its tube 6 lines long, its lobes about half as long; stamens unequally inserted, included; style shorter than calyx.—Dry hills, 4000 ft., rare: Siskiyou Co.

5. *P. speciosa* Pursh. Stems several, erect or ascending from a branched woody root-crown, 4 to 20 in. high; herbage puberulent or the leaves sometimes glabrous on one or both sides; leaves linear or lanceolate to ovate,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; flowers in a terminal umbellate cyme; calyx puberulent,  $\frac{1}{2}$  to  $\frac{4}{5}$  as long as corolla-tube, its lobes short-subulate,  $\frac{1}{2}$  as long as its own tube; corolla red to lavender, its tube 6 to 7 lines long, the lobes obcordate,  $\frac{1}{2}$  to  $\frac{3}{4}$  as long; stamens unequal and unequally inserted, included; style shorter than calyx.—Hill slopes, 1500 to 5000 ft.: Sierra Nevada from Fresno Co. to Tuolumne Co.; ne. Mendocino Co. to Siskiyou Co.; Modoc Co.; n. to Wash. and Ida. (*P. occidentalis* Dur.)

6. *P. adsurgens* Torr. Stems diffuse or ascending, simple or sparingly branched, 4 to 10 in. long; arising from slender creeping root-stocks; herbage glabrous, the inflorescence glandular-puberulent; leaves elliptic to ovate, 6 to 14 lines long; flowers in terminal few-flowered cymes; pedicels mostly longer than calyx; calyx glandular-pubescent, its lobes subulate, spreading or recurved, longer than the tube; corolla pink-

767. *Phlox gracilis* Greene; a, habit x  $\frac{1}{2}$ ; b, flower x 2; c, long. sect. of corolla x 2; d, capsule x 2.

ish-white, minutely glandular, 1 in. long, its lobes entire, about half as long as the tube; stamens very unequal, the 2 upper ones often exserted; style equaling or longer than the corolla-tube; ovary-cells 1-ovuled.—Montane, 4000 to 6000 ft.: Mendocino Co. to w. Siskiyou Co.; n. to Ore.

7. *P. grácilis* (Hook.) Greene. Fig. 767. Stem simple or branched, 3 to 8 in. high; herbage pilose-pubescent, the hairs often gland-tipped; leaves oblong to linear or lanceolate,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long, sessile or the lowest shortly petioled; flowers in terminal cymes; calyx cylindrical, much distended in fruit by the globose capsule, the short teeth accrescent; corolla salverform, purple or white,  $3\frac{1}{2}$  to 5 lines long, little surpassing the calyx, the tube often yellow; corolla-limb 1 to  $1\frac{1}{2}$  lines broad, its lobes roundish, emarginate; stamens unequally inserted; seeds 1 in each cell, with a rather broad thin margin.—Open hills, 300 to 8600 ft., almost throughout Cal. Mar-Apr. (*Gilia gracilis* Hook. *Collomia gracilis* Dougl.)

#### 4. NAVARRETTIA R. & P.

Small annuals with mostly rigid stems. Leaves alternate, pinnate or pinnatifid or the lowest sometimes entire or subentire, the segments mostly rigid, subulate, cuspidate or spinose. Calyx not accrescent, its teeth or lobes mostly unequal, toothed or cleft, or entire, its tube scarious between the 5 angles or ribs. Corolla tubular-funnelform or salverform, blue, white or yellow. Capsule 3-celled and 3-valved, or in some species 1-celled and 4-valved. (Fr. Ferd. Navarrete, a Spanish physician.)

A. HEADS WITH THE BRACTS AND CALYCES DENSELY WHITE-WOOLLY.....1. *N. abramsii*.

B. HEADS WITH THE BRACTS AND CALYX-TEETH PUBESCENT TO GLABROUS, COMMONLY VERY SPINESCENT.

1. Capsule not regularly dehiscent, the walls thin and transparent and closely covering the seeds which are agglutinated into a mass; flowers white (sometimes pale blue in no. 2).

Stems erect or spreading.

Leaves bipinnatifid; bracts densely white-tomentose.....2. *N. intertexta*.

Leaves once pinnatifid; sinuses of the calyx white-hairy.....3. *N. leucocephala*.

Primary flower-cluster seated on the ground, the branches radiating from beneath it and prostrate; calyx-segments trifid.....4. *N. prostrata*.

2. Capsule regularly dehiscent by valves and releasing the seeds which are free from each other.

Leaves (or some of them) pinnately parted with the divisions incised or parted.

Stamens exserted; capsule 1-celled.

Leaves with soft lobes; capsule 2-seeded.

Corolla creamy-white; flowers 4-merous.....5. *N. cotulaefolia*.

Corolla yellow; flowers 5-merous.....6. *N. nigellaeformis*.

Leaves with firm, rigid or pungent lobes.

Terminal leaflet spatulate- or lanceolate-dilated.

Calyx-lobes or some of them toothed; corolla blue; common.....7. *N. pubescens*.

Calyx-lobes commonly all entire; corolla blue or purple.

Capsule rounded at apex; s. of San Francisco Bay.

Calyx-lobes merely cuspidate, sub-glabrous; capsule dehiscent from the apex.....8. *N. setiloba*.

Calyx-lobes subulate, pungent, crisp-villous; capsule dehiscent from the base.....9. *N. jaredii*.

Capsule obscurely 4-lobed at apex; diffusely branched; n. of San Francisco Bay.....10. *N. mitracarpa*.

Terminal leaflet acicular-acerose; corolla yellow; low plant with much-congested heads; Sierra Nevada.....11. *N. breweri*.

Stamens not exserted; corolla blue or white.

Seeds 8 to 12 in each cell; herbage strongly mephitic-scented.....12. *N. squarrosa*.

Seeds 4 in each cell; herbage honey-scented.....13. *N. mellita*.

Leaves merely pinnatifid or incised or pinnate, or some of them entire.

Small plants, 2 to 3 (or 8) in. high; stems slender; leaves filiform, entire or with 1 or 2 (or 3) pairs of short filiform lobes mostly near the base; bracts dilated, palmately cleft into 3 to 5 unequal subulate entire lobes.

Plants erect, the heads mostly on slender branches proliferous from beneath the terminal head of the main stem.....14. *N. prolifera*.

Plants diffusely branched, mostly broader than high; branches filiform, mostly proliferous.

Stamens exserted from corolla.....15. *N. filicaulis*.

Stamens included in corolla.

Calyx-lobes white-villous; middle altitudes, Sierra Nevada.....

16. *N. divaricata*.

Calyx-sinuses densely short-hairy, otherwise subglabrous; Lassen and

Modoc Cos. ....17. *N. minima*.

Small or large plants, 2 to 15 in. high; leaves, or some of them, commonly with the rachis relatively broad ( $\frac{1}{2}$  to 1 or 3 lines wide); bracts laciniately cleft or coarsely toothed.

Capsule several-seeded.

Stems slender; erect plants; bracts mostly ovate, lacinate towards the base.

Stems stoutish; mostly spreading plants, very coarse and spiny; bracts spiny-pinnatifid.

Capsule with 1-seeded cells; corolla 6 to 7 lines long; bracts, especially the inner, dilated, palmately cleft into lanceolate often toothed segments.

18. *N. heterodoxa*.

19. *N. atractyloides*.

20. *N. viscidula*.

1. *N. abramsii* Elmer. Stem freely branching from and above the base, 2 to 5½ in. high; herbage lanate, soon glabrate, the heads persistently white-woolly; leaves  $\frac{3}{4}$  to 1½ in. long, pinnately divided with 1 or 2 pairs of filiform segments, or entire and filiform; bracts with linear-filiform or subulate divisions; flowers in heads, the heads terminal on the branches, about 5 to 7 lines broad; calyx with lanceolate-subulate lobes  $\frac{1}{2}$  as long as the very scarious tube; corolla tubular-funnelform, pale blue, 2½ lines long, its lobes narrow, about  $\frac{1}{2}$  as long as the tube; capsule 3-seeded, the seeds mucilaginous under water. —Very rare: Santa Cruz Mts. (Black Mt.); perhaps also Lake Co.

768. *Navarretia intertexta* Hook.; a, fl. branch x 1; b, bract x 2½; c, fl. x 2½.

2. *N. intertexta* (Benth.) Hook. Fig. 768. Stem erect, simple or often branching from the base, 2 to 7 in. high; herbage white-puberulent but not glandular; leaves 4 to 12 lines long, bipinnatifid, the narrowly linear or subulate segments spinescent-tipped; bracts pinnatifid, strongly dilated at base, body of bracts and exterior of calyx-tube densely white-villous or woolly-tomentose; calyx-lobes with a tuft of hairs on the base inside, otherwise glabrous; calyx  $\frac{2}{3}$  as long as corolla; corolla white or lavender, slender-funnelform, 4½ lines long.—Depres-

sions in the valleys and hills, 50 to 4000 ft.: Great Valley; Coast Ranges; Sierra Nevada foothills; e. side Sierra Nevada; s. to San Diego Co.; n. to Wash. and Mont. May-June. (*Gilia intertexta* Steud.)

3. *N. leucocéphala* Benth. Fig. 769. Stems simple or branching from the base, 3 to 5 in. high; herbage whitish-puberulent; leaves  $\frac{1}{2}$  to 2 in. long, pinnately parted, the divisions filiform, mostly remote, entire or sparingly toothed, the rachis broad and often prolonged into an elongated terminal entire division; calyx glabrous but with a tuft of hairs at each sinus, the teeth mostly entire and nearly equal, equaling the corolla; corolla clear white, 2 to 4 lines long.—Low places in fields and beds of pools where water has stood in winter or early spring, often forming dense colonies, 100 to 1500 ft.: Sierra Nevada foothills; Great Valley; Sonoma and Lake Cos. to Mendocino Co.; n. to southern Ore.

4. *N. prostrata* (Gray) Greene. Plants prostrate; primary flower-cluster or head sessile at the ground, the branches radiating from beneath it, simple or once forked, terminating in the head-like clusters, 1 to 2½ in. long; herbage glabrous; bracts and calyces white-puberulent; leaves pinnatifid,  $\frac{3}{4}$  to 2 in. long, the rachis broad and elongated, the segments remote; heads dense, surrounded by foliaceous bracts 1 to 1¾ in. long; inner bracts trifid at apex, chartaceous below, not exceeding the corolla; calyx with unequal

teeth, the 2 longer tri-dentate; corolla white,  $3\frac{1}{2}$  lines long; calyx-teeth in fruit contracted over the 2-celled capsule; seeds 9 to 11, small.—Plains and valleys, 50 to 1500 ft.: Sacramento and San Joaquin valleys s. to coastal S. Cal. May. (*Gilia prostrata* Gray.)

5. *N. cõtulaefolia* (Benth.) H. & A. Stem erect, corymbosely branching from above base, 4 to 13 in. high; herbage finely pubescent; leaves  $\frac{1}{2}$  to 2 in. long, bipinnatifid, the segments linear, soft, barely cuspidate; bracts and calyx white-hairy, glabrous at the base; flowers commonly 4-merous; calyx-lobes varying from nearly equal and entire to unequal, with the longer variously toothed; corolla creamy or dull white, 3 to 5 lines long, somewhat exceeding the calyx; capsule 1-celled, 4-valved, dehiscing from the base, 2-seeded; embryo with entire cotyledons.—Valley fields, 20 to 1500 ft.: Coast Ranges from San Benito Co. to Mendocino Co.; Sacramento Valley and foothills w.; n. Sierra Nevada foothills; n. to Siskiyou Co. and Ore. (*Gilia cotulaefolia* Steud.)

6. *N. nigellaefõrmis* Greene. Very close to no. 5 but flowering later when growing with it; bracts multifid; calyx-teeth pinnatifid; corolla yellow, 8 lines long.—Low places in valleys: Sacramento and San Joaquin valleys; Coast Ranges.

7. *N. pubescens* (Benth.) H. & A. Stem erect, usually branching above, 8 to 18 in. high; herbage puberulent; leaves pinnately divided with the divisions laciniately lobed,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long; terminal portion of the leaf less deeply divided or merely laciniate-toothed, so that the rachis appears as if spatulate-dilated; lower portion of bracts and middle portion of calyces white-hairy, sometimes merely puberulent; 3 calyx-teeth small and entire, 2 longer and toothed, or all pinnately toothed; corolla deep blue, 7 to 8 lines long,  $1\frac{1}{4}$  times as long as the calyx, the throat funnellform; stamens exserted; capsule 1-celled, 4-valved as in *G. cõtulaefolia*; cotyledons of the embryo parted into 3 lobes, the divisions so deep as to give the appearance of 6 cotyledons.—Low hills and valleys, 10 to 1500 ft.: Coast Ranges; Great Valley; Sierra Nevada foothills. Var. *TAGETINA* Jepson n. comb. Bracts finely bipinnatifid, these and the calyces merely pubescent.—Great Valley and foothills of neighboring ranges. (*N. tagetina* Greene.)

8. *N. setiloba* Cov. Stem erect, branching from near the base or subsimple, 4 to 6 in. high; herbage minutely puberulent; leaves with ovate-lanceolate terminal lobe, the rachis bearing small bipinnatifid pinnae with acicular segments; terminal lobe 4 to 8 lines long, its margin irregularly and finely laciniate; bracts with lanceolate terminal lobe and subregular acerose-toothed margin, the rachis bearing on and above the dilated base 2-forked acerose segments; calyx mostly equaling the corolla; corolla blue, 4 to 5 lines long; capsule 1-seeded.—Walker Basin to Tehachapi Mts.

9. *N. jarédlí* Eastw. Stem with many branches from or near the base, slender, 2 to 10 in. high; herbage puberulent; lower leaves simply pinnate,  $1\frac{1}{2}$  to 1 in. long, the segments acerose, cuspidate,  $\frac{1}{2}$  to  $1\frac{1}{2}$  lines long, regular, that is remotely pectinate; bracts pinnatifid; calyx about  $\frac{2}{3}$  as long as corolla, the larger lobes toothed; corolla 5 lines long, the tube filiform, the throat ample and limb 2 to  $2\frac{1}{4}$  lines broad; capsule 1-celled, 1-seeded.—Dry hills, 800 to 1500 ft.: Monterey and San Luis Obispo Cos.

769. *Navarretia leucocephala* Benth.; a, habit x  $\frac{1}{2}$ ; b, fl. x  $2\frac{1}{2}$ ; c, bract x  $2\frac{1}{2}$ .

10. *N. mitracarpa* Greene. Stem branching at or above the base, 4 to 6 in. high, the branches ascending, slender; herbage minutely puberulent; leaves pinnate, 4 to 7 lines long, the divisions filiform, cuspidate,  $\frac{1}{2}$  to 2 lines long; upper leaves and bracts bipinnatifid into subulate segments; 2 calyx-teeth entire, the 3 longer toothed; corolla purple, 3 to 4 lines long, equaled by the longer calyx-teeth; stamens exserted; capsule 1-celled, 1-seeded, acutish at base, 4-valvate from base, the rounded summit obscurely 4-angled.—Dry hills, 1500 to 2500 ft.: Lake and Colusa Cos.

11. *N. breweri* (Gray) Greene. Stem shortly branched, the branches ending in capitate clusters, thus forming a usually dense or congested plant 1 to  $3\frac{1}{2}$  in. high and commonly as broad; leaves pinnate with the lobes tripartite into acicular-subulate divisions, 4 to 6 or 9 lines long, the bracts with similar divisions; calyx-teeth acicular-subulate, twice as long as the tube, exceeding the corolla; corolla yellow; stamens exserted; ovary-cells 1 or 2-ovuled.—Montane valleys or flats, 4000 to 8000 ft.; easterly summits or easterly slopes of the Sierra Nevada from Amador Co. to Nevada Co.; n. to Modoc Co.

12. *N. squarrosa* (Esch.) H. & A. SKUNKWEED. Stem erect, branching at or above the base, 8 to 16 in. high; herbage pubescent and noxiously glandular; leaves  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long, once or twice pinnatifid, the segments lanceolate and often crowded; calyx 6 lines long, very scarious below, the teeth lanceolate and pungent; corolla blue, sometimes very pale, 5 to 6 lines long, its tube little or scarcely at all exceeding the teeth; stamens included; seeds many, small.—Valley levels and low hills, 50 to 2300 ft., common; Monterey Co. to Alameda, Napa, Lake and Humboldt Cos.; n. to B. C.

13. *N. mellita* Greene. Stem slender, diffusely branching from the base or sometimes subsimple and erect, often reddish. 3 to 6 (or 13) in. high; herbage glandular-villous; leaves  $\frac{1}{4}$  to  $1\frac{1}{4}$  in. long, pinnately parted into linear-subulate entire or toothed segments; bracts dilated and laciniately toothed or cleft into narrow divisions, or the middle division ovate, abruptly cuspidate and often entire; heads small, 4 to 6 (or 10) lines broad; calyx equaling the corolla; corolla very slender-funnelform, very pale blue or white, 3 to 6 lines long; stamens not exserted.—Hill slopes, 200 to 1500 ft.: w. Lake Co.; Mendocino, Napa and w. Solano Cos. to Santa Clara Co. July.

14. *N. prolifera* Greene. Main stem erect, simple, 1 to 3 in. high, bearing a single terminal head, with 2 to several branches proliferous from beneath the primary head, these branches slender or filiform, naked, 1 to 3 in. long, each bearing a single head; herbage glabrous, the bracts white-tomentulose; leaves 5 to 11 lines long, filiform and entire, or with 1, 2, or 3 remote pairs of short filiform lobes  $\frac{1}{2}$  to 1 line long; bracts palmately 5-cleft, the undivided portion white-chartaceous; calyx about  $\frac{2}{3}$  as long as corolla, its teeth subulate, nearly twice as long as chartaceous tube, somewhat tomentulose; corolla purple or yellow, 2 to 5 lines long.—Chaparral slopes, 2000 to 4000 ft.: Sierra Nevada from Eldorado Co. to Tulare Co.

15. *N. filicaulis* (Torr.) Greene. Stems 1 to several from the base, very slender or wiry, 2 to 8 in. high; herbage minutely glandular-puberulent; leaves filiform, entire,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long, or pinnate with 1 or 2 pairs of short-filiform lobes near the base or at the middle; flowers in small heads, the heads  $1\frac{1}{2}$  to  $2\frac{1}{2}$  lines broad, on peduncles 3 to 10 lines long; bracts with subulate-spinose tips exceeding the flowers; calyx  $1\frac{1}{2}$  lines long, the teeth very unequal, 2 very small; corolla dark purple,  $2\frac{1}{2}$  lines long; stamens and style exserted,  $1\frac{1}{2}$  times as long as corolla; capsule thin-walled, 1-celled (or imperfectly 2-celled), 4 to 8-seeded.—Dry hills, 500 to 2000 ft.: Sierra Nevada foothills from Butte Co. to Mariposa Co.

16. *N. divaricata* (Torr.) Greene. Main stem short,  $\frac{1}{4}$  to  $\frac{1}{2}$  in. high, terminated by a head of flowers and bearing 2 to several ascending or spreading very slender branches, each terminated by a head usually with 2 to 4 branches proliferous from beneath each secondary head, these latter branches ending in a head or cluster of heads, the plants  $1\frac{1}{4}$  to  $3\frac{1}{4}$  in. high, usually broader than high; body of heads 3 to 5 lines broad; herbage villous or glabrate; bracts white-pubescent at base, palmately cleft into 3 to 5 acerose divisions equaling or exceeding the flowers; leaves filiform

or acicular, 4 to 9 lines long, simple or with 2 pairs of short-acicular teeth near the base; calyx 2 to  $2\frac{1}{2}$  lines long, exceeding or at least equaling the corolla, rarely a little shorter, its lobes very unequal, acerose, entire, cobwebby; corolla minute, pinkish or purplish; capsule cells 3 to 6-seeded.—Sandy flats and borders of meadows or dry openly forested slopes and ridges, abundant, often forming dense colonies: Sierra Nevada, 3500 to 8200 ft., from Kern Co. to Nevada Co. and n. to Siskiyou and Modoc Cos.; White Mts.; Coast Ranges, 2500 to 5000 ft., from Lake Co. to Mendocino Co.; n. to southern Ore.

17. *N. minima* Nutt. Stem branched from the base, 1 to  $2\frac{1}{2}$  in. high; herbage scantily puberulent or subglabrous; leaves pinnate, 3 to 5 lines long, the segments linear or subulate; bracts similar to the leaves; calyx-lobes  $1\frac{1}{2}$  times as long as the tube, the scarious intervals between the ribs very broad, the sinuses densely short-hairy; corolla white,  $2\frac{1}{2}$  to 3 lines long, shorter than the calyx.—Overflowed places or margins of ponds, 4000 to 6000 ft.: Lassen Co. to Modoc Co.; n. to Ore., e. to Cal. July-Aug.

18. *N. heterodóxa* (Gray) Greene. Stem very slender, erect, branching, rarely simple, 4 to 11 in. high; herbage slightly glandular-puberulent; internodes long; leaves  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long, the lower ones with narrowly linear rachis and many pinnate short-subulate segments, the uppermost lanceolate and entire except at the laciniately toothed base; bracts lanceolate to broadly ovate, lacinate-toothed towards the base; calyx-segments entire, nearly equal; corolla blue, 5 lines long, with exserted declined stamens; capsule 8 to 14-seeded, the seeds small.—Dry hills, 500 to 1500 ft.: Napa and Sonoma Cos. to Santa Clara Co. June. (*N. parvula* Greene. *N. rosulata* Brand.)

19. *N. atráctylóides* (Benth.) H. & A. Stems freely branched, stoutish, the branches short and spreading or procumbent, 2 to 8 in. high; herbage somewhat purplish and villous-pubescent; leaves rigidly coriaceous, oblong-lanceolate to ovate,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long, the rachis or main body (1 or) 2 to 4 lines broad, the margin armed with subulate or aristate teeth; bracts similar to the leaves, very coriaceous and spiny; calyx-segments moderately or very unequal, ovate to lanceolate, entire, setaceous at apex; corolla narrowly funnelliform, purple, 7 to 9 lines long; stamens included; seeds about 10 in each cell.—Dry hills, 500 to 1500 ft.: Humboldt Co., w. Colusa Co. and Lake Co. to coastal S. Cal. July. Habit suggesting certain species of *Chorizanthe*. (*N. macrantha* Brand.) Var. *FOLIACEA* Jepson n. comb. Leaves with broad (2 to  $3\frac{1}{2}$  lines) rachis, less coriaceous, the lobes or teeth less spinose; corolla white.—Monterey Co. to San Diego Co. (*N. foliacea* Greene.) Var. *FLÁVIDA* Jepson n. var. Similar to var. *foliacea*; corolla yellow with purple markings.—San Gabriel Mts. (North Fork San Gabriel River, 1500 ft., F. W. Peirson, type). Var. *HAMÁTA* Jepson n. comb. Stems sometimes slender; rachis of leaves  $\frac{1}{4}$  to 3 lines broad; 3 terminal spines of leaves and bracts conspicuously divaricate or hooked.—Open ground or open woods, near the coast, Monterey Co. to San Diego Co. (*N. hamata* Greene.)

20. *N. viscidula* Benth. Fig. 770. Stem erect, subdivaricately or somewhat proliferously branched, sometimes spreading or subprostrate,

770. *Navarretia viscidula* Benth.; a, habit x 1; b, bract x 2; c, long. sect. of fl. x 2.

sometimes dwarfish and simple,  $1\frac{1}{4}$  to 7 in. high; herbage viscid-pubescent; leaves  $\frac{1}{4}$  to  $2\frac{1}{2}$  in. long, narrow, the lower with slender rachis and remote filiform lobes, the upper with broad rachis and remote short-subulate lobes; bracts little dilated, palmately parted, the lobes incisely toothed, or ovate with 1 or 2 laciniate teeth on each side; corolla rather large, blue-purple, 5 to 7 lines long,  $1\frac{1}{2}$  times as long as the calyx, the limb 2 lines broad, its lobes elliptic; stamens exserted; ovules 1 to 4 in each cell.—Valleys, plains and low hills, sandy soil, rocky slopes, or sun-baked clays, 100 to 1500 ft.: Coast Ranges (back from the coast) from Contra Costa Co. to Mendocino Co.; Great Valley; Sierra Nevada foothills from Butte Co. to Tulare Co. (*Gilia viscidula* H. & A.) Var. *PURPUREA* Jepson n. comb. Bracts rather densely villous at base.—Amador and Calaveras Cos. (*N. purpurea* Greene.)

#### 5. *HUGELIA* Benth.

Herbs lanate when young, not at all glandular. Leaves or their simple divisions linear or filiform and rigid. Flowers crowded into capitate leafy-bracted clusters. Bracts 3 to 5-cleft, these and the calyces densely woolly-matted. Calyx-lobes subulate, pungent. Corolla salverform. Stamens exserted; anthers deeply sagittate. Capsule many-seeded. Seed-coats changing under water. (Baron Charles de Hugel of Vienna.) *WELWITSCHIA*.

Woody-based perennial; corolla-tube 2 to 3 times longer than the calyx. . . . 1. *H. densifolia*. Annual or biennial; corolla-tube scarcely or but little longer than the calyx.

Corolla regular.

Corolla-lobes  $\frac{1}{4}$  to  $\frac{1}{2}$  as long as tube, the limb blue. . . . . 2. *H. filifolia*. Corolla-lobes scarcely or but little longer than the tube.

Corolla yellow. . . . . 3. *H. lutea*. Corolla blue.

Leaves 1 to 3-parted. . . . . 4. *H. virgata*

Leaves 3 to 7-parted. . . . . 5. *H. brauntonii*

Corolla-lobes arranged in 2 lips, the limb lavender. . . . . 6. *H. eremica*.

1. *H. densifolia* Benth. Stems many from a tufted woody base, erect, simple or branched above, 5 to 14 in. (or 2 ft.) high; herbage lanate-tomentose when young, glabrate in age; leaves  $\frac{1}{4}$  to  $2\frac{1}{4}$  in. long, narrowly linear and entire or with 1 to 3 pairs of short-subulate spinulose lobes at the middle or toward the base; flower-clusters terminal, dense, the foliaceous bracts and the calyces implexed-woolly; corolla deep blue, 5 to 8 lines long, its tube little longer than the longest calyx-lobe, its own lobes oblong, about 2 lines long.—Dry or chaparral slopes, 1000 to 6000 ft.: San Diego Co. to the San Bernardino and San Gabriel mountains and n. to Santa Clara Co.; Tehachapi Mts.; s. Sierra Nevada in Kern Co.; Owens Valley. June-Sept. (*Gilia densifolia* Benth.) Var. *SANCTORUM* Jepson n. comb. Corolla 1 to  $1\frac{1}{4}$  in. long. San Bernardino Valley. (*Gilia densifolia* var. *sanctorum* Milliken.)

2. *H. filifolia* Jepson n. comb. Stem erect, simple or virgately branched, 2 to 8 in. high; herbage white-tomentulose or glabrate; leaves filiform, entire or at base with 2 small lobes, 4 to 11 lines long; heads densely woolly; bracts 2 to 5-cleft, mostly recurved, at base hyaline; calyx densely woolly, its lobes shorter than the tube; corolla blue, 5 to 6 lines long, its tube mostly equaled by the calyx; stamens barely exserted, ovary-cells 4-ovuled.—Plains and valleys, 1500 to 4000 ft.: San Diego Co.; Lassen Co.; n. to Wash., e. to N. Mex., s. to L. Cal. (*Gilia filifolia* Nutt.) Var. *SPARSIFLORA* Jepson n. comb. Heads 1 to 3-flowered; corolla white, the throat purple-dotted.—S. Sierra Nevada in Fresno Co. (*Gilia sparsiflora* Eastw.)

3. *H. lutea* Benth. Stem erect, nearly simple or branched from the base, 2 to 7 in. high; herbage arachnoid-tomentose or glabrate, the heads woolly; leaves linear, entire or with 1 or 2 short lobes at base,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long; corolla bright yellow, salverform,  $4\frac{1}{2}$  to 5 lines long, its lobes narrow-ovate, nearly as long as the tube; ovary-cells 1 or 2-ovuled.—Mountain slopes, 500 to 1500 ft.: Monterey Co. to n. San Luis Obispo Co. (*Gilia lutescens* Steud.)

4. *H. virgata* Benth. Stems simple or branching from the base, 5 to 15 in. high; leaves filiform, entire, the upper 3-parted,  $\frac{1}{2}$  to 1 in. long; flowers in small head-like clusters, the clusters terminal on the stem or branches or virgately disposed along the branches, or the branchlets much elongated and the inflorescence thus corymbose; bracts and calyx very densely woolly; corolla tubular-funnelform, blue (the throat yellow), 6 to 8 lines long, surpassing the

acrose calyx-lobes; stamens exserted; anthers 1 line long.—Hillslopes, 1000 to 2000 ft.: coastal S. Cal.; n. to Monterey Co. June-July. (*Gilia virgata* Steud.) Var. *SAPPHIRINA* Jepson n. comb. Openly branched,  $\frac{3}{4}$  to 2 ft. high; leaves entire; clusters few (2 to 4)-flowered, weakly lanate.—San Jacinto Mts. to Cuyamaca Mts. (*Gilia sapphirina* Eastw.) Var. *FLOCCOSA* Jepson n. comb. Stem freely branched, 5 to 11 in. high, the heads small, densely and persistently woolly; leaves linear-filiform, entire; corolla lavender; anthers  $\frac{1}{2}$  line long.—East slope or e. summits of the Sierra Nevada from Lassen Co. to Fresno Co. (*Gilia floccosa* Gray.) Var. *PYGMAEA* Jepson n. var. Plants 4 to 7 lines high, the flower-clusters 1 to 3, capitate congested, almost sessile on the ground; leaves linear, entire.—New York Mts., e. Mohave Desert (Jepson 5463, type). Var. *DASYANTHA* Jepson n. comb. Closely and repeatedly branched, 2 to 5 in. high; leaves narrow, entire or with 1 or 2 pair of teeth or short lobes near the base; heads 6 to 8-flowered, densely woolly.—Colorado Desert. (*Navarretia virgata* var. *dasyantha* Brand.)

5. *H. brauntonii* Jepson & Mason n. comb. Stem mostly simple below and branched above, erect, 5 to 9 in. high; leaves pinnately parted into 3 to 7 filiform divisions,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long, shortly petioled or subsessile; heads dense, floccose,  $\frac{1}{2}$  to mostly 1 in. broad; corolla tubular-funnelform, vivid blue, 6 to 9 lines long; stamens exserted beyond the tube.—Sandy flats in the mts. or valleys, 1000 to 6000 ft.: South Coast Ranges; San Joaquin Valley; s. Sierra Nevada foothills from Fresno Co. to Tulare Co. June-Aug. (*Gilia brauntonii* Jepson & Mason. *G. virgata* var. *floribunda* Gray.)

6. *H. eremica* Jepson n. sp. Stems many from the base, freely and often dichotomously branched, 4 to 6 in. high; leaves 5 to 9 lines long, pinnately divided into 5 to 7 short linear lobes; heads small, densely woolly; corolla violet or lavender, twice as long as the calyx, its lobes bilabiate arranged, with 3 lobes in upper lip, and 2 lobes spreading right and left as a lower lip.—Central Mohave Desert (Calico Wash, ne. of Barstow, Jepson 5414, type).

## 6. GÍLIA R. & P.

Annual or sometimes perennial herbs. Leaves all, or rarely only the upper, alternate, pinnately toothed, lobed, or divided, or sometimes entire. Calyx-teeth usually equal, the tube scarious below the sinuses, ruptured by the growing capsule. Corolla funnel- to salver-form, blue, yellow, red or white, the lobes mostly shorter than the tube, the stamens equally (rarely unequally) inserted on its throat. Capsule 3-celled and 3-valved, the seeds many, rarely few or one. (Felipe Luis Gil, Spanish botanist of the latter half of the 18th century.)

### A. PLANTS PERENNIAL OR BIENNIAL.

Flowers red (pink or yellowish).....1. *G. aggregata*.  
Flowers white.....2. *G. congesta*.

### B. PLANTS ANNUAL.

#### 1. Flowers in dense heads or in loose clusters.

Inflorescence not leafy.  
Flowers 25 to 50 in dense heads.....3. *G. capitata*.  
Flowers in loose clusters or open cymes, 3 to 10 in each cluster.  
Corolla tricolored.....4. *G. tricolor*.  
Corolla blue (to white).....5. *G. multicaulis*.  
Inflorescence leafy-bracted.  
Flowers loosely congested; bracts mostly twice as long as flower-cluster; stems moderately leafy.....6. *G. depressa*.  
Flowers in closely compact heads; bracts mostly little exceeding heads; stems sparsely leafy.....7. *G. polycladon*.

#### 2. Flowers in open panicles or cymes.

Corolla funnelform or tubular.  
Upper cauline leaves pinnatifid.  
Leaves predominantly cauline.  
Leaf divisions filiform or linear.....8. *G. peduncularis*.  
Leaf divisions lanceolate.  
Calyx entirely herbaceous.....9. *G. traskiae*.  
Calyx membranous below the sinuses to the base.....10. *G. giloides*.  
Leaves predominantly basal; flowers yellow.....11. *G. ochroleuca*.

- Upper cauline leaves variously lobed or entire.  
 Plants with the stems arising from a basal rosette of leaves.  
 Flowers  $\frac{1}{2}$  to 1 in. long.....12. *G. tenuiflora*  
 Flowers less than  $\frac{1}{2}$  in. long.  
 Corolla-lobes entire at apex.....13. *G. latiflora*  
 Corolla-lobes notched at apex.....14. *G. leptomeria*  
 Plants with the leaves principally cauline.  
 Leaves linear or lanceolate.  
 Leaves elliptic-lanceolate (often a few serrations); corolla mostly tubular.....10. *G. gilioides*  
 Leaves subuliform to linear, entire; corolla funnelform.  
 Corolla purple to magenta.....15. *G. leptalea*  
 Corolla white.....16. *G. capillaris*  
 Leaves broad, coarsely toothed.....17. *G. latifolia*  
 Corolla campanulate.  
 Corolla  $2\frac{1}{2}$  to 5 lines long.  
 Leaves linear, entire; stamens inserted at sinuses of corolla....18. *G. filiformis*  
 Leaves oblong-ovate, dentate or entire; stamens inserted at base of corolla-tube...19. *G. campanulata*  
 Corolla  $1\frac{1}{2}$  to 2 lines long.....20. *G. micromeria*

1. *G. aggregata* (Pursh) Spreng. SCARLET GILIA. SKYROCKET. Fig. 771.  
 Stem 1 or several from the perennial or biennial root-crown, erect and usually

771. *Gilia aggregata* Spreng.; a, lower part of plant; b, infl.  $\times \frac{1}{2}$ .

simple, 1 to  $2\frac{1}{2}$  ft. high; herbage puberulent and often slightly glandular, the leaf midribs often white-villous; leaves pinnate or bipinnate with linear segments,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long, the petioles  $\frac{1}{2}$  to  $1\frac{1}{4}$  times as long, the segments rather remote or those of the basal leaves crowded, 3 to 8 lines long; flowers in an elongate thyrs; calyx  $1\frac{1}{2}$  to 3 lines long, its lanceolate lobes 2 times as long as the tube; corolla salverform, commonly scarlet but varying through salmon and pink to white,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long, the subcylindric tube 2 to 5 times as long as the calyx, the lobes ovate-lanceolate, 4 to  $5\frac{1}{2}$  lines long, rotate, becoming reflexed; stamens unequal, inserted in the sinuses, about equaling or much exceeded by the corolla-lobes, frequently declined; capsule ovoid, the cells many-seeded; seeds flat, showing spiracles when wetted.—Moist sandy flats or loose soil on sunny slopes, opens or openly wooded ridges, 4000 to 10,000 ft.: Sierra Nevada from Tulare and Inyo Cos. to Modoc Co.; Coast Ranges from Lake Co. to Siskiyou Co.; n. to Can., e. to the Great Plains. June-Aug.

Var. *BRIDGESII* Gray. Low, 3 to 6 in. high; leaf-segments crowded, more obtuse.—Sierra Nevada and s. to Providence Mts.

2. *G. congesta* Hook. Stems few to many, slender, tufted, simple or branched, erect or ascending, 5 to 10 in. high; herbage sparingly villous or somewhat floccose-canescens; leaves equal in size and distribution up the stem, commonly pinnate with 4 to 7 lobes but frequently trifid, the margins more or less revolute, the lobes linear, cuspidate, 2 lines long, often crowded at the end of the petiole; flowers in dense bracteate capitate clusters, the clusters 5 to 7 lines broad, corymbosely arranged; calyx about equaling the corolla-tube, its lobes linear, cuspidate, villous-pubescent, about  $\frac{1}{3}$  as long as the tube; corolla short-salverform, white,  $2\frac{1}{2}$  to 3 lines long, its tube  $1\frac{1}{2}$  lines long and the limb about as wide; stamens inserted in the sinuses, evidently but not conspicuously exerted; capsule oval, about 1 line long, 1 to 3-seeded; seed-coats changing when wetted.—Dry ridges and plateau plains,

772. *Gilia capitata* Dougl. var. *achilleaefolia* Mason;  
a, inflorescence x 1; b, fl. x 3.

5000 to 11,000 ft.: White Mts.; Tuolumne Co. to e. Shasta, Lassen and Modoc Cos.; n. to Wash., e. to Utah. June-Aug.

3. *G. capitata* Dougl. Stem simple or commonly strictly branched above,  $\frac{2}{3}$  to 3 ft. high, the leaves basal and cauline, gradually reduced upwards; herbage glabrous to puberulent, sometimes minutely glandular; leaves 1 to 4 in. long, pinnate to bipinnate with linear lobes, petioled, the petioles 2 to 12 lines long; flowers in terminal heads on naked peduncles,

the peduncles long (2 to 13 in.); heads 5 to 11 lines broad; calyx glabrous, rarely pubescent or woolly; corolla funnelform, white to blue, purple and lavender, 3 to 4 lines long, its lobes linear; stamens inserted in the sinuses, exserted; capsule ovate, several-seeded; seeds showing spiracles when wetted.—Open slopes and flats, 500 to 5000 ft.: Sierra Nevada; North Coast Ranges; n. to Wash. (*G. glandulifera* Hel.) The varieties merge with the species, the geographic segregation here indicated being only approximate. Var. *ACHILLEAEFOLIA* Mason n. comb. Fig. 772. Heads commonly 8 to 18 lines broad; calyx commonly woolly or pubescent, sometimes glabrous; corolla 4 to 6 lines long.—Hillslopes and valleys, 50 to 5300 ft.: Sonoma and Contra Costa Cos. to San Diego Co.; San Joaquin Valley; Tehachapi Mts. (*G. achilleaefolia* Benth. *G. abrotanifolia* Nutt. *G. chamissonis* Greene.) Var. *REGINA* Jepson n. var. Stem erect, 2 to 6 in. high, forked once, the leaves in a sub-basal tuft; heads 1 to  $1\frac{3}{4}$  in. broad; corolla deep blue.—Sand dunes, Pt. Reyes peninsula (Jepson 8315, type).

4. *G. tricolor* Benth. Fig. 773. Stem slender, erect, with few branches from or above the base, or with many branches from the base and ascending, 8 to 16 in. high, the leaves in a basal tuft and also cauline; herbage glabrate to somewhat glandular; leaves pinnate, 1 to  $1\frac{3}{4}$  (or  $3\frac{1}{2}$ ) in. long, the petioles  $\frac{1}{4}$  to  $\frac{1}{2}$  as long, the segments linear, mostly remote, entire or pinnately toothed or laciniately cleft, 1 to  $1\frac{1}{2}$  lines long; flowers in terminal cymes, the cymes on slender peduncles; calyx cylindric to turbinate, somewhat glandular, 2 lines long, the slender teeth  $\frac{1}{2}$  as long as the tube; corolla funnelform, 6 to  $8\frac{1}{2}$  lines long, tricolored, lobes light blue, tube and base of throat yellow, top of throat dark blue; stamens equal, equally inserted just below the sinuses; anthers oval; style exceeding the

773. *Gilia tricolor* Benth.; a, infl.; b, lower leaf. x 1.

stamens; capsule many-seeded.—Open foothills, 100 to 3000 ft.: Coast Ranges from San Emigdio Mts. and from Monterey Co. to Mendocino Co.; Sierra Nevada foothills from Kern Co. to Butte Co.

5. *G. multicaulis* Benth. Stem simple to much branched, strict or ascending, 6 to 20 in. high; herbage glabrate or puberulent or occasionally glandular; leaves chiefly basal or sub-basal, slightly reduced up the stem, pinnate or bipinnate with remote very narrow lobes, the lower ones  $1\frac{1}{2}$  to 4 in. long, petioled, upper ones sessile; flowers in terminal 2 to 7-flowered glomerules, without bracts; calyx cleft  $\frac{1}{3}$ , its lobes triangular-lanceolate; corolla funnelform, blue or pinkish,  $3\frac{1}{2}$  to 5 (usually about 4) lines long, about twice as long as calyx; tube yellowish; stamens shorter than the corolla-lobes, inserted in the corolla-throat; capsule ovate-oblong, the cells many-seeded; seeds showing spiracles when wetted.—Open places, hillsides and valleys, 500 to 3000 ft.: Vaca Mts. and Marin Co. to S. Cal. Feb.-June. A common and variable species. Var. *MILLEFOLIATA* Jepson n. comb. Corolla little surpassing calyx, its throat ornamented with 5 black spots.—Along the coast, Humboldt Co. to Monterey Co. (*G. millefoliata* F. & M.) Var. *NEVINII* Jepson n. comb. Stem erect with usually strict short branches, 9 to 14 in. high; herbage pubescent, slightly glandular; leaves numerous, cauline, thrice pinnate with short narrow segments,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long, the lower on petioles  $\frac{1}{4}$  to as long, the upper reduced and becoming sessile; glomerules bracteate; corolla very narrowly funnelform, bluish,  $3\frac{1}{2}$  to 4 lines long,  $\frac{1}{4}$  longer than calyx; capsule oblong.—Insular: Santa Barbara Isls.; Guadalupe Isl. (*G. nevinii* Gray.)

6. *G. depréssa* Jones. Stem branched from or above the base, 2 to  $3\frac{1}{2}$  in. high; herbage grayish-pubescent, especially above; leaves thickish, linear-lanceolate or lanceolate-ovate, entire or with a pair of small spreading cuspidate-tipped lobes, thickish, 6 to 10 lines long, short-petioled; bracts ovate to ovate-lanceolate; flowers in very leafy terminal glomerules; calyx cleft  $\frac{1}{2}$ ; corolla tubular-funnelform, 3 lines long, white, 1 to  $1\frac{1}{2}$  times as long as calyx; stamens included; capsule globose-ovate, its cells several-seeded; seeds showing spiracles when wetted.—Desert flats or cañons, rare: Rabbit Sprs., Mohave Desert; Argus Mts.; Deep Spring Valley, Inyo Co.; e. to Nev. and Utah.

7. *G. polycladon* Torr. Branches from the base about 2 to 7, erect or strictly ascending, 4 to 8 in. high, the leaves remote along the branches and in a basal rosette (which disappears early); herbage puberulent, the stems sometimes a little glandular; leaves pinnatifid with cuspidate segments,  $\frac{1}{2}$  to  $\frac{3}{4}$  in. long, on petioles about  $\frac{1}{2}$  as long; flowers in close very leafy clusters  $\frac{1}{2}$  to  $\frac{3}{4}$  in. broad; bracts narrowly ovate to obovate; corolla tubular, white, 1 to 2 lines long, little or scarcely at all exceeding the calyx; stamens on short filaments in the corolla-throat, included; capsule oval, the cells 2 (occasionally 1)-seeded; seeds showing spiracles when wetted.—Inyo Co. (Deep Spring Valley); e. to Utah and western Tex.

8. *G. pedunculâris* Eastw. Stem much-branched from the base, 8 to 16 in. high, the branches slender, the leaves few and remote; herbage glabrate or somewhat glandular-villous above; leaves simple or bipinnate with remote narrow lobes, 1 to 2 in. long, petioled or the upper sessile; flowers in cymes, the cymes 1 to 4-flowered, the peduncles slender,  $1\frac{1}{2}$  to 2 in. long, somewhat divaricate; calyx  $1\frac{1}{2}$  lines long, rather more than half as long as the corolla; corolla tubular-funnelform, blue,  $2\frac{1}{2}$  to 4 lines long; stamens included, inserted at the sinuses; capsule ovate, the cells several-seeded; seeds mucilaginous when wetted.—Grassy slopes, Coast Ranges from Santa Clara Co. to s. Monterey Co.; s. to San Diego Co. and L. Cal. May.

9. *G. traskiae* Eastw. Stem slender, branching, erect or decumbent, 5 to 6 in. high; herbage glandular-pubescent; leaves variously pinnately toothed to divided or entire,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long, the lower on petioles  $\frac{1}{3}$  or  $\frac{1}{2}$  as long; flowers solitary on the upper portions of the stem, the pedicels slender; calyx entirely herbaceous, the lobes cut nearly to the base; corolla tubular-funnelform, white, 3 lines long,  $1\frac{1}{2}$  times calyx; stamens equal, equally inserted near base of corolla-tube; capsule many-seeded.—Santa Catalina Isl.

10. *G. gilioides* (Benth.) Greene. Fig. 774. Stem erect, 4 to 12 in. high, or becoming much branched, with the branches diffusely spreading or prostrate,  $\frac{1}{2}$  to  $2\frac{1}{2}$  ft. long, leafy; herbage more or less villous and glutinous; leaves simple, linear, oblanceolate or narrowly obovate,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long, the lower narrowed to a short petiole, or pinnate or pinnately cleft with 5 lobes or leaflets, these similar in shape to the simple leaves, or the upper leaves commonly trifid and sessile, the leaflets or lobes entire, commonly very unequal; flowers solitary or at times geminate and glomerate on slender peduncles, arranged in open irregular leafy cymes; calyx-lobes erect, linear, half as long as the tube; corolla tubular to somewhat funnel-form, blue (rarely white or crimson), 3 to 5 lines long, 2 to 3 times as long as the calyx; stamens unequal, inserted unequally high in the tube, not conspicuously exserted; style exserted; capsule globose, its cells 1 (rarely 2)-seeded; seeds becoming mucilaginous when wetted.—Dryish flats or slopes, hills and mountains, 2500 to 9000 ft.; common throughout Cal. Mar.-Aug. Var. *GREENEANA* Brand. Leaves with very broad segments, 2 to 5 lines wide, at times entire.—Same range, but in moister places. Var. *GLUTINOSA* Jepson n. comb. Stamens exserted.—Coastal S. Cal. (*Collomia glutinosa* Benth.)

774. *Gilia gilioides* Greene.; a, habit  $\times \frac{1}{2}$ ; b, c, d, leaf types  $\times \frac{1}{2}$ ; e, fl.  $\times 3$ .

11. *G. ochroleuca* Jones. Stems slender, several from the base, branched, erect or ascending, 4 to 7 in. high, the leaves in a basal tuft but also cauline and reduced upwards; herbage glabrous, the stems often somewhat glaucous, the leaves rarely a little villous beneath, the inflorescence usually glandular; lower leaves pinnate, 8 to 10 lines long, shortly petioled, the lobes linear, entire or pinnatifid; cauline leaves pinnate or pinnatifid, sessile; flowers on slender pedicels in loose open cymes; calyx about 1 line long, its teeth  $\frac{1}{4}$  to  $\frac{1}{2}$  as long as the tube; corolla tubular-funnelform, yellow, rarely purplish-tinged, 2 to  $2\frac{1}{2}$  (or  $3\frac{1}{2}$ ) lines long, its tube  $\frac{3}{4}$  to 1 line long, commonly about equaling the calyx, or distinctly shorter or  $1\frac{1}{2}$  times as long, the throat usually a trifle shorter than the tube; stamens included; capsule ovate, cells several-seeded; seeds showing spiracles when wetted.—Desert slopes and mesas, 2000 to 4000 ft.: Mohave Desert; s. Sierra Nevada in Kern Co.; Inyo Co. Feb.-June.

12. *G. tenuiflora* Benth. Stems 1 to many, erect or ascending from a basal cluster of leaves,  $\frac{1}{3}$  to  $2\frac{1}{2}$  ft. high; herbage glabrous to tomentulose, or often floccose below, often glandular, especially above; leaves pinnately parted or divided, or some merely toothed,  $\frac{1}{2}$  to 2 in. long, on petioles  $\frac{1}{4}$  to  $\frac{1}{2}$  as long; primary segments pinnatifid or bipinnatifid or some entire, 1 to 4 lines long; cauline leaves greatly reduced, becoming short linear-lanceolate bracts toward the inflorescence; inflorescence paniculate to glomerate, the flowers usually on short ( $\frac{1}{2}$  to 6 lines long) pedicels; calyx cylindrical to globose, glandular-pubescent, membranous to base below the sinuses,  $1\frac{1}{4}$  to  $1\frac{1}{2}$  lines long, the teeth lanceolate,  $\frac{1}{2}$  to  $\frac{1}{2}$  as long as the tube; corolla slenderly tubular-funnelform, pink, red or blue, 7 to 14 lines long; stamens unequal, equally inserted below the sinuses, included or slightly exserted; capsule many-seeded, equaling or exceeding the calyx; seed-coats developing mucilage when wetted.—Valleys and open hillslopes, 1500 to 6000

ft.: coastal S. Cal.; Colorado Desert; Mohave Desert; n. to Monterey, Tulare and Inyo Cos. (*G. arenaria* Brand. *G. grinnellii* Brand.) Var. *PURPUSII* Milliken. Basal leaves floccose to arachnoid-pubescent, the segments incisely pinnatifid, broad-based.—Desert mts.: Inyo Co. Var. *CANA* Jepson n. comb. Basal leaves white-tomentose, the segments orbicular or ovate, crenate or subentire, often with narrow base.—Mountain slopes, 6000 to 9000 ft.: Inyo Co. (*G. latiflora* var. *cana* Jones.) Var. *DAVYI* Mason n. comb. Leaves pinnately toothed, glabrous and somewhat fleshy.—San Gabriel Mts.; Mohave Desert; s. Sierra Nevada in Tulare Co. (*G. davyi* Milliken.)

13. *G. latiflora* Gray. Stems few to many, erect or ascending from a basal cluster of leaves,  $\frac{1}{3}$  to  $2\frac{1}{2}$  ft. high; herbage glabrous to tomentulose, or often floccose below, often glandular; leaves pinnately parted or divided, or some merely toothed,  $\frac{1}{2}$  to 2 in. long, on petioles  $\frac{1}{4}$  to  $\frac{1}{2}$  as long; primary segments pinnatifid or some entire, 1 to 4 lines long; cauline leaves greatly reduced, becoming short bracts toward the inflorescence; inflorescence paniculate, the flowers on short pedicels; calyx cylindric to globose, glandular-pubescent, membranous to base below the sinuses,  $1\frac{1}{2}$  to 2 lines long, the teeth lanceolate,  $\frac{1}{2}$  to  $\frac{1}{2}$  as long as tube; corolla funnelform, blue to lavender, pink or whitish, 4 to 5 lines long; stamens unequal, equally inserted below the sinuses, somewhat exserted; capsule many-seeded, equaling or exceeding the calyx; seeds developing mucilage when wetted.—Valleys, plains and open hillslopes, 1500 to 5500 ft.: coastal S. Cal.; Colorado and Mohave deserts; Inyo Co.; Modoc Co. Var. *CARUIFOLIA* Jepson n. comb. Stem erect,  $1\frac{1}{4}$  to 2 ft. high, branching above and forming a very large panicle; corolla purple, its throat yellow.—Ventura Co. to Cuyamaca and Laguna mountains. (*G. caruifolia* Abrams.)

14. *G. leptomèria* Gray. Stems few to many from the base, more or less glandular, 3 to 9 in. high; leaves in a basal rosette, linear or oblanceolate in outline, pinnately lobed or toothed,  $\frac{1}{4}$  to 2 in. long, shortly petioled; cauline leaves represented by small oblong or linear bracts subtending the branches of the open-paniculate cymes; calyx about  $\frac{1}{2}$  as long as corolla; corolla salverform, white, pinkish or purplish, 2 to 3 lines long, its lobes short, acute or with 1 to 3 cuspidate teeth; stamens inserted in throat, very short; capsule oval or oblong, the cells several-seeded; seeds unchanged when wetted.—Desert valleys, 2000 to 5000 ft.: e. Mohave Desert; Inyo Co.; n. to Ore., e. to Utah and Ariz. Apr.-June.

775. *Gilia leptalea* Greene; a, habit  $\times \frac{1}{2}$ ; b, fl.  $\times 2$ ; c, long. sect. of fl.  $\times 2$ .

15. *G. leptalea* (Gray) Greene. Fig. 775. Stem freely (sometimes diffusely) and dichotomously branched or sometimes simple, erect, 2 to 12 in. (or to  $1\frac{3}{4}$  ft.) high, the leaves scanty, all cauline, the lowest pairs of leaves opposite but these early disappearing; herbage glabrate to puberulent, minutely glandular; leaves mostly subfiliform (or very narrowly linear or very narrowly lanceolate), 6 to 15 lines long, mostly  $\frac{1}{4}$  to  $\frac{1}{2}$  (or 1) line wide; inflorescence diffusely cymose, the flowers on filiform pedicels 2 to 10 lines long; calyx  $1\frac{1}{4}$  to 2 lines long, its lobes about half as long as the tube; corolla funnelform, rose to purple or magenta,  $4\frac{1}{2}$  to 9 lines long, the tube very narrow, dilated into a very large throat; throat light or whitish with blue markings, the tube yellowish; stamens inserted in throat,

more or less unequal, included or exserted; capsule oblong, its cells 2 to 4-seeded; seeds showing spiracles when wetted.—Open slopes and flats in the mts., 1000 to 9000 ft., common: Sierra Nevada from Tulare Co. to Plumas Co.; North Coast Ranges from Lake Co. to Mendocino Co. June-Aug.

16. *G. capillaris* Kell. Stem erect, commonly branching above, 2 to 9 in. high; leaves linear to narrow-lanceolate, 4 to 12 lines long, mostly  $\frac{1}{2}$  to 1 line wide; corolla tubular-funnelform, white, 2 to 3 lines long, the tube much less conspicuously dilated than in *G. leptalea*.—Northerly or half-shaded slopes, 6000 to 8100 ft., n. Sierra Nevada from Mariposa Co. to Siskiyou Co., infrequent.

17. *G. latifolia* Wats. Coarse plants 3 to 13 in. high, the primary axis short and stout (1 to 2 in. long) with several ascending branches, or sometimes the stem simple and erect; herbage glandular-villous; leaves borne mostly on the lower  $\frac{1}{3}$  or  $\frac{1}{2}$  of the plant, or subsessile, 1 to  $4\frac{1}{2}$  in. long, ovate-oblong or nearly orbicular, coarsely serrate or irregularly incised, the teeth or lobes cuspidate; lower leaves petioled, the petioles 5 to 11 lines long, the upper leaves subsessile; flowers more or less congested into umbellate clusters borne in a dichotomous cyme; pedicels none to 12 lines long; calyx glandular-hairy, cleft halfway, about as long as corolla-tube, its lobes subulate; corolla short-salverform, pinkish,  $3\frac{1}{2}$  to 4 lines long, the tube slightly exceeding the calyx, the lobes ovate, broader at the middle than at base, very acute; stamens unequal, inserted on the tube; capsule oblong, the cells many-seeded; seeds not showing spiracles when wetted.—Desert plains and washes of cañons, 100 to 4000 ft., abundant: Colorado and Mohave deserts; Inyo Co. Apr.-May. It has the odor of *Datura meteloides*.

18. *G. filiformis* Parry. Stem branching from near the base, erect or diffuse, 4 to 7 in. high; herbage glabrous, sometimes with a faint bloom, sometimes minutely glandular above; leaves all cauline, filiform,  $\frac{1}{2}$  to 1 in. long; inflorescence paniculately cymose, the flowers on filiform pedicels  $2\frac{1}{2}$  to 12 lines long; calyx about  $\frac{1}{2}$  as long as corolla, its lobes lanceolate, twice as long as the tube; corolla campanulate, yellow,  $2\frac{1}{2}$  to 3 lines long, parted to near the base into oblong lobes; stamens unequal, inserted at the sinuses; capsule ovate, the cells several-seeded; seeds mucilaginous when wetted.—Desert mesas and cañons, 2000 to 4000 ft.: e. Mohave Desert; Inyo Co.; e. to Utah. May.

19. *G. campanulata* Gray. Stem branched from or above the base with ascending somewhat glandular slender branches,  $1\frac{1}{4}$  to 3 in. high; leaves oblong or linear-oblong, entire or with a few narrow divergent teeth, cauline and basal 3 to 8 lines long; inflorescence cymose, the flowers solitary on slender pedicels 1 to 6 lines long or grouped in small glomerules; calyx parted nearly to base, the lobes broadly lanceolate with white scarious margins; corolla campanulate, white with a yellowish throat, 3 to 4 lines long, twice as long as the calyx, its lobes much shorter than throat and tube; stamens included, unequal, inserted at base of corolla-tube; capsule ovate, the cells several-seeded.—Arid slopes, 5000 to 6500 ft.: e. Inyo Co.; e. to southern Nev. Var. *BREVIUSCULA* Jepson n. var. Corolla 2 lines long, the lobes equaling throat and tube.—Flats or cañons, 5200 to 6200 ft.: s. Sierra Nevada in Tulare Co. (Lloyd Mdw., Kern River, Jepson 4902, type); w. Inyo Co.

20. *G. micromeria* Gray. Stems several from the base, diffuse, 2 to 6 in. high; herbage glabrous or with minute gland-tipped hairs; leaves basal and cauline, linear-lanceolate, entire or pinnatifid, 3 to 7 lines long, much reduced above; cyme paniculately branched; pedicels slender, 2 to 10 lines long; calyx wholly herbaceous with 5 blunt lobes, glabrous; corolla campanulate to very short-funnelform, white or blue,  $1\frac{1}{2}$  to 2 lines long; stamens equal, equally inserted; anthers oval.—E. side Sierra Nevada (presumably Modoc Co.); nw. Nev. to e. Ore.

## 7. LINANTHUS Benth.

Low or slender annuals. Leaves opposite, palmately divided to the base into narrowly linear or filiform divisions (thus almost seeming as if in whorls in some species), rarely entire, rarely with some uppermost alternate. Flowers

scattered or in terminal capitate clusters. Calyx-tube commonly scarious between the ribs or angles, its teeth equal. Corolla campanulate, funnelform, or salverform. Stamens equally inserted on the corolla. Capsule with few to many seeds in each cell. (Greek linon, flax, and anthos, flower.)

A. COROLLA CAMPANULATE TO FUNNELFORM, ITS PROPER TUBE VERY SHORT OR OBSCURE, MUCH SHORTER THAN THE THROAT; DESERTS OR MOSTLY SO.—Subgenus PARRYA.

Flowers 2 to 3½ lines long; calyx-lobes a little unequal.

Disk at base of corolla 5-lobed.....1. *L. maculatus*.

Disk at base of corolla entire.....2. *L. demissus*.

Flowers 5 to 7½ lines long; calyx-lobes equal.....3. *L. parryae*.

#### B. COROLLA FUNNELFORM OR SALVERFORM.

1. Flowers mostly scattered, usually solitary in the axils or terminal; corolla funnelform or tubular-funnelform, the throat tapering gradually down to the tube.

Calyx-tube almost wholly membranous; corolla-lobes with 2 dark lines at base.—Subgenus MILLIKENIA.....4. *L. concinnus*.

Calyx-tube membranous only below the sinuses.

Flowers 7½ to 10 lines long.

Corolla-lobes dentate; filaments hairy at base; anthers elliptic.—Subgenus FENZLIA.....5. *L. dianthiflorus*.

Corolla-lobes entire; anthers linear-oblong.—Subgenus EULINANTHUS.

Filaments flattened at base into a hairy pad.....6. *L. dichotomus*.

Filaments glabrous at base.....7. *L. bigelovii*.

Flowers 1 to 7½ lines long (see also no. 15).—Subgenus DACTYLOPHYLLUM.

Stamens inserted just below sinuses; corolla golden or cream yellow.

Flowers mostly in close glomerules, short-pedicel to subsessile; pedicels ¼ to 1½ lines long.....8. *L. lemmonii*.

Flowers panicately cymose, long-pedicel; pedicels 2 to 8 lines long.....9. *L. aureus*.

Stamens inserted on lower half of throat.

Corolla funnelform, white or cream-color, rarely lilac.

Stems branching from the base, the branches at length dichotomous; plants diffuse.....10. *L. filipes*.

Stems simple below, branching above, the branches mostly simple; plants erect.

Filaments glabrous at base, the corolla without hairy ring.

Corolla ¾ to 1 line long.....11. *L. harknessii*.

Corolla 4 to 7½ lines long.....12. *L. liniflorus*.

Filaments hairy at base, forming a hairy ring on the corolla at insertion.....13. *L. pharnaceoides*.

Corolla tubular-funnelform.

Corolla white or pink, 2½ to 5 lines long.....14. *L. bolanderi*.

Corolla blue, 6 to 10 lines long.....15. *L. ambiguus*.

#### 2. Flowers sessile in dense clusters or heads.

Corolla funnelform or tubular-funnelform, the tube as long to twice as long as throat.—Subgenus PACIFICUS

Corolla-tube subequal to or shorter than lobes.....16. *L. grandiflorus*.

Corolla-tube longer than lobes.....17. *L. orcuttii*.

Corolla strictly salverform, the tube slender-filiform, mostly 10 to 20 times as long as the throat.—Subgenus LEPTOSIPHON.

Calyx membranous only in sinuses.

Corolla-lobes 2 to 3 lines broad.

Corolla-tube twice as long as calyx.....18. *L. serrulatus*.

Corolla-tube 3 to 4 times as long as calyx.....19. *L. androsaceus*.

Corolla-lobes ½ to 1½ lines broad.

Corolla-lobes 2 to 3 lines long; corolla purple, pink or pale yellow.....20. *L. parviflorus*.

Corolla-lobes 1 to 1½ lines long.

Corolla golden-yellow.....21. *L. actularis*.

Corolla pinkish or purplish.....22. *L. bicolor*.

Calyx membranous to base below sinuses.

Inflorescence coarsely ciliate-pubescent.

Corolla-lobes 1 to 1½ lines long.....23. *L. ciliatus*.

Corolla-lobes 2½ to 3½ lines long, a purple spot at base.....24. *L. montanus*.

Inflorescence finely pilose.

Leaf-segments linear; corolla 7½ to 12½ lines long, its lobes obovate, obtuse.....25. *L. breviculus*.

Leaf-segments oblanceolate; corolla 4 to 6 lines long, its lobes quadrate, truncate or emarginate.....26. *L. oblanceolatus*.

1. *L. maculatus* (Pursh) Milliken. Stem branched from the base, ¾ to 1 in. high, sparsely hispid-villous, equally leafy; leaves oblong-linear, entire, cuspidate, thick, 1 to 2 lines long; flowers on very short pedicels in leafy glomerate cymes; calyx parted almost to base, exceeding the corolla-tube, nearly equaling the corolla-lobes; calyx-lobes oblong-linear, ciliate, with a very narrow hyaline margin, evidently unequal, cuspidate; corolla campan-

ulate, white, 2 lines long, the lobes about  $\frac{1}{4}$  as long as tube; stamens on long filaments, inserted low in the tube; capsule oval, the cells several-seeded; seeds unchanged when wetted.—Nw. corner of Colorado Desert: Palm Sprs.; Whitewater. Rare. Mar.-Apr.

2. *L. demissus* (Gray) Greene. Branches many from base, dichotomously rebranched, decumbent or ascending, 1 to 3 in. long, equally leafy throughout, the leaves not reduced above; herbage glabrate or thinly puberulent, sparingly and microscopically glandular; leaves trifidly divided with spreading or divergent lobes, or entire, the leaf or its lobes linear, conspicuously cuspidate,  $2\frac{1}{2}$  to 5 lines long; flowers in close leafy cymes, short-pedicelled; calyx divided nearly to base into lanceolate lobes with hyaline or white-scarious margins, exceeding the corolla-throat; calyx-tube below sinuses scarious; corolla campanulate, white with purple-streaked throat,  $2\frac{1}{2}$  to 4 lines long; corolla-lobes quadratish-oblong,  $\frac{2}{3}$  as long as throat, the proper tube very short, the long stamens inserted almost on its summit; capsule oblong-oval,  $\frac{1}{2}$  as long as the calyx; cells several-seeded; seeds unchanged when wetted.—Desert plains and cañons, 2000 to 7500 ft.: e. Mohave Desert; Panamint Mts.; e. to Utah and Ariz. Apr.-May. (*Gilia demissa* Gray. *L. dactylophyllum* Rydb.)

3. *L. párryae* (Gray) Greene. Stem compactly branched, 1 to  $2\frac{1}{2}$  in. high; herbage puberulent; leaves opposite; at least below, palmately 3 to 7-parted into acerose segments, 2 to 5 lines long; flowers several to numerous, congested in leafy cymes; calyx-lobes broadly scarious-margined, 2 to 3 times as long as the tube; corolla funnelform, yellow (with a dark throat) or bluish-lilac, or white, with dark purple reniform crests at base of the lobes. 5 to 8 lines long, 6 to 9 lines wide, the lobes nearly twice as long as tube and throat combined, the tube about  $\frac{1}{2}$  as long as the throat; filaments dilated at base, inserted at the summit of the corolla-tube; capsule obovate, the cells many-seeded; seeds minute, scarcely  $\frac{1}{6}$  line long, showing spiricles slightly when wetted.—Sandy desert flats and hard soil of arid slopes, 2000 to 6300 ft.: Mohave Desert; n. to southern Sierra Nevada in Kern and Inyo Cos. Mar.-June.

4. *L. concinnus* Milliken. Stem loosely branched, the branches ascending, 2 to 5 in. high; herbage slightly glandular-puberulent; leaves opposite, at least below, palmately 3 to 7-parted into linear or linear-spatulate acerose or cuspidate lobes, 3 to 6 lines long; flowers in bracteate loosely glomerate cymes; calyx-lobes linear,  $\frac{1}{4}$  to  $\frac{1}{2}$  as long as tube, the intervals between the ribs and base of tube conspicuously hyaline-membranous; corolla funnelform, white with a yellowish tube and throat, 5 to  $7\frac{1}{2}$  lines long,  $4\frac{1}{2}$  to 6 lines wide, the limb equaling the tube and throat; filaments inserted in the corolla-tube, somewhat dilated at the base; capsule ovoid-oblong, the cells 2 to 4-seeded; seeds about a line long, unchanged when wetted.—Dry rocky mountain slopes, 5000 to 7000 ft., infrequent: San Gabriel Mts.

5. *L. dianthiflorus* (Benth.) Greene. FRINGED PINK. Stem branching, erect or spreading, 2 to 6 in. high; herbage subglabrous or minutely puberulent; leaves opposite below but frequently alternate above, linear-filiform, entire, 2 to 7 (or 15) lines long; plants abundantly floriferous, the flowers in small few-flowered leafy cymes, the pedicels shorter than the calyx; calyx usually cleft to below the middle; corolla funnelform, lilac or pink, 6 to 9 lines long,  $5\frac{1}{2}$  to 10 lines wide, its lobes dentate, about equaling the combined length of tube and throat; throat yellow, marked with 5 spots, a little exceeding the yellowish or purplish tube; filaments hairy and dilated at the base, inserted in the tube, included; capsule oblong, the cells many-seeded; seeds winged.—Sandy ground, 500 to 2000 ft.: common in open fields in the coastal valleys of S. Cal. or sometimes on cañon flats: w. side Colorado Desert; s. to L. Cal. Jan.-May. (*Gilia dianthoides* Endl.)

6. *L. dichotomus* Benth. EVENING SNOW. Fig. 776. Stem simple or dichotomously branched, 3 to 12 in. high, the leaves all opposite, the flowers on short pedicels in the forks or terminal, the pedicels  $\frac{1}{4}$  to 2 lines long; herbage glabrous with a glaucous tinge; leaves entire or palmately 3 to 5 or 7-divided, the leaf or its divisions narrowly linear or filiform, 6 to 12 lines long; flower

776. *Linanthus dichotomus* Benth.; a, fl. branch  $\times \frac{3}{4}$ ; b, entire leaf  $\times \frac{1}{2}$ ; c, divided leaf  $\times \frac{1}{2}$ ; d, long. sect. of corolla-tube  $\times 1\frac{1}{4}$ ; e, calyx  $\times 1\frac{1}{4}$ .

opening in late afternoon and closing the next morning; calyx cylindraceous with conspicuous hyaline intervals, its subulate lobes spreading,  $\frac{1}{3}$  or  $\frac{1}{4}$  as long as the tube; corolla tubular-funnelform, white with a brownish throat,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long, about 2 times as long as calyx, the lobes a little exceeding the tube and strongly convolute in the bud; stamens inserted below the middle of the tube, included; filaments with a hairy pad at base; style very short, about equaling the ovary; capsule oblong, the cells many-seeded; seeds with a white bladdery very loosely investing alveolate testa.—Gravelly or sandy places, 1000 to 5000 ft.: Sierra Nevada from Butte Co. to Tulare Co.; Great Valley (infrequent); Sonoma and Napa Cos. s. to Los Angeles and San Diego Cos.; Mohave Desert; Inyo Co. Mar.-July.

7. *L. bigelovii* (Gray) Greene. Stem dichotomously branched from the base, 2 to 12 in. high, the flowers subsessile in the forks or terminal on the branchlets; herbage glabrous, pallid; leaves opposite throughout, very narrowly linear and entire, or rarely 2 or 3-parted, 6 to 10 lines long; calyx cylindrical, glabrous, with very con-

spicuous hyaline intervals between the ribs, 4 to 5 lines long, its spreading lobes 1 to  $1\frac{1}{2}$  lines long; corolla funnelform-tubular, yellow or orange with a dark circle in the throat, 4 to 6 lines long, exceeded by or exceeding the calyx; corolla-tube well developed and twice as long as the lobes, these usually strongly convolute in bud and 1 to 2 lines long; stamens inserted at about the middle of the tube, included; filaments glabrous at base; style 3-cleft more than half way; capsule oblong, the cells many-seeded; seeds with a closely enveloping slightly bladdery testa.—Desert slopes and valleys, 2000 to 5300 ft., infrequent: Colorado and Mohave deserts; Mt. Pinos; San Carlos Range; e. to Utah and western Tex. Apr.-June. Var. *JONESII* Jepson and Mason n. comb. Calyx covered with stout stipitate glands; hilum of seeds often in a deep pit.—Deserts, 500 to 2000 ft.: Inyo Co.; Mohave and Colorado deserts; s. to L. Cal.; uncommon. Mar.-May. (*Gilia jonesii* Gray.)

8. *L. lemmönii* (Gray) Greene. Stem diffusely branched, spreading, 2 to 6 in. high; herbage puberulent or somewhat canescent; leaves divided into 3 to 5 linear lobes, 1 to 2 lines long, somewhat ciliate; flowers in close terminal glomerules, or a few long-pedicelled; calyx-lobes about as long as the tube, slightly ciliate; corolla funnelform, dull or pale cream-white or yellowish with dark throat,  $2\frac{1}{2}$  to 3 lines long, the tube about 1 line long and equaling the broad throat, the lobes 1 to  $1\frac{1}{2}$  lines long; stamens inserted in the throat; capsule oblong, the cells many-seeded.—Sandy ground, 1000 to 5500 ft., back of the coast: San Bernardino Valley and San Jacinto Mts. to San Diego Co.; w. side Colorado Desert; s. to L. Cal. Apr.-June.

9. *L. aureus* (Nutt.) Greene. Stem diffusely and usually widely branched,  $1\frac{1}{2}$  to 7 in. high; herbage glabrate to puberulent, occasionally a little glandular; leaves palmately divided into 3 to 7 linear lobes,  $1\frac{1}{2}$  to 3 lines long; flowers on capillary pedicels in small paniculate cymes; calyx exceeding the corolla-tube, its lobes  $\frac{1}{3}$  to  $\frac{2}{3}$  as long as the calyx-tube; corolla lemon-yellow with a brownish throat, funnelform, 3 to 7 lines long, the tube whitish, 1 to  $1\frac{1}{2}$  lines long, the throat slightly exceeding tube; stamens inserted in the sinuses; capsule ovoid, the cells many-seeded; seeds small,

showing spiracles when wetted.—Sandy ground, 1000 to 4000 (or 6000) ft., often very abundant locally: coastal S. Cal.; Colorado and Mohave deserts and their bordering ranges; Inyo Co. Apr.-June. Var. *DECORUS* (Gray) Jepson. Corolla white or pale violet.—Colorado Desert.

10. *L. filipes* (Benth.) Greene. Fig. 777. Stem commonly much branched dichotomously, erect or very diffuse, filiform, 2 to 5 in. high; herbage puberulent; leaves palmately 5-parted,  $1\frac{1}{2}$  to 4 lines long; inflorescence dichotomously paniculate-cymose; pedicels filiform, 2 to 5 lines long; calyx hispidulose,  $\frac{2}{5}$  as long as the corolla, the lobes equal, somewhat pungent-tipped; corolla short-funnelform, white to cream-color, rarely lilac,  $2\frac{1}{2}$  to 4 lines long, with a hairy ring at the insertion of stamens; stamens inserted near the base of the throat; style exceeding the stamens.—Open or openly wooded slopes or flats in the foothills, 200 to 4000 ft., abundant: Sierra Nevada from Tulare Co. to Siskiyou Co., thence s. to Humboldt and w. Solano Cos.; also on the rolling plains bordering the foothills. (*Gilia filipes* Benth. *G. pusilla* Gray.)

777. *Linanthus filipes* Greene; a, habit x  $\frac{1}{2}$ ; b, fl. x 2; c, long. sect. of corolla x 2; d, calyx x 2.

11. *L. harknessii* (Curran) Greene. Stem strictly erect, very slender, branching mostly above the base and ending above in a dichotomously branched paniculate cyme, 3 to 10 in. high; herbage sparsely puberulent, becoming glabrous; leaves palmately 3 to 5-parted into linear segments  $1\frac{1}{2}$  to 8 lines long; flowers minute, solitary on filiform pedicels, the pedicels 3 to 10 lines long; calyx glabrous or nearly so, little shorter than the corolla, its lobes equal, about  $\frac{1}{2}$  as long as the calyx-tube; corolla funnelform, white,  $\frac{3}{4}$  to  $1\frac{1}{2}$  lines long, glabrous; stamens inserted at the base of the throat, filaments glabrous.—Open places, usually in granite soil, 5000 to 7000 ft.: Plumas, Modoc, Shasta and Siskiyou Cos.; Yollo Bolly Mts.; n. to Ida., e. to Wyo. June.

12. *L. liniflorus* (Benth.) Greene. Stem erect, usually simple below but freely and widely branched above,  $\frac{3}{4}$  to  $1\frac{1}{2}$  ft. high, glabrous; leaves palmately 3 to 7-divided into linear-filiform segments, microscopically scabrous pubescent in the sinuses, 3 to 5 (or 10) lines long; flowers on long capillary pedicels in a dichotomously branched paniculate cyme, the pedicels mostly 4 to 14 lines long; calyx 2 to  $2\frac{1}{2}$  lines long, its lobes oblong or lanceolate,  $\frac{1}{4}$  to  $\frac{1}{2}$  as long as the tube; corolla short-funnelform, white or tinged with pink or lilac, 5 to 8 lines long, the tube very short,  $\frac{1}{2}$  to 1 line long, the throat about 2 lines long; stamens inserted in the corolla-sinuses, about  $\frac{1}{2}$  the length of the lobes; capsule oval, the cells several-seeded; seeds mucilaginous when wetted.—Open places, 100 to 4500 ft.: San Joaquin Valley; Placer Co.; Contra Costa Co. and San Francisco to San Mateo Co.; s. to coastal S. Cal. (*Gilia liniflora* Benth.) Var. *VALLECOLA* Jepson n. var. Pedicels widely divaricate, curved at tip, the flower thus erect.—Bakersfield plain (Jepson 8944, type.)

13. *L. pharnaceoides* (Benth.) Greene. Stem erect, simple below or loosely and oppositely branched from the base upwards, 8 to 18 in. high; herbage glabrous or puberulent; leaves palmately 3 to 7-divided into linear-filiform segments; flowers on long capillary pedicels, in a dichotomously branched cymose panicle; calyx 2 to  $2\frac{1}{2}$  lines long, its lobes  $\frac{1}{4}$  to  $\frac{1}{2}$  as long as tube;

corolla short-funnelform, 3 to 4 lines long, the tube  $\frac{1}{2}$  to  $\frac{3}{4}$  line long, the throat not much exceeding it; stamens inserted in the sinuses, not exerted, the filaments hairy at base; capsule oval, the cells several-seeded; seeds mucilaginous when wetted.—San Luis Obispo Co. to Monterey Co. Apr.-June. (*Gilia pharnaceoides* Benth.)

14. *L. bolánderi* (Gray) Greene. Stem very slender, di- or tri-chotomously branched from the base or sometimes simple, 2 to 6 in. high, glabrate or puberulent, occasionally a little glandular above but very minutely so; leaves palmately parted into 3 to 7 linear lobes, a little hirsutulose, 1 to 2 lines long; flowers cymose, the pedicels capillary, 3 to 6 lines long; calyx usually distinctly striate, about as long as corolla-tube; corolla tubular-funnelform, pink or white, 3 to 4 (or 6) lines long; stamens inserted in the sinuses, about 4 to 9 lines long; capsule oblong, the cells several-seeded; seeds showing spiracles when wetted.—Dry slopes, often on outcropping ledges, 500 to 2000 ft.: Coast Ranges from San Benito and San Mateo Cos. to Tehama and Siskiyou Cos., thence s. in the Sierra Nevada foothills to Mariposa Co. and Tehachapi Range; n. to Wash. (*Gilia bolanderi* Gray. *G. rattani* Gray.)

15. *L. ambiguus* (Rattan) Greene. Stem simple or branched, erect,  $2\frac{1}{2}$  to 6 (rarely 12) in. high, puberulent; leaves palmately 5-parted, 1 to 3 lines long, hirsutulose; flowers loosely cymose, the pedicels filiform, 5 to 10 lines long; calyx-lobes equal, puberulent; corolla tubular-funnelform, light blue, the tube very long, brown to purplish; stamens inserted at top of throat; style slightly exceeding anthers.—Open hill slopes, forming colonies, 2000 to 3000 ft.: Mt. Hamilton Range, e. slope Santa Cruz Mts. from Loma Prieta to Redwood City. The flowers close about 4 o'clock in the afternoon and open tardily the next morning. (*Gilia rattani* Fl. W. Mid. Cal.)

16. *L. grandiflorus* (Benth.) Greene. Stem simple, erect, 3 to 10 or 14 in. high, pubescent when young, at length glabrous; leaves palmately parted into narrowly linear lobes  $7\frac{1}{2}$  to  $12\frac{1}{2}$  lines long, the lower puberulent to glabrous, those in the inflorescence ciliate; flowers 1 to many in a dense head in the terminal and subterminal axils; calyx scarious below the sinuses, its lobes ciliate, the tube longer than the lobes; corolla funnelform to almost salverform, white or pink,  $7\frac{1}{2}$  to  $12\frac{1}{2}$  lines long, the throat long-tapering, about equaling the tube, the tube hairy within; stamens inserted on the base of the throat, equaling the throat, the filaments glabrous; style included.—Openly wooded mountain slopes or valley flats, 20 to 2500 ft.: Marin and Alameda Cos. to Monterey Co. (*L. densiflorus* Jepson. *Leptosiphon densiflorus* Benth.)

17. *L. orcuttii* Jepson n. comb. Stem branched from the base, 3 to 5 in. high; herbage puberulent; leaves palmately parted,  $1\frac{1}{2}$  to 3 lines long; flowers capitately congested, sometimes axillary; calyx-lobes equal, sometimes pungent-tipped, membranous-margined below, the membrane united and forming a tube near the base; corolla funnelform to salverform, pink-white,  $7\frac{1}{2}$  to 10 lines long, the tube exceeding the calyx, the throat about  $\frac{1}{2}$  as long as the tube; stamens inserted on the base of the throat and as long; filaments glabrous, recurved from the point of insertion; style exceeding the stamens.—Palomar Mt., n. San Diego Co.; s. to northern L. Cal. (*Gilia orcuttii* Parry & Gray. *L. pacificus* Milliken.)

18. *L. serrulatus* Greene. Stem erect, simple or branched, 4 to 8 in. high, sparsely pubescent; leaves in few whorls, palmately 5 to 7-parted, lobes linear; flowers capitately and terminally congested, occasionally a few flowers in the axils of the branches; calyx mostly herbaceous, only slightly membranous in the sinuses, parted nearly to base into subulate lobes,  $\frac{1}{2}$  to as long as corolla-tube; corolla salverform, white to cream-color, the tube purple, 5 to 10 lines long, pilose-pubescent, the throat yellow; corolla-lobes  $2\frac{1}{2}$  to 4 lines long; stamens inserted on the base of the throat; style exceeding the anthers; ovary-cells 1 to many-ovuled.—Mountain valleys and cañon slopes, 2000 to 4000 ft.: s. Sierra Nevada from Mariposa Co. to Tulare Co. (*L. mariposanus* Milliken.)

19. **L. androsæceus** (Benth.) Greene. Fig. 778. Stem simple or branched from the base, 3 to 14 in. high, puberulent; leaves palmately divided into oblanceolate or linear lobes, 2 to 12 lines long, commonly ciliate or sometimes puberulent; flowers in dense heads; bracts few to many; calyx herbaceous, membranous only in the sinuses; corolla salverform, white, pink, lavender or yellow, the tube 6 to 13 lines long, 4 to 6 times as long as the calyx, often darker in color than the corolla-lobes; corolla-lobes broadly obovate to oblong, 2 to 3 lines broad by 3 to 5 lines long; stamens little surpassing throat of corolla.—Open hillslopes and valleys, 50 to 3500 ft.: Coast Ranges from Humboldt Co. to Solano, Santa Clara and San Luis Obispo Cos. Apr.-June. It is very variable as to size and color and not well differentiated from *L. parviflorus*. Var. **CRŒCEUS** Jepson n. comb. Corolla golden-yellow; tube 1 to 1¾ in. long, the limb 5 to 7 lines broad.—Coastal bluffs and beaches, San Mateo Co. (*Linanthus croceus* Eastw.)

778. *Linanthus androsaceus* Greene; a, fl. stem x 1; b, fl. x 1½.

20. **L. parviflorus** (Benth.) Greene. Stem simple or with few branches from the base, erect, commonly 3 to 6 or 11 in. high, almost glabrous to puberulent; leaves palmately 3 to 7-parted, the lobes spatulate to linear, 2½ to 6 lines long; bracts scabrous or hirsutulous, not ciliate or scarcely so, commonly 3 to 4 lines long; flowers capitately congested; calyx ¼ to ⅓ as long as corolla-tube; corolla purple, pinkish, white, or pale yellow, ¾ to 1½ in. long, the lobes oval, 1½ to 2½ lines long, tinged with red or brown on the outside, the throat yellow; stamens half or commonly more than half as long as corolla-limb.—Open ground in the hill country, 200 to 2000 ft., a very abundant species: Coast Ranges from Mendocino Co. to Monterey Co.; s. to coastal S. Cal. as far as San Diego. (*Gilia micrantha* Steud.) Var. **ROSÆCEUS** Jepson. Much branched from the base; leaves often palmately parted rather than divided; corolla rose-color or white, larger than in the species.—Sand-hills and bluffs along the coast: San Francisco Co. to San Mateo Co.

21. **L. áculâris** Greene. Stem simple, somewhat rigid, very slender, 1 to 4 in. high; near to but less pubescent than *L. parviflorus*; leaf-segments linear-acerose; corolla golden-yellow throughout, its tube slenderly filiform, about 6 lines long, obovate lobes not exceeding 1 line.—Wooded hills, 200 to 2300 ft., not common: Tehama and Humboldt Cos. to Alameda and San Benito Cos.; Sierra Nevada from Tuolumne Co. to Kern Co.; s. to Palomar Mt. (*L. parviflorus* var. *luteolus* Milliken.)

22. **L. bicolor** (Nutt.) Greene. Very near *L. parviflorus* but dwarf, 1 to 4 in. high; leaves and bracts hispidulous-ciliate; corolla dull purple or pink with yellow throat, its lobes very short (1 to 1½ lines long) in proportion to the tube which is 6 to 9 lines long.—Open hills or thinly wooded hills, 300 to 2500 ft., infrequent: Coast Ranges from Humboldt Co. to Contra Costa and Santa Clara Cos. and s. to coastal S. Cal.; Sierra Nevada from Placer Co. to Tulare Co. May. (*Gilia tenella* Benth.)

23. **L. ciliâtus** (Benth.) Greene. Stem simple or branched, somewhat rigid, 4 to 5 (rarely to 12) in. high; herbage finely puberulent; leaves palmately parted into linear lobes, ciliate, 2 to 6 (rarely 9) lines long; flowers capitately congested; bracts ciliate; calyx membranous to base below the sinuses, ½ to as long as corolla-tube, the lobes acerose; corolla salverform,

6 to 9 lines long, deep rose-red or purple, only slightly exceeding the bracts, the throat yellow, the lobes 1 to  $1\frac{1}{2}$  lines long by  $\frac{3}{4}$  line broad.—Openly wooded hills and mountain slopes, 300 to 8000 ft.: Siskiyou Co.; Coast Ranges; Sierra Nevada; coastal S. Cal. Var. *NEGLÉCTUS* Jepson n. comb. Stem very slender, simple, 1 to 2 in. high; corolla-lobes variegated.—Sierra Nevada, 6000 to 9000 ft. (*L. neglectus* Greene.)

24. *L. montanus* Greene. MUSTANG CLOVER. Stem commonly simple, erect, 4 to 22 in. high, coarsely pubescent near the base, puberulent above; internodes long; leaves palmately 5 to 7-parted into oblanceolate or linear lobes, 3 to 15 lines long, hispid or hispidulose; flowers capitately congested; bracts densely and coarsely bristly-ciliate; calyx membranous to base below sinuses, about  $\frac{1}{2}$  as long as corolla-tube; calyx-lobes subulate, about as long as tube; corolla long-salverform, pink-red or white, the tube 10 to 14 lines long, pubescent; throat yellow, short, lobes  $2\frac{1}{2}$  to  $3\frac{1}{2}$  lines long, often with a purple spot at the base; stamens inserted at the base of the throat, often one shorter than the rest; style slightly exceeding the stamens.—Openly wooded slopes, 1200 to 5000 ft.: Sierra Nevada from Calaveras Co. to Tulare Co. Apr.-May.

25. *L. brevifolius* (Gray) Greene. Stem simple or much branched from or above the base, glabrate or minutely pilose, 4 to 12 in. high; leaves palmately 3 to 5-lobed, finely pilose, the lobes linear-oblong, 1 to 3 lines long; flowers capitately congested at the ends of the branches and in clusters in the uppermost axils; bracts few; calyx membranous to the base below the sinuses, pilose-pubescent; corolla salverform, white to purple or lavender-crimson,  $7\frac{1}{2}$  to 12 lines long, the tube  $2\frac{1}{2}$  to 3 times as long as the calyx; tube and lower portion of the throat dark blue or purple; stamens inserted near the base of the throat; style exceeding the anthers.—Open or brushy slopes or mesas, 3000 to 7000 ft.: San Gabriel Mts. and San Bernardino Mts.; desert ranges in Mohave Desert. Var. *NUDATUS* Mason n. comb.—Bracts membranous in sinuses to half their length.—Montane flats, 5000 to 6000 ft.: s. Sierra Nevada in Tulare Co. to Tehachapi Mts. (*L. nudatus* Greene.)

26. *L. oblanceolatus* Eastw. Stem simple or with a few short branches,  $1\frac{1}{2}$  to 6 in. high; herbage scantily puberulent; cotyledons sessile, persistent; leaves palmately parted, the lobes oblanceolate to linear-oblancoate, somewhat callous-margined,  $1\frac{1}{2}$  to 4 lines long; flowers congested in a terminal head or occasionally with 1 or 2 flowers in the uppermost axils; calyx membranous in the sinuses, the tube somewhat distended by the maturing capsule; corolla salverform, white,  $2\frac{1}{2}$  to 5 lines long, the lobes quadrate, truncate or emarginate, the tube equaling or somewhat exceeding the bracts, the throat yellow; stamens inserted in the throat, exserted, exceeding the style.—Mountain flats, 8600 to 10,000 ft.: upper basin of Kern River. (*Gilia tularensis* Brand.)

### 8. LEPTODÁCTYLON H. & A.

Perennial herbs or undershrubs, commonly tufted and very leafy. Leaves alternate or opposite, much fascicled in the axils, palmately 3 to 9-parted. Flowers showy, pink, lilac or white, borne in few-flowered terminal clusters or solitary. Corolla salverform or with funnellform throat, the tube commonly exceeding the calyx. Stamens short, inserted in or below the throat. (Greek *leptus*, narrow, and *dactylon*, finger, in reference to the palmately parted leaves.)

Leaves alternate, pungent; dwarf shrubs or woody-based herb-like plants; calyx membranous below sinuses.

Leaves mostly persistent for 2 or more seasons; corolla tubular-funnelform, the tube  $1\frac{1}{2}$  to 2 times as long as the lobes; stamens inserted in throat.....

1. *L. pungens*.

Leaves deciduous after first season; corolla strictly salverform, the tube equaling or shorter than the lobes; stamens inserted at middle of corolla-tube.....

2. *L. californicum*.

Leaves opposite, not pungent; plants herbaceous or woody-based; calyx not membranous below sinuses.....

3. *L. nuttallii*.

1. *L. pungens* (Torr.) Nutt. GRANITE GILIA. Fig. 779. Stems several to numerous, branching, arising from a branched woody base, crowded densely with leaves to top, 3 to 8 in. high, Phlox-like and often forming a rough mat;

stems of the season puberulent to densely villous and frequently also glandular, the older branches shedding their juvenile pallid pubescent epidermis, leaving them dark and rough; leaves persistent for 2 or 3 seasons, prevalently alternate but the lower ones occasionally opposite, palmately divided into 3 or 5 acerose lobes, 1 to 7 lines long, with shorter ones in the axils; leaf-lobes not strongly unequal; flowers sessile, terminal or solitary in the upper axils, or congested into a few-flowered cluster; calyx scarious between the ribs, its lobes unequal,  $\frac{1}{2}$  to  $\frac{3}{4}$  as long as the tube; corolla tubular-funnelform, white or pink or at times yellow, 9 to 11 lines long, the tube  $1\frac{1}{2}$  to 2 times as long as the calyx and about 2 times as long as the obovate corolla-lobes; stamens equal, the anthers almost sessile, inserted in the corolla-throat, included; capsule oblong, the cells many-seeded; style very short, only a little longer than the capsule; seeds unchanged under water.—Dry gravelly or rocky places, mostly on granite, 6000 to 12,000 ft.: mts. of S. Cal.; Mt. Pinos;

779. *Leptodactylon pungens* Jepson; a, fl. branchlet  $\times \frac{1}{2}$ ; b, long. sect. of corolla  $\times 1$ ; c, calyx  $\times 1\frac{1}{2}$ .

desert ranges; Sierra Nevada from Tulare Co. to Sierra Co.; e. Ore. and Nev. to Rocky Mts. (*Cantua pungens* Torr. *Gilia pungens* Benth.) Var. *HOOKERI* Jepson n. comb. Stems less crowded with leaves, or in places naked on account of the long internodes; leaves palmately 3 or 5-lobed, the lateral lobes about  $\frac{1}{2}$  shorter than the intermediate; corolla white, 7 to 8 lines long, its lobes oblanceolate.—Interior or more arid ranges, 6000 to 8500 ft.: mts. of S. Cal.; east slope or easterly summits of the Sierra Nevada; n. to B. C., e. to Col. (*Gilia hookeri* Benth. *G. pungens* var. *hookeri* Gray.) Var. *TENULOBUM* Jepson n. comb. Leaves alternate, palmately 3-parted, the middle lobe 2 times longer than the lateral ones; bracts mostly longer than the calyx; flowers solitary and terminal; corolla light yellow.—San Gabriel, San Bernardino and San Jacinto mountains. (*Gilia tenuiloba* Parish.) Var. *HALLII* Jepson n. comb. Leaves mostly opposite, palmately 3-parted, the middle lobe 2 to 3 times longer than the lateral ones; corolla white or yellowish, 5 to 7 lines long.—Coyote Cañon, Santa Rosa Mts. (*Gilia hallii* Parish.)

2. *L. californicum* H. & A. PRICKLY PHLOX. Erect shrub 1 to 3 ft. high, or at least woody below, the branches thickly clothed with spiny foliage; herbage puberulent, sometimes slightly glandular, densely pubescent in the inflorescence; leaves alternate, or occasionally opposite, especially below, 1 to  $3\frac{1}{2}$  lines long, palmately 5 to 9-divided into rigid narrowly linear acerose lobes, deciduous; flowers sessile, solitary in the upper axils but thus congested into few-flowered clusters; calyx as long to  $\frac{1}{2}$  as long as corolla-tube, its lobes pungent,  $\frac{1}{2}$  as long as calyx-tube; corolla salverform, bright rose-color or pink, 7 to 9 lines long, 9 to 17 lines wide, its lobes equaling or slightly exceeding the tube; stamens included, inserted above the middle of the tube, the filaments very short; capsule elongated, the cells many-seeded; style rather short, included; seeds unchanged under water.—Chaparral slopes or borders of washes, 1000 to 5000 ft.: s. Monterey Co. to Orange and w. Riverside Cos. Feb.-May. (*Gilia californica* Benth.)

3. *L. nuttallii* (Gray) Rydb. Stems numerous from a woody root-crown, erect or ascending, simple or oppositely branched, 3 to 9 in. high; herbage minutely puberulent; leaves opposite, cauline, not reduced up the stem, simple

and linear or lanceolate, or palmately lobed into 3 to 7 similar lobes, firm, 3 to 10 lines long; flowers sessile, clustered in corymb-like cymes, or sometimes solitary or geminate; calyx-lobes lanceolate, about  $\frac{1}{2}$  as long as the tube; corolla salverform, white, rarely rose,  $3\frac{1}{2}$  to 5 lines long, the throat commonly yellowish, the tube shorter than or a little exceeding the calyx and usually a little exceeding the obovate corolla-lobes; stamens equal, inserted in the throat, included; capsule oblong.—Rocky or brushy slopes, 5500 to 12,000 ft., common: San Bernardino Mts.; White Mts.; Sierra Nevada; n. Humboldt Co. and Trinity Co. to Siskiyou Co. (3000 to 6000 ft.); n. to Wash., e. to Wyo. and N. Mex. (*Gilia nuttallii* Gray.) Var. *FLORIBUNDUM* Jepson n. comb. Stems of the season many from a woody base, simple or sparingly branched, 5 to 12 in. high; herbage glabrous; leaves linear-filiform, 5 to 7 lines long; inflorescence open, the flowers commonly on slender pedicels, the pedicels 2 to 9 lines long.—Montane, 600 to 6000 ft.: Temescal and San Jacinto mountains to San Diego Co.; s. to L. Cal., e. to N. Mex. and Utah. (*Gilia floribunda* Gray.)

### 9. *LANGLOISIA* Greene

Low annuals. Leaves alternate, pinnatifid, the lower segments replaced by long bristles, the upper teeth or segments bristle-tipped. Flowers in terminal bracteate heads, the bracts with bristle-tipped lobes. Calyx-lobes equal, bristle-tipped, in fruit splitting to base. Corolla showy, tubular-funnel-form, 2-lipped with 2 lobes in the upper lip and 3 in the lower, or equally 5-lobed with the lobes only obscurely disposed in 2-lipped fashion. Stamens inserted in the corolla-throat, often somewhat declined. Capsule many-seeded; seeds somewhat mucilaginous when wetted. (A. B. Langlois, a botanist of Louisiana.)

Leaves abruptly dilated at apex; corolla regular.

Corolla-lobes about  $\frac{1}{2}$  as long as tube.....1. *L. setosissima*.

Corolla-lobes little shorter than tube.....2. *L. punctata*.

Leaves pinnatifid, the rachis broad or ligulate; corolla strongly 2-lipped.

Corolla-lobes  $\frac{1}{2}$  to  $\frac{3}{4}$  as long as the tube.....3. *L. schottii*.

Corolla-lobes equaling or nearly equaling the tube.....4. *L. matthewsii*.

780. *Langloisia punctata* Hel.; a, habit x  $\frac{1}{2}$ ; b, leaf x  $\frac{1}{2}$ ; c, calyx and pistil x  $1\frac{1}{4}$ ; d, long. sect. of corolla x  $1\frac{1}{4}$ ; e, seed x 4.

1. *L. setosissima* (T. & G.) Greene. Main axis short, erect,  $\frac{1}{4}$  to  $2\frac{1}{4}$  in. high, the branches spreading horizontally or ascending,  $\frac{1}{2}$  to  $3\frac{1}{4}$  in. long; herbage subglabrous to puberulent; leaves 6 to 11 lines long, cuneately and somewhat abruptly dilated upward from a slender petiolar base, 3-toothed at apex and with a pair of teeth below these, all bristle-tipped; corolla lavender-blue, 6 to 7 lines long, the lobes about  $\frac{1}{2}$  as long.—Desert valleys and washes, 100 to 1000 ft.: Colorado Desert.

2. *L. punctata* Hel. LILAC SUN-BONNET. Fig. 780. Similar to no. 1; herbage glabrate; leaves with deltoid 3-toothed or 3-lobed apex, sometimes with a pair of teeth below the terminal teeth, the petiolar or cuneate base with 2 or 3-forked bristles; flowers subsessile; corolla-lobes purple-dotted, each with 2 very shallow longitudinal channels from above the middle towards the base, and ending below in a lunate yellow ridge; corolla-tube little surpass-

ing the calyx.—Ranges in the desert, 1700 to 4500 ft.: Mohave Desert; Inyo Co. (*Gilia setosissima* var. *punctata* Gray.)

3. *L. schöttii* (Torr.) Greene. Main axis very short, erect,  $\frac{3}{4}$  to 2 in. high, the branches mostly divaricately spreading, 1 to 3 in. long; herbage villous-pubescent; leaves regularly pinnatifid,  $\frac{1}{2}$  to 1 in. long, the rachis very broad or ligulate, the teeth bristle-tipped or replaced by bristles; corolla pale pink, 6 to 9 lines long, the lower lip 3-lobed (the sinuses not so deep as the sinuses between the lips), these lobes spreading, purple-spotted or patterned, their sinuses with a small but distinct erect scale-like process; 2 lobes of upper lip more deeply parted than those of the lower, divergent, sometimes purple-dotted towards base.—Sandy washes on tilted mesas and in sandy valleys, 500 to 2700 ft.: coastal S. Cal. in Riverside Co.; Colorado Desert; e. Mohave Desert; e. to southern Utah and Ariz., s. to Sonora and L. Cal. Apr. Sometimes the lower lip is 4-lobed and the upper lip is a single lobe.

4. *L. matthewsii* (Gray) Greene. Main axis very short, erect, 1 to  $1\frac{1}{2}$  in. high, bearing many horizontal or divaricate branches, forming a low plant 1 in. to  $1\frac{1}{4}$  ft. broad; branches sparsely leafy or naked and peduncle-like, simple or branched above, ending in dense or head-like clusters of flowers, the heads leafy-bracteate; herbage thinly villous; epidermis of the stems white; leaves linear,  $\frac{1}{4}$  to  $1\frac{1}{4}$  in. long, regularly pinnatifid, the lobes spine-tipped or replaced by white bristles, the bristles often recurving; bracts linear, margined with long bristles; calyx about  $\frac{2}{3}$  as long as corolla, divided nearly to base into lanceolate lobes tipped with a long bristle; corolla white or pink, 5 to 7 lines long, the 3 upper lobes purple-spotted, also often with a double oblong pink pattern; stamens and style exserted.—Sandy washes, 600 to 3700 ft.: Colorado and Mohave deserts; Inyo Co.; e. to Nev. and Ariz., s. to Sonora.

#### 10. GYMNOSTERIS Greene

Diminutive annuals with leafless simple stems. Proper leaves none, the cotyledons persistent, connate-perfoliate. Flowers few in terminal heads, the 4 bracts united at base and forming a distinct involucre. Calyx-tube membranous, the teeth slightly unequal. Corolla salverform or slender-funnel-form, white or yellow. Anthers sessile in the corolla-throat. Capsule dehiscent, many-seeded. (Greek *gymnos*, naked, and *steris*, robbed, referring to the leafless stems.)

Cotyledons remote from involucre; involucre several-flowered; style cleft  $\frac{1}{2}$ : corolla-lobes acutish; var. *parvula* of..... 1. *G. nudicaulis*.  
Cotyledons closely subtending involucre or rarely somewhat removed; involucre 1 (or 3)-flowered; style cleft to middle or a little below; corolla-lobes obtuse..... 2. *G. minuscula*.

1. *G. nudicaulis* (Gray) Greene var. *parvula* Jepson n. comb. Plants 1 to  $1\frac{1}{2}$  in. high; involucre 3 to  $4\frac{1}{2}$  lines long; corolla 3 to 4 lines long, its lobes acutish.—E. side Sierra Nevada in Nevada Co.; e. to Col., n. to Ida. (*Gilia parvula* Rydb.)

2. *G. minuscula* Jepson n. sp. Plants 2 to 3 lines high; calyx-lobes lanceolate, about as long as the tube; corolla yellow,  $1\frac{1}{4}$  lines long, exceeding the calyx, its lobes short; capsule about 13 to 18-seeded.—Alpine gravelly or sandy slopes, 10,300 to 11,800 ft., White Mts., n. Inyo Co.: Sheep Mt. (Jepson 7326, type); Big Prospecter Mdw.

#### HYDROPHYLLACEAE. PHACELIA FAMILY

Herbs or shrubs with opposite or alternate leaves. Flowers complete, regular, 5-merous (except the superior ovary which is 1 or 2-celled), in racemes or spikes (often scorpioid), or capitate, or solitary. Stamens 5, inserted near the base of the corolla, alternate with its lobes, which are imbricate in the bud. Styles 1, entire or often more or less 2-cleft at apex, or 2 and distinct. Fruit a 1-celled capsule or partly or quite 2-celled by the intrusion of the placentae or their union in the axis; valves 2, rarely 4. Seeds few or many. Seed-coat usually pitted, the cavities regular and honeycomb-like, or sometimes rugulose.

- Styles 2 and distinct, or 1 and 2-cleft at apex; ovary hairy or pubescent, not glabrous except in no. 11.
- Flowers in spikes, racemes, cymes or heads, or solitary in the axils of leafy stems.
- Calyx-lobes or sepals essentially alike.
- Stamens equal; style 2-cleft at apex; herbs.
- Flowers not scorpioid; ovary with the placentae expanded, each forming a sac-like lining to the cell.
- Stamens longer than the corolla; flowers in head-like clusters; leaves alternate or mainly basal. . . . 1. *HYDROPHYLLUM*.
- Stamens shorter than the corolla; flowers solitary or in racemes; leaves (at least the lower) opposite.
- Calyx with a reflexed appendage at each sinus. . . . 2. *NEMOPHILA*.
- Calyx naked at the sinuses. . . . 3. *ELLISIA*.
- Flowers in scorpioid spikes, racemes or cymes.
- Leaves all opposite, entire; ovary 2-celled. . . . 4. *DRAPERIA*.
- Leaves all or all but the lowest alternate; ovary more or less pubescent, the placentae narrow or thin, projecting into its cavity or meeting in the axis.
- Corolla blue, purple or white, deciduous. . . . 5. *PHACELIA*.
- Corolla yellow or cream-color, persistent.
- Flowers erect, on pedicels  $\frac{1}{2}$  to  $\frac{3}{4}$  as long; calyx-lobes linear-oblongate; style (in ours) persistent.
6. *MILTITZIA*.
- Flowers pendulous, on pedicels as long; calyx-lobes ovate; style deciduous. . . . 7. *EMMENANTHE*.
- Stamens unequal and unequally inserted; styles distinct to base (one and cleft at apex in some species in no. 9); herbs or herb-like (no. 10 shrubs).
- Placentae with 2 or 3 ovules, the ovules superposed; small depressed repeatedly dichotomous annual. . . . 8. *LEMMONIA*.
- Placentae with several to numerous ovules.
- Capsule more or less membranous, 2-valved, its placentae 6 to 50 (or more)-seeded; low annuals, or perennials of various habit. . . . 9. *NAMA*.
- Capsule coriaceous, 4-valved, when dehiscing behaving as if 4-celled, each cell 1 or 2-seeded; shrubs. . . . 10. *ERIODICTYON*.
- Calyx-lobes strongly dissimilar, the 3 outer cordate, enlarged and veiny in fruit; herbs. . . . 11. *TRICARDIA*.
- Flowers solitary on a naked peduncle arising from a leaf-rosette on the ground; herbs. . . . 12. *HESPEROCHIRON*.
- Style 1, entire; ovary glabrous; flowers in racemes, white; leaves mainly basal; herbs. . . . 13. *ROMANZOFFIA*.

### 1. *HYDROPHYLLUM* Tourn. WATER-LEAF

Perennial herbs, ours with horizontal rootstocks, the leaves and peduncles sub-basal or on short stems. Leaves alternate, pinnately parted or divided. Flowers violet-blue or white, in cymose or head-like clusters. Calyx opening early, with or without a small appendage at each sinus, little changed in fruit. Corolla campanulate, the tube within bearing a pair of narrow longitudinal scales opposite each lobe, one on either side of the midrib, their edges meeting and forming a closed nectar-bearing groove. Filaments long, hairy at the middle, these and the styles long and filiform, conspicuously exerted. Ovules 4; seeds 1 to 4. (Greek hudor, water, and phullon, leaf.)

Stems very short, the peduncles and leaves mostly basal or sub-basal; rootstock short, densely set beneath with many fleshy tap-like roots; leaves pinnately divided, rarely subpalmate, the divisions mostly with obtuse or sub-acute lobes or teeth; pedicels much shorter than the calyces; montane.

Peduncles shorter than the petioles; blades roundish or ovate in outline, the 5 to 7 divisions entire or 1 or 2-incised at apex. . . . 1. *H. capitatum*.

Peduncles longer than the petioles, often exceeding the subtending leaf; blades broadly oblong or elliptic in outline, the 7 to 15 divisions freely serrate or incised on the sides. . . . 2. *H. occidentale*.

Stems about 9 to 12 in. high; peduncles commonly longer than the petiole of the subtending leaf; leaf divisions conspicuously serrate or incised, the lobes or teeth acute; pedicels mostly 1 to 2 times as long as the calyces; mts. along or near the north coast.

Leaves pinnately divided into 5 or 7 divisions; pubescence mostly soft. . . . 3. *H. fendleri*.

Leaves subpalmately divided; pubescence mostly hirsute. . . . 4. *H. tenuipes*.

1. *H. capitatum* Dougl. CAT'S BREECHES. Plants 4 to 9 in. high; peduncles much shorter than the petiole of the leaf, in fruit recurved,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long.—Pine woods, 4000 to 7000 ft.: Eldorado Co. to Modoc and Siskiyou Cos.; n. to Wash., e. to Utah. May-June.

2. *H. occidentale* Gray. SQUAW LETTUCE. Fig. 781. Plants 5 to 15 in. high, the peduncles longer than the petioles, often longer than the leaves, bearing

1 or 2 capitate clusters of flowers; herbage hirsute, the leaves green above, white-pubescent beneath; leaves 5 to 12 in. long, their divisions or leaflets broadly oblong, entire or incised; heads 1 to  $1\frac{3}{4}$  in. broad; calyx deeply parted, its divisions lanceolate; corolla pale blue or lilac, 4 to 6 lines long.—Montane, open pine woods or brushy slopes, 3500 to 7000 ft.: Tehachapi Mts.; Sierra Nevada from Tulare Co. to Modoc Co.; Santa Lucia Mts.; Mt. Diablo; Napa and Mendocino Cos. to Humboldt and Tehama Cos.; n. to Ore. Apr.-June.

781. *Hydrophyllum occidentale* Gray;  
a, habit x  $\frac{1}{2}$ ; b, fl. x 1.

3. *H. fendleri* Hel. var. *albifrons*

Mebr. Plants erect, 8 to 14 in. high; herbage thinly soft-puberulent or rarely hirsute; leaves with mostly 5 or 7 divisions or leaflets, the leaflets ovate, deeply and irregularly incised or toothed,  $1\frac{1}{4}$  to  $2\frac{3}{4}$  in. long; flowers in usually somewhat compact cymes; corolla white, 3 to 5 lines long.—Damp shady places, 500 to 5500 ft.: mts. of Humboldt, Del Norte and w. Siskiyou Cos. Apr.-July.

4. *H. tenuipes* Hel. var. *viride* Jepson n. var. Plants erect, 10 to 20 in. high; herbage thinly hispidulose and the stems often conspicuously retrorse-bristly; leaves 4 to 7 in. wide, palmately 3-divided, the central division much larger and deeply 3-cleft, all the segments serrate and incised; corolla greenish-white.—Shady woods along the coast, 20 to 500 ft.: Mendocino and Humboldt Cos. (Ft. Bragg, W. C. Mathews, type); n. to Wash. May-June.

2. *NEMÓPHILA* Nutt.

Low annuals. Leaves mostly opposite. Flowers solitary in the axils or racemose. Calyx with a reflexed appendage in each sinus (rarely obsolete). Corolla white, blue, purple or variegated, basin-shaped or almost rotate to campanulate-tubular, with 10 minute internal scales in pairs between the stamens, at base. Stamens included, inserted at or near base of corolla. Style more or less 2-cleft. Capsule 1-celled. Seeds 2 to 25, usually with a deciduous caruncle. (Greek *nemos*, grove, and *phileo*, to love.) (?) *VITICELLA* Mitch.

Stems armed with retrorsely curved prickles; uppermost flowers clustered.

Petioles broadly winged and auriculate-clasping; corolla 8 to 11 lines broad.....

1. *N. aurita*.

Petioles not broadly winged nor auriculate-clasping; corolla about half as large.....

2. *N. racemosa*.

Stems not armed with prickles, although often retrorse-hairy; flowers all solitary and axillary.

Corolla commonly with a conspicuous purple blotch at apex of each lobe.....

3. *N. maculata*.

Corolla uniformly colored or veined or dotted.

Flowers large,  $4\frac{1}{2}$  to  $16\frac{1}{2}$  lines broad; calyx appendages much shorter than sepals.

Corolla blue or white; common.....4. *N. menziesii*.

Corolla with a large purple blotch on the lower part of each lobe; rare.....

5. *N. venosa*.

Flowers commonly smaller.

Calyx appendages either in flower or in fruit nearly equaling sepals.

Placentae 3 to 6-ovuled; corolla tubular or tubular-campanulate.....

6. *N. pedunculata*.

Placentae 2-ovuled; corolla open-campanulate or basin-shaped.....

7. *N. sepulta*.

Calyx appendages much shorter than the sepals.

Corolla  $1\frac{1}{2}$  to 2 times as long as calyx.

High-montane dwarf; leaves cuneate, 3-toothed at apex.....

8. *N. spatulata*.

Foothills; stems  $\frac{1}{2}$  to 2 ft. long; leaves mostly pinnately divided or pinnatifid.

Corolla rotate or basin-shaped.

Flowers commonly white; common, widely distributed...

9. *N. heterophylla*.

Flowers not white.

Flowers purple; scales wholly adnate; local, s. Sierra Nevada.....10. *N. pulchella*.

- Flowers light blue; scales partly free above; coastal S. Cal. .... 11. *N. rotata*.  
 Corolla subcampanulate or bowl-shaped. .... 12. *N. exilis*.  
 Corolla scarcely or not at all exceeding the calyx. .... 13. *N. parviflora*.

1. *N. aurita* Lindl. FIESTA FLOWER. CLIMBING NEMOPHILA. Stem weak and straggling, angled or winged, armed with retrorse prickles which enable it to climb over other plants, 2 to 6 ft. long; leaves 1 to 2 in. long, coarsely, unequally and irregularly pinnately parted into 3 to 7 lobes, the lobes  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long, often a little downwardly curved, the petioles broadly winged and auriculate-clasping; corolla deep purple or violet, paler outside, with short throat constricted below top, and spreading limb 8 to 12 lines broad.—Moist shady places in the foothills, 100 to 3000 ft.: coastal S. Cal.; n. in the Coast Ranges to San Francisco Bay and in the Sierra Nevada foothills to Tuolumne Co. Mar.-May.

2. *N. racemosa* Nutt. Stems weak, simple or branched,  $\frac{1}{2}$  to  $1\frac{1}{2}$  ft. long; herbage hispid or setose-hispid, the stems retrorsely so; leaves round-ovate in outline, mostly very coarse, 1 to 2 in. long, pinnatifid into ovate or linear entire or toothed lobes, the lobes 3 to 8 lines long,  $\frac{1}{3}$  to  $\frac{1}{2}$  as broad; corolla campanulate,  $1\frac{1}{2}$  times as long as the calyx, the narrow scales free at the apex; capsule globose, shorter than the calyx, 1-seeded.—Hillslopes and ravines, 50 to 500 ft.: Santa Barbara Isls.; San Diego coast; s. to L. Cal. Mar.-Apr.

3. *N. maculata* Benth. FIVE-SPOT. Stems several from the base, ascending or decumbent, 5 to 10 in. long; leaves broadly oblong in outline, 1 to  $1\frac{1}{2}$  in. long, pinnately parted into 5 to 9 ovate or suborbicular divisions or lobes, the lobes entire or 2 or 3-lobed; upper leaves (or sometimes all) usually with only 3 (or 5) entire lobes at tip and cuneately tapering base, or lanceolate and entire; peduncles surpassing the leaves; corolla white, with rows of purple dots radiating from the center to the large purple spot at the end of each lobe, 1 to  $1\frac{1}{4}$  in. broad; scales half free, rolled toward the filaments, ciliate.—Meadows, 1500 to 6500 ft.: Sierra Nevada foothills from Nevada Co. to Kern Co. Apr.-Aug. Also called Calico Flower and Spotted Nemophila. Var. *CÓNCOLOR* Brand. Leaves pinnatifid; corolla without purple blotches at tips of its lobes; scales oblong and half free.—Clear Creek, Butte Co.

4. *N. menziesii* H. & A. BABY BLUE-EYES. Fig. 782. Stems branching from the base, slender or succulent, diffuse or ascending, 3 to 18 in. long; herbage more or less hirsute-pubescent; lower leaves  $1\frac{1}{2}$  to  $3\frac{1}{2}$  in. long, pinnately divided into 5 to 9 mostly 2 or 3-lobed divisions; upper leaves less divided; peduncles twice as long as leaves; calyx-lobes 2 to 5 lines long; corolla light to deep blue, often veined with purple, lighter and often dotted toward center, but seldom hairy, basin-shaped, divided about  $\frac{3}{4}$  of the way to base,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. wide; scales broad and wholly adherent to narrow and part free, often enlarged at tip, laciniate, ciliate, or entire.—Moist spots on valley floors and hillsides, 20 to 5000 ft., common: cismontane Cal. (*N. insignis* Benth. *N. intermedia* Bioletti.) Extremely variable. Var. *ATOMARIA* Chandler. Pale Baby Blue-eyes. More succulent and less pubescent, often nearly glabrous; calyx-lobes shorter and broader; corolla white or pale blue, rather smaller, somewhat more deeply divided, dotted or rarely only veined dark purple or black, hairy at center; scales very narrow or linear, usually hairy, often reduced to a mere line of hairs.—Moist places, Coast

782. *Nemophila menziesii* H. & A.; a, habit  $\times \frac{1}{2}$ ; b, scales and sect. of corolla base  $\times 3$ .

Ranges. (*N. atomaria* F. & M.) Var. *INTÉGRIFÓLIA* Parish. Leaves entire or with 3 to 5 broad lobes; corolla white or light blue.—Mts. of S. Cal. Apr.-July.

5. *N. venôsa* Jepson. Similar to no. 4; corolla with a large purple blotch on each lobe and in throat, the pale blue upper portion of each lobe conspicuously purple-veined.—Mts. of Napa and Sonoma Cos.

6. *N. pedunculâta* Dougl. Stems prostrate or among underbrush lax, sparingly pubescent, 2 to 6 (or 12) in. long; leaves oblong, 5 to 7-lobed or -divided; peduncles shorter than the leaves, strongly deflexed in age, burying the capsules; corolla white or pale blue, often black-dotted, the scales linear, often reduced to hairy lines; style as long as ovary or longer.—Damp places in the foothills or mts., grassy slopes and shade of thickets, 50 to 6000 ft.: Modoc and Lassen Cos. w. to Humboldt Co., thence s. along the coast to San Diego Co.; not common. Apr.-May.

7. *N. sepûlta* Parish. Stems usually prostrate, the branches often strongly angled or winged, 2 to 5 (or 15) in. long; leaves oblong, pinnately parted into 5 or 7 oblong lobes; peduncles deflexed in age; corolla open-campanulate, not hairy at center, whitish, often dotted with blue or purple toward the center, 2 lines broad; scales linear or reduced to hairy lines; capsules a little broader than long,  $2\frac{3}{4}$  lines broad.—Mts., 1500 to 4000 ft., widely distributed in Cal. but not common. Mar.-Apr.

783. *Nemophila spatulata* Cov.; a, habit  $\times \frac{1}{2}$ ; b, fl.  $\times 2$ ; c, stamen and scales  $\times 4$ .

8. *N. spatulâta* Cov. Fig. 783. Stems few from the root-crown, 1 to  $2\frac{1}{2}$  (or 4) in. long (rarely to 8 in. long), diffuse or prostrate; herbage hispidulose; leaves cuneate or linear-cuneate, coarsely 3 (rarely 5 or 7)-toothed at apex,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long; corolla bluish or white, often with a purple spot at tip of each lobe and a few dots in

center, 3 lines long; scales small and laciniate or obsolete; style cleft at apex.—Montane ridges in pine forests, 5000 to 9000 ft.: Sierra Nevada from Nevada Co. to Tulare Co.; Tehachapi Range; s. to San Jacinto Mts.; w. Nev. May-June. (*N. humilis* Eastw.)

9. *N. h  teroph  lla* F. & M. SMALL WHITE NEMOPHILA. Stems erect, ascending or lax, 8 to 13 in. long; herbage thinly hirsute or hirsutulose; leaves pinnately divided or cleft into 5 or 7 oblong or elliptic divisions; calyx-appendages evident; corolla white or bluish, devoid of blue or purple dots, basin-shaped or broadly campanulate, not hairy within, 3 to  $4\frac{1}{2}$  lines broad; scales semi-circular, oblong or triangular, entire or laciniate, not reduced to hairy lines.—Ca  ons and hillslopes, mostly in shady spots, 20 to 4000 ft. in the foothills: Coast Ranges and Sierra Nevada. It is the most common species and is extremely variable. Var. *FL  CCIDA* Brand. Upper leaves (or sometimes all) broadly 1 or 2-toothed or -cleft or subentire.—Mendocino, Shasta and Butte Cos. (*N. flaccida* Eastw.) Var. *NEMOR  NSIS* Jepson n. comb. Scales narrowly linear or almost obsolete.—Near the coast, Marin Co. to Santa Clara Co. (*N. nemorensis* Eastw.)

784. *Nemophila pulchella* Eastw.; a, fl. branchlet  $\times \frac{9}{4}$ ; b, gland  $\times 19$ .

10. *N. pulchella* Eastw. Fig. 784. Similar to no. 8; calyx-appendages minute or even obsolete; corolla deep blue or purplish, rotate or basin-shaped; scales broadly linear, wholly adnate, ciliate or not, or reduced to short-hairy bands.—Foothills, 500 to 4800 ft.: s. Sierra Nevada from Fresno Co. to Kern Co. Apr.

11. *N. rotata* Eastw. Similar to no. 9; corolla light blue, saucer-shaped, 4 lines broad; scales linear, deeply and finely fimbriated, partly free above.—Valleys and mesas, coastal S. Cal.

12. *N. exilis* Eastw. Stems diffuse, 6 to 12 in. long; herbage hirsute or hirsutulose; leaves  $\frac{1}{2}$  to 1 in. long, pinnately divided into 5 or 7 divisions or lobes, the lobes oblong, ovate or roundish, contracted or broadly petiolulate at base, sometimes again 3-lobed; upper leaves (or again sometimes all) merely coarsely or irregularly few-toothed or lobed, or even nearly entire; corolla white, broadly campanulate or bowl-shaped, ( $1\frac{1}{2}$  or)  $2\frac{1}{2}$  to 4 lines broad; scales narrow, the pairs divergent.—Foothills, 500 to 5000 ft.: Coast Ranges from Santa Clara Co. to Mendocino Co.; Sierra Nevada foothills from Tulare Co. to Butte Co. Apr.-May.

13. *N. parviflora* Dougl. SMALL-FLOWERED NEMOPHILA. Stems decumbent or ascending, hispid,  $\frac{1}{2}$  to  $1\frac{1}{4}$  ft. long; leaves suborbicular to roundish-ovate in outline, 4 to 12 lines long, pinnately cleft into 5 lobes (or sometimes merely dentately 5-toothed), the lobes acute; peduncles shorter than leaves, not deflexed in age; corolla scales minute, various, but usually half free and lacinate or ciliate; style as long as the ovary or longer.—Foothills and cañons, moist or shady places, 50 to 4500 ft.: Coast Ranges from Santa Cruz Mts. to Humboldt and Trinity Cos.; Sierra Nevada from Fresno Co. to Plumas Co.; n. to Wash. Mar.-Apr. Var. *AUSTINAE* Brand. Leaves shallowly lobed, the lobes more nearly rounded.—Siskiyou Co.; Plumas Co., passing into the next variety. Var. *QUERCIFOLIA* Chandler. Oak-leaf Nemophila. Pubescence softer and more spreading than in the species; leaves roundish or ovate in outline, 6 to 9 lines long, sinuately parted or divided into about 5 lobes, the lobes rounded and tending to be broader towards the apex; peduncles mostly exceeding the leaves.—Sierra Nevada, 1500 to 5000 ft. (*N. quercifolia* Eastw.)

### 3. *ELLISIA* L.

Annuals, similar to *Nemophila*. Leaves opposite or the uppermost alternate, pinnately parted or twice or thrice pinnately dissected. Flowers bractless, in axillary peduncled racemes. Calyx without appendages at the sinuses, and usually much enlarged under the fruit. Corolla white, campanulate, shorter or little longer than the calyx, the internal scales minute or none. Ovules 4 to 8. Seeds not carunculate. (John Ellis, English botanist of the 18th century, whom Linnaeus called a "bright star of natural history.")

Sepals sparsely bristly or ciliate, not glandular.

Leaves once pinnately parted, the lobes remote; ovules 2 on each placenta, borne on the front of it. . . . . 1. *E. membranacea*.

Leaves twice or thrice pinnatifid; ovules 4 on each placenta, 2 on the front and 2 on the back.

Corolla  $1\frac{1}{2}$  to 2 times as long as calyx; flowers many or numerous, racemose or commonly paniculate; erect plants; coastal. . . . . 2. *E. chrysanthemifolia*.

Corolla not exceeding calyx; flowers few in a raceme; diffuse plants; deserts. . . . . 3. *E. torreyi*.

Sepals sparsely bristly and also sprinkled with black short-stipitate glands; leaves once pinnately parted. . . . . 4. *E. micrantha*.

1. *E. membranacea* Benth. Fig. 785. Stems procumbent, 1 to 2 ft. long; herbage glaucous, the leaves with a few short scattered stiff hairs, the stems with minute prickles on the angles; leaves ovate in outline or often nearly as broad as long, 1 to 5 in. long, pinnately divided, with 2 broad lobes (obtuse at apex and broadest at base) spreading at right angles to the terminal lobe, or often with 4 to 8 similar lateral lobes, the lobes remote; petiole wing-margined; flowers racemose, few or many on the peduncles; calyx without appendages, its lobes ciliate-bristly; corolla white with a small lance-shaped purple spot in the center of each lobe, 2 lines broad, no scales in the throat but with 10 glandular elevations; capsule often purple in age, with several muricate prickles, 1 or 2-seeded; seed globose, reticulated.—Shady

places in the foothills: San Diego to Mt. Diablo, e. to Tulare Co., Mohave Desert and west side Colorado Desert.

2. *E. chrysanthemifolia* Benth. Stem often stout, erect, freely branching,  $\frac{1}{2}$  to 2 ft. high; herbage thinly short-hirsute with spreading hairs, or the leaves hispidulose; leaves ovate in outline, 2 to 4 in. long, twice to thrice pinnately dissected or incised, shortly petioled or sessile, with a conspicuous auriculate dilation at base; flowers loosely racemose; corolla open-campanulate, surpassing the oval calyx-lobes; scales in tube a diverging pair to each stamen; capsule whitish, thinly hirsute, the placentae lining and exactly conforming to the valves; placentae with two roughened seeds borne on the front of each, and 2 smooth ones concealed behind each, that is, between the placentae and the valves.—Shady places along the coast: Contra Costa Co. to San Diego Co.

3. *E. torreyi* Gray. Similar to no. 2; stems weak, diffuse, 6 to 13 in. long; herbage thinly soft-hairy or pilose; leaves  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long, pinnately parted, the lobes incised or toothed; upper leaves with a dilated auriculate base, the lower petioled; racemes few-flowered; corolla broadly campanulate, not exceeding calyx.—Mohave and Colorado deserts; e. to Ariz.; s. to L. Cal.; rare.

4. *E. micrantha* (Torr.) Brand. Stems erect, branching from the base, slightly glandular-pubescent or subglabrous, 5 to 10 in. high; leaves oblong in outline,  $\frac{1}{2}$  to 1 in. long, pinnately parted, the lobes entire or rarely 1-toothed; lower leaves petioled, the upper auriculate-dilated at the sessile base; flowers many in racemes and subpaniculate; corolla white, deeply bowl-shaped, 2 lines long, the lobes quadratish, emarginate; stamens unequal, 3 longer, a yellowish spot on corolla between the filaments.—Washes and mesas, often in shade, 300 to 7500 ft., rather infrequent: Colorado and Mohave deserts; Inyo Co.; e. to Utah and western Tex.; s. to L. Cal. and Sonora. (*Phacelia micrantha* Torr.)

785. *Ellisia membranacea* Benth.; a, fl. branch  $\times \frac{2}{3}$ ; b, fl.  $\times 1\frac{1}{2}$ ; c, pistil  $\times 4\frac{1}{2}$ ; d, gland  $\times 7$ .

786. *Draperia systyla* Torr.; a, portion of fl. stem  $\times \frac{1}{2}$ ; b, long. sect. of fl.  $\times 1\frac{1}{2}$ ; c, capsule  $\times 2$ .

#### 4. DRAPERIA Torr.

Low diffuse perennial herb with slender stems and opposite entire leaves. Flowers in a terminal cyme, its branches consisting of unilateral racemes. Calyx-segments linear. Corolla pale lavender, tubular-funneliform, without appendages. Stamens unequal and unequally inserted low on the corolla-tube, included. Ovary 2-celled, the ovules in each cell 2, pendulous. Style long, filiform, 2-cleft at apex. Capsule subglabrous. (J. W. Draper, American historian.)

1. *D. systyla* Torr. Fig. 786. Stems few or several, 4 to 7 in. long, arising from the horizontal rooting branches of a large root-crown; herbage silky-hirsute; leaves ovate, entire,  $\frac{3}{4}$  to  $1\frac{3}{4}$  in. long; corolla 5 to 6 lines long; ovary densely hairy.—Pine woods, 4000 to 5500 ft.: Sierra Nevada from Tulare Co. to Shasta Co.; Siskiyou Co. June-July.

### 5. PHACÈLIA Juss.

Perennial or annual herbs of marked aspect, with alternate leaves (or sometimes the lower opposite). Flowers violet, blue or white, in scorpioid spikes or racemes. Calyx of 5 nearly distinct sepals, commonly accrescent. Corolla from nearly rotate to campanulate, tubular or funnelliform, promptly deciduous, the tube commonly with internal lamellate projections or scales. Stamens inserted on the base of the corolla. Style 2-cleft or -parted, or divided to the base. Capsule 1-celled or nearly or quite 2-celled by the approximation or union of the placentae in the axis, 2-valved, the thin septa-like placentae adherent to the valves. Seeds reticulate-pitted or favose or transversely corrugated. (Greek phakelos, a cluster, many species with crowded flowers.)

#### A. Seeds commonly reticulate or favosely pitted, never transversely corrugated.

##### I. SCALES (IF PRESENT) FREE FROM COROLLA; ANNUALS.

Corolla scales none; corolla deeply saucer-shaped; ovules 20 to 80 on each placenta.—Subgenus GYMNOBYTHUS.

Corolla blue with white or purple center, mostly 6 to 9 lines broad. . . . . 1. *P. viscida*.

Corolla pale blue or purplish without white center,  $\frac{3}{4}$  to 2 in. broad. . . . . 2. *P. grandiflora*.

Corolla scales present, adnate to lower portion of filament; ovules 8 to 50 on each placenta.

—Subgenus WHITLAVIA.

Corolla open-campanulate or somewhat bowl-shaped, cleft to the middle or below; ovules not very numerous.

Ovules about 20 to each placenta; corolla deep violet,  $\frac{3}{4}$  to 1 in. broad; cleft below the middle. . . . . 3. *P. parryi*.

Ovules 8 to 10 to each placenta; corolla white, 3 to 6 lines broad, cleft to the middle. . . . . 4. *P. longipes*.

Corolla oblong-campanulate, not cleft to the middle; ovules more numerous (20 to 50 to each placenta). . . . . 5. *P. minor*.

##### II. SCALES COMMONLY ADNATE TO THE COROLLA-TUBE.

##### 1. Ovules always 2 to each placenta.—Subgenus EUPHACELIA.

##### a. Leaves entire, or pinnately parted or divided and the lobes entire.

Coarse perennials with stout stems  $1\frac{1}{4}$  to  $3\frac{1}{2}$  ft. high; corolla commonly white.

Herbage pubescent and hirsute; plants of rocky and usually dry places.

Leaves entire or with 1 pair of supplementary lobes at summit of petiole; montane or high-montane, at least mostly.

Sepals bristly and finely pubescent, not venulose; leaves not glaucous. . . . . 6. *P. heterophylla*.

Sepals bristly mostly or only on margins, transversely venulose; leaves subglaucous beneath. . . . . 7. *P. corymbosa*.

Leaves pinnatifid with usually large terminal lobe, rarely entire; mostly foothills or middle altitudes. . . . . 8. *P. californica*.

Herbage hispid-bristly with stinging hairs; plants of shady moist places. . . . . 9. *P. nemoralis*.

Annuals with stems 2 to 9 in. high; corolla commonly blue, rarely whitish.

Leaves mostly incisely lobed or parted; racemes rather lax but many-flowered; style parted scarcely to the middle; Coast Ranges. . . . . 10. *P. breweri*.

Leaves entire or essentially so; Sierra Nevada or mts. of S. Cal.

Style parted to base; corolla 1 to  $1\frac{1}{2}$  times as long as calyx; stem branching at or near the base. . . . . 11. *P. eisenii*.

Style parted to middle or just below middle.

Corolla long-persistent, 2 times as long as calyx or nearly; scales very long and very narrow; rare. . . . . 12. *P. marcescens*.

Corolla deciduous.

Racemes rather densely flowered.

Scales with the outer edges free; common. . . . . 13. *P. humilis*.

Scales of contiguous pairs with the outer edges partly connivent in pairs; rare. . . . . 14. *P. irritans*.

Racemes not densely flowered; stem simple below, the branches in opposite pairs at or above the middle; frequent. . . . . 15. *P. racemosa*.

##### b. Leaves cleft, parted or divided, but whether cleft, parted or divided the lobes or divisions in any case crenate or toothed; annuals except no. 19.

Leaves divided, that is mostly with distinct or discrete divisions or leaflets.

Divisions of leaves mostly rather delicate with numerous lobes, teeth or scallops, the whole more or less fernlike in appearance.

- Sepals unlike, 1 or 2 of them dilated and leaf-like and often toothed or cleft;  
Sierra Nevada foothills.....16. *P. platyloba*
- Sepals essentially alike.  
Stamens much-exserted; Sacramento Valley to S. Cal....17. *P. tanacetifolia*.  
Stamens little or not at all exserted; mostly Coast Ranges and coastal S. Cal..  
18. *P. distans*.
- Divisions of leaves or leaflets coarser, the teeth or scallops fewer and larger.  
Perennial; herbage somewhat glandular; corolla yellowish-white or bluish; sta-  
mens somewhat exserted.....19. *P. ramosissima*.
- Annuals.  
Corolla longer than calyx.  
Stamens not or scarcely surpassing the blue or lavender corolla; divi-  
sions of leaves or leaflets without petiolules; style cleft halfway  
or below.  
Sepals narrow-oblancheolate, very narrow-attenuate downward,  
never becoming chartaceous.  
Scales wholly adnate to corolla; common....20. *P. hispida*.  
Scales with a bristle-like apex projecting into tube; rare....  
21. *P. eremica*.  
Sepals oblong to broadly ovate, in fruit becoming chartaceous....  
22. *P. ciliata*.  
Stamens well-exserted from the white corolla; sepals linear or oblan-  
cheolate; divisions of leaves or leaflets mostly with petiolules..  
23. *P. pedicellata*.  
Corolla shorter than calyx; stamens included.....24. *P. cryptantha*.
- Leaves toothed or cleft, seldom divided (except in *P. crenulata*).  
Leaves oblong to linear-oblong, crenately lobed or pinnatifid; stamens well-exserted...  
25. *P. crenulata*.
- Leaves round- or elliptic-ovate, slightly lobed; sepals unequal.  
Racemes dense, many-flowered; stamens and style exserted....26. *P. malvaefolia*.  
Racemes slender, becoming loose, fewer-flowered; stamens and style included...  
27. *P. rattanii*.
2. *Orules usually more than 2 to each placenta*.—Subgenus EUTOCA.
- a. Perennials.  
Leaves 3 to 6 lines long, as broad as long; main stems white-woolly; Panamint Mts.....  
28. *P. peritylloides*.
- Leaves much larger (1 to 7 in. long), longer than broad; stems never white-woolly.  
Stamens strongly exserted; leaves not glandular nor harsh-hairy.  
Stem branched, 4 to 10 in. high; leaves silky-pubescent on both sides; Sierra  
Nevada.....29. *P. hydrophyllloides*.  
Stem simple, 3 to 7 ft. high; leaves puberulent; mts. of n. Cal....30. *P. procera*.  
Stamens little or not at all exserted; leaves glandular or harsh-hairy, merely toothed  
or cleft, rarely divided; north coast.....31. *P. bolanderi*.
- b. Annuals.  
Leaves pinnately parted or divided.  
Plants robust, 1 to 2 ft. high; racemes congested in a terminal cymose panicle; leaves  
bipinnately parted; Santa Catalina Isl.....32. *P. lyoni*.  
Plants slender, the stems commonly 3 to 10 in. long; pedicels retrocurved, at least in  
age.  
Leaves pinnately and often finely parted.....33. *P. douglasii*.  
Leaves mainly entire or merely coarsely toothed.....34. *P. davidsonii*.
- Leaves entire or toothed or cleft, sometimes parted or divided toward base.  
Leaves cordate at base, mostly broader than long.....35. *P. rotundifolia*.  
Leaves not cordate, longer than broad.  
Pedicels curved or retrocurved-spreading in age; stamens included; filaments a  
little hairy; dwarf (mostly only 1 to 3 in. high).....36. *P. curvipes*.  
Pedicels straight (1½ lines long to almost none).  
Leaves linear or oblanceolate, mostly entire.  
Herbage hirsute and minutely pubescent; stems ½ to 1 or 1½ ft.  
high; style cleft ½.....37. *P. linearis*.  
Herbage glandular; stems 2 to 10 in. high; style cleft about ¾.  
Stamens conspicuously exserted; herbage hispid as well as gland-  
ular; mts. bordering Mohave Desert...38. *P. mohavensis*.  
Stamens included; herbage not hispid; mts. of n. Cal.....  
39. *P. pringlei*.
- Leaves broader, orbicular, ovate or broadly oblong.  
Style bifid or cleft near the apex; stamens included.  
Corolla 4½ to 7 lines long; leaves entire or with 1 or 2 lobes or  
teeth near base.....40. *P. divaricata*.  
Corolla 2 to 4 lines long; leaves crenate or dentate.  
Plants 3 to 10 in. high; desert plants.  
Stems few to several from base; corolla blue or bluish..  
41. *P. parishii*.  
Stem simple at base, branched above; corolla white.....  
42. *P. lemmonii*.  
Plants 1 ft. high; corolla light blue; cent. Coast Ranges....  
43. *P. suaveolens*.  
Style cleft or parted to near the middle or below.  
Divisions of style short, not exserted from corolla.....  
44. *P. phacelioides*.

Divisions of style long, well-exserted from corolla.

Stamens exserted.

Corolla nearly white; ovules 5 or 6 to each placenta;

Santa Lucia Mts. .... 45. *P. grisea*.

Corolla violet; ovules 2 to 4 to each placenta; s. Sierra

Nevada. .... 46. *P. purpusii*.

Stamens included; Mariposa Co. .... 47. *P. vallicola*.

**B. Seeds transversely corrugated; corolla with scales distinct or indistinct or none; ovules more than 2 to each placenta; deserts or mountain ranges bordering them (except no. 52).—Subgenus MICROGENETES.**

Leaves pinnately divided or pinnatifid into many or numerous lobes or divisions, the divisions rather fine (mostly 1 to 2 or 3 lines long) or somewhat larger in no. 49.  
Corolla small, shorter than or only slightly exceeding calyx; scales inconspicuous or wanting.

Sepals linear, slightly dilated and often recurved or spreading at apex; stems diffuse or ascending. .... 48. *P. ivesiana*.

Sepals strongly spatulate, straight; stems erect. .... 49. *P. affinis*.

Corolla 2 or 3 times longer than calyx.

Corolla scales connate their whole length with the filaments. .... 50. *P. bicolor*.

Corolla scales entirely free from the stamens, or none.

Corolla 5 to 7 lines long. .... 51. *P. fremontii*.

Corolla not more than 3 lines long.

Corolla open-campanulate, often as broad as long. .... 52. *P. brachyloba*.

Corolla narrowly tubular-campanulate. .... 53. *P. hallii*.

Leaves round-ovate, subcordate at base, entire or crenate, not pinnatifid; stamens included; style cleft  $\frac{1}{2}$  to  $\frac{1}{2}$ ; capsule globose, the calyx  $\frac{1}{4}$  to as long.

Corolla  $1\frac{1}{2}$  times longer than the calyx; small dwarfs. .... 54. *P. pachyphylla*.

Corolla 2 to 3 times longer than calyx; robust plants. .... 55. *P. calthifolia*.

**I.—Subgenus GYMNOBYTHUS. Corolla without scales; ovules 20 to 80 to each placenta; seeds small, not transversely corrugated.**

1. *P. viscida* Torr. Stems  $\frac{3}{4}$  to 2 ft. high, simple or slightly branching; herbage densely viscid-glandular and hirsute-pubescent; leaves broadly ovate or roundish, cuneate or truncate at base, doubly serrate or irregularly dentate,  $\frac{1}{2}$  to 1 or 3 in. long, short-petioled or the upper sessile; flowers few to many in a single terminal raceme; calyx-lobes linear to almost spatulate, about equaling the capsule; corolla deeply saucer-shaped or rotate-campanulate, deep blue with purple or whitish center 6 to 9 (or 11) lines broad; stamens included; filaments very slender, sparingly pilose-hirsute.—Open ground along the coast, 50 to 1500 ft.: San Luis Obispo Co. to San Diego Co.; s. to L. Cal. Apr.-June. Var. *ALBIFLORA* Gray. Corolla white.—S. Cal.

2. *P. grandiflora* (Benth.) Gray. Similar to no. 1; plants larger throughout, 2 to 3 ft. high, more robust and hispid-viscid; leaves 2 to 6 in. long, the petioles 1 to  $4\frac{1}{2}$  in. long; corolla  $1\frac{1}{4}$  to 2 in. broad.—Along S. Cal. coast from Santa Inez Mts. to San Diego, 500 to 2000 ft. Apr.-June. (*Eutoca grandiflora* Benth.)

**II.—Subgenus WHITLAVIA. Corolla scales free from corolla except at base, adnate to the lower portion of the filament; style much longer than calyx or ovary; seeds not transversely corrugated; ovules 8 to 50 on each placenta.**

3. *P. parryi* Torr. Stem erect, simple or sparingly branched above,  $\frac{1}{2}$  to  $1\frac{1}{2}$  ft. high; herbage glandular-puberulent and hirsute or even hispid; leaves ovate, obtuse to sub-cordate at base, irregularly double-toothed or lacinate,  $\frac{3}{4}$  to 2 in. long, the lower long-petioled, the upper cauline shortly petioled or almost sessile; racemes loose, elongated in age; pedicels widely spreading, slender,  $\frac{1}{4}$  to 1 in. long; sepals linear; corolla open-campanulate, cleft below the middle, royal purple or deep violet with a yellowish or whitish 5-rayed center, 5 to 6 lines long,  $\frac{3}{4}$  to 1 in. broad, about twice the length of the calyx-lobes; filaments pilose, equaling or slightly exceeding the corolla; ovary with a row of hairs at apex on each side midway between placentae; style sparsely hispid, divided  $\frac{1}{2}$  to  $\frac{1}{2}$  the way down.—Valleys and hill-slopes, 600 to 2500 ft.: Santa Lucia Mts. to San Diego, thence e. to west side Colorado Desert; s. to L. Cal. Mar.-June. The foliage stains paper brownish.

4. *P. longipes* Torr. Stems erect or ascending, freely branching at or above the base, 3 to 12 in. high; herbage hirsute and densely glandular throughout; leaves cordate at base, usually rounded at apex, ovate or orbicular, coarsely and obtusely crenate, 1 to  $1\frac{1}{4}$  in. long; the petioles mostly

much longer; racemes loose, the lower pedicels becoming  $\frac{3}{4}$  to  $2\frac{1}{4}$  in. long; sepals linear-spatulate, 2 to 3 lines long; corolla white, open-campanulate, usually parted to the middle, 4 to 6 lines long; scales glabrous; stamens slightly pilose at or near the base, little longer than the corolla; style pilose, deeply 2-cleft; "ovules about 8 to each placenta."—Mts. of coastal S. Cal. from Santa Barbara Co. to San Diego Co., 3000 to 7500 ft. Apr.-June.

5. *P. minor* (Harvey) Thell. CALIFORNIA BLUE-BELL. Stem erect, simple or branching, hispid with short spreading hairs,  $\frac{1}{2}$  to 2 ft. high; herbage glandular-viscid throughout; leaves broadly or round-ovate, truncate or cordate at base, coarsely and sometimes doubly serrate, hispid, 1 to  $2\frac{1}{2}$  in. long, the lower long-petioled, the upper short-petioled or nearly sessile; racemes elongated; lower pedicels  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; sepals linear, 4 lines long; corolla blue or purple, long-tubular, as broad or even a little broader below than above (that is at the throat),  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long, 3 to 5 lines broad; stamens scarcely if at all exceeding the corolla; scales hairy.—Valleys and mesas, 500 to 4000 ft.: Los Angeles and San Bernardino Valley to San Diego Co. and e. to west side of Colorado Desert; L. Cal. (*P. whitlavia* Gray.) Var. *CAMPANULARIA* Jepson n. comb. Leaves  $\frac{1}{2}$  to 3 in. long, long-petioled; raceme loose, elongated; fruiting pedicels usually exceeding the calyx; sepals decidedly glandular, 4 to 7 lines long; corolla deep blue (the tube widened upward), scarcely if at all ventricose,  $\frac{3}{4}$  to  $1\frac{1}{8}$  in. long; scales glabrous or sometimes hairy.—Desert ranges, 800 to 4000 ft.; Mohave and Colorado deserts. Apr.-May. (*P. campanularia* Gray.)

III.—Subgenus *EUPHACELIA*. Ovules 2 to each placenta; lower part of the corolla-tube with 10 scales, each attached by one side to the corolla-tube, and by the other side to the base of a stamen; seeds not transversely corrugated (or in a few species corrugated on the margin).

6. *P. heterophylla* Pursh. Stems several from the base, erect, 2 to  $2\frac{1}{2}$  ft. high, scantily to grayish-hirsute; leaves mostly cauline, lanceolate to broadly elliptical, with a pair of reduced leaflets at base, greenish to grayish with short appressed pubescence, 1 to 2 in. long; racemes 1 to  $1\frac{3}{4}$  in. long, so disposed as to be openly paniculate; sepals linear; corolla white,  $2\frac{1}{2}$  lines long; scales narrow, wholly adnate, one each of adjacent pairs connivent by their free edge; stamens exserted, long-hairy at the middle.—Montane, 5000 to 7000 ft.: Sierra Nevada from Tulare Co. to Placer Co., n. to B. C. and Ida., e. to Ariz. Var. *GRISEOPHYLLA* (Brand) Mcbr. Stems  $\frac{2}{3}$  to  $1\frac{1}{2}$  ft. high; leaves lanceolate to narrowly elliptic, acute, mostly entire or with a pair of reduced leaflets at base, greenish to grayish with a spreading hirsute pubescence,  $1\frac{1}{4}$  to 2 in. long, a few of the basal leaves long-petioled; inflorescence loose.—Montane, 4000 to 7200 ft.: San Bernardino Mts.; Sierra Nevada from Tulare Co. to Nevada Co. and Modoc Co.; Mendocino Co. to Siskiyou Co. (*P. magellanica* f. *griseophylla* Brand.) Var. *FRIGIDA* Jepson n. comb. Plants usually compact and low, the stems ascending or diffuse, nearly naked, 3 to 10 in. high; basal leaves lanceolate to oblong, acute, commonly entire, grayish-hirsute, rarely sub-silky, 1 to 2 in. long, tapering into a petiole  $\frac{1}{4}$  to as long; cauline leaves few or almost none, similar, short-petioled or the upper subsessile; racemes rather short, usually in a rather compact panicle.—Montane, 6000 to 13,000 ft.: San Jacinto Mts.; San Bernardino Mts.; White Mts.; Sierra Nevada from Tulare Co. to Lassen Co.; Yollo Bolly Mts. to Mt. Shasta. (*P. frigida* Greene.) Var. *COMPACTA* Jepson n. comb. Stems many, ascending from the freely branched crown of a stout taproot, 7 to 9 in. high, pubescent; leaves linear-oblancheolate or linear, acute, gradually narrowed at base to a petiole, entire or with a pair of small lobes at base, densely appressed-silky, 1 to 2 in. long; racemes rather short in a compact panicle; corolla white.—Mts. bordering or near the w. side of the Great Basin, 6000 to 9000 ft.: Marble Mt., w. Siskiyou Co.; Mt. Shasta; mts. about Lake Tahoe; w. Nev. (*P. compacta* Greene.) Var. *PYGMAEA* Jepson n. var. Plant very much condensed, tufted, 2 to 4 in. high; leaves oblong-lanceolate, appressed white-silky, 4 to 9 lines long, short-petioled; panicle of racemes reduced to a small head or nearly.—Mt. Shasta, 9000 ft. (Jepson, type). Var. *DASYPHYLLA* Jepson n. comb. Similar in habit to var. *pygmaea*; filaments very slightly or obscurely hairy and only below the middle.—Alpine, 11,400 to 12,600 ft.: Silver

787. *Phacelia californica* Cham.; a, leaf  $\times \frac{1}{2}$ ; b, panicle  $\times \frac{1}{2}$ ; c, corolla spread open  $\times 2$ ; d, cross sect. ovary  $\times 10$ .

Pass, Fresno Co.; Mt. Whitney. (*P. dasyphylla* Greene.)

7. *P. corymbosa* Jepson n. sp. Stems few or several, very slender, almost naked, erect or ascending from a basal or subbasal tuft of many leaves, 11 to 14 in. long; herbage hirsute and minutely puberulent, the stems glandular-hirsute above, the leaves greenish-white or subglaucous beneath; leaves broadly oblong, entire, acute at base and apex, 1 to  $1\frac{1}{2}$  in. long, rather definitely though not abruptly petioled, the petioles half to as long; racemes subumbellately disposed or corymbose, 1 to 3 in. long; flowers somewhat discrete, at least not densely crowded; sepals oblong, somewhat bristly, especially on the margins, transversely venulose; corolla white, 3 lines long.—Upper Sacramento River (Dunsmuir, 2200 ft., Jepson 6161, type).

8. *P. californica* Cham. Rock PHACELIA. Fig. 787. Stems stout, simple, erect,  $1\frac{1}{4}$  to 2 ft. high, usually several from the root-crown; stems and petioles hispid, sometimes very sparsely so, the blades

strigose, either green or canescent; leaves pinnate or pinnatifid, the large terminal lobe elliptic to lanceolate, 2 to 4 in. long, with 1 to several pairs of smaller or much reduced leaflets or lobes below, or entire; petioles commonly long; racemes dense, 1 to 2 in. long, mostly rather short-peduncled and disposed in a terminal panicle; sepals oblong; corolla commonly purple, 3 lines long.—Rocky points or ledges, near the coast, 20 to 1500 ft.: Marin, w. Contra Costa, w. Alameda and San Francisco Cos. to Monterey Co. Var. *IMBRICATA* Jepson. Stems 2 to  $2\frac{1}{2}$  ft. high; racemes 2 to 4 in. long, many in an often large panicle (less commonly in 2s and 3s), mostly on long peduncles; corolla dingy white; fruiting calyces ovate or broad, conspicuously imbricated.—Dry rocky foothills, 300 to 3000 ft., mostly toward the interior: Coast Ranges; Sierra Nevada foothills; cismontane S. Cal. Var. *VIRGATA* Jepson n. comb. Stem stout, simple, usually erect, 1 to  $3\frac{3}{4}$  ft. high, leafy at base and to the middle of the stem, thence with the many racemes compactly virgate-racemose to the summit; stem and petioles sparsely or densely coarse-hispid with a dense almost plush-like short indument beneath; leaves pinnately divided to entire, appressed-pubescent.—Montane, 2000 to 6000 ft.: Mendocino Co. to Shasta and Siskiyou Cos.; Modoc Co. to Nevada Co. One of the most well-marked forms of this variable group, but intergrading, especially at the limits of its range, with var. *imbricata*. (*P. virgata* Greene). Var. *RUBACEA* Jepson n. var. Somewhat similar to var. *virgata*, but the branches of the main axis (especially the lower) more or less elongated and bearing subumbellate or corymbose clusters of racemes, the whole inflorescence loosely paniculate; sepals becoming red, bristly-ciliate.—Lower slopes of Mt. Konocti, Lake Co. (Jepson, type). Var. *BERNARDINA* Jepson n. comb. Stems 1 to  $1\frac{1}{4}$  ft. high; sepals ovate, obtuse or acutish.—Mts. of S. Cal., s. to L. Cal. (f. *bernardina* Mcbr.) Var. *PATULA* Jepson n. comb. Stems erect, ascending or decumbent, nearly naked, 5 to 12 in. high; leaves mostly basal, ovate or elliptic-ovate with 2 or 3 pair of supplementary lobes below, or deeply pinnatifid; sepals narrowly obovate to lanceolate or linear-lanceolate.—Mts., 5500 to 8000 ft.: cent. and s. Sierra Nevada; mts. of S. Cal. (*P. magellanica* f. *patula* Brand. *P. californica* f. *ballii* Mcbr.)

9. *P. nemoralis* Greene. Stems 1 or few from the base, simple below, paniculately branched above,  $1\frac{1}{4}$  to 3 ft. high, very bristly with stinging hairs; herbage light green; leaves elliptical to oblong, 1 to 4 in. long, simple and entire or with a pair of small leaflets at base; basal and lower leaves on petioles 2 to 3 in. long, uppermost short-petioled or sessile; racemes  $1\frac{1}{2}$  to  $2\frac{1}{2}$  in. long, slender, in 2s or 3s, terminating the stems or lateral branches; corolla whitish, 2 lines long; capsule 2-seeded.—Shade of woods or brush in the foothills, 300 to 1500 ft.: Santa Cruz Mts. to w. Alameda Co. and Sonoma Co.; Calaveras Co. to Fresno Co. May-July.

10. *P. breweri* Gray. Fig. 788. Stem diffusely branching from the base, 4 to 9 in. high, the branches slender and with rather long internodes; herbage puberulent and hispidulose; leaves oblong-lanceolate, entire, cleft towards the base, or the lowermost and basal pinnately divided; racemes slender, lax or sometimes dense, 1 to 3 in. long, often geminate at the ends of the branches; sepals linear; corolla blue or whitish, 2 to  $2\frac{1}{2}$  lines long; scales narrow-oblong, acute at apex, attached the whole length; filaments glabrous, not exserted; capsule ovate, mostly 1-seeded.—Dry slopes, 2000 to 4000 ft., South Coast Ranges: Mt. Diablo; Mt. Day; Cedar Mt.; Mt. Hamilton; Santa Cruz Mts.; Santa Lucia Mts.; San Carlos Range. May-July.

11. *P. eisèni* Bdg. Stems slender, branched from base, erect or diffuse,  $1\frac{1}{2}$  to 7 in. high; herbage short-hirsute and somewhat glandular; leaves elliptic-oblong, entire or few-lobed, 6 to 8 lines long, narrowed to a petiole half as long; racemes loose, hardly scorpioid, the flowers on slender spreading pedicels; calyx-lobes narrowly spatulate, moderately unequal, 1 to  $1\frac{1}{2}$  lines long; corolla blue or white,  $1\frac{1}{4}$  to  $1\frac{1}{2}$  times as long as the calyx; the nearly parallel lobes surpassing the anthers, the scales short, wholly adnate and united at base in front of the filament; capsule ovate, shorter than the calyx; seeds scrobiculate.—Montane, 4100 to 8000 ft., Sierra Nevada from Mariposa Co. to Tulare Co. May-July.

12. *P. marcéscens* Eastw. Stems erect, branching, 8 to 9 in. high; herbage and inflorescence glandular, puberulent; leaves ovate-lanceolate, coarsely dentate or pinnatifid, the upper entire; racemes rather dense; corolla blue, 2 lines long, only gradually or slowly pushed off by the enlarging capsule; scales long and very narrow, adnate; style cleft  $\frac{2}{3}$  or  $\frac{3}{4}$ .—Nevada Co. (Bear Valley, 3500 ft.); not otherwise known.

13. *P. humilis* T. & G. Fig. 789. Stem 1 or several from the base,  $2\frac{1}{2}$  to 5 (or 8) in. high, the racemes borne terminally on short axillary branchlets along the leafy axis from the base to the summit, sometimes not exceeding the subtending leaves, sometimes much elongated; herbage glandular-puberulent; leaves lanceolate, entire, 1 to  $1\frac{1}{2}$  in. long, shortly petioled, or the very lowest ovate and half as long; sepals linear to narrowly spatulate, hispid,  $\frac{1}{2}$  to  $\frac{3}{4}$  as long as corolla; corolla campanulate, pale lavender or pale purple with a white center,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  lines long; scales narrow, adnate, the free edge of adjoining pairs connivent; stamens slightly exserted; style deeply parted, sparingly glandular-puberulent; capsule 4 (rarely 6)-seeded, the seeds

788. *Phacelia breweri* Gray; a, fl. branchlet x 1; b, leaf x 1; c, long. sect. of fl. x 3; d, long. sect. of ovary x 6.

789. *Phacelia humilis* T. & G.; a, habit  $\times \frac{1}{2}$ ; b, fl.  $\times 2\frac{1}{2}$ ; c, corolla spread open  $\times 2\frac{1}{2}$ ; d, corolla scales  $\times 5$ ; e, cross sect. of ovary  $\times 5$ .

glabrous and glaucous; leaves narrowly lanceolate, entire, tapering at base,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long, shortly petioled or subsessile, equaling or surpassing the loose spikes or branches of the cyme; sepals linear-spatulate, shorter than the corolla; corolla dull white or blue, narrow-campanulate, 1 to 2 lines long; scales linear or oblong; stamens included, glabrous; capsule globose, shorter than the calyx.—Montane, 5300 to 7500 ft.: Sierra Nevada from Fresno Co. to Tehama Co., thence to Siskiyou and Trinity Cos. June-July. (*P. namatoides* Gray.)

16. *P. platýloba* Gray. Stem very slender, erect, sparingly branched, sparsely leafy, 1 to 2 ft. high; herbage minutely pubescent or the inflorescence somewhat hirsute; leaves pinnately divided (at least below apex) into distinct divisions or leaflets; leaflets discrete or remote, oblong to linear in outline, 3 to 6 lines long, pinnately parted or minutely pinnatifid into small ( $\frac{1}{2}$  to  $1\frac{1}{2}$  lines long) entire or toothed segments; upper leaves less divided; racemes dense and loose, terminal and axillary; pedicels shorter than the calyx; sepals about 2 lines long, unequal, foliaceous, 3 linear-lanceolate and entire, 2 broadly ovate, contracted into a petiole-like base and crenately toothed, lobed or entire; corolla lavender, open-campanulate, 2 to  $2\frac{1}{2}$  lines long, lobed to about the middle; scales oblong, subcordate above; stamens slightly exserted; anthers purple; style twice as long as the corolla, deeply parted; capsule glabrous, acute at apex, shorter than the calyx.—Foothills, 1000 to 2000 ft., Mariposa Co. to Fresno Co. Apr.-May.

17. *P. tanacetifolia* Benth. FIDDLE-NECK. Fig. 790. Stem stout, erect, sparingly branched,  $1\frac{1}{4}$  to 4 ft. high; leaves pinnately divided, the leaf-

regularly foveolate.—Granite sand of talus or rocky slopes, 4000 to 8300 ft.: San Bernardino Mts.; San Gabriel Mts.; Tehachapi Mts.; Sierra Nevada from Tulare Co. to Lassen Co.; n. Nev. to e. Ore. May-July. (*P. congdonii* Greene.)

14. *P. irritans* Brand. Stem branching from near the base, 4 to 6 in. high, the branches widely spreading or ascending; herbage hispid; leaves oblong-ovate, entire,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long, narrowed at base to a short petiole; racemes rather dense,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long; corolla pale blue, campanulate, cleft nearly to middle, 2 lines long; scales semilanceolate, wholly adnate, the free edges of contiguous pairs partly connivent; stamens exserted, the filaments a little hairy.—N. Sierra Nevada, 5000 to 6100 ft., from Sierra Co. to Plumas and Lassen Cos.

15. *P. racemosa* (Kell.) Bdg. Stem slender,  $1\frac{1}{2}$  to 4 in. high, simple below, commonly with opposite branches above, the successive pairs spreading at right angles with each other; herbage glandular-puberulent, the stems mostly

790. *Phacelia tanacetifolia* Benth.; fl.  $\times 5$ .

lets pinnatifid, 2 to 7 lines long; racemes 3 to 4 in. long, ascending and approximate; sepals linear, beset with rigid bristles, in fruit little exceeding the oval capsule; corolla lavender or bluish, open-campanulate, 3 to 4 lines long, its scales entirely adnate; stamens much exserted.—Valleys and foothills, 100 to 1500 ft.: Great Valley; Sierra Nevada foothills; sporadic and in some localities perhaps introduced in the Coast Ranges, Mohave Desert and coastal S. Cal. Apr.-June.

18. *P. distans* Benth. Stem erect and strict, or branching and diffuse, 8 to 23 in. high; herbage with scattered hispid hairs and close fine pubescence; leaves pinnately divided, the divisions commonly linear or oblong, once or twice pinnately and (for the most part) finely dissected; spikes scattered, solitary or geminate; sepals unequal, narrowly obovate to spatulate, rarely linear; corolla 3 to 4 lines long, rotate-campanulate, sordid white, blue, or violet, its scales semi-ovate, very undulate, with free tips; stamens little or not at all surpassing the corolla-lobes; capsule globose.—Foothills and mesas, loamy or sandy soil, 500 to 4000 ft.: Tehama and Napa Cos. to San Diego Co., e. to the s. Sierra Nevada in Tulare and Kern Cos.; Panamint Range; Nev. to Ariz.

19. *P. ramosissima* Dougl. Stems several from the root-crown, simple or branching above, somewhat diffuse,  $1\frac{1}{2}$  to  $3\frac{1}{4}$  ft. long; herbage somewhat glandular, hispid throughout and soft-pubescent (or only the leaves soft-pubescent); leaves pinnately divided into 5 to 9 oblong and serrate or incised divisions or leaflets, the lower distinct, the upper more or less confluent; stamens and style somewhat exserted; corolla sordid- or yellowish-white or bluish; calyx-lobes linear-spatulate to obovate, twice the length of the capsule or longer; seeds oblong, 1 line.—Foothill and mountain slopes and cañons, 200 to 9000 ft.: almost throughout Cal.; n. to Wash., s. to L. Cal. May-July. Var. *SUFRUTESCENS* Parry. Stems glandular-hirsute or hispid; sepals oblanceolate, abruptly narrowed to a claw-like base, mostly distant.—Foothills, San Bernardino and San Gabriel mountains to Tejon Pass. Var. *SUBSINUATA* Mcbr. Stems hispid-pubescent; sepals as in preceding var.—Near the coast, Monterey Co. to San Diego Co. (*P. subsinuata* Greene.) Var. *CINEREA* Jepson n. comb. Herbage ashy, pubescent (ex char.).—San Nicolas Isl. (*P. cinerea* Eastw.)

20. *P. hispida* Gray. CATERPILLAR PHACELIA. Stems diffusely branched or erect and subsimple.  $\frac{3}{4}$  to 2 ft. high; herbage with long slender spreading white bristles; leaves divided, the leaflets mostly distinct, discrete and deeply incised, 6 to 9 lines long, or the uppermost leaves merely lacinate-incised; racemes in age not dense; sepals oblanceolate, very narrow, slender-attenuate downward, densely set with long spreading white bristles; corolla pale blue or lavender, campanulate, 3 to  $4\frac{1}{2}$  lines long,  $1\frac{1}{2}$  to 2 times as long as the calyx; scales undulate or ruffled below, acutely narrowed upward and wholly adnate; stamens well or scarcely exserted; fruiting sepals  $1\frac{1}{2}$  to 2 times as long as the globose capsule.—Foothills, 1000 to 5700 ft.: Santa Lucia Mts. to San Diego; San Joaquin Valley; Sierra Nevada foothills from Butte Co. to Kern Co.; Tehachapi Range; Inyo Co.; Mohave Desert; w. side Colorado Desert. May-Aug. Var. *CICUTARIA* Mcbr. Racemes rather dense; stamens included.—Sierra Nevada foothills to S. Cal. Var. *HÜBBI* Mcbr. Racemes very dense, commonly erect and often approximate; racemes and calyces shaggy-hirsute.—Mts. of Ventura Co.; San Gabriel Mts.

21. *P. eremica* Jepson n. sp. Stems branching from the base, diffuse, 6 to 9 in. long; pubescent, with short spreading glandular hairs; leaves pinnately divided, the divisions or leaflets discrete, mostly toothed, scarcely incised, 3 to 5 lines long; racemes short, the flowers not crowded; sepals narrow, oblanceolate, slender or filiform (at base), conspicuously pilose; corolla blue, its throat irregularly translucent,  $2\frac{1}{2}$  to 3 lines long, little longer than calyx; scales narrow, adnate except at apex, terminating in a short bristle-like tooth which projects behind the filament, its tip approximating the tooth of the scale of the adjacent pair.—Rocky cañon walls, w. side Colorado Desert (Collins Valley, Jepson 8852, type).

791. *Phacelia ciliata* Benth.; a, habit x  $1\frac{1}{2}$ ; b, stamen and scales x 2; c, cross sect. ovary x 4.

22. *P. ciliata* Benth. Fig. 791. Stem branched from the base with rather simple ascending branches, 9 to 14 in. high; herbage scabrous-pubescent; leaves pinnately divided, the divisions oblong, toothed or incised; spikes in terminal clusters or geminate or solitary; sepals  $\frac{1}{2}$  to  $\frac{3}{4}$  as long as corolla; corolla blue, deeply bowl-shaped,  $2\frac{1}{2}$  to  $3\frac{1}{2}$  lines long; scales sub-orbicular, spreading horizontally, partly free; capsule ovate, mucronate; sepals in fruit twice as long as in flower, oblong-ovate to broadly ovate, chartaceous with thickened margins and prominent midrib, markedly venulose, sparsely bristly-ciliate, 3 to 5 lines long, arched over the capsule, their tips meeting.—Valley fields and montane flats, 20 to 5000 ft.: Coast Ranges from Humboldt Co. to San Benito Co. and Mt. Pinos; Tehachapi Mts.; w. side the Great Valley; n. L. Cal. Apr.-May. Var. *THERMALIS* Jepson n. comb. Low, 3 to 6 in. high; herbage strigose-pubescent or sometimes bristly; sepals oblong-ovate or lanceolate,  $\frac{1}{4}$  as long as in fruit, much enlarged, 4 to 5 lines long, decidedly bristly-ciliate.—About warm springs, Shasta and Modoc Cos.; n. to southern Ore. June. (*P. thermalis* Greene.)

23. *P. pedicellata* Gray. Stem robust, erect, openly branched, 6 to 13 in. high; herbage short-villous and glandular; leaves broadly ovate or sub-orbicular in outline,  $2\frac{1}{2}$  to  $4\frac{1}{2}$  in. long, pinnately divided (at least below the apex) into 3 to 7 distinct leaflets with petiolules; leaflets sub-orbicular to ovate, serrate or incisely lobed,  $\frac{1}{2}$  to 2 in. long; upper leaves often round-ovate and merely deeply toothed; racemes short, dense, in terminal clusters; pedicels filiform, nearly as long as the flowers, often deflexed in fruit; sepals linear or oblanceolate, 2 to 3 lines long, exceeding the globular capsule; corolla white, open-campanulate, 3 lines long; scales short, rounded; stamens and style exserted, style 2-cleft.—Desert valleys and cañons, 500 to 4000 ft.: Funeral Mts.; Panamint Mts.; Providence Mts.; Colorado Desert; s. to L. Cal. Apr.-May.

24. *P. cryptantha* Greene. Stem 12 in. high, branched from the base; herbage thinly covered with spreading bristles; leaves pinnately divided into 5 to 7 divisions or leaflets, these obovate or elliptic, 4 to 9 lines long, the lower ones discrete and distinctly petiolulate; upper leaves 3-lobed or divided; racemes 3 to 4 in. long in fruit, not very dense; sepals oblanceolate or spatulate, rather densely set with long white spreading bristles, 4 to 5 lines long in fruit; corolla white, tubular-campanulate, 2 lines long, shorter than, or not exceeding, the calyx; scales broadly semi-ovate, wholly adnate, a little erosulate or slightly toothed; stamens included; seeds roughly favose; capsule globose, the fruiting sepals 3 times as long.—Cañons and washes, arid mountain ranges, 4000 ft.: Panamint Range; e. slope Sierra Nevada in Inyo Co.; Tehipite Valley. (*P. hispida* var. *brachyantha* Cov.)

25. *P. crenulata* Torr. Stem erect, branching, 6 to 12 (sometimes 18) in. high; herbage hispid-pubescent, glandular throughout and ill-scented; leaves elliptic-oblong to linear-oblong, undulately or crenately lobed or pinnately divided with oblong or elliptic incisely toothed segments, 1 to  $3\frac{1}{2}$  in. long, the lower ones petioled, the upper usually sessile; racemes dense, in terminal clusters; pedicels very short; sepals oblong, obtuse, 2 lines long; corolla deep violet or purple-blue, rotate-campanulate, 3 to 5 lines long, the lobes crenulate; scales broadly lobed below, narrowed to an acute tip, wholly adnate; stamens and deeply cleft style long-exserted; filaments naked.—Desert val-

leys and mesas, 300 to 4700 ft.: Colorado Desert; e. Mohave Desert; Inyo Co.; e. to Nev., Col. and Ariz., s. to L. Cal. May-July.

26. *P. malvaefolia* Cham. STINGING PHACELIA. Stem erect, freely branching or subsimple,  $\frac{1}{2}$  to  $2\frac{1}{2}$  ft. high; herbage hispid-bristly throughout, the bristles with a conspicuous pustulate base; leaves round-ovate to elliptic-ovate, truncate or cordate at base, shallowly lobed (the lobes serrate), 1 to 3 in. long, the petioles  $\frac{1}{2}$  to  $\frac{1}{2}$  as long; spikes solitary or geminate; corolla white, 2 to  $2\frac{1}{2}$  lines long, longer than the unequal spatulate sepals; scales semi-ovate, the apical point free; stamens exserted; capsule 2 to 4-seeded; seeds pitted.—Along the coast, especially on ocean bluffs, 10 to 200 ft.: Monterey Co. to Humboldt Co.; n. to southwest Ore. May-Aug. Var. *LOASAEFOLIA* Brand. Lower leaves pinnately divided, the leaflets discrete; capsule 3 to 6-seeded.—Coast of Monterey and San Luis Obispo Cos., and e. to Nacimiento River. (*P. loasaefolia* Gray.)

27. *P. rattanii* Gray. Similar to *P. malvaefolia* but smaller throughout; spikes slender,  $\frac{1}{2}$  to 2 in. long; four sepals spatulate, the fifth obovate and longer; corolla white, 2 lines long; stamens included; filaments hairy.—Bushy hillsides, 1500 to 2000 ft.: Santa Cruz Mts.; Lake Co. to Shasta and Siskiyou Cos.; n. to southern Ore. June.

IV.—Subgenus *EUTOCA*. Scales of the corolla in some species free from the stamens, in others adnate to them; ovules more than 2 to each placenta; capsule with few to many seeds, these not transversely corrugated.

28. *P. perityloides* Cov. Stems several from a branched root-crown, freely and often densely branching, 3 to 9 in. high; main stems white-lanate with a dense covering of short spreading hairs; branchlets and foliage densely pubescent and glandular; leaves orbicular, cordate or truncate at base, dentate, 3 to 6 (or 11) lines long, mostly shorter than the slender petioles; racemes short, rather few-flowered; sepals spatulate, in fruit slightly exceeding the capsule; corolla white with purple tube, 4 lines long, twice as long as the calyx; scales narrowly linear; stamens not exserted; ovules 25 to each placenta.—Desert cañons, 3000 to 4500 ft.; Panamint Mts. May. Odor semi-mephitic and very disagreeable.

29. *P. hydrophylloides* Torr. Fig. 792. Stems simple or branched, 4 to 10 in. high, arising on slender subterranean shoots from the crown of a very thick root; herbage puberulent and hispid except the leaves, these silky-pubescent on both sides; leaves broadly ovate to oblong-ovate, incisely few-toothed or lobed (especially towards base), 1 to  $2\frac{1}{2}$  in. long, sometimes with 1 or 2 supplementary leaflets near summit of the long petioles; spikes or racemes of the congested or capitate cyme short, not elongating; sepals narrow-linear or linear-spatulate; corolla violet-blue or whitish, its spreading lobes rolled under from each side so that they become pointed, the corolla-limb thus a little star-shaped; scales semi-oval or broadly linear, wholly adnate, the free edge undulate, the pair united below with base of filament; stamens and style strongly exserted; the style 2-parted below or to the middle; seeds 3 to 8, angled.—Dry sandy or gravelly soil, high montane, 5000 to 9000 ft.: Sierra Nevada from Tulare Co. to Lassen Peak. June-Aug.

792. *Phacelia hydrophylloides* Torr.; a, fl. branch  $\times \frac{1}{2}$ ; b, flower  $\times 2$ ; c, sect. of corolla showing 2 stamens and scales  $\times 2$ .

30. *P. procera* Gray. Stems usually in clusters from a heavy root, very stout, erect, simple, leafy to the inflorescence, 3 to 7 ft. high; herbage minutely puberulent, the summit of the stem and the inflorescence glandular; leaves ovate to ovate-lanceolate, laciniate-pinnatifid into coarse acute lobes or sometimes merely incised,  $2\frac{1}{2}$  to 4 in. long; spikes mostly geminate, disposed in a terminal rather dense panicle; sepals linear, acute, shorter than the mature capsule; corolla white or bluish, bowl-shaped,  $2\frac{1}{2}$  to 3 lines long, with short obtuse revolute lobes; scales oblong, adnate, divergent, united over the base of the filament; stamens well-exserted; style deeply 2-cleft; seeds 10 to 18, wing-angled.—Mountain meadows, 5000 to 6300 ft.: Nevada Co. to Lassen and Tehama Cos.; Humboldt Co. to Trinity and Siskiyou Cos.; n. to Wash. and Ida. July.

31. *P. boländeri* Gray. Stem stout, simple or sparingly branched,  $\frac{1}{2}$  to 2 ft. high; leaves broadly ovate to oblong, coarsely serrate or incised, 2 to  $3\frac{3}{4}$  in. long, the lower commonly with 1 or 2 pairs of small leaflets towards summit of petiole; inflorescence terminal, the racemes in pairs and somewhat corymbosely or at length racemosely disposed; corolla nearly rotate, violet, very pale blue or white,  $\frac{1}{2}$  to 1 in. wide; scales narrow, attached throughout; stamens somewhat exserted, sparingly pilose; style cleft to middle or below.—Rocky soil or on cliffs along the coast from Sonoma Co. to Del Norte Co.: Gualala; Navarro River; Cottonaby; Kenny to Usal; Camp Grant; Idlewild; Stitz Creek; between Bluff Creek and Orleans. The herbage has a disagreeable odor; it stains paper brownish in drying.

32. *P. lyonii* Gray. Stem robust, erect, branching, 1 to 2 ft. high; herbage dark glandular-pubescent and somewhat hispid, heavy-scented; leaves large (broadly ovate in outline, 3 to 4 in. long), bipinnately divided into ovate crenate divisions 2 to 4 lines long; racemes dense, 1 to  $1\frac{1}{4}$  in. long, compacted into a dense terminal cymose panicle; sepals linear-spatulate, nearly equaled by the capsule; corolla light blue, broadly campanulate, 2 to 3 lines long; scales semi-oval, united at base to the filament; stamens not exserted; capsule narrowly oblong, many-seeded; seeds oval, scrobiculate.—Santa Catalina Isl. May-June.

793. *Phacelia douglasii* Torr.; a, habit x 1; b, stamen x 5; c, cross-sect. ovary x 6.

33. *P. douglasii* (Benth.) Torr. Fig. 793. Stems several from the base, mostly simple, ascending or decumbent, 3 to 9 in. long; herbage puberulent and short, hirsute with mostly spreading hairs; leaves elongated-oblong or linear in outline, pinnatifid or pinnately parted, the lobes often unequal, entire or few-toothed; flowers loosely racemose; pedicels slender, frequently longer than the flowers, commonly more or less curved or retrocurved, 2 to 6 lines long; sepals spatulate, 1 to 3 lines long; corolla light-blue, open-campanulate, 3 to 6 lines long; scales semi-ovate or semi-lanceolate, wholly adnate; style 2-cleft at apex, hairy below; ovules 12 to 24 to each dilated placenta; capsule ovate, mucronate; seeds scrobiculate.—Sandy valleys, 20 to 2000 ft.: San Bernardino Valley and Los Angeles; n. to the upper San Joaquin Valley and to Contra Costa and San Francisco Cos. The habit and aspect are suggestive of *Nemophila menziesii*. Var. *CRYPTANTHA* Brand. Corolla small, scarcely longer than the calyx.—Flood-beds of rivers: w. San Diego Co.; L. Cal. Var. *PETROPHILA* Jepson n. var. Leaves entire, or some with 1, rarely 2, coarse teeth on each side below middle; corolla pale lavender, broad-campanulate, 3 lines long, its

scales almost obsolete; style very shortly cleft.—Surface of rock masses, Corral Hollow, Mt. Hamilton Range, 600 ft. (Jepson 9583, type).

34. *P. davidsonii* Gray. Habit of no. 33 and seemingly too close to it; leaves oblong-lanceolate to lanceolate, entire, coarsely few-toothed, rarely pinnatifid.  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long, drawn down to a rather long petiole; corolla purple or violet with yellowish-white tube, broad-campanulate, 3 to 5 lines long, 5 to 6 lines broad; tube often bearing 3 linear translucent spots between each set of scales.—Pine belt, 5000 to 7500 ft.: San Gabriel and San Bernardino mountains; Tehachapi Range; Greenhorn Range; e. side Sierra Nevada. (*P. curvipes* var. *pratensis* Brand.) Var. *MACRANTHA* Parish. Leaves deeply pinnatifid; flowers somewhat larger.—San Bernardino and San Gabriel mountains.

35. *P. rotundifolia* Torr. Stem commonly much-branched from base, 3 to 8 in. high; herbage hispid-pubescent, dark glandular; leaves cordate-ovate or cordate-orbicular, coarsely crenate, 5 to 8 lines long, on petioles often twice as long; racemes short, lax, rather few-flowered; sepals spatulate to linear-spatulate, exceeding the mature capsule; corolla tubular, white,  $1\frac{1}{2}$  to 2 lines long; scales reduced to linear thickenings; stamens not exerted; style slightly bifid at the apex; ovules 20 to 30 to each placenta; seeds globular.—Shady spots amongst rocks or cliffs, desert cañons: Ord Mts.; Providence Mts.; Panamint Mts.; e. to Utah.

36. *P. curvipes* Torr. Stems few to many from the base, diffuse or ascending, 1 to 3 (or 6) in. high; herbage pubescent; leaves oblong-ovate or obovate to oblong or linear-lanceolate, entire, 3 to 9 lines long, rather long-petioled; racemes simple, rather lax; pedicels 1 to 2 lines long, curved or retrocurved in age; sepals ligulate-spatulate; corolla blue (sometimes white), campanulate, 2 to 3 lines long; stamens half as long as the corolla; scales narrow; style cleft  $\frac{1}{2}$  or  $\frac{1}{2}$ ; capsule ovate, acuminate, erect upon the spreading or deflexed pedicel; seeds 16, irregularly pitted.—Mountain slopes bordering the deserts, 4000 to 8000 ft., often under pines: Laguna Mts.; Santa Rosa Mts.; San Jacinto Mts.; e. side Sierra Nevada from Inyo Co. to Washoe Co., Nev.

37. *P. linearis* (Pursh) Holz. Stems rigid, simple or racemosely branched,  $\frac{1}{2}$  to 1 or  $1\frac{1}{2}$  ft. high; herbage hirsute and minutely pubescent; leaves linear-lanceolate, entire, rarely 2-toothed, or sometimes a few of them deeply 3-cleft into linear entire lobes,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long, mostly sessile; spikes or spike-like racemes disposed in a virgate or thyrsoid panicle; sepals narrowly linear or spatulate-linear, exceeding the capsule; corolla violet or sometimes white, 3 to 5 lines long; scales long and narrow, free from the filaments; stamens little or not at all exerted, the filaments sparsely hairy near the middle; ovules 12 to 16; seeds oblong, coarsely reticulate.—Montane, 2000 to 4000 ft.: Sierra Co. to Modoc Co., thence w. to Siskiyou and Trinity Cos.; n. to B. C., e. to Utah. June.

38. *P. mohavensis* Gray. Stems slender, usually strictly branched at or above the base, sometimes diffuse, 2 to 7 (or 10) in. high; herbage hispid and glandular-pubescent; leaves oblanceolate or linear, entire or few-toothed,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; racemes strict, at length 1 to 2 in. long, the short pedicels erect; sepals spatulate or linear-spatulate, exceeding the capsule; corolla purple, campanulate, 2 to 3 lines long; scales narrow, adnate, widely divergent from base of filament; stamens slightly exerted, the filaments mostly glabrous; style cleft  $\frac{2}{3}$ ; ovules 4 or 5 to each placenta.—Ranges bordering the Mohave Desert, 4000 to 7000 ft.: San Gabriel and San Bernardino mountains; s. Sierra Nevada in Tulare Co. May-June.

39. *P. pringlei* Gray. Stems slender, simple or widely branched, 3 to 7 in. high; herbage finely glandular-puberulent or the stems glabrous and glaucous; leaves oblanceolate, entire,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long, at least the lower opposite; racemes axillary, few-flowered, loose; sepals linear, exceeding the capsule; corolla pale blue,  $1\frac{1}{2}$  to 2 lines long, the scales semi-lanceolate or very obscure; stamens not exerted, the filaments hairy at middle; ovules 2 or 3 (or 5) on each placenta.—Montane, 5000 to 8000 ft.: Eldorado Co. to Lassen Co. and Mt. Shasta. Sept. Very near *P. racemosa* Bdg. Var. *ORÓGENES*

Jepson n. comb. Herbage white-pilose, not glandular; corolla-tube white; stamens slightly exserted.—Mineral King, Tulare Co. (*P. orogenes* Brand.)

40. *P. divaricata* (Benth.) Gray. Stem branched from the base, diffuse or spreading, the branches 3 to 16 in. long; herbage both pubescent and hirsute; leaves ovate to broadly oblong, 1 to 2 in. long, equaling or exceeding the petioles, entire, rarely with a pair of coarse teeth or with a pair of supplementary lobes at summit of the petiole; petioles equaling or exceeding the blade, or the cauline ones very short; pedicels about 1 line long; sepals in fruit linear, 4 to 7 lines long, sparsely hispid-ciliate, with somewhat thickened margins and prominent midnerve and cross-veins; corolla blue, broadly open-campanulate, 6 to 9 lines broad; style 2-cleft at apex; seeds 7 to 10, regularly pitted.—Open hills, 1000 to 2000 ft., Coast Ranges from Marin Co. to San Benito Co.: Mt. Tamalpais; Oakland Hills; Mt. Diablo; Mt. Hamilton; Santa Cruz Mts.; San Carlos Range. Mar.-June.

41. *P. parishii* Gray. Stems few to several from base, diffuse, 2 to 3 in. high, somewhat scape-like, the leaves mostly basal or sub-basal; herbage viscid-puberulent; leaves roundish-ovate or crenulate, 6 to 9 lines long, petioled; peduncles as long as the fruiting spikes; flowers crowded, the pedicels very short; sepals spatulate or obovate-spatulate, in fruit equaling the oblong capsule; corolla blue or bluish, 2 lines long, somewhat surpassing the calyx; scales obscure or none; stamens not exserted; style bifid at apex; seeds narrowly oblong, scrobiculate,  $\frac{3}{4}$  line long.—Desert valleys, very rare: Rabbit Sprs., Mohave Desert. Steptoe Valley, Nev. May-July.

42. *P. lemmönii* Gray. Stem more or less branched, 3 to 10 in. high; herbage minutely glandular-puberulent; leaves roundish-ovate or elliptic-ovate, angular-dentate or crenate,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long, the petioles 3 to 8 lines long; spikes rather short-peduncled, rather loose in fruit; pedicels short, erect; calyx-lobes spatulate to linear-spatulate, in fruit a little longer than the ovoid capsule; corolla white, 2 to 3 lines long, hardly twice as long as the calyx; scales semi-oblong; stamens not exserted; seeds about 30, short-oval,  $\frac{1}{3}$  line long, minutely scrobiculate.—Moist spots, desert cañons, 4000 to 5000 ft., rare: Rock Creek, n. side San Gabriel Mts.; Argus Mts., Inyo Co.; e. to Ariz. May.

43. *P. suaveolens* Greene. Stem branched from the base, erect or ascending, 10 to 12 in. high; herbage pubescent and glandular, leaves obovate to oblong-elliptic, coarsely toothed (the teeth entire or sparsely denticulate), 1 to 2 in. long, on petioles  $\frac{1}{2}$  to  $\frac{3}{4}$  as long; racemes solitary or in 2s, densely-flowered, often becoming  $1\frac{1}{2}$  to 2 in. long; pedicels very short ( $\frac{1}{4}$  or  $\frac{1}{3}$  line long); sepals obovate-spatulate, much longer than the capsule; corolla light blue, 4 lines long, nearly twice as long as the calyx; scales linear; stamens not exserted; style shortly bifid at apex; ovules 6 to each placenta.—Mountain slopes, Mt. Tamalpais to the Vaca Mts. Apr.-June.

44. *P. phacelioides* (Benth.) Brand. Stem diffusely branching from the base, 5 to 8 in. high, puberulent and hispid; leaves elliptic to oblong-lanceolate, parallel-veined, entire, strigose-hispid, 1 to  $1\frac{3}{4}$  in. long; flowers short-pedicelled or at first nearly sessile, in dense racemes or spikes; sepals in fruit linear-spatulate, hirsute or hispid with long spreading hairs, especially toward the base, 5 to 6 lines long, twice or thrice the length of the capsule; corolla dull white, narrowly funnelform,  $2\frac{1}{2}$  to 3 lines long; capsule ovate, acute or mucronate, 6 to 16-seeded; seeds scrobiculate.—Mountain peaks, 3500 to 4000 ft., central Coast Ranges, rare: Mt. Diablo, Mt. Hamilton. (*P. circinatifomis* Gray.)

45. *P. grisea* Gray. Stem diffusely branched,  $\frac{1}{2}$  to  $1\frac{1}{2}$  ft. high; herbage hirsute and finely pubescent, somewhat viscid; leaves ovate or oblong, entire or 1 or 2-toothed or incised, 1 to 2 in. long, tapering to a short petiole; spikes densely flowered, at length 2 to 4 in. long; calyx-lobes obovate-spatulate, little exceeding the capsule; corolla nearly white, 4 lines long; stamens and 2-cleft style conspicuously exserted; ovules 5 or 6 to each placenta.—Along the coast, Santa Lucia Mts. June.

46. *P. purpusii* Bdg. Stem erect, simple or branched, 6 to 14 in. high; herbage hispid-pubescent, the stems and inflorescence glandular; leaves ovate

or oblong-lanceolate, obtuse or acutish, entire (rarely coarsely toothed),  $\frac{3}{4}$  to 2 in. long, petioled; spikes many, racemously disposed along the axis and terminal, densely many-flowered, at length 4 in. long; sepals spatulate, slightly exceeding the mature capsule; corolla pale or sordid blue, 3 to 4 lines long, the tube with lucid spots alternate with the scales; scales narrow or semi-oblong, one from each contiguous pair connivent by the free margins from top to bottom; stamens exserted; style parted below the middle; ovules 2 to 4 to each placenta.—Montane, 4000 to 6000 ft., Sierra Nevada from Mariposa Co. to Tulare Co.; rare. June-July.

47. *P. vallicola* Congdon. Similar to *P. purpusii*; stem simple or strictly branched, 6 to 12 in. high; herbage hispid, somewhat glandular, or the leaves silky; leaves ovate or oblong-elliptic, entire,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long, on petioles  $\frac{1}{2}$  to nearly as long; racemes moderately densely flowered, becoming  $2\frac{1}{2}$  to 3 in. long; pedicels short; sepals spatulate or linear-spatulate, exceeding the capsule at maturity; corolla lavender,  $2\frac{1}{4}$  lines long, a little longer than the calyx; scales narrowly linear; stamens not exserted; style short, parted a little below the middle; ovules 12 to 15 to each placenta; capsule globose-ovate, shortly subulate-beaked; seeds angular-oblong, reticulate.—Foothills, Mariposa Co. May.

V - Subgenus MICROGÉNETES. Corolla funnelform or cylindraceous, the scales vertical, long and narrow, often more or less united to the base of the filaments, or inconspicuous or absent; stamens unequal, included; style 2-cleft at apex; ovules several to each placenta; seeds oblong, with strong transverse corrugation.

48. *P. ivesiana* Torr. Stems several to many from the base, diffuse or ascending, branching, 2 to 5 in. high; herbage thinly hirsute, pubescent and somewhat glandular throughout; leaves pinnately parted into several to many lobes, the lobes oblong-linear, usually entire or slightly toothed, 1 to 2 lines long; racemes few-flowered; sepals linear-spatulate, 2 lines long, the tips often recurved or spreading; corolla white or pale purple, nearly tubular, equaling or longer than the calyx, 2 to 3 lines long; scales mostly wanting or very small; stamens included; capsule glandular, conspicuously shorter than the calyx.—Desert flats, 200 to 2000 ft.: Colorado and Mohave deserts; Inyo Co.; n. to Ore., e. to Utah.

49. *P. affinis* Gray. Stems erect, usually several from the base, simple or sparingly branched, 3 to 12 in. high; leaves mostly basal or sub-basal, pinnately but irregularly parted into many lobes, the divisions or leaflets oblong, obtuse, few-toothed or entire, 1 to 2 lines long, often with small triangular lobes between; racemes densely flowered; sepals mostly straight (not recurving at tip), spatulate, somewhat glandular; corolla pale purple, oblong-campanulate,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  lines long, about equaling the calyx; stamens included; scales narrowly linear, inconspicuous or obsolete; style slightly bifid at apex, shorter than the calyx; capsule nearly equaling the calyx; seeds reticulate but with conspicuous transverse corrugations.—Mountain slopes and cañons, 1000 to 3000 ft.: n. side San Gabriel Mts. (Arrastre Cañon); w. side Colorado Desert (Grapevine Spr. and Campo); s. to L. Cal. Mar.-May.

50. *P. bicolor* Torr. Stems several from the base, diffuse or ascending, 4 to 7 in. high; herbage whitish-puberulent, glandular above; leaves pinnately divided into divisions, 1 to 2 (or 4) lines long, the divisions again finely pinnatifid; racemes not very densely flowered; sepals narrowly linear or a little spatulate; corolla violet or purple with white tube, narrowly funnelform, 6 to 8 lines long, 3 times as long as the calyx; scales narrow, adnate to corolla and united with the filaments almost their whole length thus forming a tubular pocket behind the stamen; style sharply cleft at apex; capsule oval-oblong.—Sandy valleys or flats, 2000 to 6000 ft.: ranges in or bordering the Mohave Desert; San Benito Co.; Inyo Co.; Lassen Co.; e. to Nev.

51. *P. fremontii* Torr. Stems several to many from the base, diffuse or ascending, 6 to 12 in. high; herbage rather densely pubescent, the inflorescence and calyces glandular; leaves pinnately parted into many divisions or lobes, the lobes oblong or obovate, entire or usually so, 3 to 6 in. long, often

with smaller lobes between; basal leaves long-petioled, upper short-petioled or almost sessile; flowers crowded in elongated spike-like racemes; corolla lilac-blue or lavender, with yellow throat, broadly funnelform, 5 to 7 lines long, 2 times as long as the spatulate sepals; scales narrow, wholly adnate to corolla and free from the filaments or none.—Sandy soil, 2000 to 6800 ft.: mountain slopes bordering the Mohave Desert; upper San Joaquin Valley; South Fork Kern River; desert ranges of Inyo Co.; e. to Nev. and Ariz. Mar.-June.

52. *P. brachýloba* Gray. Stem erect, with many branches from the base or subsimple, 1 to 1½ ft. high; herbage densely short-hairy-pubescent and often glandular; leaves linear to oblong in outline, 1 to 2½ in. long, coarsely pinnatifid or pinnately parted, the lobes oblong, mostly obtuse, often somewhat dentate; racemes spicate, densely flowered, the flowers sessile; sepals linear-spatulate, 2 lines long; corolla white, or clear pink-lavender with yellow throat, campanulate, 3 lines long; throat bearing an oblong-ovate areola behind each stamen and a pair of smaller ones between each of these; scales of corolla usually absent; stamens included; filaments dilated at base; capsule oblong, shorter than the calyx; seeds inconspicuously corrugated.—Mountain slopes, moist sandy soil, 1500 to 5000 ft.: Cuyama, Santa Inez, San Gabriel and San Bernardino mountains to San Diego Co.

53. *P. hálili* Brand. Stems several from the base, simple or branching, erect or decumbent, ascending, 5 to 12 in. high; herbage minutely puberulent, the inflorescence glandular; leaves pinnately divided, the segments oblong or linear, entire or few-toothed, 1 to 4 lines long; foliage more or less distinctly brown in color; racemes rather dense, 1 to 3 in. long; sepals linear-lanceolate; corolla bluish-purple, tubular, 4 lines long; stamens unequal, included; scales adnate to corolla, free from filaments, much reduced or often wanting; style hairy below, 2-cleft at apex; capsule oblong, 2 lines long.—Desert valleys or flats, 2000 to 7000 ft.: Mohave Desert and its bordering ranges; n. to Inyo Co.

54. *P. pachyphýlla* Gray. Stem compactly branched forming a low dwarf 1½ to 2½ (or 4) in. high; herbage viscid or glandular-pubescent throughout; leaves roundish to ovate, obtuse, subcordate at base, entire or crenate, 5 to 12 lines long, the petioles often as long or longer; racemes short, in flower not exceeding the leaves; sepals glandular, oblong-spatulate, 1½ to 2 lines long; corolla purple, narrowly campanulate, 2 to 3 lines long; stamens included; scales narrowly linear.—Alkaline soil or gravelly benches in the deserts, 200 to 2000 ft.: e. Mohave Desert; Colorado Desert; s. to L. Cal., e. to Ariz.

55. *P. calthifolia* Brand. Stem stout, erect, commonly branching from the base, 3½ to 11 in. high; herbage densely glandular-pubescent throughout, staining paper brownish in drying; leaves roundish and subcordate, crenate or crenulate, 1 to 2 in. long, the lower long-petioled, the upper almost sessile and nearly opposite, smaller; racemes densely flowered, 1½ to 6 in. long, the flowers almost sessile; sepals broadly linear, 2 to 3 lines long, very glandular; corolla purple, broadly campanulate, 4 to 6 lines long; scales semiobovate, rounded and free at apex, the sides adnate to corolla, the other edge attached to filament, so that the pair makes a pocket behind stamen; stamens unequal, included.—Desert washes, 100 to 2500 ft., e. Mohave Desert; Death Valley region.

## 6. MILTITZIA A. DC.

Annuals, similar to *Phacelia*. Pedicels commonly ⅓ to ½ as long as the flowers. Calyx-lobes in ours linear-oblancheolate. Corolla persistent, the scales in its tube very minute. Style in ours persistent. Capsule ovoid. (Frederich von Miltitz of Dresden, author of a handbook of botanical literature, 1829.)

Stems diffuse; corolla 1¼ to 1½ times as long as calyx.....1. *M. glandulifera*.  
Stems erect; corolla slightly exceeding calyx.....2. *M. inyoensis*.

1. *M. glandulifera* (Torr.) Hel. Stems several from the base, branching, diffuse, 2½ to 6 in. long; herbage pubescent, the inflorescence usually slightly glandular; leaves broadly oblong or ovate, pinnatifid, 5 to 12 lines long;

flowers in short racemes, a little crowded; pedicels  $\frac{1}{2}$  as long as the calyx; corolla bright yellow, 3 lines long,  $1\frac{1}{4}$  to  $1\frac{1}{2}$  times as long as the calyx.—Madeline plains, Lassen Co.; e. to Washoe Co., w. Nev. (*Emmenanthe glandulifera* Torr.)

2. *M. inyoensis* Mcbr. Stems slender, erect; leaves oblong, incisely pinnatifid and dentate; racemes lax; corolla bright yellow (ex char.).—Foot-hills, w. Inyo Co.

#### 7. EMMENANTHE Benth.

Annuals, similar to *Phacelia*. Flowers soon pendulous, borne on filiform pedicels about as long. Corolla cream-color or yellow, campanulate, persistent. Style deciduous. Capsule compressed. (Greek *emmeno*, to abide, and *anthos*, flower, the corolla not deciduous.)

1. *E. penduliflora* Benth. WHISPERING BELLS. Fig. 794. Stem erect, usually much branched from the base, 8 to 21 in. high; herbage villous-pubescent and somewhat viscid; lobes of the pinnatifid leaves numerous, short, toothed or incised; racemes loose, straight, ascending, panicle at summit of the stem; corolla 4 to 5 lines long, the glabrous filaments adnate to the very base; ovary short-bristly and stipitate-glandular; placentae conspicuously dilated in the axis; seeds conspicuously pitted in somewhat regular lines.—Open or chaparral slopes, 200 to 5200 ft.: Coast Ranges from Glenn Co. to San Luis Obispo Co.; Sierra Nevada (Amador Co. to Mariposa Co.; Kern Co.); Tehachapi Mts.; coastal S. Cal.; Mohave and Colorado deserts; L. Cal.; Ariz. to Nev. and Utah. June-July.

794. *Emmenanthe penduliflora* Benth.; a, fl. branchlet; b, leaf. x 1.

#### 8. LEMMONIA Gray

Small depressed annual with repeatedly dichotomous stems and alternate leaves. Flowers small, sessile, solitary in the lower forks, cymose-glomerate at the ends of the branches. Corolla narrowly bowl-shaped, without appendages. Stamens short, included, abruptly dilated at base, the dilations joined by a very much reduced or lineate wing or margin. Ovary 2-celled, each cell 2 or 3-ovuled. Styles 2, distinct to the base, short. Capsule membranous, 2-valved. Seeds 4, roughly pitted. (J. G. Lemmon, a pioneer botanical explorer of California.)

1. *L. californica* Gray. Plants prostrate or diffuse, 3 to 9 in. broad; herbage puberulent; leaves rosulate at base, solitary in the forks and crowded at the ends of the branches, spatulate, tapering into a short petiole, entire, 3 to 7 lines long; sepals narrowly linear, densely white-hairy, in fruit twice the length of the capsule; corolla white, 5-lobed,  $1\frac{1}{4}$  lines long, not exceeding the sepals; ovary densely hairy at summit; capsule 1 line long.—Mts. bordering the Mohave Desert on the sw. and n.: Cajon Pass; Arrastre Creek; Mt. Pinos; Tehachapi Mts.; s. Sierra Nevada in Kern Co.; also Mt. Hanna, Lake Co.

#### 9. NAMA L.

Herbs. Flowers purple, bluish or white. Calyx deeply 4 or 5-parted. Corolla funnelliform, the tube without appendages. Stamens included, commonly unequal and often unequally inserted on the lower part of the corolla-tube. Styles 2, distinct or united except at apex. Capsules thin-walled, 2-celled (the 2 thin placentae meeting in the axis) or incompletely 2-celled (the placentae only approximate), finally dehiscing into 2 entire valves. Ovules 6 to 60 to each placenta, seeds usually as many. (Greek *nama*, a spring.)

## A. ANNUALS; LOW PLANTS OF ONE ASPECT; LEAVES ENTIRE.

Styles more or less connate.

Ovary superior; leaves not clasping; sepals straight.—Subgenus CONANTHUS.

Corolla  $4\frac{1}{2}$  to  $7\frac{1}{2}$  lines long.....1. *N. arctioides*.

Corolla  $2\frac{1}{2}$  to 3 lines long.....2. *N. densum*.

Ovary half-inferior; upper leaves clasping; sepals linear, spatulate-dilated at tip, in fruit accrescent, spreading or recurved at tip, the midnerve strongly thickened.—Subgenus ZONOLACUS.....3. *N. stenocarpum*.

Styles distinct.—Subgenus NEONAMA.

Corolla campanulate,  $4\frac{1}{2}$  to 7 lines long, its limb rather broad.

Stems ascending; adnate portion of filaments not winged.....4. *N. hispidum*.

Stems prostrate; adnate portion of filaments with a narrow margin on each side.

5. *N. demissum*.

Corolla cylindric or salverform, 1 to  $2\frac{1}{2}$  lines long, its limb narrow.

Leaves obovate, abruptly attenuate into a petiole, the blade 1 to  $2\frac{1}{2}$  lines long. .

6. *N. pusillum*.

Leaves oblanceolate, gradually attenuate into a petiole, the blade about 2 to 5 lines long.....7. *N. depressum*

## B. PERENNIALS; PLANTS VERY DIVERSE IN ASPECT.

Stems procumbent, woody at base; herbage silky-woolly; leaves entire, dimorphic; adnate portion of stamens not winged or scarcely so.—Subgenus LOBBIANA.....

8. *N. lobbia*.

Stems erect; herbage hirsute or hispid; leaves of one kind, not entire; adnate portion of stamens narrowly winged on each side.

Stems low, herbaceous, from a deep-seated perennial root-crown; leaves sinuate-toothed or pinnatifid.—Subgenus ROTHROCKIA.....9. *N. rothrockii*.

Stems tall, woody at base; leaves revolute.—Subgenus TURRICULA.....10. *N. parryi*.

1. *N. arctioides* (H. & A.) Brand var. *multiflorum* Jepson n. comb. Stems 3 to 5 from the base, dichotomous, leafy below the terminal cymes,  $1\frac{1}{2}$  to  $4\frac{1}{2}$  in. long; cymes dense, very leafy; leaves narrow-oblong, 6 to 8 lines long; fruiting sepals subulate, hirsute,  $3\frac{1}{2}$  lines long, about  $2\frac{1}{2}$  times as long as the capsule; corolla purple or rose-red, tubular-funnelform, 6 to  $7\frac{1}{2}$  lines long; capsule narrow-elliptic,  $1\frac{1}{4}$  lines long, each placenta about 10-seeded.—Sandy washes or flats, 4000 to 5000 ft.: Inyo Co.; Bishop foothills; Argus Mts. (f. *multiflora* Brand.) Var. *CALIFORNICUM* Jepson n. comb. Corolla tubular,  $4\frac{1}{2}$  to 5 lines long.—Sierra Co. (f. *californica* Brand.)

2. *N. densum* Lem. Similar to no. 1; leaves and sepals white-hispid; leaves oblanceolate, acute, gradually narrowed to a petiole,  $\frac{1}{2}$  to 1 in. long; flowers in terminal clusters and solitary in the forks; corolla purple, cylindric, 3 lines long; seeds black, angular.—Plains or mountain slopes, 3000 to 8000 ft., e. and n. side of Sierra Nevada, rather rare: Inyo Co.; Plumas Co. to Modoc and Siskiyou Cos.; Nev. to Wash.

3. *N. stenocarpum* Gray. Stems many from the base, diffuse, 3 to 11 in. long, mostly very leafy; herbage hirsute; leaves oblanceolate to linear-oblong,  $\frac{3}{4}$  to 2 in. long; flowers in terminal clusters; sepals  $1\frac{1}{2}$  times as long as the capsule; corolla tubular, 3 to  $3\frac{1}{2}$  lines long; capsule linear, 3 lines long.—Shores of lakes or ponds, S. Cal.: Santa Monica; Diamond Lake, Colorado Desert; Sweetwater Valley, San Diego Co.; s. to L. Cal. Mar.-May. (*N. humifusum* Brand.)

4. *N. hispidum* Gray var. *coulteri* Brand. Stems few to many from the base, ascending, 4 to 7 in. long; herbage hispid; leaves narrow-oblong, gradually narrowed to base,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; flowers in loose or somewhat dense terminal clusters; corolla purple, 4 to 6 lines long; style shorter than the calyx; ovules 20 to 50 to each placenta.—Sandy valleys or washes, Colorado Desert: Palo Verde; Chuckawalla Valley; Mecca; Calexico; Split Mt.; e. to N. Mex., s. to Mex. Var. *REVOLUTUM* Jepson n. var. Leaves linear, the margin revolute,  $\frac{1}{2}$  to  $\frac{3}{4}$  line wide.—Colorado River (Pilot Knob, J. Grinnell, type).

5. *N. demissum* Gray. Stems prostrate or diffuse, spreading from a basal rosette, 1 to 6 in. long; herbage hirsutulose-pubescent; leaves linear-spatulate, gradually attenuate to a petiole,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; flowers in terminal clusters; sepals narrowly linear; corolla bright crimson-purple, 5 to 6 lines long; filaments unequal and unequally inserted, their adnate bases with somewhat free margin; capsule "10 to 16"-seeded; ovary a little hairy.—Desert plains and mesas, 3000 to 5000 ft.: Lassen Co.; Inyo Co.; Mohave and Colorado deserts (common); s. to L. Cal. Apr.-May.

6. *N. pusillum* Lem. Stems 3 to 5 from the base, prostrate, dichotomously branching,  $\frac{1}{2}$  to  $2\frac{3}{4}$  in. long, ending in cymose flower-clusters; herbage hirsute-pubescent; leaves broadly obovate, 1 to  $2\frac{1}{2}$  lines long, rather abruptly contracted into a petiole nearly as long; sepals linear, densely hirsute-ciliate; corolla white, cylindric with narrow limb,  $1\frac{1}{2}$  to  $1\frac{3}{4}$  lines long; capsules elliptic,  $1\frac{1}{8}$  lines long.—Stony mesas: Inyo Co.; e. Mohave Desert; n. side Colorado Desert. May.

7. *N. depressum* Lem. Stems 3 to 8, spreading from the basal rosette of leaves, decumbent or ascending, naked or nearly so below the leafy dichotomous cyme, 1 to  $3\frac{1}{2}$  in. long; herbage puberulent; leaves linear-ob lanceolate, gradually attenuate into a petiole, the whole 4 to 10 lines long; sepals linear, thinly hirsute-ciliate; corolla white, cylindric with narrow border,  $1\frac{1}{2}$  to 2 lines long, its lobes crenulate, the lower one with 2 dots; capsules oblong,  $1\frac{1}{4}$  to  $1\frac{1}{2}$  lines long, the cells 6 to 8-seeded.—Sandy flats or mesas: Mohave Desert; Inyo Co.; Kernville.

8. *N. lobbii* Gray. Fig. 795. White-woolly plant with creeping or ascending woody stems  $\frac{1}{2}$  to 2 ft. long; leafy shoots of 2 kinds: vegetative shoots glandular and greenish, their leaves rather crowded, linear or narrow-ob lanceolate, more or less revolute,  $\frac{3}{4}$  to 1 in. long, with a short branchlet or dense fascicle of smaller leaves in the axils; flowering shoots arising terminally the next year from the vegetative branchlets, their leaves scattered, white-woolly, oblanceolate to spatulate, 1 to  $2\frac{1}{4}$  in. long, and bearing sessile or shortly peduncled clusters of flowers in their uppermost axils, the two types of foliage shoots thus appearing in regular alternation; sepals narrowly linear,  $\frac{3}{4}$  as long as corolla; corolla purple, narrow-funnelform, 4 lines long; ovary densely and style somewhat hairy.—Montane, in rocky or red soil, 4000 to 7000 ft.: n. Sierra Nevada from Placer Co. to Lassen Peak, thence to Siskiyou Co.; w. Nev.

9. *N. rothrockii* Gray. Stems erect, simple, several from a deep-seated perennial root, 6 to 8 in. high; herbage glandular-pubescent, the stems, petioles and especially the calyx with spreading bristles; leaves narrowly oblong, regularly sinuate-dentate, 1 to  $1\frac{5}{8}$  in. long, sessile or nearly so; flowers numerous in a dense terminal head, the heads  $1\frac{1}{2}$  to  $1\frac{3}{4}$  in. broad; sepals narrowly linear, 4 to 5 lines long, the lavender corolla 1 to 2 lines longer; ovary and lower part of styles hispidulous; seeds few, minutely reticulate-pitted.—Sandy meadows, 6500 to 10,000 ft., upper Kern River region from the South Fork to the Kern-Kaweah Falls.

10. *N. parryi* Gray. Stems coarse, several in a clump from a deep tap-root, often slightly woody at base, 4 to 9 ft. high; herbage viscid-pubescent and ill-scented; leaves lanceolate, coarsely serrate to dentate or denticulate, acuminate, drawn down to a narrow base, 6 to 10 in. long; flowers in scorpioid spikes, the spikes in a virgate panicle 6 to 18 in. long; pedicels short ( $\frac{1}{2}$  line); calyx glandular-hirsute, its tube shallow, its lobes linear-lanceolate, about  $\frac{1}{4}$  length of corolla; corolla purple, pubescent outside, the middle lobe of lower lip smaller than the lateral, its tube 5-angled at base; stamens included, 3 long and 2 short; filaments almost wholly adnate, slightly hairy at their middle; base of style and summit of ovary hairy; style 2-cleft to

795. *Nama lobbii* Gray; a, fl. branchlet  $\times \frac{2}{3}$ ; b, fl.  $\times 1\frac{1}{2}$ ; c, long. sect. of fl.  $\times 1\frac{1}{2}$ .

base.—Montane, 4000 to 6500 ft.: s. Sierra Nevada (Shadequarter Mt., Tulare Co.); San Emigdio, San Gabriel, San Bernardino, Santa Ana and San Jacinto mountains; Palomar Mt.; Cuyamaca Mts.; s. to L. Cal.

# 10. ÉRIODÍCTYON Benth.

Shrubs with aromatic herbage. Leaves alternate, pinnately veined, finely reticulated, coriaceous, dentate, and petiolate. Inflorescence a terminal, usually naked, panicle of scorpioid cymes. Sepals narrow, not dilated above. Corolla funnelform to campanulate, its tube without appendages. Filaments more or less adnate to the tube of the corolla, little or not at all exerted, sparsely hirsute. Ovary nearly or quite 2-celled by the meeting of the dilated placentae in the axis; styles 2, distinct. Capsule 2 lines long or less, first loculicidal, then septicidal, thus 4-valved, each valve with a short beak or acumination and closed on one side by the adherent dissepiment or half-partition. (Greek erion, wool, and diktuon, a net, by reason of the netted woolly under surface of the leaves.)

Leaves glutinous, nearly or quite glabrous above.

Calyx sparsely hirsute; corolla weakly puberulent outside; cent. and n. Cal. ....

1. *E. californicum*.

Calyx densely white-silky; corolla densely hairy outside; mts. of S. Cal. ....

2. *E. trichocalyx*.

Leaves densely tomentose on both surfaces. .... 3. *E. crassifolium*.

1. *E. californicum* (H. & A.) Greene. YERBA SANTA. MOUNTAIN BALM. Fig. 796. Shrub, 2 to 8 ft. high; leaves oblong to oblanceolate, tapering

796. *Eriodictyon californicum* Greene;  
a, fl. branchlet; b, leaf.  $\times \frac{1}{2}$ .

below and frequently above, dentate except at base or below the middle, very glutinous-resinous, as if varnished, the areas between the veins and cross-veinlets on the under surface with a close dense felt; calyx 1 line long with linear lobes; corolla white or pale blue, tubular-funnelform, 4 to 6 lines long; stamens and styles included. — Dry mountain slopes and ridges, 500 to 4000 ft., common and often abundant and gregarious over extensive areas: Coast Ranges from Monterey Co. to Siskiyou Co.; Sierra Nevada from Tulare Co. to Eldorado Co.; n. to southern Ore. May-June. (*E. glutinosum* Benth.)

2. *E. trichocalyx* Hel. Shrub, rather too close to no. 1; calyx densely white-hairy; corolla narrow-campanulate, 3 to 4½ lines long, densely pubescent outside. — Mesas and chaparral belt, 1200 to 5500 ft.: Santa Inez, San Gabriel and San Bernardino mountains. (*E. angustifolium* var. *pubens* Gray.) Var. *LANATUM* Jepson n. comb. Leaves very white-tomentose beneath. — Santa Rosa, Cuyamaca and Laguna mountains; s. to L. Cal. (*E. californicum* var. *lanatum* Brand.)

3. *E. crassifolium* Benth. Shrub 4 to 6 (or 12) ft. high, leafy at the top; herbage densely tomentose, sometimes snow-white, sometimes dull or greenish; leaves oblong to oval, thick and rigid, crenate, 2 to 4 in. long; cyme 2 to 3 in. broad; calyx densely

villous, half as long as the slightly villous corolla; corolla somewhat salverform, 4 to 6 lines long. — Mts., 2000 to 6000 ft.. Ventura Co. to San Diego Co. Var. *NIVEUM* Brand. Sepals white-silky, not glandular; corolla 2 to 2½ lines long, scarcely longer than the calyx, its lobes connivent in anthesis. — Santa Lucia Mts. of Monterey and San Luis Obispo Cos. (*E. niveum* Eastw.) Var.

**TRÁSKIAE** Brand. Similar to var. *niveum*; sepals black-glandular; corolla 2½ to 3 lines long.—Santa Inez Mts.; Santa Catalina Isl. (*E. traskiae* Eastw.)

#### 11. **TRICÁRDIA** Torr.

Perennial herb, the leaves mostly in a basal rosette. Flowers purplish, rather few in loose spicate racemes. Sepals almost distinct, very dissimilar, the 3 outer large and cordate, becoming much enlarged, scarious and reticulate-veiny in fruit, the 2 inner linear. Corolla broad-campanulate, slightly contracted at the mouth, deciduous, the 10 narrow internal appendages free from the filaments. Stamens unequal, equally inserted on the lower part of the corolla-tube. Ovary 1-celled, glabrous; ovules 4 on each placenta; style 2-cleft. Capsule thin-walled, 1-celled. (Greek tri, three, and cardia, heart, referring to the 3 outer sepals.)

1. **T. watsonii** Torr. Stems ascending or erect, several from a short root, 5 to 11 in. high; leaves oblong-spatulate to oblong-linear, serrate, 1 to 2½ in. long; sepals 2 lines long, becoming ½ to 1 in. long in fruit; corolla purplish, 3 lines long.—Hillslopes or cañons, 1500 to 7000 ft.: Colorado and Mohave deserts; Inyo Co.; e. to southern Utah.

#### 12. **HÉSPEROCHIRON** Wats.

Dwarf perennial herbs. Flowers solitary on naked peduncles arising from a leaf-rosette on the ground. Leaves oblong, spatulate or ovate, entire, ciliate, equaling or exceeding the peduncles. Calyx 5-parted, with linear-lanceolate lobes. Corolla purplish or nearly white, campanulate or rotate, deciduous, the stamens inserted on the base of its tube. Filaments subulate, more or less hairy at base. Ovary 1-celled; placentae narrow, projecting into the cavity, borne on narrow plates or half-partitions. Style 2-cleft at apex. (Greek hesperus, western, and Chiron, referring to the Centaur.)

Corolla oblong-campanulate, its lobes shorter than the tube.....1. *H. californicus*.  
Corolla saucer-shaped, its lobes longer than the tube.....2. *H. pumilus*.

1. **H. californicus** (Benth.) Wats. Leaves many in a basal tuft, narrowed at base to a short petiole, 1 to 1½ in. long; herbage grayish-pubescent; corolla white with a flare of pinkish veins, a little hairy at base.—Mountain valleys and flats, 4000 to 8600 ft.: Sierra Nevada from Tulare Co. to Siskiyou Co.; e. to Utah, n. to Wash.

2. **H. pumilus** (Dougl.) Porter. Leaves few in a basal tuft, oblong or ovate, 1 to 1¾ in. long, the petioles ¼ to ½ as long; herbage greenish, the leaves subglabrous except on the margins; flowers 6 to 8 lines wide.—Moist flats or meadows in the mts.: Sierra Nevada from Fresno Co. to Plumas Co., 6000 to 8000 ft.; Lake Co., 1300 ft.

#### 13. **ROMANZÓFFIA** Cham.

Low and delicate perennial herbs with the aspect of some species of *Saxifraga*. Stems somewhat scape-like, loosely racemose. Leaves mostly basal (the cauline alternate), round-cordate, crenately lobed, long-petioled. Flowers white. Calyx 5-parted into nearly distinct sepals. Corolla broadly funnel-form, destitute of appendages, deciduous. Stamens unequal, inserted on the base of the corolla-tube. Style filiform, entire; stigma small. Capsule 2-celled or nearly so, with narrow placentae. Seeds numerous. (Count Romanzoff, promoter of the Russian voyage of Kotzebue; dedicated to him by Chamisso, the German poet and botanist, who accompanied the expedition.)

1. **R. sitchénsis** Bong. Stems slender, 4 to 9 in. high, arising from a filiform rootstock bearing tubers; pedicels spreading, much longer than the flowers; calyx-lobes linear or lanceolate, not more than ½ as long as the corolla and exceeded by the capsule.—On moist rocks in shady places near the coast: San Mateo Co. and Mt. Tamalpais to Humboldt Co.; n. to Alas. Rare within our limits.

### **BORAGINACEAE. BOBAGE FAMILY**

Herbs, usually rough with coarse hairs. Leaves simple, commonly entire and alternate. Flowers complete, in one-sided spikes or racemes, coiled spirally (scorpioid) and uncoiling as flowering proceeds. Calyx with com-

monly 5 divisions or teeth. Corolla regular, 5-lobed, with 5 stamens inserted on its tube and alternating with its divisions. Ovary superior, deeply 4-lobed (except in *Heliotropium*), with a simple style inserted between the lobes, in fruit splitting into 4 one-seeded nutlets. Style entire or none, rarely 2-cleft. Nutlets commonly roughened or prickly. Endosperm none, except in *Heliotropium*. Ovary not deeply parted in *Heliotropium*, *Euploca* and *Coldenia*, or merely lobed or laterally grooved. Nutlets often inserted on a short thick prolongation of the receptacle known as the gynobase. The spikes or racemes (here so-called for convenience) are really one-sided scorpioid cymes. *Euploca* has 2 nutlets.

*A. Ovary undivided or merely lobed, sometimes 2 to 4-grooved on the sides; style terminal.*

Style entire, the style or stigmas provided with a glandular ring.

Flowers axillary (or appearing so) and solitary; fruit of 2 nutlets; stigma annular, surmounted by a tuft of short bristles; deserts.....1. *EUPLOCA*.

Flowers in dense scorpioid racemes; fruit of 4 nutlets; stigma peltate, not tufted (in ours); common.....2. *HELIOTROPIUM*.

Style 2-cleft, the stigmas capitate; herbs; deserts.....3. *COLDENIA*.

*B. Ovary deeply 4-parted; style entire or none (or rarely barely 2-cleft at apex), arising from between the lobes of the ovary.*

1. Nutlets armed with barbed prickles.

Nutlets globose or thick; flowers mostly blue, rarely white; plants mostly stout, tall (1 to 3 ft.).

Nutlets spreading, prickly all over; perennials.....4. *CYNOGLOSSUM*.

Nutlets erect, prickly on the margin and sometimes on the back; perennials or annuals.

5. *LAPPULA*.

Nutlets thin and flat, divergent or spreading in pairs; flowers white, low and slender; annuals.....6. *PECTOCARYA*.

2. Nutlets unarmed or merely tuberculate.

Calyx pubescent, hispidulose or glabrous, not armed with barbed prickles.

Receptacle flat or merely convex; perennials.

Flowers with tubular or tubular-funnelform corollas; corolla blue; nutlets wrinkled.....7. *MERTENSIA*.

Flowers with rotate or funnelform corollas; nutlets smooth and shining.

Throat of the corolla contracted by prominent crests; racemes mostly without bracts; corolla light-blue.....8. *MYOSOTIS*.

Throat of corolla naked or with low crests; racemes bracteate; corolla greenish-yellow.....9. *LITHOSPERMUM*.

Receptacle more or less elongated or produced upward into a structure (gynobase) to which the nutlets are attached.

Corolla bright or orange yellow, the throat open and naked....10. *AMSINCKIA*.

Corolla white, or cream-color or pale yellow, the throat with more or less prominent bulbous swellings or crests.

Perennials; calyx persistent; mostly high montane.....11. *OREOCARYA*.

Annuals (except 2 species each in nos. 13 and 14); mostly low altitudes.

Calyx circumscissile.....12. *GREENEOCHARIS*.

Calyx not circumscissile (except two species in no. 16).

Nutlets erect, attached from the base to the middle by a groove or scar.

Calyx (and pedicels) usually falling away with the fruit; corolla-throat with crests; leaves commonly alternate.....13. *CRYPTANTHA*.

Calyx (and pedicels) persistent; corolla-throat with only obscure crests; lower leaves opposite.....14. *ALLOCARYA*.

Nutlets oblique or incurved so that the apices are approximate in center, attached above the base to an elevated scar or caruncle.

Caruncle borne on a stipe-like base; lowest leaves opposite...15. *ECHIDIOCARYA*.

Caruncle commonly borne in a hollow or transverse groove; leaves mostly in a basal rosette.16. *PLAGIOBOTHRYS*.

Calyx-lobes armed with barbed prickles, the calyx in fruit modified to form a bur-like envelope for the nutlets; annual.....17. *HARPAGONELLA*.

### 1. *EUPLOCA* Nutt.

Small annuals. Flowers solitary. Corolla white, the upper part of the tube enlarged and the orifice narrowed, the limb scarcely lobed. Style elongated. Stigma annular, surmounted by a tuft of short bristles. Fruit globosely 2-lobed, each lobe splitting into 2 hemispherical one-seeded nutlets. (Greek *eu*, well, and *ploke*, a woven thing.)

1. *E. albiflora* (Raf.) Jtn. Stem branched, 1 to 3 in. high; herbage, calyx, corolla-tube and midnerve of limb strigose-hispid; leaves ovate to oblong-lanceolate, 5 to 9 lines long, petioled; flowers shortly pediceled, "sweet-

scented''; corolla 5 lines broad.—Desert valleys, 200 to 1800 ft.: Ludlow, e. Mohave Desert; Palo Verde Valley; e. to Neb., s. to Mex. (*E. convolvulacea* Nutt.)

## 2. *HELIOTROPIMUM* L. *HELIOTROPE*

Herbs with alternate mostly entire leaves. Flowers white, in dense one-sided spikes. Calyx-segments lanceolate or linear. Corolla salverform, short, with open throat; sinuses more or less plaited in the bud. Stamens included; anthers acuminate, connivent, nearly sessile. Stigma annular or conic. Ovary not lobed, separating when ripe into 4 one-seeded closed nutlets. (Greek helios, sun, and trope, a turning, "the flowers beginning to appear at the summer solstice.")

1. *H. curassavicum* L. CHINESE PUSLEY. Fig. 797. Stems branching,  $\frac{1}{2}$  to 3 ft. long, prostrate, from a perennial root; herbage glabrous, glaucous, fleshy; leaves obovate to broadly oblanceolate; spikes mostly in pairs; corolla white with the yellow eye changing to purple,  $1\frac{1}{2}$  to 2 lines long; stigma turned downward over summit of ovary and thus resembling a skull-cap; style none.—Common along the seashore, in stream beds, and in low moist or alkaline lands throughout Cal. June-Nov. Immigrating locally.

797. *Heliotropium curassavicum* L.; a, fl. branchlet x 1; b, corolla spread open x 5; c, pistil x 10.

## 3. *COLDENIA* L.

Low prostrate or spreading plants, mostly suffrutescent, hoary-pubescent and often hispid, the small pale flowers sessile and usually clustered in the forks or at the ends of the branches and subtended by a tuft or circle of leaves. Leaves small, petioled, with veins usually conspicuous. Calyx 4 or 5-parted into slender segments. Corolla short-funnelform or nearly salverform, not more than twice as long as the calyx, the short lobes broad and rounded. Stamens included. Style 2-cleft or -parted. Ovary entire or 4-lobed, 4-celled. Fruit separating at maturity into 4 one-seeded nutlets, or by abortion fewer. (Dr. Cadwallader Colden, Colonial Lieutenant-Governor of New York, a correspondent of Linnaeus.)

Stems dichotomously branched; leaves conspicuously veined, the petioles often equaling or longer than the blade; corolla appendaged within.

Leaves ovate to rotund or rhombic, with 2 or 3 pairs of veins; herbage pubescent and somewhat hispid or hirsute.

Annual; leaf-margins revolute.....1. *C. nuttallii*.

Perennial; leaf-margins sinuate.....2. *C. brevicalyx*.

Leaves mostly obovate with 5 or 6 pairs of veins; perennial (apparently); herbage not hispid or hirsute.....3. *C. palmeri*.

Stems diffusely branched; leaves obscurely veined, the blade longer than the petiole; corolla not appendaged within; perennial.....4. *C. canescens*.

1. *C. nuttallii* Hook. Stem dichotomously branched, prostrate, 4 to 10 in across; herbage grayish-pubescent, and sparsely hirsute or hispid; leaves ovate to rotund, revolute, with 2 or 3 pairs of veins, 2 to 4 lines long, the petioles often longer; flowers densely clustered in the forks and at the ends of the branches, subtended by a circle of leaves; calyx-lobes linear, equaling the corolla-tube; corolla pink or whitish,  $1\frac{1}{2}$  lines long, bearing 5 short obtuse scales near the base of the tube; filaments shorter than the anthers, inserted nearly in the throat of the corolla-tube; nutlets oblong-ovate,

polished, the scar linear.—East side Sierra Nevada from Death Valley to Lassen Co.; n. to Wash., e. to Wyo., Utah and Ariz.

2. *C. brevicalyx* Wats. Stems white-barked, dichotomously branched from a woody perennial base, 5 to 10 in. long; herbage grayish-pubescent and somewhat hispid; leaves ovate to rhombic, with sinuate revolute margins, irregularly 2 or 3-nerved, 2 to 4 lines long, hispid toward the margin; calyx 1 line long, the acute lobes shorter than the tube; corolla 2 lines long; filaments slender, somewhat dilated below the insertion; nutlets subglobose.—Colorado Desert. Mar.-Apr.

3. *C. pálmeri* Gray. Stems freely branched dichotomously from a suffrutescent base, forming a dense rounded tuft or mat; herbage grayish-pubescent, not hispid or hirsute; leaves obovate, sometimes ovate, strongly plicate, with 5 or 6 pairs of veins, 2 to 4 lines long, the margins thickened-revolute; flowers clustered in the forks and at the ends of the branchlets, subtended by a circle of leaves; calyx-lobes about  $\frac{2}{3}$  as long as corolla-tube; corolla bluish, 2 lines long, with 5 narrowly intruding plates extending from the base of the tube to the base of the filaments or about  $\frac{1}{2}$  the length of the tube; nutlets globular, with an orbicular scar, only 1 or 2 maturing.—Desert sandhills: e. Mohave Desert; Colorado Desert; e. to Ariz. Apr.-May. (*C. plicata* Cov.)

4. *C. canescens* DC. Stems gnarled, woody and rough-barked, prostrate or procumbent, from a stout perennial base; herbage tomentose and hispid; leaves ovate or oblong, entire, the veins obscure, 3 to 5 lines long, the blade longer than the petiole; flowers 3 lines long, solitary or in small clusters at the axils or forks; fruit depressed-globose; nutlets 4, thick-walled, smooth and rounded on the back, obscurely rugose on the plane sides, pointless.—Colorado Desert; e. to southern Tex. Apr.-May.

#### 4. CYNOGLOSSUM L.

Ours perennial herbs. Flowers blue or pink, in a bractless panicle or raceme on a naked terminal peduncle. Corolla with a ring of conspicuous appendages or crests at the throat. Nutlets large, covered all over with short barbed prickles and thus bur-like. (Greek kuno, dog, and glossa, tongue, on account of the shape and texture of the leaves in some species.)

798. *Cynoglossum grande* Dougl.; a. fl. branchlet  $\times 1$ ; b. nutlet  $\times 1\frac{1}{2}$ .

Stems glabrous or nearly so; leaves ovate to ovate-oblong or elliptic, rounded or truncate at base, all on long petioles. . . . 1. *C. grande*.

Stems with spreading hairs; leaves obovate to oblong-lanceolate, varying to oblong, the upper sessile or partly clasping by a rounded or auriculate base. . . . 2. *C. occidentale*.

1. *C. grande* Dougl. WESTERN HOUND'S TONGUE. Fig. 798. Stems erect, glabrous, 1 to 3 ft. high; leaves mostly basal or borne on the lower part of the stem, hirsutulose beneath, 3 to 8 in. long, on petioles often as long; calyx-lobes narrowly oblong, obtuse, densely pubescent, 2 to 4 lines long; corolla 4 to 7 lines long, the tube often purple, the lobes elliptic; nutlets depressed.—Wooded cañons, 100 to 4000 ft.: Coast Ranges from the Santa Lucia Mts. to w. Alameda Co.; North Coast Ranges from Marin Co. and the Vaca Mts. to Siskiyou Co., thence sc. in the Sierra Nevada foothills to Eldorado Co. and Tuolumne Co., recurring in Tulare Co.; n. to Wash. Feb.-May.

2. *C. occidentale* Gray. Fig. 799. Stems erect, leafy, 1 to several from the root-crown, 1 to  $1\frac{1}{2}$  ft. high; herbage hirsute, the hairs (especially of the stems) spreading or even recurving; leaves 2 to  $7\frac{1}{2}$  in. long, the lower petioled, the upper sessile or clasping; calyx-lobes linear to lanceolate, obtuse, twice longer than the tube; corolla brownish-pink, drying greenish, 4 to  $4\frac{1}{2}$  lines long, the tube longer than the calyx-lobes

and 2 to 3 times as long as the corolla-lobes; nutlets almost globular, 4 lines long.—Moist thickets or woods of mountain slopes and flats, 4000 to 7000 ft.: Sierra Nevada from Tulare Co. to Shasta Co.; Modoc Co. to Trinity and Humboldt Cos. June.

### 5. *LÁPPULA* Moench. STICK-SEED

Tall leafy-stemmed herbs; herbage pubescent or hispid. Flowers usually small, blue, white or sometimes pink, disposed in spikes or racemes. Leaves entire, the upper sessile, the lower tapering to a winged petiole. Calyx 5-parted. Corolla rotate or short-funnelform, usually with appendages in the throat. Nutlets bur-like, armed with barbed prickles, these arranged along a distinct margin or over the entire back. (Diminutive of the Latin *lappa*, a bur.)

Annuals; racemes leafy throughout, the leaves small but still foliaceous; calyx in fruit longer than the pedicels; pedicels in fruit remaining erect; desert areas.

Dorsal area of nutlets bordered by a row of prickles. .... 1. *L. occidentalis*.

Dorsal area of nutlets with its margin annular-thickened, the ring bearing a few prickles. .... 2. *L. texana*.  
Perennials, the stems from a thick root-crown; racemes leafy-bracteate only at base, the bracts above the base minute; calyx in fruit shorter than the pedicels; pedicels in fruit recurving or deflexed.

Dorsal area of nutlets naked or with very few prickles.

Corolla white, 6 to 8 lines in diameter; panicle with markedly divergent branches.

3. *L. bella*.

Corolla blue, 2 to 4 lines in diameter; racemes or panicles rather strict. ....

4. *L. floribunda*.

Dorsal area of nutlets with numerous prickles.

Corolla white, 3 lines in diameter, the tube not exceeding the calyx. ....

5. *L. californica*.

Corolla blue, the tube  $1\frac{1}{2}$  to 2 times longer than the calyx.

Limb of corolla 5 to 7 lines broad; pubescence velvety. .... 6. *L. velutina*.

Limb of corolla 3 to 4 lines broad; pubescence somewhat roughish, not velvety. .... 7. *L. nervosa*.

1. *L. occidentalis* Greene. Stem strictly erect, commonly branched only above, 8 to 14 in. high; herbage pubescent; leaves linear to oblong-linear or the lower spatulate,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long; racemes leafy-bracteate; calyx longer than the pedicels, the narrowly lanceolate segments not recurved in fruit; corolla blue, the tube little exceeding the calyx, the throat with conspicuous crests; nutlets 1 line long, the dorsal area ovate, sharply tuberculate, bordered by a single row of barbed prickles, the prickles more or less confluent at base.—Arid valleys and mountain slopes, 4000 to 7000 ft.: San Bernardino Mts.; Inyo Co.; Lassen and Modoc Cos.; Nev. to Ore., Col. and Tex.

2. *L. texana* Britt. Stem branched from or near the base, the branches ascending, 7 to 11 in. high; leaves 3 to 12 lines long, broadly linear, ovate-lanceolate, obtuse, sessile, the lowest oblanceolate; nutlets finely tuberculate, the dorsal face with the margin strongly annular-thickened, thus making the face saucer-shaped or shallowly cup-shaped; annular thickening bearing a few prickles, especially on upper part.—Desert mesas, 1300 to 4000 ft., e. Mohave Desert: New York Mts.; Needles; e. to Tex.

799. *Cynoglossum occidentale* Gray; a, habit x  $\frac{1}{4}$ ; b, corolla x  $1\frac{1}{2}$ ; c, long. sect. of fl. x 2; d, fr. x 1.

3. *L. bella* Mcbr. Stem erect, branched above,  $1\frac{3}{4}$  ft. high; herbage finely appressed-pubescent; cauline leaves oblong-lanceolate to ovate, sessile by a cordate base,  $1\frac{1}{2}$  to  $3\frac{3}{4}$  in. long; basal leaves oblanceolate; inflorescence widely racemose-paniculate; pedicels recurved in fruit; calyx-lobes ovate, reflexed in fruit; corolla white, 6 to 8 lines in diameter, the appendages finely pubescent; nutlets  $2\frac{1}{2}$  lines high, the broadly ovate back roughened, naked or with a few very minute prickles, bordered by a row of slender prickles, the prickles not confluent at base or rarely so.—Salmon Mts., Trinity Co.

4. *L. floribunda* (Lehm.) Greene. Stem erect, 2 to  $3\frac{1}{4}$  ft. high; herbage somewhat hispid-pubescent; cauline leaves linear-oblong to lanceolate or oblong-lanceolate, narrowed at base, but sessile, 1 to 5 in. long, the basal oblanceolate, drawn down to a petiole; racemes strict, more or less branched or paniculate; pedicels in fruit deflexed, 2 to 4 lines long; calyx-lobes ovate; corolla blue, about 3 lines long, about as broad; nutlets 2 lines long, the elongate-triangular dorsal face merely scabrous, bordered by a row of conspicuously flattened spines, the spines unequal, somewhat united at base into a narrow wing; back of nutlets minutely papillate, naked or with 1, 2 or 3 small bristles, commonly with a median nerve.—Montane, 6000 to 7200 ft.: e. Mendocino Co. to Siskiyou Co.; Sierra Nevada from Tulare Co. to Nevada Co., and n. to Modoc Co.; n. to Ore. and Saskat., e. to Minn. July.

Var. *GEISIANA* Jepson n. var. Culine leaves oblong, those of the inflorescence ovate with cordate-clasping base; calyx-lobes oblong; nutlets  $2\frac{1}{2}$  lines high.—Placer Co. (Craggs Slope, Deer Park, Helen D. Geis, type).

800. *Lappula velutina* Piper; a, fl. branchlet  $\times \frac{1}{2}$ ; b, long. sect. of fl.  $\times 2$ ; c, fr.  $\times 3$ .

5. *L. californica* (Gray) Piper. Stems erect,  $1\frac{1}{2}$  to 2 ft. high; herbage pubescent; leaves  $\frac{3}{4}$  to  $3\frac{1}{2}$  in. long, upper cauline oblong to lanceolate, sessile, the lower cauline and basal oblong, tapering to a long petiole; racemes widely branched; calyx-lobes ovate; corolla white, the tube not or barely exceeding the calyx, the limb 3 to 6 lines broad; nutlets  $2\frac{1}{2}$  lines high, the ovate dorsal face beset and also bordered with bristles.—Montane, 5000 to 7300 ft.: Sierra Nevada from Butte Co. to Tehama and Modoc Cos.; also Inyo Co.

6. *L. velutina* Piper. Fig. 800. Stems erect, 1 to 2 ft. high; herbage velvety-pubescent; leaves 1 to 3 in. long, the cauline oblong-lanceolate to ovate, the basal oblong-spatulate; racemes simple or branched; calyx-lobes ovate, obtuse; corolla blue or sometimes pink, the tube much exceeding the calyx, the limb 5 to 6 lines broad, the crests conspicuous,  $\frac{1}{2}$  as long as the corolla-lobes; nutlets with back thickly beset with prickles.—Montane, 5000 to 8500 ft.: Sierra Nevada from Tulare Co. to Shasta Co. June-July.

7. *L. nervosa* (Kell.) Greene. Stems 1 to 3, erect,  $1\frac{1}{2}$  ft. high, glabrous or sparingly hairy; leaves rough-pubescent,  $\frac{3}{4}$  to  $3\frac{1}{2}$  in. long, pubescent, ciliate, the cauline oblong to ovate, the basal oblong to oblong-spatulate; racemes somewhat loose or with spreading branches; calyx-lobes ovate; corolla blue, the tube much exceeding the calyx, the limb 2 lines broad, the throat with small crests only  $\frac{1}{6}$  as long as lobes; dorsal area of nutlets broadly ovate, covered with prickles.—Montane, 6000 to 7000 ft.: Sierra Nevada from Fresno Co. to Plumas Co. June-July.

## 6. PECTOCARYA DC.

Low slender obscure annuals with strigose pubescence and narrowly linear leaves. Flowers minute, white, on very short pedicels, scattered along the stems or branches. Calyx deeply 5-cleft, spreading or reflexed in fruit. Corolla with a circle of processes or crests which almost close the throat. Stamens included. Nutlets flat, thin, radiately divergent, bordered at apex or all around with a row of bristles hooked at tip. (Greek pectos, combed, and karua, nut, on account of the row of bristles on the nutlet.)

Nutlets not winged, the acute margin bordered all around by bristles; calyx hispidulose... 1. *P. pusilla*.

Nutlets bordered by a wing.

Wing coriaceous, undulate or lacinate; calyx hispidulose.

Wing parted or cleft into subulate teeth ending in a delicate uncinatate bristle... 2. *P. linearis*.

Wing merely undulate or incurved, the apex thickly and the sides rarely beset with slender uncinatate bristles... 3. *P. penicillata*.

Wing thin-scarious, entire or obscurely undulate, the hooked bristles of the body extending beyond its margin; calyx armed with divergent bristles... 4. *P. setosa*.

1. *P. pusilla* Gray. Stem erect, somewhat flexuous, simple or sparingly branched, 3 to 5 in. high; herbage strigulose-canescens; nutlets 4 and equably divergent (or sometimes but 2), 1 line long, cuneate-obovate or somewhat rhomboidal, carinately nerved on the upper face, not winged, the margin bearing a row of slender bristles hooked at the tip.—Shady north slopes in the hills, 500 to 2500 ft.: North Coast Ranges from Napa Co. to Siskiyou Co.; thence se. in the Sierra Nevada to Mariposa Co. Mar.-Apr.

2. *P. linearis* DC. Stem diffusely branched from the base, the branches 2 to 4 in. long; body of nutlets narrowly oblong, 1 to 2 lines long, surrounded by a broad wing laciniately and often irregularly parted or cleft into subulate teeth, the teeth ending in a delicate bristle uncinatate at tip; cotyledons oblong.—Valleys and mesas, 500 to 2100 ft.: coastal S. Cal.; Colorado and Mohave deserts; Inyo Co.; e. to Ariz. and Utah. Apr.-May.

3. *P. penicillata* (H. & A.) A. DC. Stem branching at the base, the branches diffuse, 1 to 4 in. long; nutlets divergent in pairs, oblong, 1 line long, surrounded by a wing which is incurved along the middle in age and bears at the rounded apex a series of slender bristles hooked at the tip.—Hillslopes and valleys, 100 to 400 ft., throughout cismontane Cal.; n. to B. C., e. to Nev. Var. *heterocarpa* Jtn. Two of the 4 nutlets unmarginated, 2 margined.—Colorado Desert.

4. *P. setosa* Gray. Stem stoutish, freely and diffusely branched, 6 to 9 in. high; herbage hispid as well as minutely strigose-pubescent; calyx-lobes armed with 3 to 6 large divergent bristles; nutlets in pairs, 2 wingless, 2 bordered by a broad thin-scarious wing, the body of the nutlet and commonly also the wing beset with slender uncinatate-tipped bristles, the body rarely naked or nearly naked, the wing entire or obscurely undulate.—Desert mesas or their bordering ranges, 2000 to 4500 ft.: San Jacinto Mts.; San Antonio Mts.; Mohave Desert; Lassen Co. Apr.-May. Var. *holoptera* Jtn. Nutlets all wing-margined.—Mts. on n. side Mohave Desert; also Inyo Co. Var. *aptera* Jtn. Nutlets all without margins.—E. San Diego Co.

## 7. MERTENSIA Roth. LUNGWORT

Perennial herbs with erect leafy stems terminated by clusters of showy light blue flowers. Herbage glabrous or nearly so. Leaves broad, the lower mostly petioled. Stamens with flattened or filiform filaments inserted on the crested open throat of the corolla. Style filiform; stigma entire. Nutlets attached to the convex receptacle by a small scar just above the base, roughish or wrinkled at maturity. (F. K. Mertens, a German botanist, 1764-1831.)

Calyx-lobes oblong or oblong-linear, mostly obtuse; corolla-tube  $2\frac{1}{2}$  to 3 lines long, about as long as the throat and limb, with an obscure or shallow depression on the outside opposite the crests; var. *stomatechoides* of... 1. *M. ciliata*.

Calyx-lobes lanceolate or linear, mostly acute; corolla-tube 4 to  $5\frac{1}{2}$  lines long, 3 to 4 times as long as the throat and limb, with a pair of pockets or rounded pits on the outside opposite the crests... 2. *M. longiflora*.

801. *Mertensia ciliata* var. *stomatechoides* Jepson; a, fl. branchlet  $\times \frac{1}{2}$ ; b, leaf  $\times \frac{1}{4}$ ; c, sect. of corolla  $\times 1\frac{1}{2}$ .

1. *M. ciliata* (James) G. Don var. *stomatechoides* Jepson n. comb. Fig. 801. Stems several from the root-crown, simple or somewhat branched, leafy, 2 to 5 ft. high; herbage glabrous or nearly so, glaucous; leaves oblong or oblong-spatulate to ovate or lanceolate, entire, 2 to 7 in. long, narrowed to a broad petiole, or the upper cauline ones sessile; flowers in short panicle racemes at the ends of the stem and branchlets, more or less drooping; calyx-lobes oblong to oblong-linear or -lanceolate, obtuse or sometimes acute, mostly ciliolate,  $\frac{1}{4}$  to  $\frac{1}{2}$  as long as the corolla; corolla a lively light-blue, with small yellow-tipped crests in the summit of tube, the cylindrical tube  $2\frac{1}{2}$  to 3 lines long, the open-campanulate throat and limb nearly or quite as long; filaments broad, included, inserted on the corolla-tube alternate with the crests; style exserted.—Montane, 5000 to 8500 (or 10,000) ft.: e. Mendocino Co.; Sierra Nevada from Tulare Co. to Nevada Co. and n. to Modoc Co.; e. to Col. (*Mertensia stomatechoides* Kell. *M. sibirica* Bot. Cal.) June-Aug.

2. *M. longiflora* Greene. Stem erect, simple, leafy,  $\frac{1}{2}$  ft. high; herbage glabrous or nearly so, the upper side of the leaves scabridulous; leaves oblong-ovate or spatulate-obovate, 1 to  $2\frac{1}{4}$  in. long; flowers in a close cluster or subcorymbose panicle; calyx deeply 5-parted or cleft, the lobes lanceolate or linear, mostly acute; corolla bright blue, the tube narrow, 4 to  $5\frac{1}{2}$  lines long, the throat very short, the limb 5-lobed, 1 to  $1\frac{1}{2}$  lines long.—Hillsides, 5000 to 7000 ft.: Modoc Co.; n. to B. C., se. to Ariz. Apr.-May.

#### 8. MYOSOTIS L. FORGETMENOT

Slender leafy-stemmed perennials with small light blue flowers in loose naked racemose clusters terminating the stem and branchlets. Corolla rotate with prominent crests in the throat. Nutlets small, ovoid, smooth and shining. (Greek mus, mouse, and otos, ear, mouse-ear, to which the leaves of some species are likened.)

1. *M. sylvatica* Hoffm. Stems leafy, somewhat branched above, 1 ft. high, decumbent at base, usually several from a perennial rootstock; herbage hirsute-pubescent, the stem with soft spreading hairs, those of the calyx consisting of bristly hairs with hooked tips; leaves lanceolate or oblong to oblong-spatulate, entire, 1 to 4 in. long, the basal and lower cauline petioled; calyx-lobes lanceolate, equaling or longer than the tube; corolla light blue.—Garden plant from Eur., sparingly naturalized: San Anselmo; Mill Valley; Berkeley; San Francisco. Apr.-July.

*M. PALÚSTRIS* With. Calyx-lobes triangular, shorter than the calyx-tube; pubescence appressed, that of the calyx consisting of straight hairs.—Adv. from Eur.: Quincy.

#### 9. LITHOSPÉRMUM Tourn. PUCCOON

Ours pubescent or hairy perennial herbs, usually with red or violet-colored roots containing coloring matter. Flowers in leafy spikes or in the axils of the upper leaves. Calyx 5-parted. Corolla in ours greenish-yellow, salver-

form or funnelform, with rounded lobes imbricated in the bud. Filaments short; anthers short, included. Style slender; stigma truncate-capitate or 2-lobed. Nutlets 4 or by abortion fewer, ovate, naked, in ours white, bony and shining, erect, attached to the flat receptacle by the base; scar flat, rather small. (Greek lithos, a stone, and sperma, a seed.)

1. *L. ruderale* Dougl. Stems densely leafy,  $\frac{1}{2}$  to  $1\frac{1}{4}$  ft. high; herbage pubescent; leaves linear-lanceolate to lanceolate, 1 to  $2\frac{3}{4}$  in. long, mostly tapering from base to apex, sessile; flowers crowded in a leafy cluster; corolla campanulate-funnelform, dull greenish-yellow, 4 to 5 lines long, the tube hardly longer than the calyx, silky outside, the open throat naked or nearly so; nutlets broadly ovate, acute, smooth and polished, 2 to  $2\frac{1}{2}$  lines long.—Modoc Co.; n. to B. C., e. to Nev. and ne. to N. Dak. May. Var. *CALIFORNICUM* Jepson n. comb. Stems less rigid; upper leaves oblong or ovate-lanceolate; corolla orange-yellow, 5 to 6 lines long, the tube considerable longer than the calyx.—Montane, 3000 to 5000 ft.: Placer Co. to Shasta Co., thence w. to Trinity Co., n. to southern Ore. (*L. californicum* Gray.)

#### 10. *AMSINCKIA* Lehm.

Annuals with rough-hairy herbage, the hairs commonly with pustulate-dilated base, which is often conspicuously hardened or granular. Flowers yellow, in elongated spikes. Calyx-lobes 5, or 4 or 3 through the more or less complete union of two into one. Corolla salverform, the throat somewhat funnelform and with more or less distinct folds, but destitute of crests or processes. Nutlets crustaceous, triquetrous or ovate-triangular, smooth or rough. Cotyledons deeply 2-parted. (Wm. Amsinck of Hamburg, patron of the Botanic Garden in that city.)

Nutlets smooth and polished.

Corolla 5 to 6 lines long; scar of nutlets very obscure, narrowly lineate, nearly basal; mostly deserts.....1. *A. vernicosa*.

Corolla about 6 to  $7\frac{1}{2}$  lines long; scar of nutlets conspicuous, ovate-lanceolate, nearly median; S. F. Bay region.....2. *A. spectabilis*.

Nutlets roughened.

Corolla 2 to  $2\frac{1}{2}$  lines long.....3. *A. parviflora*.

Corolla 4 to 9 lines long.

Nutlets carinate on back, more or less rugulose or muriculate.

Nutlets gray or pale; mostly interior, very common.....4. *A. douglasiana*.

Nutlets black or brown; seaboard.....5. *A. intermedia*.

Nutlets flattened or rounded on the back.

Back of nutlets with low thin or faint rugae, the rugae forming areoles.....

6. *A. lycopsoides*.

Back of nutlets tessellate or pavement-like.....7. *A. tessellata*.

1. *A. vernicosa* H. & A. Stem stout, branching above, 7 to 18 in. high, mostly glabrous below; leaves linear-oblong to ovate-lanceolate or lanceolate,  $1\frac{1}{2}$  to 5 in. long, hispid-ciliate and more or less hispid above and below, often glabrate, the pustulate disks frequently producing a tessellate effect; fully developed spikes 5 in. long; calyx-segments strongly hirsute, often partly or wholly confluent so as to appear as 3 or 4, in fruit 5 to 7 lines long; corolla golden yellow, 5 to 6 lines long, the limb narrow; nutlets carinate on the lateral angles with sharp edges, back and lateral faces plane or nearly so, smooth and polished, gray, 2 to 3 lines long, the scar very narrow or hair-like.—Mohave Desert to Inyo Co., 4000 to 4500 ft. Apr.-May.

2. *A. spectabilis* F. & M. Stem erect, rather strictly branched above, about 2 ft. high; herbage rough-hispid; leaves linear-oblongate or -oblong, 1 to  $3\frac{1}{2}$  in. long, the reduced upper ones narrow-ovate or -lanceolate; corolla yellow, 7 to 9 lines long.—Antioch; Judsonville. Too little known.

3. *A. parviflora* Hel. Stem erect, strictly branched above, 5 to 12 in. high, hispid with spreading hairs and also somewhat strigose; leaves mostly linear, 1 to  $2\frac{1}{2}$  in. long; corolla pale yellow, 2 to  $2\frac{1}{2}$  lines long; nutlets brown, finely papillate or slightly muriculate, faintly rugulose, 1 to  $1\frac{1}{4}$  lines long, the scar large, ovate.—Sierra Nevada, 3000 to 6000 ft., from Mariposa Co. to Plumas Co.

*A. ECHINATA* Gray. Erect,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  ft. high, very hispid with white spreading bristles; sepals very narrow, yellow-hispid; corolla light yellow, about twice as long, little dilated at the throat, the limb 2 or 3 lines broad; nutlets muricate with slender points or almost prickly, not rugose.—Sandy

plains, very rare: Camp Mohave and Maricopa, Ariz. To be looked for in e. Mohave Desert.

4. *A. douglasiana* DC. BUCKTHORN WEED. Erect, frequently widely branched,  $1\frac{1}{2}$  to 4 ft. high; stems and branches with scattered white bristles, the foliage densely hispid-bristly with rather shorter bristles; inflorescence hispid and with a short curly pubescence; leaves oblong-lanceolate to linear, thickish, entire, 1 to 9 in. long; racemes more or less crowded at the top of the stem or branches and leafy-bracteate; developed racemes 5 to 10 in. long, peduncled; calyx-segments rusty-hispid, linear-acuminate,  $\frac{1}{2}$  as long as the narrow orange-yellow corollas, in fruit twice as long at least as the nutlets; nutlets incurved, carinate dorsally, scabrous-rugose and granulate, exceeding 1 line in length.—Fields and hillslopes, often forming rank thickets, 20 to 2000 ft.: Great Valley; Coast Ranges; coastal S. Cal. Apr. Also called Fireweed and Zaccato Gorda. (*A. intermedia* Fl. W. Mid. Cal.) Var. *CAMPÉSTRIS* Jepson n. comb. Calyx with appressed pubescence.—Sacramento Valley and n. to Siskiyou Co. (*A. campestris* Greene.) Var. *EASTWOODAE* (Mcbr.) Jtn.

Corolla 8 to 9 lines long, 2 to 3 times as long as the calyx.—Sierra Nevada foothills from Amador Co. to Fresno Co. and s. to Tehachapi Range. (*A. eastwoodae* Mcbr.)

802. *Amsinckia intermedia* F. & M.; a, leaf  $\times \frac{1}{2}$ ; b, fl. branchlet  $\times \frac{1}{2}$ ; c, long. sect. of fl.  $\times 2$ ; d, nutlet, dorsal view  $\times 5$ ; e, nutlet, ventral view  $\times 5$ .

5. *A. intermedia* F. & M. Fig. 802. Stem erect, branching, the branches at length decumbent, 1 to 2 ft. long; herbage of a light yellowish green, setose-hispid; leaves ovate-lanceolate or narrowly oblong, with erose-sinuate or entire margins; racemes rather short, frequently leafy-bracteate; peduncles short or none; calyx sparsely setose-hispid, the lobes lanceolate or ovate-oblong, obtuse, 2 or 3 of the lobes often united; corolla pale yellow, very slender; nutlets brown or blackish, muriculate and rugulose, scarcely more than  $\frac{1}{2}$  line long.—Sandy soil along the seacoast: San Diego Co. to San Francisco, Sonoma and Mendocino Cos. and n. (*A. lycopsoides* Jepson.) Var. *NICOLAI* Jepson n. comb. Racemes leafy-bracteate throughout.—San Nicolas Isl. (*A. sancti-nicolai* Eastw.)

6. *A. lycopsoides* Lehm. Diffuse plant; similar to no. 5; nutlets rounded on the back, not carinate, the thin low rugae forming irregular

areoles these minutely granulate.—Along the coast: Mendocino Co.; n. to Wash.

7. *A. tessellata* Gray. Coarsely hispid, 1 to 2 ft. high; leaves linear to oblong-lanceolate, or the upper ovate, 1 to 2 in. long; developed spikes 5 to 6 in. long, loose; calyx of 3 or 4 sepals, 1 narrow and 2 broad, or 3 narrow and 1 broad, rusty-hispid, accrescent in fruit with the broadly-ovate foliaceous segments about twice the length of the nutlets; corolla small, orange-yellow; nutlets broadly ovate, abruptly acute, not carinate but flattish on the back, which is surrounded by a dentate border and filled in with a few short transverse rugae and many wart-like projections fitted closely together, and so resembling a somewhat uneven cobble-stone pavement.—Sandy plains or desert mesas, 100 to 4000 ft.: Colorado and Mohave deserts; San Joaquin Valley; Inyo Co.; e. to Utah. Apr.-May. Var. *LEMMONII* Jepson n. comb. Calyx densely clothed with soft-appressed cinnamon-brown hairs; corolla

6 to 7 lines long, the limb much broader; nutlets tessellate but scarcely rugose.—San Luis Obispo and Monterey Cos. May. (*A. lemmonii* Mcbr.)

# 11. OREOCARYA Greene

Perennial herbs, the leafy stems more or less tufted on the branched root-crown and terminating in a thyrsoïd or spicate leafy-bracteate panicle. Entire plant tomentose or strigose-pubescent, the upper parts usually densely hispid. Leaves mostly basal. Calyx 5-parted to the base or nearly so, the segments lanceolate or ovate-lanceolate. Corolla with prominent crests. Nutlets smooth and polished or roughened and dull, the margins without wings. (Greek oreos, mountain, and karua, nutlet, on account of the habitat.)

Nutlets polished; herbage strigose or strigulose.

Corolla-tube well-exserted ( $1\frac{1}{2}$  to 2 times as long as calyx); inflorescence hirsute; stems  $\frac{1}{2}$  to  $1\frac{1}{2}$  ft. high. . . . . 1. *O. confertifolia*.

Corolla-tube not exserted; inflorescence not at all hirsute; stems 3 to 5 in. high; var. abortiva of. . . . . 2. *O. suffruticosa*.

Nutlets roughened, dull; herbage hispid, the older leaves white-tomentose, the younger ones greenish-silky.

Nutlets gray, keeled, densely rugose and often finely tuberculate dorsally. . . . . 3. *O. echinoides*.

Nutlets brown, narrow-ovate, weakly keeled, sparingly wrinkled. . . . . 4. *O. nubigena*.

1. *O. confertifolia* Greene. Stems erect or at base decumbent, leafy,  $\frac{1}{2}$  to  $1\frac{1}{2}$  ft. high, arising from a branched root-crown; herbage strigose-pubescent with silky hairs, above more or less hirsute; leaves mostly in a basal tuft and some on stem, especially lower part, oblanceolate to linear-lanceolate, acute, 1 to 3 in. long; basal leaves more particularly drawn down to a petiole, the petioles white-silky; inflorescence spicate-glomerate, more or less interrupted below; calyx-lobes lanceolate; corolla cream-color or yellow, the tube well-exserted, the crests prominent; nutlets ovate, keeled ventrally, rounded on the back, smooth and polished.—Arid montane slopes or summits, 5000 to 8500 ft.: e. slopes or easterly summits of the Sierra Nevada from Kern Co. to Mono Co.; White Mts.; s. to north slope San Bernardino Mts.; e. to Utah and N. Mex.

2. *O. suffruticosa* Greene var. *abortiva* Mcbr. Stems decumbent or several from the root-crown, diffuse, leafy, branching, 3 to 5 in. long; herbage covered with a fine strigose puberulence, the leaves setose-ciliate toward the base; flowers in a close thyrsoïd panicle, leafy-bracteate; leaves linear-oblanceolate or linear, 2 to 4 in. long, mostly exceeding the panicles; calyx-tube ovate-lanceolate, the tube very short; corolla white, the tube not exserted, the lobes rounded; nutlets 1 to 4, irregularly triangular, polished, mottled on ripening.—Montane, 6000 to 10,200 ft.: northerly flats, San Bernardino Mts.; White Mts.; e. to Nev.

3. *O. echinoides* Mcbr. Stems few, ascending or erect, leafy, 3 to 9 in. high; herbage hispid throughout with long whitish hairs; leaves spatulate, mostly tufted at or near the base,  $\frac{3}{4}$  to  $1\frac{3}{4}$  in. long; inflorescence a spike-like thyrusus, leafy-bracteate below; calyx-lobes ovate-lanceolate, densely hispid; corolla yellow, its tube scarcely exceeding the calyx, the lobes rounded, the crests prominent; nutlets gray, ovate, keeled dorsally, sulcate ventrally, rugose and finely tuberculate.—Desert ranges or arid slopes of ranges bordering the deserts, 4000 to 6000 ft.: San Bernardino Mts.; Providence Mts.; Ivanpah Mts.; Panamint Mts.; Silver Mt., Mono Co.; Squaw Valley, Truckee River; e. to Utah, n. to Can. June.

4. *O. nubigena* Greene. Stems erect, leafy, 3 to 5 in. high, usually several from the branched root-crown; herbage hispid with long yellowish hairs, densely so above, tomentulose throughout; leaves spatulate-obovate, mostly in a basal tuft,  $\frac{3}{4}$  to  $1\frac{3}{4}$  in. long, the basal narrowed to a petiole; inflorescence contracted into a dense cluster or shortly spike-like; calyx-lobes ovate-lanceolate; corolla white with yellow center, the tube little or not at all exserted, the lobes broad and rounded, the throat with prominent crests; nutlets brown, narrow-ovate, sparingly rugose or wrinkled.—Summits of the Sierra Nevada, 4000 to 12,000 ft.: Modoc Co.: Sonora Pass; Clouds Rest; Mt. Whitney; also White Mts. May-July. Well-developed mature fruit is still unknown.

12. **GREENEOCHARIS** Gurke & Harms

Low, diffusely branching annuals, the small white flowers leafy-racemose and leafy-glomerate. Herbage hispid-canescens. Calyx 5-cleft to the middle, the scarious tube circumscissile about midway, the upper part falling, the lower persistent around the small ovate nutlets. (E. L. Greene, writer on western borages, and Greek charis, grace or beauty.)

1. *G. circumscissa* (Torr.) Rydb. Stem slender, diffusely much branched,  $1\frac{1}{2}$  to 7 in. high; leaves linear, alternate or some of the lower opposite, 3 to 7 lines long; flowers sessile in the axils of the leaves or crowded in leafy-bracteate clusters at the ends of the branchlets; calyx early circumscissile; corolla 1 line long, the throat naked and open; nutlets ovate, rounded on the back, dull, smooth or punctulate,  $\frac{1}{2}$  line long.—Desert mesas or mt. slopes, 4000 to 6500 ft.: Mohave Desert and its bounding mountain ranges; n. along east side Sierra Nevada to Lassen Co.; n. to Wash., e. to Utah. May-June. (*Piptocalyx circumscissus* Torr.) Var. *DICHOTOMA* Jepson n. comb. Seeds smooth and shining,  $\frac{1}{2}$  to  $\frac{3}{4}$  line long.—E. slope Sierra Nevada from Inyo Co. to e. Nevada Co. (Boca); Verdi, w. Nev. July-Aug. (*Krynitzkia dichotoma* Greene.)

13. **CRYPTANTHA** Lehm. NIEVITAS

Annuals, rarely biennials or perennials. Flowers nearly always sessile and scorpioid-spicate. Calyx 5-parted to the base, as long as the corolla-tube; segments more or less hispid or with hooked bristles, in fruit usually closely embracing the nutlets, eventually deciduous. Corolla white, small ( $\frac{1}{2}$  to 3 lines broad). Nutlets 4, sometimes 3, 2 or 1, smooth, papillate, or muriculate, never rugose; face of nutlet with a ventral groove from the apex to the scar near the base, usually continued beyond the scar as a fork and either open (areolate) or closed. Nutlet attached to the subulate gynobase from the scar halfway or wholly to the apex along the groove. (Greek *kruptos*, hidden, and *anthos*, flower, perhaps on account of the minute flowers in some species.)

## A. INFLORESCENCE BRACTEATE.

Floral bracts not exceeding flowers; annuals.

Lower leaves not exceeding  $\frac{1}{2}$  in. .... 1. *C. micrantha*.

Lower leaves more than  $\frac{1}{2}$  in. .... 2. *C. costata*.

Floral bracts exceeding flowers.

Biennial or perennial; nutlets broad, mucronulate. .... 3. *C. racemosa*.

Annual; nutlets lanceolate, brown, polished. .... 4. *C. ramosissima*.

## B. INFLORESCENCE NOT BRACTEATE; ANNUALS.

## 1. Nutlet surface roughened.

Fruiting calyx, including pedicel, seldom more than 2 lines long.

Calyx in fruit recurved. .... 5. *C. recurvata*.

Calyx in fruit not recurved.

Plants profusely branched, thickly covered with bristles or short stiff hairs; nutlets minutely white-papillate upon purplish-gray or brown.

Desert plants; calyx 1 line long.

Nutlets without margins. .... 6. *C. angustifolia*.

Nutlets with whitish margins. .... 7. *C. holoptera*.

Cismontane plants; calyx  $\frac{1}{2}$  line long. .... 8. *C. micromeres*.

Plants scarcely branched, hispid to hirsute; nutlets conspicuously papillate or mucronate, white to brown or brown-flecked, never purplish.

Nutlets wingless.

Calyx-segments with both bristles and hairs.

Papillae on nutlets straight.

Nutlets ovate, acute. .... 9. *C. muriculata*.

Nutlets ovate, acuminate. .... 10. *C. ambigua*.

Papillae on nutlets dentate to curvidentate; nutlets lanceolate. .... 11. *C. intermedia*.

Calyx-segments with soft hairs but no bristles. .... 12. *C. utahensis*.

Nutlets winged; calyx-segments with soft hairs but no bristles. .... 13. *C. pterocarya*.

Fruiting calyx, including pedicel, three lines long or more; calyx-segments densely covered with long soft hairs.

Lower leaves about 1 line wide; calyx-segments silky-villous. .... 14. *C. crinita*.

Lower leaves 2 to 3 lines wide; calyx-segments hirsute. .... 15. *C. barbiger*.

## 2. Nutlet surface smooth.

Nutlets ovate-lanceolate.

Stems strigose; plants of interior foothills and mountains.

- Spreading montane plants, 2 to 4 in. high.....16. *C. glomeriflora*.  
 Erect foothill plants, 5 to 18 in. high.....17. *C. flaccida*.  
 Stems with spreading pubescence; coast or coast ranges.....18. *C. leiocarpa*.  
 Nutlets ovate-acute.  
 Plants stout; calyces with stiff bristles, fruiting calyx-lobes elongated.....  
 Plants slender; calyces with softer bristles, fruiting calyx-lobes scarcely if at all  
 elongated.....20. *C. affinis*.  
 19. *C. torreyana*.

1. *C. micrantha* (Torr.) Jtn. Stems slender, leafy, 2 to 5 in. high, diffusely much-branched from the base; root carrying purple stain; herbage grayish with somewhat appressed hispid hairs; leaves linear, 2 lines long; flowers in the axils of the leaves or crowded in leafy clusters at the ends of the branchlets; calyx-lobes oblong, obtuse; corolla 1 line long, the throat obscurely appendaged; nutlets ovate, acuminate, purplish-gray, polished, one or more commonly mucronulate.—Desert or arid valleys and mountain slopes, 1000 to 6000 ft.: Mohave and Colorado deserts and their bordering ranges s. and w.: San Bernardino Valley. Apr.-June. (*Eremocarya micrantha* Greene.)  
 Var. *LEPIDA* Jtn. Stems less slender and only sparsely hispid; corolla larger with the appendages in the throat less obscure.—Montane, 4500 to 6800 ft.: San Bernardino and San Jacinto mountains to mts. of e. San Diego Co. June-Aug. (*Eremocarya lepidia* Greene.)

2. *C. costata* Bdg. Stem profusely branched throughout, 3 to 6 in. high; stems and leaves gray with appressed hispid hairs, these interspersed with more sparse spreading longer and stiffer hairs; leaves lanceolate, the lower leaves  $\frac{3}{4}$  to 1 in. long; flowers minute, in dense leafy-bracteate spikes, the bracts and sepals closely beset with long rigid white or yellowish bristles with softer shorter hairs between; sepals lanceolate, 1 to  $1\frac{1}{2}$  lines long, in fruit twice as long; nutlets ovate,  $\frac{1}{2}$  line long, minutely roughened but shining, rounded on the back, with sharp edges, the ventral groove dilated from above the middle downward.—Desert valleys, 200 to 1000 ft.: Colorado Desert; n. to Death Valley region.

3. *C. racemosa* (Wats.) Greene. Stem profusely branched throughout,  $\frac{1}{2}$  to 1 or 2 ft. high, the ultimate branchlets almost filiform, the main stem and larger branches woody; herbage hispid with spreading bristles or the stem mostly strigose-hispid; leaves linear,  $\frac{1}{2}$  to 1 in. long; inflorescence loosely racemose-paniculate, the lowest flowers often on spreading pedicels, the upper nearly sessile; calyx in fruit usually about 1 line long, the segments lanceolate, bristly-hispid; corolla limb 1 line in diameter; nutlets ovate-lanceolate, unequal (the 3 smaller becoming free from the gynobase earlier, the fourth sometimes abortive),  $\frac{1}{2}$  line long, gray, mucronulate, the brown endocarp showing through the white coat, the margins whitish, sharp, the ventral groove open and gradually widening at base.—Deserts: Inyo Co.; Mohave and Colorado deserts; s. to L. Cal., e. to Ariz.

4. *C. ramosissima* (Gray) Greene. Stem usually stout with many ascending branches, 5 to 11 in. high; herbage rufescent, hispid, often, also, with more appressed finer hairs; leaves linear, somewhat thickened,  $\frac{1}{2}$  to 1 in. long; spikes elongate in age, rather densely flowered, more or less leafy-bracteate; calyx-segments linear, 1 line long with stiff bristles of about the same length among softer hairs; corolla minute; nutlets smooth, usually solitary, lanceolate,  $\frac{1}{2}$  to  $\frac{3}{4}$  line long, pale brownish-green with translucent pericarp, abruptly acute-margined; groove closed in perfect nutlets.—Deserts and desert mts., Inyo Co. to Colorado Desert; s. to L. Cal.

5. *C. recurvata* Cov. Stem slender, more or less branched from below, 2 or 3 to 8 in. high; herbage appressed-hispid, or the leaves with somewhat spreading hairs; leaves linear-ob lanceolate,  $\frac{1}{4}$  to  $\frac{3}{4}$  in. long; spikes in 2s or 3s. naked, becoming loose; calyx in fruit recurved, 1 to  $1\frac{1}{2}$  lines long, hispid-bristly with stiff divergent hairs; corolla minute, scarcely exserted; nutlet single, not 1 line long, ovate-lanceolate, muriculate, rounded on the angles, slightly incurved at apex, adherent to columnar gynobase for half the length of the closed ventral groove.—Mts. of Inyo Co.: White Mts.; Panamint Mts.

6. *C. angustifolia* (Torr.) Greene. Stem diffusely branched from base, 3 to 9 in. high; herbage densely hispid with white hairs which are commonly

pustulate at base; leaves narrowly linear, 3 to 8 lines long; flowers in dense spikes; sepals narrowly linear, 1 to  $1\frac{1}{2}$  lines long, densely covered with stout rigid often yellowish bristles nearly as long; corolla minute, exserted; nutlets ovate-lanceolate, about  $\frac{1}{2}$  line long (or 1 or 2 shorter, these sometimes abortive), minutely white-papillate upon purplish-gray, the ventral groove widened toward the base.—Colorado and Mohave deserts, n. to Inyo Co.; e. to Ariz. Mar.-May.

7. *C. holóptera* (Gray) Mcbr. Stem paniculately branched, 1 ft. high; or in depauperate specimens less than 3 in.; herbage gray with spreading (or on the stems appressed) hispid hairs; leaves lanceolate,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long, thickly white-dotted with the white pustules at the bases of the hairs; spikes naked or bracteate only at base, paniculate, finally elongate; calyx segments lanceolate,  $\frac{3}{4}$  (in fruit  $1\frac{1}{2}$ ) lines long, armed with bristles nearly as long, the midrib prominent at base; corolla minute; nutlets ovate,  $\frac{3}{4}$  line long, wing-margined, white-papillate upon a purplish-gray ground, the ventral groove open from the middle downward.—Colorado and Mohave deserts; n. to Inyo Co.; e. to Ariz. Mar.-Apr.

8. *C. micrómeres* (Gray) Greene. Stem slender, rather widely branched above the base, 4 to 9 in. high; herbage rough-hirsute almost throughout, the hairs not white; leaves oblong to linear,  $\frac{1}{4}$  to 1 in. long; spikes mostly terminal or subterminal, ebracteate, not dense, 2 to 4 in. long; calyx  $\frac{1}{2}$  line long; nutlets ovate, acute,  $\frac{1}{2}$  line long, minutely papillate, ventral groove opening at base.—Foothills: South Coast Ranges from Contra Costa Co. to Monterey Co. and s. to San Diego Co.; Amador Co.

9. *C. muriculata* (A.DC.) Greene. Stem robust, branching,  $\frac{1}{2}$  to  $1\frac{1}{4}$  ft. high; herbage rough-hirsute or hispid; leaves linear,  $\frac{1}{2}$  to 1 in. long; spikes well-developed, rather dense, mostly in 2s and 3s at the end of the branches; calyx  $1\frac{1}{2}$  lines long; corolla 2 to 3 lines broad; nutlets 1 line long, muricate-papillose, and somewhat rugose on the back; ventral groove and its basal bifurcation mostly closed; lateral angles acutish, distinct.—Montane, 2000 to 8000 ft.: Coast Ranges from Sonoma Co. s.; Santa Inez Mts.; Sierra

Nevada from Mariposa Co. southward; San Gabriel Mts. Var. *vitrea* Jepson n. comb. Profusely branched and vigorous, very floriferous; flowers much smaller; nutlets broader. — S. Sierra Nevada in Fresno Co. (*C. vitrea* Eastw.)

10. *C. ambigua* (Gray) Greene. Fig. 803. Stem much branched from the base,  $\frac{1}{2}$  to  $1\frac{3}{4}$  ft. high; herbage rough-hirsute throughout; leaves linear, 1 to  $1\frac{1}{2}$  in. long; spikes 1 to  $2\frac{3}{4}$  in. long, commonly very loose below, ternate or geminate, often pedunculate; calyx-segments linear, 1 to  $1\frac{1}{2}$  (or in fruit  $2\frac{1}{2}$ ) lines long, more densely hispid-bristly towards the base; corolla  $2\frac{1}{2}$  to 3 lines broad; nutlets gray, 4 or 3, narrowly ovate, papillate but not pointed or prickly, the lateral angle obtuse and the groove more or less closed, with the basal bifurcation open-areolate (or sometimes closed). — Mountain slopes, 1500 to 6000 ft.: inner North Coast Ranges from Lake Co. to Siskiyou Co., thence s. in the Sierra Nevada to Tulare Co.

11. *C. intermedia* Greene. Stem more or less diffusely branched

803. *Cryptantha ambigua* Greene; a, habit x  $\frac{1}{2}$ ; b, fl. x 4; c, nutlet, dorsal view x 8; d, nutlet, ventral view x 8.

from base,  $\frac{1}{2}$  to 1 ft. high; herbage hispid with appressed and spreading hairs; leaves lanceolate or linear,  $\frac{1}{2}$  to 1 in. long; spikes naked, in 2s or 3s, finally much elongated so that the flowers are remote; calyx-segments linear, scarcely 1 line long, in fruit often 2 to 3 or 4 lines long, hispid and armed with bristles 1 to  $1\frac{1}{2}$  lines long; corolla 2 lines broad; nutlets ovate, acuminate, roughened with unusually sharp-pointed papillae, the ventral groove open and widening at base.—Hills and valleys, 1000 to 4000 ft.: coastal S. Cal.; Colorado and Mohave deserts; Tehachapi Mts.; Inyo Co. Var. *DUMETORUM* Jepson n. comb. Diffuse flexuous branches  $\frac{1}{2}$  to 1 ft. high; leaves lanceolate,  $\frac{1}{2}$  to 1 in. long, densely studded with the conspicuous white pustules at the base of the hairs; spikes single, in 2s or 3s, finally elongating so that the flowers are distant.—Mohave Desert and bordering ranges. (*Krynitzkia dumetorum* Greene.)

12. *C. utahensis* Greene. Stem branched from base,  $\frac{1}{2}$  to 1 ft. high; herbage strigose-hispid; leaves linear,  $\frac{1}{4}$  to  $\frac{3}{4}$  in. long; spikes in 2s or 3s, very short; calyx 1 line long, rather densely silky-pubescent, not at all bristly; corolla  $1\frac{1}{2}$  lines broad; nutlets (often solitary and adhering closely to gynobase) ovate-acuminate, sharp on the edges,  $1\frac{1}{4}$  lines long, papillate and somewhat nerved dorsally, the ventral groove gradually widening toward base.—Desert valleys, 2000 to 4000 ft.: cent. and e. Mohave Desert; Inyo Co.; e. to Utah. May.

13. *C. ptërocarya* Greene. Stem slender and loosely branched or diffusely much branched from base, 6 to 9 in. high; herbage hispid with appressed or spreading hairs; leaves linear,  $\frac{1}{2}$  to 1 in. long; spikes short, at first glomerate, in 2s or 3s; calyx in fruit 2 lines long, the segments with a few stiff bristles, linear at first, in fruit becoming ovate, the midrib prominent; corolla not 1 line broad; nutlets ovate, papillate on the back, the edges produced into broad scarious somewhat crenate wings (or 1 nutlet wingless), the ventral groove open or closed, with open forks at base.—Colorado and Mohave deserts; e. side Sierra Nevada from Inyo Co. to Lassen Co.; n. to Wash., e. to Tex. Apr.-June. Var. *PURPUSII* Jepson n. var. Inflorescence denser; calyces smaller; nutlets with narrow wing (one wingless).—Argus Mts. (*Purpus* 5433, type).

14. *C. crinita* Greene. Stem rather strictly branched from near base, 7 to 12 in. high; herbage hirsute; the pustulate bases of the hairs giving them a salty appearance; leaves linear,  $\frac{1}{2}$  to 1 in. long; spikes elongate, very dense, on very slender peduncles, the shaggy-hirsute covering of the calyces almost concealing the individual flowers; calyx-segments linear, obtuse, in fruit  $2\frac{1}{2}$  to 3 lines long; corolla  $1\frac{1}{2}$  to 2 lines broad; nutlet solitary, sharply acuminate, with granular brittle pericarp,  $1\frac{1}{2}$  lines long, the ventral groove open at the base.—Creek bottoms, 500 ft., Shasta Co. Apr.-May.

15. *C. barbigerà* Greene. Stem freely branched from base,  $\frac{3}{4}$  to 1 ft. high; herbage hispid and hirsute; leaves oblong-linear,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; spikes solitary or paniculate, becoming elongated, the flowers at length remote and less secund; calyx-lobes linear-attenuate, in fruit 3 to 4 lines long, armed with numerous bristles  $1\frac{1}{2}$  to 2 lines long and also white-villous; corolla 2 to 3 lines broad; nutlets mostly 1, ovate, acuminate, 1 line long, the grayish-brown surface thickly studded with white papillae, the ventral groove open, dilated at base; gynobase subulate with the infertile ovary-lobes persistent.—Santa Barbara Co.; Colorado and Mohave deserts; Inyo Co.; e. to Utah and Ariz. Apr.-May. Var. *INOPS* (T. Bdg.) Mcbr. Branches slender, terete, divaricate to flexuous.—Colorado and Mohave deserts, n. to Inyo Co. Apr. (*Krynitzkia barbigerà* var. *inops* Bdg.)

16. *C. glomeriflora* Greene. Stem diffusely branching from base, 2 to 4 in. high; herbage hispid; leaves linear-oblong,  $\frac{1}{4}$  to  $\frac{1}{2}$  in. long; flowers in glomerules of 2 or 3 at the ends of the branches and in the axils of even the lowest leaves; calyx-segments linear,  $\frac{1}{2}$  line long, armed with bristles as long; corolla very minute; nutlets smooth and shining, ovate, acute, the ventral groove open only at base.—Montane 6000 to 10,300 ft.: Sierra Nevada from Nevada Co. to Tulare Co.; White Mts. July.

804. *Cryptantha flaccida* Greene; a, habit  $\times \frac{1}{4}$ ; b, lf.  $\times 4$ ; c, fr. calyx  $\times 4$ ; d, nutlet, dorsal view  $\times 8$ ; e, nutlet, ventral view  $\times 8$ .

17. *C. flaccida* (Dougl.) Greene. Fig. 804. Stem strictly and rigidly erect, with few ascending branches at the top,  $\frac{3}{4}$  to  $1\frac{1}{4}$  ft. high; leaves linear; spikes 2 to 4 in. long, at length not crowded; corolla nearly or quite 1 line broad; fruiting calyx  $1\frac{1}{2}$  lines long, appressed to the rachis, its narrowly linear segments thickish at base, connivent above, nearly twice as long as the nutlet, hispid and bearing toward the base a deflexed tuft of bristles; nutlet 1, ovate, rostellate-acuminate at apex, smooth and shining, the groove enlarged below but not forked.—Gravelly hillslopes or valleys, 500 to 4000 ft.: throughout cismontane Cal. Apr.-June.

18. *C. lilocarpa* (F. & M.) Greene. Stem commonly branched from the base, with many erect or ascending branches, 5 to 18 in. long; branches mostly simple below, branching above, and bearing many spikes which are often more or less congested; herbage hirsute or hispid with spreading hairs; leaves linear,  $\frac{1}{2}$  to 1 or  $1\frac{1}{4}$  in. long; spikes leafy-bracted, rarely bractless, the terminal longer and interrupted, the lateral short and glomerate; calyx-lobes short-linear, hispid-bristly, 1 line long; nutlets usually 4, rarely 1, narrowly ovate, acute,  $\frac{3}{8}$  line long, the ventral groove not forked, or scarcely so.—Sandy lands near the coast: Humboldt Co. to Monterey Co. May-June. Bristles often pustulate-dilated at base. Nutlets mottled transversely on the ventral side and longitudinally on the back. (*C. hispidissima* Greene.)

19. *C. torreyana* (Gray) Greene. Stem erect, usually stout, branched from the middle and sometimes from the base; herbage markedly hispid; leaves linear,  $1\frac{1}{2}$  to  $2\frac{1}{4}$  in. long; spikes commonly elongated, loose below, frequently geminate; calyx-segments very bristly, elongating in fruit; nutlets ovate, acute, the groove forked at base, the fork sometimes minute.—Hillslopes, 1500 to 5000 ft.: Mt. Hamilton Range; North Coast Ranges; Sierra Nevada from Tehama Co. to Kern Co. Apr.-June. Var. *incana* Jepson n. comb. Whole plant gray with dense spreading hispid hairs and (on the stems) finer strigose hairs; calyx elongating less in fruit.—Nine-Mile Creek, Tulare Co. (*C. incana* Greene.)

20. *C. affinis* Greene. Stem slender, branching,  $\frac{1}{2}$  to 1 ft. high; herbage hispid with rather short hairs; leaves oblong to oblanceolate,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long, those of the main stem often opposite; spikes simple or in pairs, leafy at base, interrupted; flowers minute; calyx-segments narrowly linear, 1 to  $1\frac{1}{2}$  lines long, not elongating in fruit, rather sparsely armed with stiffish bristles; nutlets ovate, acute or acuminate, rounded on the back, smooth and shining, mottled,  $\frac{3}{4}$  line long, attached only up to the middle to the gynobase, the ventral groove closed to base.—Montane, 4000 to 7500 ft.: San Bernardino Mts.; Sierra Nevada from Tulare Co. to Shasta Co.; North Coast Ranges from Lake Co. to Siskiyou Co.; n. to Wash. and Ida. June-July.

#### 14. *ALLOCARYA* Greene

Low herbs of wet ground, mostly branching from the base. Leaves linear or narrow, entire, the lowest always opposite. Pedicels persistent. Calyx 5-parted to the base, indurated and somewhat accrescent in fruit. Corolla white with yellow throat, salverform, with short tube; processes or crests

in the throat none or weakly developed. Nutlets ovate or lanceolate-ovate, smooth, rugose, tuberculate or even with barbed or prickly points, often carinate on one or both sides. Scar of the nutlet basal or above the base, concave or sometimes raised and stipe-like. (Greek allos, diverse, and karua, nut, the plants separated from *Cryptantha* on account of the different fruits.)

A. PERENNIALS; HERBAGE WITH A DENSE COVER OF LONG SOFT HAIRS.

Nutlets gray, rugose, the lateral angles carinate.....1. *A. mollis*.  
Nutlets brown, reticulate, without lateral carina.....2. *A. vestita*.

B. ANNUALS.

1. Scar basal or very nearly so, not excavate or at least not deeply so.

Nutlets drawn to a lanceolate point above the middle.

Scar exactly basal; calyx strongly accrescent.

Stems fistulous-enlarged; nutlets strongly 3-carinate dorsally.....3. *A. glabra*.

Stems not fistulous; nutlets lightly 3-carinate dorsally.....4. *A. stipitata*.

Scar not exactly basal; calyx not accrescent or not markedly so.

Northern Sierra Nevada.....5. *A. ambigens*.

Mohave Desert.....6. *A. cooperi*.

Nutlets ovate or ovoid; scar extending a little way up one side from the base (except in no. 12).

Keel on ventral side of nutlets lying in a groove.

Nutlets whitish or light-colored, perfectly smooth and shining...7. *A. lithocarya*.

Nutlets roughened, drab or brownish.....8. *A. chorisiana*.

Keel on ventral side not lying in a groove or not obviously so.

Nutlets not bristly.

Rugae not sharp or dentate.

Ventral rugae or tuberculations distinct from carina or essentially so.

Scar linear; nutlets transversely and closely rugulose.9. *A. scalpta*.

Scar ovate.

Surface of nutlets more or less reticulate, not tuberculate or scarcely so.....10. *A. minuta*.

Surface of nutlets densely tuberculate.....11. *A. diffusa*.

Ventral rugae or tubercles more or less distinctly merged with carina..

12. *A. californica*.

Rugae sharp or dentate or muriculate.

Scar linear; nutlets of a granitic cast.....13. *A. stricta*.

Scar ovate; nutlets brown.....14. *A. trachycarpa*.

Nutlets microscopically bristly.

Scar linear; bristles stout.....15. *A. hispidula*.

Scar ovate; bristles very slender.....16. *A. humistrata*.

2. Scar distinctly suprabasal, deeply excavate, large, usually half as large as the nutlet; nutlets with bristles or barbed prickles.

Nutlets not rugulose dorsally.

Bristles scattered over the whole back of the nutlet.

Bristles very unequal, not barbed.....17. *A. spiculifera*.

Bristles subequal, barbed.....18. *A. greenii*.

Bristles only on the dorsal ridge and marginal angles.....19. *A. austinae*.

Nutlets more or less rugulose-areolate, the rugae bearing bristles.

Rugae high; areoles tuberculate.....20. *A. acanthocarpa*.

Rugae low; areoles smooth.....21. *A. scripta*.

1. *A. mollis* (Gray) Greene. Stems 1 to several from the base, spreading or ascending, 2 to 5 in. high; herbage densely clothed with long straight and rather soft hairs even to the calyx; leaves linear-lingulate, obtuse,  $1\frac{1}{2}$  to  $3\frac{1}{4}$  in. long; racemes dense, or at length looser, bractless; corolla  $2\frac{1}{2}$  to 3 lines broad; nutlets ovate, irregularly rugose or rugose-foveolate, more or less carinate on the back and at the lateral angles, the scar shortly ovate-lanceolate.—Moist alkaline flats and borders of ponds: Sierra Co. to Modoc Co.; n. to eastern Ore.

2. *A. vestita* Greene. Rank plant with ascending stems 1 to  $1\frac{1}{2}$  ft. high; herbage conspicuously pilose throughout even to the calyx; spikes 3 to 6 in. long, bractless; flowers about 2 lines broad; fruit not scattered; nutlets brown, nearly 1 line long, regularly reticulate on the back, carinate from the apex to below the middle (the carina there vanishing in the meshes of the reticulation) or not carinate, strongly ridged ventrally down to the roundish scar, which is bounded toward the base by a horseshoe-shaped ridge; epidermal cells microscopically muriculate.—Valley floors: Sonoma Co.; Tulare Co. An unusually localized distribution. (*A. mollis* var. *vestita* Jepson.)

3. *A. glabra* (Gray) Mebr. Branched from the base, or strictly erect and simple, 5 to 6 in. high; rachis of the spikes fistulous-enlarged, the flowers

rather dense, but strictly unilateral in 2 rather marked rows; calyx-segments spatulate or ovate, very strongly callous-thickened toward the base, the sinus next the axis much deeper than the others, some of the outer sepals united nearly to the summit in some cases; nutlets finely tuberculate, carinate dorsally and with rather sharp lateral angles.—Salt marshes, e. side San Francisco Bay and s. to Santa Clara Co. (*A. salina* Jepson.)

4. *A. stipitata* Greene. Branches many from the base, mostly simple, slender, somewhat spreading, commonly 9 to 12 in. long; herbage sparsely setulose; leaves linear-oblongate, 1 to 3 in. long, or the basal obovate or oblong, attenuate into a long petiole; pedicels turbinate-thickened beneath the flower; corolla 2 to 3 lines broad, white with yellow eye or the eye changing to white; sepals at length brownish and often spreading, strongly accrescent, becoming 3 to 4 lines long; nutlets obscurely constricted at base, somewhat flattened on the back, rugose and more or less finely tuberculate, strongly carinate ventrally, the dorsal carina obsolete just above the middle.—Plains, very common: inner Coast Range valleys; Great Valley; Sierra Nevada foothills. Apr.-May. Var. *MICRANTHA* Mcbr. Corolla 1 to 2 lines broad.—With the species.

5. *A. ámbigens* Piper. Four to 6 in. high; herbage nearly glabrous except on the younger parts; calyx only slightly accrescent; corolla  $1\frac{1}{2}$  to 2 lines broad; nutlets as in *A. stipitata* except that the scar is basally oblique.—Plumas Co.

6. *A. cóoperi* (Gray) Greene. Diffusely branched from the root, 4 to 8 in. high; leaves linear, somewhat succulent,  $\frac{1}{2}$  to 1 in. long, the basal 1 to  $2\frac{1}{2}$  in.; calyces densely white-hispid; nutlet ovate-trigonal, obcompressed, abruptly contracted above the middle, ventrally reticulate-rugulose, dorsally transversely rugulose, the scar shortly sub-linear.—Mohave Desert; n. to Inyo Co.

7. *A. lithocàrya* (Gray) Greene. Stems 7 to 10 in. high; leaves linear, 1 to  $1\frac{1}{2}$  in. long; racemes becoming loose and more or less leafy-bracted; nutlets smooth and vitreous-shining, whitish or somewhat mottled, lightly carinate dorsally, the ventral keel hidden by lateral folds for nearly its entire length; scar narrowly linear, likewise hidden by the folds.—Lake and Mendocino Cos.

8. *A. chòrisiàna* (Cham.) Greene. Diffuse (or at first erect) with reclining branches 7 to 16 in. long, strigose throughout and very leafy below; basal leaves linear-elongated, 2 to 4 in. long; racemes elongated, at length very loose, leafy below; fruiting pedicels 3 to 6 lines long, seldom only 1 line long; calyx little accrescent, about 1 line long, the segments at length spreading; corolla 3 to 4 lines wide; nutlets ovate,  $\frac{1}{2}$  line long or a trifle more. dark brown, carinate ventrally only, or also dorsally toward the apex, more or less rugulose or minutely tuberculate; ventral carina set in a groove; scar linear.—Low ground towards the coast, sw. Solano Co. to Monterey Co. Apr.-June. Var. *MÝRIÁNTHA* Jepson n. comb. Pedicels nearly all shorter than the calyx; corolla 1 to  $1\frac{1}{2}$  (or  $2\frac{1}{2}$ ) lines broad; nutlets brownish, rugulose, minutely tuberculate, carinate half-way down the back.—Monterey coast from Monterey to San Simeon. (*A. myriantha* Greene.) Var. *HICKMÁNNII* Jepson n. comb. Like var. *myriantha* but obscurely tuberculate, scarcely rugulose.—Southern Monterey Co. (*A. hickmannii* Greene.) Var. *UNDULÁTA* Jepson n. comb. Nutlets closely rugulose, not tuberculate.—Santa Barbara. (*A. undulata* Piper.)

9. *A. scálpita* Piper. Stems loosely branched, 5 to 8 in. high; nutlets keeled dorsally only near the apex, closely transverse-rugulose; scar ovate.—Humboldt Co.

10. *A. mínúta* Piper. Stems erect, 6 to 10 in. high; nutlets closely reticulate with fine ridges, keeled dorsally near the apex, the surface not tuberculate or scarcely so, scar ovate; epidermal cells microscopically muriculate.—Mendocino and Humboldt Cos. Var. *RETÍCULÁTA* Jepsor n. comb. Nutlet reticulate, the areoles large, smooth; no dorsal keel.—Humboldt Co. (*A. reticulata* Piper.)

11. *A. diffusa* Greene. Branches several from the base, decumbent or spreading, 5 to 8 in. long; corolla 1 to  $1\frac{1}{2}$  lines broad; nutlet transversely rugulose-reticulate on back and finely tuberculate; scar ovate; epidermal cells microscopically muriculate.—Valleys about San Francisco Bay.

12. *A. californica* (F. & M.) Greene. Similar in habit to *A. stipitata*; flowers 1 to  $1\frac{1}{2}$  lines broad; nutlets ovate, carinate ventrally and a little past the apex dorsally, usually grayish, closely rugulose dorsally; scar not raised, nearly basal, ovate or sometimes linear (even on same plant).—Throughout montane Cal., but most common in the North Coast Ranges and n. Sierra foothills.

13. *A. stricta* Greene. Stem slender, strictly erect, commonly branching freely from the base, 6 to 15 in. high; stems and leaves glabrous or nearly so; spikes very dense; corolla 2 lines broad; nutlet keeled to the middle and transversely rugulose dorsally, the rugae sharp, the interspaces very narrow but more or less tuberculate; scar linear.—Upper Napa Valley.

14. *A. trachycarpa* (Gray) Greene. More or less diffuse or decumbent; racemes leafy throughout or nearly so; calyx-segments spreading; corolla small, 1 to  $1\frac{1}{2}$  lines broad; nutlets broadly ovate, transversely and sharply rugose and papillate or muricate, carinate ventrally and dorsally; dorsal rugosities commonly simple, and keel mostly dentate-interrupted; scar deltoid-orbicular, nearly basal.—Sacramento and San Joaquin valleys and w. to Sonoma and Monterey Cos.

15. *A. hispídula* Greene. Spreading, 2 to 6 in. high; herbage hirsutulose; nutlet finely tuberculate, rugulose-reticulate, microscopically bristly on the ridges, carinate ventrally; scar linear, not excavated; bristles more or less barbed at tip.—Montane, 5000 to 8000 ft.: Sierra Nevada; San Bernardino Mts. Var. *PENICILLATA* Jepson n. comb. Nutlets with the barbed bristles tufted, especially on the tubercles; scar excavated.—Sierra Nevada, 5000 to 8700 ft. (*A. penicillata* Greene.)

16. *A. humistrata* Greene. Branches stoutish, mostly prostrate, 6 to 12 in. long; pedicels short and stout, commonly deflexed; calyx markedly accrescent, in fruit 4 to 6 lines long; nutlets muriculate and sharply rugulose, bearing minute penicillate bristles; scar roundish, exactly basal.—San Diego and n. to the San Joaquin Valley. Var. *SIMILIS* Jepson n. var. Scar ovate, oblique at the base.—E. Contra Costa Co. (Antioch, K. Brandegee, type).

17. *A. spiculifera* Piper. Branches spreading, 4 to 8 in. long; nutlet covered with short spines which arise from the dorsal keel and from low reticulations, some of the spines barbed at tip; scar deltoid, bordered by a flange-like margin.—Tulare Co. plains.

18. *A. greenei* (Gray) Greene. Diffusely branched from the base, the straggling branches 5 to 15 in. long; herbage strigulose-pubescent; leaves linear-oblongate; racemes simple, leafy or bracteate below, the flowers scattered; nutlets broadly ovate, 1 line long, carinate, densely and minutely tuberculate and well armed with slender barbed prickles; prickles  $\frac{1}{4}$  to  $\frac{1}{2}$  line long, quite distinct at base.—Grassy clay hills or adobe plains, northern Sierra foothills from Calaveras Co. to Siskiyou Co.; n. to Ore. Var. *HYSTRICULA* Jepson n. comb. Bristles very short (about  $\frac{1}{8}$  the length of the nutlet), densely barbed throughout, disposed in rows, either crowded or interrupted, but so arranged as to make the surface somewhat areolate; areoles covered with fine tubercles.—Low plains, Solano Co. (*A. hystricula* Piper.)

19. *A. austinae* Greene. Erect, 6 to 9 in. high; herbage almost glabrous; leaves linear,  $1\frac{1}{2}$  to 3 in. long; surface of nutlet densely tuberculate, the dorsal keel and lateral angles armed with stout bristles; bristles barbed from midway up.—N. Sierra Nevada foothills and bordering plains from Amador Co. to Shasta Co. Var. *CRISTATA* Jepson n. comb. Surface of nutlet not tuberculate.—Calaveras Co. (*A. cristata* Piper.)

20. *A. acanthocarpa* Piper. Branches several from the base, simple, 4 to 6 in. high; corolla  $\frac{3}{4}$  line wide; keel and ridges of the lateral reticulations armed with bristles; interspaces tuberculate.—San Joaquin Valley in Kern Co. Var. *ECHINACEA* Jepson n. comb. Reticulations of the nutlet small; bristles of the nutlet very numerous.—Great Valley and South Coast Ranges

to San Diego Co. (*A. echinacea* Piper.) Var. *OLIGOCHAETA* Jepson n. comb. Bristles very few.—E. Contra Costa Co. (*A. oligochaeta* Piper.)

21. *A. scripta* Greene. Branches prostrate, 6 to 10 in. long; back of the nutlets smooth and brown, except as marked by sharp white-reticulated ridges, these irregularly beset with tufts of spreading bristles.—Sacramento Valley.

### 15. *ECHIDIOCARYA* Gray

Annual herbs with the lower leaves opposite. Flowers in racemes. Nutlets strongly incurved, dorsally rugose; scar elevated on a conspicuous slender projection or stipe. Ventral keel prominent, continuous downward and joined to the base of the stipe. (Greek echidion, a diminutive viper, and carua, nutlet, the stipe suggestive of the head and neck of a snake.)

1. *E. californica* Gray. Stems several or numerous from the base, diffuse or prostrate, mostly slender, often very leafy, 5 to 14 in. long, flowering for  $\frac{2}{3}$  or more of their length; herbage hispid or hirsute; leaves linear; racemes spike-like, mostly bractless, in age remotely flowered; calyx cleft nearly to the base; corolla  $1\frac{1}{2}$  to 3 lines wide; nutlets usually 4, ovate,  $\frac{3}{4}$  line long, the median dorsal ridge well-marked towards apex, the ridges of the lateral angles not conspicuous and blending with the transverse ridges of the back which connect to form polygonal areas.—Mesas, 100 to 1500 ft., constal S. Cal. from the Santa Inez Mts. to San Diego Co. Var. *URSINA* Jepson n. comb. Stems stout, short, depressed; nutlets about 1 line long, the dorsal ridges few.—Summit valleys, San Bernardino Mts. (*Plagiobothrys ursinus* Gray.)

### 16. *PLAGIOBOTHYRS* F. & M. POP-CORN FLOWER

Rather slender annuals. Herbage soft-pubescent, the hairs often rusty when young, especially on the calyx. Leaves alternate, mostly in a basal rosette. Flowers in spike-like, elongated, loose and sometimes leafy racemes or sometimes glomerate. Pedicels very short or almost none, filiform, persistent. Corolla short, white, with crests or processes at the mouth of the throat. Nutlets ovate, carinate on both sides towards the apex and often also laterally margined, on the back rugose or roughened; insertion above the base or median, the scar raised and rounded and leaving a corresponding depression on the receptacle or gynobase. (Greek plagios, on the side, and bothrus, pit or excavation, the first known species having a hollow scar.)

Caruncle rounded or circular in outline; nutlets ovate or cruciform.

Flowers in an elongated raceme; caruncle firm or cartilaginous, borne at or a little below the middle of the nutlet in a transverse groove and thus lying below the ventral keel; basal rosette of leaves conspicuous; mature nutlets 1 to 4.

Calyx-lobes erect or spreading, not circumsissile; mature nutlets usually 4.

Nutlets with the back marked off by transverse lineate grooves into broad flattish ridges.

Plants conspicuously purplish; nutlets ovate, constricted only at apex, the base rounded, dark-colored.....1. *P. torreyi*.

Plants not purplish or rarely so; nutlets strongly constricted at apex and at base, and thus cruciform, vitreous-shining or glassy.

Calyx about twice as wide as long; racemes not bracteate or only at base; stems many from base, slender...2. *P. tenellus*.

Calyx nearly as broad as long; racemes bracteate; stems few, stout.....3. *P. shastensis*.

Nutlets with transverse dorsal ridges very thin and sharp, the ridges rather widely separated, so that, with the 3 keels, there are enclosed depressed rectangular areas with granulate surface.

Caruncle conspicuous, ring-like or annular; calyx cleft to the base; corolla-tube exceeding the calyx; var. *campestris* of.....

4. *P. fulvus*.

Caruncle solid; calyx cleft  $\frac{2}{3}$  to base; corolla-tube not exerted from calyx.....5. *P. canescens*.

Calyx-lobes connivent over fruit, in age circumsissile; mature nutlets 1 or 2.

Flowers in forked racemes, not bracteate or only at base; stems mostly erect, rather tall (10 to 30 in. high); nutlets, in lateral outline, compressed.....6. *P. nothofulvus*.

Flowers in a long simple bracteate raceme; stems low (5 to 8 in. high), usually ascending, branched mainly below the middle; nutlets, in lateral outline, strongly arched.....7. *P. arizonicus*.

Flowers in a close cluster or glomerule; e. side Sierra Nevada.....8. *P. hispidus*.  
Caruncle elongated, extending along the median ventral keel; nutlets trigonous; deserts on e. side Sierra Nevada.

Nutlets irregularly rugose; corolla 2 to  $3\frac{1}{2}$  lines broad; flowers in a congested cluster or glomerule; var. *harknessii* of.....9. *P. kingii*.  
 Nutlets regularly tessellate; corolla  $\frac{1}{2}$  to 1 line broad.....10. *P. jonesii*.

1. *P. torreyi* Gray. Fig. 805. Stems several to many from the base, erect or decumbent, commonly simple, 2 to 6 in. long, commonly rather densely leafy throughout; roots purple; herbage very dark green, conspicuously hispid; leaves oblong to oblong-ovate or linear, sessile, 5 to 10 lines long; racemes leafy-bracteate throughout, somewhat loose; calyx cleft nearly to base; corolla 1 to  $1\frac{1}{2}$  lines broad; nutlets commonly 4, ovate, dull or gray, somewhat constricted at apex, rounded at base,  $\frac{3}{4}$  to 1 line long, the dorsal ridge weak, produced around apex into the narrow and very prominent ventral keel; lateral angles well-defined, the back with transverse lineate grooves, thus separating the dorsal area into low ridges; caruncle small, sunken in the transverse groove.—Montane, 4000 to 8000 ft.: Sierra Nevada from Nevada Co. to Tulare Co. Var. *DIFFUSUS* Jtn. Stems diffusely spreading, more leafy; bracts larger; flowers more numerous.—Sierra Nevada.

2. *P. tenellus* Gray. Stems 1 to several from the base, commonly erect, simple or branching above, 3 to 7 (or 12) in. high; herbage pubescent or often hirsute with spreading hairs; leaves of the basal tuft oblong, acute or obtuse,  $\frac{1}{2}$  to 1 in. long; cauline leaves few, ovate or ovate-oblong, 2 to 6 lines long; spikes 1 to 3 in. long, comparatively few-flowered; calyx deeply cleft, at first rusty-yellowish, at length pale, sometimes imperfectly circumscissile; nutlets minute ( $\frac{1}{4}$  line long), shining and enamel-like on the back, papillate-scabrous on the lateral angles and often also on the rugae; rugae transverse, straight, smooth and low, separated by very fine lines.—Hill slopes, 100 to 2000 (or 3000) ft.: Coast Ranges; Sierra Nevada foothills; coastal S. Cal. May.

3. *P. shastensis* Greene. Stems erect, stoutish, one or few from the base, simple or branching above, 5 to 12 in. high; herbage thinly hirsute; leaves linear; racemes loose; calyx 2 to  $2\frac{3}{4}$  lines broad, scarcely longer, cleft to the middle; corolla  $1\frac{1}{4}$  lines broad; nutlets glassy, transversely lineate-grooved with broad flat ridges between the grooves.—Hillslopes and valleys, 500 to 2500 ft.: e. San Joaquin Co. to Butte Co.; Lake Co. to Siskiyou Co.; n. to southern Ore.

4. *P. fulvus* (H. & A.) Jtn. var. *campéstris* (Greene) Jtn. Stems 1 or several from the base, erect or simple or branching only above, 1 to 2 ft. high; herbage hispid-hirsute; roots, petioles and midribs of leaves purple-dyed; herbage hirsute; leaves linear or lanceolate,  $\frac{1}{2}$  to  $3\frac{1}{4}$  in. long; racemes very loose and leafless; calyx-segments nearly distinct, lanceolate, connivent over the nutlets, more or less reddish even in age, 2 to 3 lines long in fruit; corolla 1 to 2 lines broad; nutlets usually 4,  $1\frac{1}{2}$  lines long, nearly 1 line wide in the middle, abruptly beaked, the transverse rugae more or less interrupted and often dot-like or granulate; median and lateral ridges prominent; caruncle raised and ring-like, bordering a deep circular excavation.—Plains and foothills, 100 to 1500 ft.: Sacramento Valley and its bordering foothills; s. to Mariposa, Santa Clara and San Luis Obispo Cos. Apr.-May. (*P. rufescens* var. *campestris* Jepson.)

805. *Plagiobothrys torreyi* Gray; a, habit x  $\frac{1}{2}$ ; b, fl. x 4; c, corolla spread open x 3; d, nutlet x 8.

5. *P. canescens* Benth. Stem divided at or near the base into long and straggling branches, rarely erect, the branches nearly or quite simple,  $\frac{1}{2}$  to 2 ft. long, loosely flower-bearing and leafy nearly throughout, or quite leafless above and spicate; herbage pale, hirsute; leaves oblong to linear, lanceolate or oblanceolate,  $\frac{3}{4}$  to  $2\frac{1}{2}$  in. long; calyx cleft to below the middle, the segments broadly lanceolate, in fruit circular-depressed, 2 to 3 lines long, the tips of the segments connivent over the nutlets; pedicels short, stubby, persistent, the calyx in age deciduous; nutlets commonly 4, incurved-connivent, rugose-reticulate, light gray, 1 line long, the areola smooth, longer transversely, and the lateral angles very distinct.—Low open hills and rolling plains, 100 to 1500 ft.: Sacramento and San Joaquin valleys and their bordering foothills; s. to San Diego Co. Apr. Var. *APÉRTUS* Greene. Calyx-segments stellately spreading; caruncle green, a small hollow like a pin point on the upper part of it.—Alameda and Santa Clara Cos. to San Diego Co.; also Great Valley. Var. *CATALINÉNSIS* Jepson n. comb. Herbage purple-stained; nutlets commonly 2.—Santa Catalina Isl. (*P. arizonicus* var. *catalinensis* Gray.)

6. *P. nothofulvus* Gray. Stems slender, 1 to several from the base, erect or suberect, simple or forked only above, 1 to  $2\frac{1}{2}$  ft. high; roots, petioles and midribs of leaves purple-dyed; herbage silky-villous, the hairs very reddish when young, especially on the calyx and sometimes on the leaves; raceme forked once, twice or more, the inflorescence then paniculate, leafless or bracted only at base; leaves 1 to  $3\frac{1}{2}$  in. long, oblong-ovate or lanceolate, those of the basal tuft oblong-ovate or oblanceolate; calyx cleft to the middle,  $1\frac{1}{2}$  lines long, in fruit circumscissile below the middle, the upper part falling away and leaving the persistent base as a shallow cup about the nutlets; corolla 2 to 4 lines broad; nutlets 3 (sometimes 4, 1 or 2), ovate, narrowed to a stout apical beak, flat dorsally, dull; transverse ridges joining the median dorsal keel with the lateral keels complete (and thus making rectangular areoles) or incomplete; caruncle situated in the shallow transverse groove.—Foothills and valleys, 100 to 3100 ft.: Sierra Nevada foothills (common); Coast Ranges (frequent but usually not on the immediate coast); Great Valley (infrequent); s. to San Diego Co.; n. to Wash. Mar.-May.

7. *P. arizonicus* (Gray) Greene. Stems several from the base, usually simple, erect or ascending, 8 to 15 in. high; herbage hispid with spreading hairs; leaves linear-lanceolate to linear; roots, midribs and margins of leaves purple, or occasionally the whole plant purplish; racemes elongated, remotely flowered, mostly naked above; calyx cleft nearly half-way to base, the oblong lobes connivent over the fruit, the lower portion at length circumscissile near base; corolla 1 to  $1\frac{1}{4}$  lines broad; nutlets 2 (sometimes 1, 3 or 4), ovate, light colored, abruptly narrowed to a stout beak,  $\frac{3}{4}$  to  $1\frac{1}{4}$  lines long; dorsal keel narrow, sharp; transverse ridges parallel, setting off rectangular areoles; caruncle seated in a transverse groove and thus sunken below the crest of the ventral keel.—Mts. on w. side Colorado Desert; w. side Mohave Desert; mts. on w. side upper San Joaquin Valley; Inyo Co.; e. to N. Mex. and southern Utah.

8. *P. hispidus* Gray. Stem erect, much-branched, 6 in. high; herbage roughly hispid; leaves linear-spatulate, the upper oblong; flowers in close clusters or glomerules; nutlets ovoid, acute, obscurely carinate on back, not rugose or muricate, but papillate-granulate; caruncle small, soft or fragile.—East side Sierra Nevada from Mono Co. to Lassen Co., thence nw. to Siskiyou Co.; w. Nev. to cent. Ore.

9. *P. kingii* (Wats.) Gray var. *harknessii* Jepson n. comb. Stem erect, branched, 4 to 8 in. high; herbage coarsely hirsute with spreading hairs; basal leaves spatulate, 1 to 2 in. long, the upper oblong or lanceolate about  $\frac{1}{2}$  in. long; flowers glomerate or becoming somewhat racemosely elongated; corolla 3 to 4 lines broad; nutlets interruptedly rugose or papillate.—E. side Sierra Nevada: Inyo Co.; Mono Lake; n. to eastern Ore. (*Sonnea harknessii* Greene.)

10. *P. jonesii* Gray. Stems few or several from the base, divergently branching, 5 to 8 in. high; herbage with spreading bristly hairs and also

finely pubescent with short mostly deflexed hairs; bristles mostly arising from a siliceous base or disk; leaves narrowly lanceolate,  $\frac{1}{2}$  to 1 in. long, or the basal linear-oblongate, 1 to  $1\frac{3}{4}$  in. long; calyx-segments linear, long-bristly, as well as with a shorter pubescence; corolla  $\frac{1}{2}$  to 1 line broad; nutlets  $1\frac{1}{2}$  lines long, strongly ridged dorsally and also with ridges at the lateral angles, the surface densely covered with flattened papillae, that is, tessellate; ventral keel well developed, merged below with the low narrow caruncle.—Desert valleys and cañons, 500 to 4000 ft.: Hanaupah Cañon, Panamint Mts.; Needles.

### 17. HÁRPAGONÉLLA Gray

Small annual. Flowers minute, white, somewhat racemosely disposed at the ends of the branches. Calyx-lobes rather closely beset with soft hooked spines, in fruit very unequal, 3 nearly distinct, the other 2 more united and forming a bur-like envelope enclosing the 1 or 2 nutlets which are basally attached. (Diminutive of Latin harpago, a grappling-hook.)

1. *H. pálmeri* Gray. Stem diffusely branched from the base, the branches 3 to 8 in. long; herbage thinly strigose-hirsute; leaves narrowly linear or very narrowly lanceolate,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; flowers 1 line long, on short pedicels which in fruit become strongly recurved and rigid; nutlets 1 or 2, smooth.—Dry slopes and mesas, 200 to 1500 ft., coastal S. Cal.: Santa Catalina Isl.; Murietta, w. Riverside Co.; El Cajon; San Diego; e. to Ariz.

*Lycópsis* L. Coarse setose-hispid annuals with small flowers and leafy bracts. Corolla with unequal lobes, the tube curved at the middle, the throat closed with hispid scales. Nutlets ovoid, coarsely reticulate-rugose; scar large, oval, excavated or perforate, bordered by a thickened cartilaginous ring. *L. ARVÉNSIS* L. Small Bugloss. Stems 1 to 2 ft. high, the spreading bristly hairs at length pustulate at base; leaves lanceolate, undulate-margined; flowers more or less racemose; corolla blue or at first purple, the tube not longer than the calyx, the lobes barely 1 line long.—Native of Eur.; adv. at Upland, San Bernardino Valley.

*Symphytum* L. Coarse perennial herbs with entire leaves. Flowers in forked scorpioid racemes. Corolla in ours purple, tubular, shallowly 5-lobed, its throat with 5 prominent lanceolate crests alternating with and as long as the stamens. Stamens included; style exserted. Nutlets 4, inserted by their bases. *S. ASPÉRRIMUM* Donn. Rough Comfrey. Stems 2 to 3 ft. high; herbage scabrous-hairy; leaves ovate- to oblong-lanceolate, acuminate, 4 to 7 in. long; flowers 7 lines long.—Native of Eur.: adv. at Arcata.

## VERBENACEAE. VERBENA FAMILY

Ours herbs with opposite or whorled simple leaves. Flowers complete. Calyx persistent. Corolla in ours with a tube, the 4 or 5-lobed limb almost regular or manifestly 2-lipped. Stamens 4, in 2 pairs. Ovary superior, undivided, 2 to 4-celled, separating at maturity into as many 1-celled 1-seeded achene-like nutlets; style single, entire; stigmas 2 or 1. Nutlets usually rounded and often reticulate on back, the face with a commissural scar or area of coherence. Endosperm scanty or none.

Calyx 5-toothed; nutlets 4; diffuse or erect herbs.....1. VERBENA.  
Calyx 2-cleft; nutlets 2; creeping herbs.....2. LIPPIA.

### 1. VERBÈNA L. VERVAIN

Erect or diffuse herbs. Flowers in terminal dense bracteate spikes. Calyx narrow, tubular, plicately 5-angled, 5-toothed. Corolla salverform, the limb 5-lobed, obscurely or slightly 2-lipped. Anthers ovate. Stigmas mostly 2-lobed, the anterior lobe larger and stigmatic, the posterior smooth and sterile. Fruit mostly enclosed by the calyx, finally separating into 4 nutlets. (Latin name of a sacred plant.)

Flowers in spikes; corolla  $1\frac{1}{2}$  to 2 lines long, its limb about 1 line broad; corolla-lobes not obcordate.

Bracts shorter than the flowers.

Spikes filiform, the flowers or fruit scattered.

Annual; leaves 1 to 2-pinnately cleft or incised.....1. *V. officinalis*.

- Perennial; leaves merely serrate or sparingly incised.  
 Leaves petioled.....2. *V. urticifolia*.  
 Leaves sessile or nearly so.....3. *V. polystachya*.  
 Spikes densely flowered, at least above; perennial.  
 Petioles naked; spikes sessile or leafy-bracted at base.....4. *V. hastata*.  
 Petioles cuneately margined; spikes peduncled.  
 Spikes at length 4 to 12 in. long,  $1\frac{1}{2}$  to 3 lines wide, loosely paniculate.....5. *V. prostrata*.  
 Spikes 1 to 2 in. long, only slightly elongating, 3 to 5 lines wide, borne in a strict compact panicle; flowers dense.....6. *V. robusta*.  
 Bracts exceeding or at least equaling the flowers; spikes thick and dense.....7. *V. bracteosa*.  
 Flowers in a head or at most an oblong spike; corolla 4 to 5 lines long, its limb 3 to 5 lines broad; corolla-lobes obcordate; annual.....8. *V. bipinnatifida*.

1. *V. officinalis* L. HERB-OF-THE-CROSS. Stem erect, diffusely branched above, 1 to 3 ft. high, glabrous or nearly so; leaves obovate or ovate, deeply incised or pinnatifid to bipinnatifid, 1 to  $1\frac{1}{2}$  in. long, narrowed into short margined petioles, the upper leaves lanceolate, incised or serrate, or entire, sessile, all minutely pubescent; bracts ovate, acuminate; corolla white or purplish, the limb 1 to 2 lines broad.—Native of Eur., adv. in S. Cal.: San Diego; Oneonta; Riverside; Indian Wells, Colorado Desert.

2. *V. urticifolia* L. NETTLE-LEAF Vervain. Erect, 1 to 3 ft. high, scabrous; leaves ovate to oblong-lanceolate, acute, serrate, 1 to 3 in. long, on petioles 4 to 7 lines long; spikes elongated, very slender, the fruits somewhat scattered; bracts ovate, acuminate,  $\frac{1}{3}$  to  $\frac{2}{3}$  as long as calyx; corolla white or purplish; commissure of nutlets sprinkled with irregular white-waxy granules. — Marshes: Los Angeles; San Bernardino; e. to the Atlantic, s. to trop. Am.

806. *Verbena hastata* L.; a, leaf  $\times \frac{1}{3}$ ; b, infl.  $\times \frac{1}{2}$ ; c, fl.  $\times 2$ ; d, nutlet  $\times 4$ .

3. *V. polystachya* H.B.K. Near no. 2; hirsute-pubescent; leaves oblong to ovate-lanceolate, serrate or sparingly incised, 1 to 2 in. long, sessile by a broad base or very sharply petioled; spikes denser than in preceding. — Marshy or moist places in the foothills, infrequent: San Gabriel Mts.; San Bernardino Mts.; s. to Mex.

4. *V. hastata* L. BLUE Vervain. Fig. 806. Stem erect, strict, 2 to 5 ft. high; herbage short-hispid; leaves oblong-lanceolate, gradually acuminate, rather finely serrate, 3 to 6 in. long, on petioles  $\frac{1}{2}$  in. long; some of the lower leaves commonly hastately lobed at base; spikes not leafy at base, more or less peduncled, densely flowered, 2 to 3 in. long, erect and numerous in a close panicle; corolla deep blue; nutlets with smooth commissure.—Islands of the lower Sacramento River; n. to B. C., e. to the Atlantic.

5. *V. prostrata* R. Br. COMMON Vervain. Fig. 807. Stem diffusely branched or spreading, 1 to 4 ft. high; herbage mostly soft-pubescent; leaves broadly ovate or oblong-ovate, coarsely serrate, and often laciniately lobed, especially toward the base which is contracted into the cuneately winged petiole, 2 to 4 in. long; lower leaves commonly 3-parted or -divided; spikes 2 to 12 in. long, solitary, or more commonly loosely paniculate; bracts subulate, shorter than the calyx; corolla violet or blue; commissure of nutlets muriculate-scaberrulous.—Dry open hill country: cismontane Cal. from San Diego Co. to Siskiyou Co.; n. to southern Ore. July-Sept.

6. *V. robusta* Greene. Similar to no. 5; stem strictly erect, paniculately branched above, 2 to 2½ ft. high; leaves irregularly incised or cleft (but commonly not divided), harshly pubescent; inflorescence rather leafy; spikes dense, 1 to 2 in. long, 3 lines broad; corolla 2½ to 3 lines long, its limb 1 line broad, its tube hairy inside.—Cañons about San Francisco Bay, 50 to 600 ft.: Tiburon; Wildcat Creek, Berkeley.

7. *V. bracteosa* Michx. Diffusely much branched, ½ to 1½ ft. high, hispidulose throughout; leaves obovate or oblong, pinnately incised or coarsely serrate, narrowed at base into a cuneately winged petiole, ¾ to 2 in. long; spikes commonly dense; bracts lanceolate, carinate-ribbed, rigid, exceeding the flowers; corolla blue; commissure of nutlets muriculate-scabrous. — Open ground: Inglewood, Los Angeles Co.; San Bernardino; lower San Joaquin River (perhaps an immigrant); n. to B. C.; e. to the Mississippi Valley.

8. *V. bipinnatifida* Nutt. Stems several from the base, ascending, 5 to 15 in. long; herbage hirsute-pubescent; leaves roundish in outline, palmately 3-parted, the divisions pinnately cleft into oblong lobes, ½ to 1¾ in. long, on petioles ½ to as long; spikes short or capitate, dense, ½ to 1¼ in. long; bracts usually rather shorter than calyx; calyx-teeth obtuse, becoming tightly plicate about the prominent midrib so as to appear acute-subulate; corolla-lobes usually obcordate; scar of nutlets narrow, running nearly to apex, ornamented with a white band of retrorse hispidulose hairs.—Desert region, 2000 to 4000 ft.: Barstow; Cima; Providence Mts.; New York Mts.; e. to southern Nev. and Ark., s. to Mex. May.

807. *Verbena prostrata* R. Br.; a, spike; b, leaf. x ½.

808. *Lippia nodiflora* Michx.; a, habit x ½; b, fl. x 3; c, long. sect. of corolla x 3; d, pistil x 6; e, nutlet x 3.

## 2. LÍPPIA L. LEMON VERBENA

Ours prostrate perennial herbs. Flowers on slender axillary peduncles, disposed in short spikes or heads and subtended by broad closely imbricated bracts. Pubescence fine, the hairs fixed by the middle and both ends acute. Calyx small and short, in ours 2-cleft, the lobes entire and lateral. Corolla-tube cylindric, the limb manifestly bilabiate, the upper lip retuse or emarginate, the lower lip 3-cleft. Style mostly short; stigma thickish, oblique. Fruit with more or less corky pericarp, not readily separating into the 2 nutlets. (Dr. A. Lippi, a French naturalist, killed in Abyssinia in 1703.)

Leaves thickish, oblanceolate or obovate.

1. *L. nodiflora*.

Leaves thinnish, ovate... 2. *L. lanceolata*.

1. *L. nodiflora* Michx. MAT-GRASS. Fig. 808. Stems extensively creeping from a lignescent perennial base; herbage minutely canescent; leaves thickish, cuneate-oblanceolate or -obovate, sharply serrate

towards the apex, sessile or shortly petioled, 5 to 10 lines long; peduncles filiform, 1 to 4 in. long, much exceeding the leaves; heads cylindraceous in age, 3 to 3½ lines thick; calyx with 2 low triangular teeth, these laterally disposed and entire or notched; corolla white, 1½ lines broad; fruit globose or didymous.—Lower Sacramento and San Joaquin rivers, especially on river banks; e. to the Atlantic. It is esteemed as a plant covering on levees for the purpose of resisting erosion. July-Sept.

2. *L. lanceolata* Michx. Similar to the preceding, but greener; leaves thinner, ¾ to 2½ in. long, ovate, pinnately straight-veined, sharply serrate except at the broadly cuneate base which is abruptly narrowed to a short petiole; peduncles often shorter than the leaves; corolla bluish white.—River banks and moist bottoms: Great Valley to S. Cal; e. to the Atlantic.

### LABIATAE. MINT FAMILY

Aromatic herbs or low shrubs with square stems and always opposite simple leaves. Flowers perfect, solitary in the axils or more commonly in small cymes; cymes sessile in the axils of the opposite leaves (rarely peduncled), commonly dense and having the appearance of a whorl, and thus denominated in the descriptions. Subtending leaves of the whorls frequently bract-like and the internodes short, the inflorescence thus becoming spike-like, or the whorl sometimes terminal and head-like. Calyx always synsepalous, frequently 2-lipped, usually 5-toothed. Corolla with a distinct tube, 2-lipped, commonly with 2 lobes in the upper lip and 3 lobes in the lower lip; or the lips sometimes subequal and the lobes regular or nearly so. Stamens inserted on tube of corolla, 4, in 2 pairs, or the upper pair of stamens wanting or represented by sterile filaments. Ovary superior, 4-lobed (or 4-parted in *Trichostema*), separating when ripe into 4 small 1-seeded smooth nutlets. Style single, commonly situated in the depression among the lobes of the ovary, cleft at apex.

#### A. Ovary 4-lobed, the style not basal; nutlets attached by the side.

Corolla-limb very irregular, apparently 1-lipped; stamens exserted.....1. *TRUCRUM*.

Corolla-limb nearly equally 5-lobed, the lobes turned downward; stamens long-exserted... 2. *TRICHOSTEMA*.

#### B. Ovary deeply 4-parted, the style basal; nutlets attached by the base.

##### I. CALYX 2-LIPPED, THE LIPS ENTIRE.

Calyx with a gibbous or helmet-shaped protuberance on the back; flowers solitary in the axils of the opposite leaves; herbs.....3. *SCUTELLARIA*.

Calyx not gibbous on the back, bladderly-inflated in fruit; flowers in a loose spike; shrub... 4. *SALAZARIA*.

##### II. CALYX REGULAR, OR 2-LIPPED, THE LIPS NOT ENTIRE.

###### 1. Corolla markedly 2-lipped.

Calyx with 10 spinescent teeth hooked at tip; stamens included in the corolla-tube..... 5. *MARRUBIUM*.

Calyx-teeth not hooked at tip; stamens not included in tube, exserted from corolla or included in throat.

Upper pair of stamens longer than the lower.

Stamens exserted; anther-cells parallel; stems glabrous.....6. *AGASTACHE*.

Stamens not exserted; anther-cells divergent; stems canescent above...7. *NEPETA*.

Lower pair of stamens longer than the upper or equaling them.

Calyx 2-lipped or with unequal teeth.

Upper calyx-lip truncate, its margin with 3 cusps, the lower-lip 2-cleft; flowers in a dense spike; herb.....8. *BRUNELLA*.

Upper calyx-lip not truncate.

Anthers 1-celled; stamens with anthers 2; filament bearing a linear connective, or jointed, or sometimes simple; shrubs or herbs... 9. *SALVIA*.

Anthers 2-celled.

Corolla-tube with a hairy ring within; anther-bearing stamens 4; flowers in loose axillary clusters; herbs...10. *MELISSA*.

Corolla-tube with no hairy ring within.

Bracts orbicular or elliptic-ovate, with about 7 to 10 prominent spines on the margin; corolla white; anther-bearing stamens commonly 2; annuals..... 11. *ACANTHOMINTHA*.

Bracts lanceolate or oblanceolate, the margin ciliate or merely pubescent, not spiny.

Herbs; corolla usually exceeding calyx.

- Style hairy, sometimes very scantily so; corolla blue or purple; bracts and calyx markedly ciliate; annuals.....12. *POGOGYNE*.  
 Style not hairy; corolla crimson; bracts and calyx soft-hairy; perennial herbs.....13. *CLINOPODIUM*.  
 Woody-based plants (ours); corolla white, scarcely exceeding calyx; style hairy.....14. *SATUREIA*.  
 Calyx-teeth equal or nearly so; stamens 4.  
 Flowers solitary.  
   Trailing evergreen, herb-like; corolla-tube with no hairy ring within...15. *MICROMERIA*.  
   Erect shrub; corolla-tube with hairy ring within.....16. *SPHACELE*.  
 Flowers several in axils of floral leaves or in dense whorls, usually forming an interrupted spike-like inflorescence; herbs except no. 20.  
   Corolla-tube with hairy ring within; calyx-teeth spine-tipped.....17. *STACHYS*.  
   Corolla-tube with no hairy ring within; calyx-teeth not spine-tipped.  
     Filaments glabrous; lower lip of corolla not saccate.  
     Corolla white; anthers glabrous; leaves sessile; perennial herbs.....18. *PYCNANTHEMUM*.  
     Corolla purplish-red; anthers hairy; leaves petioled; annuals.....19. *LAMIUM*.  
     Filaments, at least the upper, hairy; lower lip of corolla with the middle lobe saccate or deeply bowl-shaped; shrubs.....20. *HYPTIS*.  
   2. *Corolla regular or nearly so, or the lobes subequal; herbs*.  
 Flowers in terminal heads; stamens 4; dry hills or valleys or rocky mountain slopes.....21. *MONARDELLA*.  
 Flowers in axillary whorls; marshes, river bottoms or wet flats.  
   Stamens 2.....22. *LYCOPUS*.  
   Stamens 4.....23. *MENTHA*.

### 1. *TEUCRIMUM* L. GERMANDER

Ours herbs with the flowers in spike-like racemes. Calyx 5-parted. Corolla very irregular, seemingly 1-lipped; upper lip deeply cleft between its lobes, these partly united one on each side to the lateral lobes of the declined lower lip, so that the whole appears as if pinnately 5-cleft with the terminal lobe much the larger. Stamens 4, exserted and ascending from the cleft of the upper lip, the lower pair longer than the upper. Anthers confluent 1-celled. Nutlets with broad areolae. (Teucer, King of Troy.)

1. *T. cubense* L. var. *densum* Jepson n. var. Annual, stems many from the base, ascending,  $\frac{3}{4}$  to 1 ft. high, glabrous or nearly so; leaves obovate-cuneate, crenately incised and sometimes 3-parted, petioled,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long; racemes dense and regular, spike-like, the flowers solitary in the axils of and about equaling the palmately 3-divided bracts; corolla pale blue or whitish, marked with a few purple dots, slightly hairy inside on palate, 3 to 4 lines long, little exceeding the calyx; nutlets somewhat corky, obscurely few-ribbed lengthwise.—Colorado River bottoms (Palo Verde Valley, Jepson 5258, type). Resembles *Verbena bracteosa* in habit.

### 2. *TRICHOSTEMA* L. BLUE CURLS

Ours ill-scented herbs with entire leaves and blue (occasionally pinkish or whitish) flowers in axillary cymes or becoming raceme-like in age. Calyx equally or almost equally 5-cleft. Corolla with oblique limb, the oblong lobes nearly alike; tube in ours slender, often far exceeding the calyx and abruptly geniculate or curved into an arc of a circle just below the limb. Stamens 4, with the anther-cells divaricate; filaments capillary, blue or violet, spirally coiled in the bud, in anthesis very much exserted, ascending between the deeply parted upper lobes of the corolla and curved outward and downward. Nutlets rugose-reticulate. (Greek trichos, hair, and stemon, stamen.)

Corolla 1 to 3 lines long, the tube not exserted; annuals.

Herbage cinereous-pubescent; leaves lanceolate, not costate-veined; corolla 1 line long.

1. *T. micranthum*.

Herbage soft-villous or glandular-villous; leaves oblong to oval or ovate-lanceolate, costate-veined; corolla 2 to 3 lines long.

Soft-villous, seldom glandular; leaves oblong to oval; calyx-lobes narrow; corolla 3 lines long.....2. *T. oblongum*.

Glandular-villous; leaves ovate-lanceolate; calyx-lobes broad; corolla 2 lines long.

3. *T. simulatum*.

Corolla about 3 to 6 lines long, the tube exserted.

Annuals; stems  $\frac{3}{4}$  to 2 ft. high, leafy to the summit; corolla 3 to 5 lines long.

Diffusely branched, rather sparsely leafy; leaves petioled; cymes loose.....

4. *T. laxum*.

More strict and simple, densely leafy; leaves sessile or subsessile; cymes dense.

Corolla 5 lines long; leaves ovate-lanceolate.....5. *T. lanceolatum*.

Corolla 3 lines long; leaves short-ovate.....6. *T. ovatum*.

Perennial, shrubby at base; stems 2 to 3 ft. high, leafless above; corolla 9 lines long..

7. *T. lanatum*.

1. *T. micranthum* Gray. Stem simple or branched from the base, 3 to 9 in. high, leafy to the summit; herbage ashy-pubescent, somewhat glandular; leaves lanceolate, not costate-veined,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long, narrowed at base into short petioles; cymes borne in all but the lower axils, 3 to 7-flowered, pedunculate, shorter than the leaves; calyx campanulate, the lanceolate lobes little longer than the tube; corolla 1 line long, little exceeding the calyx; stamens moderately exserted.—Montane, open flats or open pine forests, 5000 to 8200 ft.: San Jacinto Mts.; San Bernardino Mts. July-Aug.

2. *T. oblongum* Benth. Stems erect, simple or branched, 6 to 13 in. high; herbage soft-villous or the leaves pubescent, the stems sometimes glandular; leaves oval or oblong (sometimes oblong-lanceolate), with narrowed base, costate-veined, membranous,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long, the petioles mostly short,  $\frac{1}{4}$  to 1 (or 3) lines long; cymes glomerate, many-flowered, short-pedunculate; calyx villous, its lobes narrow, longer than the tube, nearly equaling the corolla, this 3 lines long; filaments 4 to 5 lines long.—Montane, 2000 to 6000 ft.: San Jacinto and San Bernardino mountains; Sierra Nevada from Tulare Co. to Butte Co.; Humboldt Co.; n. to Wash. July-Aug.

3. *T. simulatum* Jepson n. sp. Stem erect, branched, 7 to 11 in. high; the leaves large but rather remote; herbage glandular-villous; leaves ovate-lanceolate, 1 to 2 in. long, on petioles 2 to 6 lines long; cymes on peduncles 2 to 6 lines long; calyx-lobes broad, triangular-acute, about equaling the tube; corolla 2 lines long.—Plumas Co. to Siskiyou Co. (Klamathon, Copeland 3534, type). July.

4. *T. laxum* Gray. TURPENTINE WEED. Stem simple or branching, 8 to 12 in. high, sparsely leafy; herbage minutely pubescent; leaves lanceolate or oblong-lanceolate, acuminate, pinnately veined, 1 to 2 in. long, on slender petioles; cymes peduncled, rather loose; corolla purple or deep blue, thinly hirsute, its straight tube towards apex curved to one side and then a little below the horizontal, all the lobes equal.—Stream beds or low summer fields of the North Coast Ranges: Sonoma and Napa Cos. to Humboldt Co. and w. Glenn Co. July-Sept. Var. *RUBRISÉPALUM* Jepson n. comb. Leaves sessile or subsessile; pubescence long-pilose; calyx-lobes becoming red; corolla obscurely 2-lipped (ex char.).—San Benito Co. (*T. rubrisepalum* Elmer.)

809. *Trichostema lanceolatum* Benth.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, fl.  $\times 1\frac{1}{2}$ ; c, upper part of stamen  $\times 2\frac{1}{2}$ ; d, fr.  $\times 2\frac{1}{2}$ .

5. *T. lanceolatum* Benth. VINEGAR WEED. CAMPHOR WEED. Fig. 809. Stem simple or branching from near the base, very leafy, 6 to 16 in. high; herbage cinerous or villous-pubescent, minutely glandular; leaves lanceolate, acuminate, with 3 to 5 strong almost parallel nerves or ribs,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long, sessile, or the lowest subsessile; cymes short-peduncled or nearly sessile; calyx villous; corolla light blue, almost filiform, somewhat pubescent, its straight tube towards apex abruptly and strongly

recurved like a hook; lobes of upper lip longer than those of the lower.—Dry plains and low hills, 100 to 2600 ft.: throughout cismontane Cal.; n. to Wash. A bee-plant of importance, abounding over extensive areas. Aug.-Sept.

6. *T. ovatum* Curran. Stem stout, branched from base, rather crowded with leaves, 6 to 13 in. high; herbage densely villous; leaves ovate, apiculate with a callous cusp, 3 to 5-nervose, 6 to 11 lines long, subsessile; corolla  $3\frac{1}{2}$  lines long, the tube somewhat exserted; stamens long-exserted.—Bakersfield plain. Kern Co. May-June.

7. *T. lanatum* Benth. Leafy shrub 2 to 4 ft. high, branched from the base; leaves linear-lanceolate, acute, glabrous above, more or less lanate below, revolute, 1-nerved, fascicled, 1 to 2 (or  $2\frac{1}{2}$ ) in. long, sessile; cymes subsessile or short-peduncled, dense, covered with a dense purple wool, borne in a virgate interrupted spike-like thyrse; corolla 9 lines long, blue-lanate outside, the tube little exserted from calyx; stamens exserted 5 to 11 lines beyond the calyx-tube.—Mountain slopes, 1000 to 4000 ft.: San Benito and Monterey Cos. to San Diego Co. May-June. It varies much in length and hue of the wool. Var. *DENUDATUM* Gray. Wool remarkably short; corolla-tube  $1\frac{1}{4}$  to  $1\frac{3}{4}$  times as long as calyx.—Ventura Co. to San Diego Co. (*T. parishii* Vasey.)

### 3. SCUTELLARIA L. SKULL-CAP

Ours perennial herbs, the flowers solitary in the opposite axils (axillary pairs) or, when the leaves are reduced, forming spikes or racemes. Calyx 2-lipped, both lips entire, the upper with a scale-like or crest-like projection on the back, in anthesis campanulate, after anthesis closed, and in fruit splitting to the base. Corolla with a long-exserted tube; upper lip galeate, entire or barely notched, the lateral lobes of the lower lip more or less attached to it so that it appears 3-lobed, the middle lobe seeming to constitute the whole lower lip. Stamens 4; anthers ciliate-pilose. Upper fork of style short or none. Nutlets rarely wing-margined. (Latin *scutella*, a dish, on account of the conspicuous protuberance on the fruiting calyx.)

Flowers 2 to 3 lines long, borne in racemes.....1. *S. lateriflora*.  
Flowers 5 to 12 lines long, solitary in the axils of cauline leaves or some occasionally imperfectly racemose.

Leaves all broad and somewhat cordate or truncate at base; tubers none or hardly any.

Leaves acute, mostly serrate; corolla blue.....2. *S. epilobifolia*.

Leaves obtuse, mostly entire; corolla whitish or cream-color.....3. *S. bolanderi*.

Leaves, at least the upper, obtuse or narrowed at base.

Leaves oblong, or oblong-ovate to linear; stems erect; tubers none or hardly any.

Corolla deep blue to purple, the lips commonly rather unequal.

Leaves (at least above base) commonly linear or oblong, but varying to ovate, the petioles short (1 to 2 lines) or hardly any; corolla about 10 to 14 lines long, its tube narrow, curving, expanded only above.....4. *S. angustifolia*.

Leaves commonly ovate to oblong-ovate, mostly with petioles 2 lines long; corolla about 5 to 7 lines long, its tube flaring immediately above calyx.....5. *S. antirrhinoides*.

Corolla white, the lips subequal; leaves oval-ovate or oblong-lanceolate.....

6. *S. californica*.

Leaves broadly oval or ovate to spatulate-obovate; stems low or diffuse; root-stocks slender, terminated by tubers.

Leaves ovate, toothed or rarely entire; corolla blue.....7. *S. tuberosa*.

Leaves mostly spatulate-obovate; entire; corolla white.....8. *S. nana*.

1. *S. lateriflora* L. Stem erect, freely branched, 1 to 2 ft. high; herbage puberulent or subglabrous; leaves ovate to ovate-lanceolate, acuminate, coarsely serrate, 1 to 2 in. long, on slender petioles 1 to 6 lines long; flowers in one-sided racemes, the racemes axillary and sometimes also terminal, 1 to  $1\frac{3}{4}$  in. long; corolla 2 to 3 lines long, the lips short, equal.—Bouldin Isl., San Joaquin Co.; B. C. to e. U. S. and n. Mex.

2. *S. epilobifolia* A. Ham. Stems slender, simple or branched,  $\frac{3}{4}$  to 2 ft. high; herbage minutely puberulent; leaves ovate-lanceolate or oblong-lanceolate, serrate or the upper entire, subcordate at base, 1 to  $1\frac{3}{4}$  in. long, subsessile or on petioles  $\frac{1}{2}$  line long, the uppermost much reduced; flowers axillary, 6 to 8 lines long, on pedicels shorter than the calyx; corolla blue, throat naked within, the lower lip nearly erect and slightly surpassing the

810. *Scutellaria angustifolia* Pursh; *a*, habit  $\times \frac{1}{2}$ ; *b*, stamens and style  $\times 1\frac{1}{2}$ ; *c*, fr. calyx  $\times 2$ .

lines long, the petioles usually longer; flowers 9 to 14 lines long, the pedicels equaling the calyx; corolla blue, the tube distinctly curving above calyx, the lips at maturity distinctly unequal, the lower one villous inside, its middle lobe with upturned edge.—Moist soil, or rocky ledges, montane, 1800 to 6000 ft.: San Jacinto, San Bernardino and San Gabriel mountains; Sierra Nevada; higher North Coast Ranges; n. to B. C. and Ida. Var. *CANESCENS* Gray. More branching, tomentulose-canescens; corolla-tube more upwardly curved at base of tube.—Sierra Nevada foothills.

5. *S. antirrhinoides* Benth. Similar to no. 4; corolla-tube mostly straight, broadly clavate-dilated or abruptly inflated upward.—Meadows or lake margins, 500 to 4000 ft.: Mendocino Co. to Siskiyou Co., thence e. to Modoc Co., thence s. to Nevada Co.; n. to Ore. and Ida., e. to Utah.

6. *S. californica* Gray. CALIFORNIA SKULL-CAP. Stems clustered, commonly simple,  $\frac{1}{2}$  to  $1\frac{1}{4}$  ft. high, from horizontal branching rootstocks; herbage puberulent; leaves oval-ovate or oblong-lanceolate, 8 to 14 lines long, the lower disposed to be crenate and purplish beneath, the upper narrower and entire, those subtending the flowers much reduced; petioles 1 to 3 lines long; corolla nearly white or slightly yellowish, 8 to 12 lines long, the throat amplate-inflated and the lips equal or nearly so; lower lip villous-bearded within; nutlets rugulose.—Open

upper.—Montane, 4000 to 6500 ft., Sierra Nevada from Eldorado Co. to Siskiyou and Modoc Cos.; also of the lower San Joaquin River islands; n. to B. C., e. to Nfd. and Ariz. July-Aug.

3. *S. boländeri* Gray. Stems simple or branching chiefly from base, 6 to 17 in. high; herbage pubescent; leaves oblong-ovate or ovate-elliptic, obtuse, serrate, or the upper entire, closely sessile by an obscurely cordate base,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long; flowers 5 to 7 lines long, on short pedicels; corolla whitish, throat dilated, villous within, the lower lip rather larger than the upper.—Foothills and mesas, 1500 to 4000 ft.: Sierra Nevada from Plumas Co. to Tulare Co.; s. to the Cuyamaca Mts. May-July.

4. *S. angustifolia* Pursh. Fig. 810. Stems erect, simple or somewhat branched, 7 to 13 (or 21) in. high; herbage glabrous or finely puberulent; leaves linear to oblong or ovate, entire or rather sparsely toothed,  $\frac{3}{4}$  to  $1\frac{1}{2}$  (or  $1\frac{3}{4}$ ) in. long, obscurely petioled or the lower distinctly petioled (the petioles 1 to 2 lines long); basal leaves orbicular to ovate or cordate, 5 to 7

811. *Scutellaria tuberosa* Benth.; *a*, habit; *b*, tubers.  $\times \frac{2}{3}$ .

woods and borders of thickets, on hillsides and in ravines, 50 to 6000 ft.: Alameda Co. to Lake, Mendocino and Humboldt Cos.; Eldorado Co. to Tehama Co.

7. *S. tuberosa* Benth. BLUE SKULL-CAP. Fig. 811. Stem 3 to 5 in. high, from tuberous rootstocks, the tubers oblong, 3 to 8 lines long; herbage pubescent; leaves thin, few-toothed; basal and lower leaves oval, purplish beneath (as also the lower cauline), on petioles as long as the blade; upper cauline ovate, the petioles commonly short; corolla violet-purple, 7 to 9 lines long; middle lobe of lower lip somewhat spreading, much larger than the galeate upper lip; nutlets muricate.—Loamy soil of shady woods or brush in the hills or in sandy valleys, 500 to 5000 ft.: coastal S. Cal.; Sierra Nevada; Coast Ranges, mostly toward the coast; n. to southern Ore. Mar.-May. Var. *similis* Jepson. Calyx very densely villous.—Same range as the species. Apr.-June.

8. *S. nana* Gray. Stems freely branched and somewhat tufted, densely leafy, 2 to 3 in. high; herbage densely grayish-puberulent; leaves obovate to spatulate-obovate, entire, thickish, 4 to 8 lines long, tapering into a short petiole; flowers long; corolla white, rather broad, with equal lips and dilated throat.—Interior plateau, ne. Cal.: Siskiyou Co.; ne. Shasta Co.; Lassen Co.; Modoc Co.; n. to Ore. and Ida., e. to Nev.

#### 4 SALAZARIA Torr.

Divaricately branched shrub with spinescent branchlets. Flowers in loose spikes. Calyx oblong, with 2 very short truncate entire lips, in fruit thin, ovate-globose, conspicuously enlarged and resembling an inflated bladder. Corolla purplish, 2-lipped, the middle lobe of lower lip roundish with recurved sides, the small lateral lobes more connected with the erect galeate upper lip. Fertile stamens 4, the lower pair longer, the filaments slightly pubescent below. Upper fork of style very short or wanting. Nutlets depressed, roughened. (Don Jose Salazar, member of the U. S. and Mex. Boundary Survey Commission.)

1. *S. mexicana* Torr. BLADDER SAGE. Fig. 812. Stems several in a cluster, simple below, intricately branched above, forming a clumpy bush 2 to 4 ft. high; leaves oblong or ovate, glabrous, 3 to 12 lines long, barely petioled; calyx 4 lines long; corolla 9 or 10 lines long, pubescent outside with short reflexed hairs; scarious fruiting calyx  $\frac{1}{2}$  in. in diameter; nutlets papillate-tessellate.—Dry washes and cañons, 500 to 4400 ft.: Mohave and Colorado deserts; e. to Utah, s. to Mex.

#### 5. MARRUBIUM L. HOREHOUND

Perennial tomentose herbs with much wrinkled leaves and rather small flowers in whorls. Calyx with cylindrical tube, 10 ribs and as many equal subulate or spinulose teeth, which are recurved at tip. Corolla white, with short tube included in the calyx, the upper lip erect, 2-cleft, the lower spreading, 3-cleft. Stamens 4, included within the tube of the corolla, all the anthers 2-celled. Nutlets rounded at the top. (From the Hebrew, meaning bitter.)

1. *M. vulgare* L. COMMON HOREHOUND. Stems tufted, erect, white-woolly,  $\frac{3}{4}$  to  $2\frac{1}{4}$  ft. high; leaves roundish, crenate, except at the cuneate or truncate base, petioled, white-woolly beneath and green above, or somewhat

812. *Salazaria mexicana* Torr.; a, infl. x  $\frac{3}{4}$ ; b, leaf of infl. x  $\frac{1}{2}$ ; c, leaf of sterile shoot x  $\frac{1}{2}$ ; d, fl. x  $1\frac{1}{4}$ ; e, fr. calyx x  $\frac{3}{4}$ .

tomentose on both faces; middle lobe of lower corolla-lip transversely oblong, much larger than the lateral lobes.—Common weed of old fields and waste places about farms and villages everywhere in the valleys and foothills; nat. from Eur. Evergreen with us. The tops are used medicinally as a remedy for colds. July-Sept.

#### 6. AGASTACHE Clayt.

Tall perennial herbs. Leaves ovate, serrate, petioled. Flowers violet-purple or whitish, crowded in a terminal spike. Calyx tubular-campanulate, rather oblique, almost equally 5-toothed. Upper lip of corolla 2-lobed, nearly erect; lower lip spreading, its middle lobe crenate. Stamens 4, exserted, the anthers not approximate in pairs. (Greek *agan*, much, and *stachus*, a corn ear, in allusion to the numerous spikes.)

Fig. 813. *Agastache urticifolia* Ktze.; a, fl. stem  $\times \frac{1}{2}$ ; b, fl.  $\times 2$ ; c, nutlet, dorsal view  $\times 10$ ; d, nutlet, ventral view  $\times 10$ .

1. *A. urticifolia* (Benth.) Ktze. Fig. 813. Stems erect, simple,  $2\frac{1}{2}$  to 5 ft. high; herbage glabrous or nearly so; calyx-lobes membranous, pinkish or whitish; corolla light violet-purple, its lobes slightly hairy but throat glabrous.—Dry flats or valleys, 2500 to 8000 ft.: San Bernardino Mts.; Sierra Nevada; North Coast Ranges; e. to Nev., n. to Wash. and Ida. (*Lophanthus urticifolius* Benth.)

#### 7. NÉPETA L.

Perennial herbs. Calyx tubular, obliquely 5-toothed, the upper teeth longer than the lower. Corolla-tube enlarged above, distinctly 2-lipped; upper lip erect, lower spreading, the middle lobe larger than the lateral. Stamens 4, not exserted, ascending under the upper lip, the lower pair the shorter, all anther-bearing, with the anthers approximate in pairs. Nutlets ovoid, flattened, smooth. (Old Latin name used by Pliny, perhaps from the city Nepete in Tuscany.)

1. *N. catária* L. CATNIP. Stems 2 to 3 ft. high; herbage canescent with fine hairs, except the green upper surface of the leaves; leaves triangular-ovate, truncate or cordate at base, coarsely crenate, 1 to 3 in. long or the upper reduced, greener above than below, petioled; spikes 1 to 3 in. long, dense or with 1 or 2 accessory whorls below; calyx-teeth lanceolate-subulate; corolla white, 4 or 5 lines long, dotted with purple.—Mountains and valleys, nat. from Eur.: San Antonio Mts.; Russian River Valley; Lake Co.; Modoc Co. July-Aug.

*N. HEDERACEA* (L.) Trev. Ground Ivy. Gill-over-the-Ground. Creeping and trailing; leaves reniform; corolla 3 times length of calyx, light blue.—Adv. from Eur.: Bouldin Isl., lower San Joaquin River.

#### 8. BRUNÉLLA L. SELF HEAL

Low perennial herbs, the nearly simple stems terminated by a short-spicate or subcapitate inflorescence, each whorl composed of 6 subsessile flowers and subtended by broad floral bracts. Calyx reticulate-veiny, membranous or chartaceous, 2-lipped; upper lip truncate with 3 cusps; lower 2-cleft; lips closed in fruit. Corolla-throat inflated and tube more or less exserted; upper lip erect, galeate, entire; lower lip 3-lobed, the middle lobe hanging downward. Stamens 4, in pairs under the upper lip, each filament or those of the upper with a small tooth below the anther. Nutlets smooth and glabrous.

(Old German breune or braune, an affection of the throat, which Self Heal was used to cure.)

1. *B. vulgaris* L. Stem 4 to 10 in. high, green and nearly glabrous; leaves ovate or ovate-oblong, rounded at base, obscurely serrate, 1 to 3 in. long, petioled; corolla violet, pinkish or lavender, exceeding the purplish calyx; middle lobe of lower lip with setaceous-incised margin.—Gardens and lawns, nat. from Eur. Var. *LANCEOLATA* Fer. Leaves mainly lanceolate to oblong, gradually narrowed or cuneate at base; margins of bracts bristly-ciliate.—Meadows, 2500 to 6000 ft.: Sierra Nevada; San Bernardino Mts. Var. *ATROPURPUREA* Fer. Margins of bracts glabrous or sparsely short-ciliate; corolla dark or blackish-purple.—Valleys, North Coast Ranges.

#### 9. *SÁLVIA* L. SAGE

Herbs or low shrubs with the flowers usually in whorls, the whorls forming terminal racemes or spikes, the floral leaves mostly reduced to bracts. Calyx 2-lipped, the upper lip entire or 3-toothed, the lower 2-cleft. Corolla with the upper lip erect, straight, concave or falcate, sometimes obsolete; lower lip spreading, 3-lobed, the middle lobe often emarginate, cleft or fringed. Stamens inserted in the throat of the corolla; lower pair fertile; upper pair obsolete or represented by sterile filaments or vestiges; anther-cells widely separated on a long filament-like connective longer than the filament itself and jointed to it by the middle or near one end; connective at its upper end (under the upper lip of the corolla) bearing a perfect anther-cell, at its lower end a reduced or deformed anther-cell or the anther-cell obsolete.—In some species the filament, while seemingly simple, is really jointed, thus indicating the presence of the connective, the lower end of which sometimes projects as a subulate point rarely but with a trace of an anther-cell. (Latin, *salveo*, to save, some of the species being officinal.)

A. Lower end of connective bearing a deformed anther-cell or a rudiment; flower-whorls few; nutlets commonly developing mucilage and long spiracles when wetted; annuals or perennials.

Herbage white-woolly; bracts much surpassing the flowers; leaves spine-tipped and -toothed. Annual; leaves 3 to 6 in. long, forming a basal rosette. . . . . 1. *S. carduacea*.  
Perennials; leaves not over 1½ in. long, cauline.

Herbage densely white-woolly; calyx resembling a woolly pellet, the teeth almost obscured by the woolly covering. . . . . 2. *S. funerea*.

Herbage white-tomentose; calyx finely and densely tomentulose but not concealing the spine-tipped teeth. . . . . 3. *S. greatai*.

Herbage green; bracts not exceeding the flowers; leaves not spine-tipped and -toothed; annuals. . . . . 4. *S. columbariae*.

B. Lower end of connective reduced to a subulate point or slender thread, or the filiform structure merely jointed and the filament thus apparently simple; flower-whorls several (except no. 7); nutlets unchanged when wetted; perennials.

Inflorescence densely whorled-glomerate and interrupted-spicate; corolla-tube longer than lower lip.

Large-flowered; corolla 1¼ to 1½ in. long, crimson-purple; lower leaves cordate or hastate at base. . . . . 5. *S. spathacea*.

Smaller-flowered; corolla 5 to 10 lines long, violet to white; leaves not cordate. Bracts, upper floral leaves and 2-lipped calyx scarious-membranous, usually colored.

Leaves spatulate or obovate, obtuse or retuse, not rugose, entire (or sparsely crenulate); bracts purplish-tinged. . . . . 6. *S. carnosae*.  
Leaves oblong, acutish, very rugose, crenulate.

Bracts apparently whitish; leaves of one kind, ovate. . . . . 7. *S. mohavensis*.

Bracts purplish or purplish-green; leaves of 2 kinds, oblong-lanceolate and linear-revolute. . . . . 8. *S. eremostachya*.

Bracts more or less herbaceous, at least not colored. Corolla barely 6 lines long; bracts blunt or subulate or aristate-tipped.

Calyx-teeth and bracts subulate or aristate-tipped; plant not hoary white.

Herb-like, the stems 9 to 12 in. high, simple, almost leafless and scape-like; style and stamens long-exserted. . . . . 9. *S. sonomensis*.

Shrub 3 to 6 ft. high, branching and leafy; style and especially the stamens little exserted. . . . . 10. *S. mellifera*.

Calyx-teeth and bracts blunt; whole plant hoary white. . . . . 11. *S. leucophylla*.

Corolla 8 to 9 lines long; bracts more or less pointed. Bracts and calyx-teeth long-aristate. . . . . 12. *S. vaseyi*.

Bracts and calyx-teeth merely acute or cuspidate. Leaves acute, the longer 2 to 3 in. long; heads 4 to 8. . . . . 13. *S. palmeri*.

Leaves obtuse, seldom over  $1\frac{1}{4}$  in. long; heads solitary or few...

Inflorescence thyrsoid-paniculate; floral leaves, bracts and bractlets small; corolla-tube shorter than lower lip..... 14. *S. clevelandii*.  
..... 15. *S. apiana*.

1. *S. carduacea* Benth. THISTLE SAGE. Stems 1 to 6 from a basal leaf-rosette, naked and scape-like, bearing 1 to 4 whorls of flowers, 4 in. to 2 ft. high; herbage white-woolly, particularly in the flower-whorls, the wool more or less deciduous; leaves oblong in outline, pinnatifid, with spinulose-dentate margin, the basal 3 to 7 in. long; bracts ovate-lanceolate or lanceolate, pectinate-spinescent, surpassing the flowers; calyx long-woolly, its upper lip strongly 3-toothed, the middle tooth larger, the lateral distant, much surpassing the lower lip; corolla light blue, deeply 2-lipped, 1 in. long; upper lip 2-cleft, the segments lacinate or denticulate at the end; lower lip with small erose lateral lobes and an exceedingly large fan-shaped and laciniately fringed middle lobe; proper filament very short.—Valley plains, mesas and cañon flats, 50 to 2500 ft.: coastal S. Cal.; inner South Coast Ranges from Contra Costa Co. s.; San Joaquin Valley; Mohave and Colorado deserts. May-June.

2. *S. funèrea* Jones. Densely branched bush 2 to  $2\frac{1}{2}$  ft. high; herbage white-woolly; leaves ovate to ovate-lanceolate, often somewhat conduplicate or folded, leathery, coarsely nerved, acuminate and spine-tipped, entire or rarely with 1 or 2 pair of spiny teeth on the sides,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long, narrowed to a short broad petiole; bracts broadly lanceolate to broadly ovate, abruptly spinose; flowers in a spicate inflorescence, the spike rather dense or interrupted; calyx cylindric, inflated, very tomentose and resembling a pellet of wool, 3 lines long, the 5 equal teeth short, cuspidate, scarcely apparent; corolla purple; upper lip cleft, the sides turned backward; middle lobe of lower lip produced, rounded, erosulate, a little hairy on lower part, the lateral lobes small, much shorter; upper anther somewhat declined or pendulous, the lower one horizontal and larger.—Dry hills, 2000 to 2500 ft., Funeral Mts., Death Valley. April-May. Var. *FORNACIS* Jepson n. var. Bracts orbicular-ovate, abruptly acerose, 5 to 7 lines long, with prominent veins on the lower surface.—Furnace Creek, Death Valley (Parish 10,032 type).

814. *Salvia columbariae* Benth.: a, habit  $\times \frac{1}{2}$ ; b, fl.  $\times 1\frac{1}{2}$ ; c, stamen  $\times 5$ .

3. *S. grèatai* Bdg. Shrubby, 3 to 4 ft. high; herbage white-tomentose and a little resinous-glandular; bark whitish; leaves broadly ovate, 3 to 5-nerved, spine-tipped and bearing 1 to 3 pairs of remote or divergent spiny teeth on the sides,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long, sessile; inflorescence with 4 or 5 whorls, the whorls 6 to 10-flowered; outer bracts like the leaves, the inner becoming linear-lanceolate; calyx 4 lines long, the upper lip spine-tipped and with 2 smaller spine-like teeth near its base, the lower lip of 2 spine-tipped lobes; corolla about twice as long as calyx; upper lip  $1\frac{1}{2}$  lines long, 2-cleft, the lobes acute; lower lip slightly longer, 3-lobed, the middle lobe fimbriate; anther of lower fork of connective half as long as the upper and pollen-bearing.—N. side Colorado desert (Cañon Sprs.). Apr.

4. *S. columbariae* Benth. CHIA. Fig. 814. Stems 1 or usually several from the base, commonly simple and bearing 1 or 2 pairs of leaves and 1 or 2 whorls of flowers, occasionally branching, 3 to 15 in. high; herbage finely pubescent, dark green; leaves mostly basal or sub-basal, bipinnatifid, very rugose, 1 to  $2\frac{1}{4}$  in. long, petioled; bracts ovate or

more commonly orbicular and broader than long, abruptly acuminate and cuspidate-tipped, not exceeding the flowers, often purple; fruiting calyx 5 lines long, oblique at the throat; upper lip arched, crowned with a pair of needle-like prickles, the prickle representing the middle tooth wanting (or very minute); lower lip very much shorter, the teeth represented by 2 shorter prickles; corolla blue, little exceeding the calyx; upper lip emarginate; lower lip with small lateral lobes and a larger somewhat 2-lobed middle one.—Hill slopes and mesas, 500 to 3500 ft., throughout cismontane Cal. Apr.-May. An infusion of the seeds was valued by the Mission fathers as a remedy for fevers; the seeds also furnished the "finest poultice for gunshot wounds." The Pomo roasted the seeds and ground them into a meal for food. Var. *BERNARDINA* Jepson n. comb. One to 2 ft. high; leaves pinnatifid, the divisions deeply lobed, not extending more than halfway to the midrib; bracts smaller; upper lip of calyx tipped with 3 aristiform teeth, these commonly united also to the end into 2 or 1.—Cañons about San Bernardino Valley, 1000 to 2500 ft. Mar.-May. (*S. bernardina* Parish.)

5. *S. spathacea* Greene. CRIMSON SAGE. Fig. 815. Coarse herb with erect simple stems  $1\frac{1}{2}$  to 3 ft. high, very viscid and glandular-pubescent or villous; leaves broadly oblong-ovate, with broadly triangular-cordate base, more or less doubly crenate or crenulate, upper surface dark green and rugulose, under surface whitened with a close short tufted tomentum, 4 to 8 in. long, on petioles 2 or 3 in. long or some of the cauline sessile; whorls of flowers 5 or 6 or more, subtended by broadly ovate or ovate-lanceolate membranous purplish bracts; calyx strongly veined, laterally compressed but somewhat inflated, 1 in. long or over,  $\frac{1}{2}$  in. wide at the broadest part, spathe-like, deeply slit in front between the two cuspidate-tipped teeth, the upper concave lip much larger, 3-dentate with the middle tooth largest; corolla crimson,  $1\frac{1}{4}$  to  $1\frac{1}{2}$  in. long; upper lip short, nearly erect, emarginate; lower lip spreading, the lateral lobes short, triangular, acute, the middle lobe much developed, broadly obcordate, 4 lines broad; stamens much exserted; lower fork of the connective capillary, 1 line long; rudiments of sterile stamens obvious. — Coast Ranges from the Vaca Mts. and Mt. Diablo to coastal S. Cal. Apr.-May. Also called Humming-bird Sage. (*Audibertia grandiflora* Benth.)

815. *Salvia spathacea* Greene; a, leaf  $\times \frac{1}{4}$ ; b, fl. branchlet  $\times \frac{1}{4}$ ; c, fl.  $\times 1$ ; d, stamen  $\times 2$ ; e, sterile filament  $\times 2$ .

6. *S. carnosa* Dougl. Low broad shrub  $\frac{3}{4}$  to  $2\frac{1}{2}$  ft. high, the branchlets canescent, leafy; leaves long, spatulate or obovate, obtuse or retuse, entire (or sparsely crenulate), finely tomentulose-canescens, glandular-dotted, not rugose, 3 to 6 lines long, all except the uppermost gradually tapering into a petiole, about as long; bracts and upper floral leaves obovate or oval, the innermost spatulate, pubescent, ciliate, tinged with rose or purple; calyx turbinate, upper lip broad, truncatish, with 3 short teeth; lobes of lower lip obtuse, mucronate, the cleft between its 2 lobes much deeper than between the lips; corolla deep blue, 4 to 5 lines long; upper lip cleft, its lobes erect, middle lobe of lower lip rather larger than the lateral, erosulate, notched at middle, the lateral lobes curving and approximate to it so as to

form a shallow bowl; stamens much exserted, the filaments with or without a tooth at the joint, the upper pair short, sterile.—Arid mountain slopes and plains, 2500 to 7500 ft.: San Bernardino Mts.; Mohave Desert; Inyo Co.; Siskiyou Co.; n. to Wash. May-June. Var. *PILOSA* Jepson n. comb. Upper part of stem and entire inflorescence finely villous or hirsutulose-pubescent; upper calyx-lip short, rounded, emarginate, the 2 lower lobes lanceolate.—Mohave Desert; San Bernardino Mts. (*Audibertia incana* Benth. var. *pilosa* Gray. *Ramona pilosa* Abrams.) Var. *COMPACTA* Hall. Woody at the base only, 2 to 3 ft. high; leaves 1 to 2 in. long; inflorescence spike-like; bracts 6 to 7 lines long.—San Bernardino Mts.; San Jacinto Mts.; San Diego Co. (*Audibertia incana* Benth. var. *pachystachya* Gray. *Audibertia pachystachya* Parish.)

7. *S. mohavensis* Greene. Shrub 1 to 2 ft. high; herbage puberulent; leaves oblong to ovate, acute or obtuse, rugose above, deeply reticulate-venulose below, crenulate, 6 to 8 lines long, the petioles  $\frac{1}{4}$  to  $\frac{1}{2}$  as long and slender; flowers usually in a single terminal head; bracts ovate or elliptical, mucronate, glandular, apparently whitish, 6 lines long; corolla blue, its lips of about equal length; upper lip shortly cleft, the lower with its 3 lobes about equal, all entire or merely erosulate.—E. Mohave Desert. May-June. (*Audibertia capitata* Gray.)

8. *S. eremostachya* Jepson n. sp. Shrub 2 to 2½ ft. high, the old stems with whitish bark; herbage hirsute or hirsutulose with spreading hairs; leaves almost dimorphic, those of the flowering branches oblong-lanceolate, plane or eventually somewhat revolute, 1 to 1¾ in. long, obtuse, truncate at base, crenulate, the upper surface rugulose, the under surface markedly reticulate with hispidulose veins and sprinkled with resin globules; leaves of the short sterile lateral spurs fascicled, linear, strongly revolute,  $\frac{1}{2}$  to  $\frac{3}{4}$  in. long; whorled heads 1 to 4; calyx 2-lipped, the upper lip bearing at apex 3 short spine-tipped teeth, the lower lip shorter, deeply cleft, the 2 teeth acuminate-spinose; corolla 8 to 9 lines long; upper lip short, rounded, cleft, the lower lip much longer, its middle lobe transversely elliptic, broadly notched, erosulate or sparingly incised, the lateral lobes small; stamens rising from the palate, 7 to 9 lines long, the filaments with a tooth at the joint.—Cañons on w. side Colorado Desert: Palm Cañon of San Jacinto to Mt. San Isidro (Indian Cañon, Collins Valley, Jepson 8847, type).

9. *S. sonomensis* Greene. CREEPING SAGE. Flowering stems almost leafless and scape-like, 4 to 8 in. high, ascending from a leafy mat-like base; leaves oblong to obovate-spatulate, crenulate, green and rugulose above, whitish with a close dense tomentum beneath, 1 to 2¼ in. long, on petioles  $\frac{1}{4}$  to as long; calyx like that of *S. mellifera* but the prickly teeth of the larger upper lip short; corolla light violet; upper lip short, of two erect or somewhat retrocurved lanceolate lobes; lower lip large, much prolonged in the direction of tube, the lateral lobes acute, short, the middle lobe with its orbicular-dilated terminal portion turned abruptly downward, its margin denticulate or somewhat fringed; upper (sterile) stamens inserted at orifice of tube, bristle-like, divergent; two lower (fertile) stamens inserted on lower lip without the orifice, ascending, straight (nearly as long as the corolla); style long exserted.—Mountain slopes or cañons, 1000 to 4000 ft.: rare but widely distributed throughout cismontane Cal. May-June. (*Audibertia humilis* Benth.)

10. *S. mellifera* Greene. BLACK SAGE. Fig. 816. Shrub 3 to 6 ft. high, the herbaceous flowering branches very leafy at the base; leaves narrowly oblong, crenulate, green and rugulose above, cinereous-tomentulose beneath, 1½ to 3 in. long, petioled; spicate inflorescence with 4 to 6 rather small flower-whorls; leafy bracts oblong or ovate, those subtending the upper whorls much reduced; proper bracts ovate or oblong, cuspidate; lower lip of calyx very short, the 2 teeth prickly; upper lip arched, crowned by 3 short sharp teeth; corolla white or slightly lilac-tinged and rather small, its tube long, exserted; upper lip notched; lower lip widely and downwardly spreading, nearly twice as long as upper lip, its middle lobe transversely oblong or orbicular, emarginate and slightly denticulate, joined to the main part of the lip by a narrow constriction; stamens and style little exserted; lower

portion of connective in fertile stamens manifest at the joint as a subulate rudiment; upper pair of stamens represented by short sterile filaments, their tips approximate. — Mountain slopes, mesas and cañon walls, 50 to 4500 ft.: coastal S. Cal. and n. to Santa Cruz Mts. and Mt. Diablo. Apr.-May. (*Audibertia stachyoides* Benth.) An important bee-plant in S. Cal.; also called Ball Sage, Button Sage and Blue Sage.

816. *Salvia mellifera* Greene; a, fl. branchlet  $\times \frac{1}{2}$ ; b, fl.  $\times 2$ ; c, long. sect. of corolla  $\times 2$ ; d, stamen  $\times 4$ ; e, nutlet  $\times 3$ .

11. *S. leucophylla* Greene. PURPLE SAGE. Stems woody below, leafy, white-farinose above, 3 to 4 ft. high; leaves oblong-lanceolate or the lowest ovate, obtuse, the upper with truncate base, finely rugulose above, white-tomentulose beneath, 1 to 3 in. long, short-petioled; whorled heads 3 to 5, very dense; bracts oval or oblong, densely white-farinose; calyx splitting down in front, at length emarginate behind; corolla light purple, 5 to 7 lines long, the tube hardly exserted; stamens and style much exserted; connective almost continuous with the filament.—Mts. along the coast, 500 to 1500 ft., from San Luis Obispo Co. to the Santa Inez, Santa Monica and San Gabriel mountains. May-June. (*Audibertia nivea* Benth.)

12. *S. vâseyi* Parish. Shrub 3 to 5 ft. high, the flowering branches virgate; herbage whitish and only the lower leaves rugose-venulose; leaves round-ovate to quadratish-ovate, truncatish or very rounded at base, obtusish or subacute at apex, 1 to  $1\frac{3}{4}$  in. long, the petioles  $\frac{1}{3}$  to  $\frac{2}{3}$  as long; upper leaves obtuse or subacute at base; bracts and calyx-teeth long-aristate; corolla white, 6 to 10 lines long; upper lip short, notched, its lobes rounded; lower lip longer than upper, spreading, its middle lobe developed into a transversely oblong structure which is notched and which nearly conceals the short lateral lobes.—Mountain slopes and cañons, n. and w. side Colorado Desert. (*Audibertia vaseyi* Porter. *Ramona vaseyi* Briq.)

13. *S. palmeri* Greene. Shrubby, 3 to 5 ft. high; leaves oblong to oblong-lanceolate, obtuse or acute, tomentulose-canescens, 1 to 2 (or 3) in. long; spike virgate, naked, its whorled heads 4 to 8, remote; bracts oblong or lanceolate, slender-cuspidate or acuminate, puberulent, 3 to 6 lines long; calyx-throat very oblique, the upper lip acute, 1 to 3-mucronate, the very short lower teeth cuspidate; corolla white, 5 to 7 lines long.—Washes and cañon flats, San Diego Co. April-June.

14. *S. clevelandii* Greene. Shrub 1 to 2 ft. high; herbage canescent, or the leaves white-tomentulose beneath; leaves oblong or the upper oblanceolate-oblong, obtuse,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long, short-petioled; heads solitary, or few and rather distant; bracts ovate or oblong, mucronate or abruptly short-pointed, viscid-pubescent; calyx viscid-pubescent, the lower teeth short and subulate, the upper lip entire and cuspidate-tipped; corolla white, 7 to 9 lines long.—Chaparral slopes, 1000 to 3300 ft., San Diego Co. May-Aug.

817. *Salvia apiana* Jepson; a, lower leaves  $\times \frac{1}{2}$ ; b, panicle  $\times \frac{1}{2}$ ; c, fl.  $\times 1\frac{1}{2}$ ; d, stamen  $\times 2\frac{1}{4}$ .

15. *S. apiana* Jepson. WHITE SAGE. Fig. 817. Shrubby, 3 to 5 (or 10) ft. high, branches virgate; leaves oblong to elliptic, 1 to 4 in. long, serrulate or subentire, mostly very white above and below, short-petioled; panicle virgate, 1 to 4 ft. long; corolla white, 6 to 9 lines long, the tube short (2 to 3 lines long); upper lip very short or almost obsolete, the lower lip much developed, the conspicuous palate curved upward so as to close the throat; middle lobe fringed, the lateral lobes small; style and stamens long-exserted.—Mesas and cañons, 1000 to 2500 ft.: coastal S. Cal., e. to west side Colorado Desert. (*Audibertia polystachya* Benth.)

#### 10. MELÍSSA L.

Lemon-scented branching perennial herb, with broad dentate petioled leaves and white flowers in loose axillary clusters. Calyx narrowly campanulate, 13-nerved, deflexed in fruit; upper lip 3-toothed, the lower 2-parted. Corolla exserted, nearly twice as long as the calyx, 2-lipped, the upper lip erect, notched; lower

lip spreading, 3-cleft. Stamens 4, converging under the upper lip. (Greek melissa, a bee, these insects visiting the flowers for honey.)

1. *M. officinalis* L. GARDEN BALM. Stems somewhat decumbent at base,  $\frac{1}{4}$  to 2 ft. high; stems and petioles short-villous; leaves hispidulous above, truncate at base,  $2\frac{1}{2}$  in. long or less, the petiole  $\frac{1}{4}$  to  $\frac{1}{2}$  as long; calyx-teeth unequal; corolla 5 lines long.—Sparingly nat. from Eur., where it is cultivated as a culinary potherb; Marin Co.; Santa Rosa; Guerneville.

#### 11. ACÁNTHOMÍNTHA Gray

Annuals with dentate leaves and flowers in distinct or at length remote whorls, each whorl subtended by a pair of leaves and a circle of broad callous-margined bracts armed with needle-like spines. Calyx 2-lipped; upper lip 3-toothed, the teeth aristate; lower lip short, 2-cleft into oblong acute lobes. Corolla 2-lipped, its tube exceeding the calyx, naked within; upper lip entire, oblong; lower lip 3-lobed. Stamens 4, inserted high in the ample throat; lower pair fertile; upper pair smaller or with imperfect anthers. Nutlets smooth. (Greek acantha, thorn, and mentha, mint.)

Bracts orbicular, with about 10 spines on the margin; anthers glabrous; style glabrous; herbage subglabrous.....1. *A. ilicifolia*.

Bracts elliptic-ovate, with about 7 spines on the margin.

Anthers glabrous; style hairy; herbage puberulent.....2. *A. lanceolata*.

Anthers woolly; style glabrous; herbage subglabrous.....3. *A. obovata*.

1. *A. ilicifolia* Gray. Stem widely branching from near the base, 4 to 13 in. high; herbage minutely puberulent or subglabrous; leaves roundish-ovate, crenate, obtuse, broadly cuneate at base, 5 to 7 lines long, on petioles about  $\frac{1}{2}$  as long; bracts orbicular, with strong callous nerves and margins, about 10-spinose, 4 to 5 lines long; corolla white and rose-color, 6 lines long.—Mesas and mountain valleys, 1000 to 5000 ft.: Mt. Pinos; w. San Diego Co.

2. *A. lanceolata* Curran. Fig. 818. Stem stoutish, branching from the base, 7 to 12 in. high; herbage soft-pubescent, oily and ill-scented; leaves ovate to oblanceolate, sparingly dentate, tapering to a slender petiole; body of bracts

elliptic-ovate, 5 to 6 lines long, the aristate prickles 3 to 4 lines long; corolla rather deeply 2-lipped, its tube rather broad, bearing within at base a zone of deflexed hairs; upper lip keeled and somewhat falcate-incurved, cleft at apex; lower lip shallowly saccate, 3-lobed, the lobes entire, the middle lobe oblong, the lateral ovate-acute. —Mt. Hamilton Range and Santa Cruz Mts.

818. *Acanthomintha lanceolata* Curran; a, bract; b, fl. x 2.

3. *A. obovata* Jepson n. sp. Fig. 819. Stems branching from the base, minutely canescent, 4 to 9 in. high; leaves obovate, denticulate, puberulent or subglabrous above, 6 to 9 lines long, on petioles 3 to 6 lines long; bracts as in *A. lanceolata*; corolla 6 lines long, its tube slender, its limb shallowly 2-lipped as compared with *A. lanceolata*; upper lip entire, a little hooded; lower lip with a curved band of hairs on the palate; corolla-tube glabrous within or with a zone of scattered hairs at the middle; stamen pairs nearly equal; anthers woolly; style glabrous. —San Carlos Range (s. San Benito Co., Julia A. Betts, type).

819. *A. obovata* Jepson; fl. x 2.

## 12. POGONYNE Benth.

Low sweet-aromatic annuals with obovate or oblanceolate leaves narrowed into a petiole. Whorls crowded into dense spikes or the lower whorls distinct. Bracts and calyx hirsute. Calyx unequally and deeply 5-cleft, the two lower teeth longer; tube mostly 15-nerved; throat naked. Corolla straight, tubular-funnelform, blue or purplish; upper lip erect, entire; lower spreading, with 3 similar oval lobes. Stamens 4, with anthers, or the upper shorter pair sterile. Style somewhat exserted, in some (perhaps all) species flattened above and always bearded. (Greek pogon, beard, and gune, female, on account of the hairy style.)

Stamens all four with perfect anthers; style conspicuously bearded above, its lobes almost equal; corolla 6 to 9 lines long.

Inflorescence oblong- or cylindrical-spicate, nearly continuous; bracts and calyx conspicuously white-hirsute or hispid with long rigid marginal hairs.

Stout, about 1 ft. high; bracts acute; lower calyx-lobes twice as long as the tube.

1. *P. douglasii*.

More slender, lower; bracts mostly obtuse; lower calyx-lobes hardly longer than the tube

2. *P. parviflora*.

Whorled clusters more or less distant; bracts and calyx inconspicuously hirsute-ciliate.

3. *P. nudiuscula*.

Upper stamens sterile; style sparingly hairy, its lobes very unequal; corolla smaller (1½ to 2 lines long).

Stems stoutish, erect; leaves ovate or oval; inflorescence capitate or short-spicate. . . .

4. *P. ziziphoroides*.

Stems slender, diffuse; leaves obovate-oval or spatulate; inflorescence an oblong or longer and much interrupted spike. . . .

5. *P. serpylloides*.

1. *P. douglasii* Benth. Fig. 820. Stem freely branched from the base or sometimes simple, 4 to 6 in. high, rarely 2 ft. high; leaves oblanceolate or obovate, ¾ to 1¼ in. long, narrowed to a petiole; whorls forming a dense terminal spike, often with a single accessory whorl in the adjacent axil below, or sometimes several of the lower axils with flowers; bracts cuspidate, the margin ciliate with white hairs; lower divisions of calyx twice longer than tube; corolla blue, the palate white, dotted with purple, bristly, 7 to 9 lines long; stigmas subequal; nutlets smooth, often mottled, minutely hispid at the apex. —Low summer-dry fields that have been overflowed in the winter season: Coast Range valleys; Great Valley; Sierra Nevada foothills. It often colors large areas in May and June.

820. *Pogogyne douglasii* Benth.; a, habit  $\times \frac{1}{2}$ ; b, fl.  $\times 1\frac{1}{2}$ ; c, corolla spread out  $\times 1\frac{1}{2}$ ; d, calyx spread out  $\times 2$ .

dark purple markings; 2 lower stamens with large anthers, the 2 upper with very small anthers or none and with shorter filaments or wholly obsolete.—Low places in fields: Sacramento Valley and e. to Sierra Nevada foothills, thence s. to Mariposa Co. Apr.-May.

5. *P. serpylloides* Gray. Stems many from the base, very slender, diffuse, 3 to 6 in. long; leaves obovate-oval or spatulate, petioled, 2 to 4 lines long; whorls except the terminal ones distinct, the lower with few or even solitary flowers; bracts sparsely hairy; calyx-lobes all longer than the tube, equaling or exceeding the violet or bluish corolla; corolla  $1\frac{1}{2}$  to 2 lines long, short-pubescent outside; sterile stamens small, with rudiments of anthers or with none; style a little bearded above.—Foothills, 500 to 2200 ft.: San Luis Obispo Co. to Humboldt Co., common; San Benito Co. to Mt. Diablo; Sierra Nevada foothills from Tuolumne Co. to Amador Co. May.

### 13. CLINOPEDIUM L.

Ours a perennial herb. Flowers scattered or loosely clustered. Calyx tubular, about 13-nerved, the 3 upper teeth broader (and united slightly higher) than the 2 lower; tube in ours with a band of erect hairs inside at the summit. Corolla

2. *P. parviflora* Benth. More slender than no. 1; bracts mostly obtuse; calyx-teeth rather broad, the lower barely longer than the tube; corolla 5 lines long.—Sonoma Co.; e. to San Joaquin Co.

3. *P. nudiuscula* Gray. Stems 6 to 12 in. high, the branches slender, puberulent; leaves 4 to 12 lines long, spatulate, obtuse, glabrous; whorls of flower-clusters distant; bracts linear-subulate, cuspidate, these and the calyx inconspicuously hirsute-ciliate; calyx-lobes lanceolate- or linear-subulate, cuspidate; corolla  $\frac{1}{2}$  in. long, about twice as long as the calyx; anthers of the upper stamens smaller than the others but polleniferous. — San Diego. Apr.-June.

4. *P. ziziphoroides* Benth. Fig. 821. Stems short, commonly several from the base, 3 to 7 in. high; leaves obovate; bracts ciliate with white bristly hairs; whorls below distinct, with long internodes, above forming a short spike or sometimes capitate; corolla 3 to 4 lines long (the calyx-teeth distinctly shorter), light purple, the center of lower lip with white and

821. *Pogogyne ziziphoroides* Benth.; a, habit  $\times \frac{1}{4}$ ; b, bract  $\times 7\frac{1}{2}$ ; c, fl.  $\times 3$ ; d, pistil  $\times 5$ .

strongly 2-lipped, with a straight tube much exceeding the calyx. Stamens 4, all anther-bearing, ascending under the upper lip, the upper pair shorter; anthers conniving in pairs. (Greek kline, a bed, and podos, foot, the flower of one species likened to a bed-castor.)

1. *C. mimuloides* (Benth.) Ktze. Slender, 2 to 5 ft. high; herbage pilose and hirsutulose; leaves ovate, serrate,  $1\frac{1}{2}$  to 3 in. long, the petioles about  $\frac{1}{3}$  as long; calyx 6 to 7 lines long; axillary clusters 1 to 5-flowered, the pedicels  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long; corolla orange-red or pale crimson,  $1\frac{3}{8}$  to  $1\frac{5}{8}$  in. long, very *Mimulus*-like; upper lip erect, cleft; lower lip spreading, its middle lobe much longer than the lateral; tube within at base very nectariferous.—Shady stream beds or moist places in thickets, 1000 to 4000 ft., near the coast from Monterey Co. to Santa Barbara Co. and s. to the San Gabriel Mts. July-Oct. (*Calamintha mimuloides* Benth.)

#### 14. SATURÈIA L.

Ours a suffrutescent plant. Flowers commonly in clusters of 2 to 4 in the axils. Calyx 10 to 15-nerved, 2-lipped, the 3 teeth of the upper lip equal and a little shorter than the 2 ovate-acute teeth of lower lip. Corolla white, 2-lipped. Stamens 4, scarcely exserted, the lower a little longer. Style hairy on one side. (The Latin name.)

1. *S. chandleri* (Bdg.) Druce. Stems 3 ft. high, branching, "forming clumps"; herbage hirsutulose; leaves thick, round-ovate, obtuse, truncatish at base, weakly crenulate, 5 to 7 lines long, the petioles 1 to 4 lines long; calyx tubular-turbinate, 15-nerved,  $3\frac{1}{2}$  to 4 lines long, hairy without, glabrous within except on the teeth; upper lip of corolla cleft, lower lip 3-cleft, with 2 lines of hairs, all the lobes obtuse.—W. San Diego Co. (San Miguel Mt.). (*Calamintha chandleri* Bdg.)

#### 15. MICROMÈRIA Benth.

Trailing evergreen perennial with very slender stems. Flowers small, white, solitary and pediceled in the axils. Calyx tubular, about equally 5-toothed and striately 12 to 15-nerved. Corolla 2-lipped, the tube straight, shorter than or exceeding the calyx. Stamens 4, all anther-bearing, shorter than the corolla. Style glabrous. (Greek mikros, small, and meros, part, on account of the small size of the flowers.)

1. *M. chamissonis* (Benth.) Greene. YERBA BUENA. Fig. 822. Stems slender,  $\frac{1}{2}$  to 2 ft. long; herbage slightly pubescent; leaves round-ovate, crenate, glandular-punctate, especially on the under surface,  $\frac{1}{2}$  to 1 in. long; petioles 1 to 3 lines long; flowers  $3\frac{1}{2}$  to 4 lines long; calyx and corolla exteriorly short-hairy; lower pair of stamens longer.—Common in woods near the coast: Humboldt Co.; Marin Co.; Berkeley; Santa Cruz Mts.; Monterey and s. to Santa Monica Mts. June. The trailing stems root at the tips in winter and thus multiply the plant vegetatively. (*M. douglasii* Benth.)

#### 16. SPHÁCELE Benth.

Low shrub or merely suffrutescent. Flowers solitary in the axils of the reduced upper leaves, thus forming a leafy raceme. Calyx campanulate, deeply and nearly equally 5-toothed, naked within, about 10 to 15-nerved, reticulate-veiny, conspicuously inflated and membranous after flowering. Corolla large and rather showy, with 4 short spreading lobes, the fifth and lowest lobe much longer

822. *Micromeria chamissonis* Greene; a, sect. of fl. stem  $\times \frac{1}{2}$ ; b, fl.  $\times 3$ ; c, corolla spread open  $\times 3$ ; d, pistil  $\times 3$ .

823. *Sphacele calycina* Benth.; a, fl. branchlet  $\times \frac{2}{3}$ ; b, nutlet  $\times 4$ .

and erect; tube broad, a hairy ring at base within. Stamens 4, somewhat ascending; filaments naked; anthers somewhat approximate, the cells diverging. (Sphakos, the name of the Greeks for sage, the plants of this genus having similar foliage.)

1. *S. calycina* Benth. PITCHER SAGE. Fig. 823. Erect, 3 to 5 ft. high; herbage pubescent or even somewhat woolly; leaves very veiny or scarcely reticulated, broadly ovate to oblong-ovate, obtuse, dentate or serrate, the base entire and varying from cordate to acute, 2 to 4 in. long, the lower on petioles  $\frac{1}{2}$  in. long, the uppermost sessile; calyx in anthesis rather broad at base, its lobes triangular-lanceolate; corolla white or pink-tinted,  $\frac{7}{8}$  to  $1\frac{1}{8}$  in. long; calyx in fruit ovoid-inflated,  $\frac{3}{4}$  to  $1\frac{1}{8}$  in. long; nutlets black, finely pubescent but smooth, elliptical in outline, nearly 2 lines long.—Hillsides and cañons

of the Coast Ranges: Vaca Mts.; Marin Co.; Santa Cruz Mts.; Monterey. May-June. On the higher ridges the leaves are small and very rugose. Passes into: Var. *GRACILIS* Jepson n. comb. Leaves often subentire, very obtuse; calyx in anthesis rather narrow at base.—Dry interior cañons from Monterey Co. to Mt. Diablo. (*S. gracilis* Eastw.) Var. *WALLACEI* Gray. Lower cauline leaves truncate at base; calyx in anthesis narrow-based, villous, its lobes linear- or narrow-lanceolate.—San Gabriel Mts.; Catalina Isl.; Santa Cruz Isl. (*S. fragrans* Greene.) Var. *GLABÉLLA* Gray. Herbage and calyces subglabrate; leaves broadly cuneate at base.—Santa Barbara Co.; Ventura Co.

## 17. STACHYS L. HEDGE NETTLE

Ours hispid or soft-pubescent herbs with the flowers few in the axils of the floral leaves, usually forming an interrupted spicate inflorescence. Calyx tubular-campanulate or turbinate, 5 to 10-nerved or -ribbed, with 5 nearly erect or spreading pointed equal teeth, sometimes the upper larger and more or less united. Corolla with cylindrical tube, not dilated at the throat; upper lip erect or slightly turned backward, over-arched or concave, entire or notched; lower lip longer, spreading, 3-lobed, the middle lobe larger, the lateral lobes often deflexed. Stamens 4, in pairs, ascending under the upper lip of the corolla, or one or both pairs sometimes deflexed to the sides of the throat and contorted after anthesis. Nutlets obtuse at the apex. (Greek stachys, an ear of corn, hence a spike; given to these plants on account of their spicate inflorescence.)

Flowers large; corolla-tube nearly twice as long as calyx; floral whorls distant; stems retrorsely hispid or hirsute, especially on the angles.

Corolla red, the tube 7 to 9 lines long. . . . . 1. *S. chamissonis*.

Corolla purplish, the tube  $4\frac{1}{2}$  to 6 lines long. . . . . 2. *S. californica*.

Flowers smaller; corolla-tube little or not at all longer than the calyx (except in no. 7) . . .

Herbage white-woolly; floral whorls distinct or indistinct, the inflorescence 3 to 9 in. long; flowers whitish. . . . . 3. *S. albena*.

Herbage not white-woolly.

Floral whorls forming a dense spike; herbage very hirsute; flowers whitish. . . . . 4. *S. pycnantha*.

Floral whorls distinct and rather remote.

Herbage silky-villous or -hirsute; flowers whitish; corolla-tube with a hairy ring below its middle. . . . . 5. *S. ajugoides*.

Herbage hispid; flowers purplish

Corolla-tube with an oblique ring of hairs at its middle; petioles of lower leaves 1 to 2 in. long. . . . . 6. *S. bullata*.

Corolla-tube with an oblique ring of hairs below its middle; petioles of lower leaves very short. . . . . 7. *S. veronicaefolia*.

1. *S. chamissonis* Benth. Fig. 824. Stem erect, simple, ending above in 1 to 3 racemes, 3 to 8 ft. high, the angles of the stems retrorsely scabrous, the hairs pustulate, often viscid; leaves soft-pubescent, ovate, 3 to 6 in. long; calyx clavate-tubular, 5 to 7 lines long; corolla red, its tube 8 to 15 lines long, much exserted, with a hairy ring near base.—Swamps or wet places near the coast: San Luis Obispo Co.; Santa Lucia Mts.; Pilarcitos, San Mateo Co.; San Francisco; Pt. Reyes; Mendocino Co.; Elk River Valley, Humboldt Co.; n. to Ore. The herbage has a clinging disagreeable odor.

2. *S. californica* Benth. Stems slender,  $1\frac{1}{2}$  to 4 ft. high, hispid, especially in the angles, with pustulate hairs; leaves oblong-ovate to ovate, or ovate-lanceolate, ample, cordate or subcordate at base, sparsely villous-hispid, 2 to 4 in. long, petioled, flower-whorls rather remote; corolla-tube  $4\frac{1}{2}$  to 6 lines long, nearly twice as long as the calyx, the hairy ring at base horizontal.—Shady woods near the coast: Santa Cruz Mts.; Monterey Co.; s. to San Gabriel Mts. June.

3. *S. albens* Gray. Stem erect, strict, 2 to 5 (or 10) ft. high; herbage white-tomentose; leaves ovate to lanceolate, obtuse or cordate at base,  $1\frac{1}{2}$  to 4 in. long, sessile or subsessile, mostly the very lowest short-petioled; whorls many-flowered, the inflorescence dense and spike-like, 3 to 9 in. long, sometimes the whorls remote; calyces often somewhat yellow-green, the teeth a little over half as long as the tube, awn-pointed.—Along rivulets or near springs in the dry inner Coast Ranges: Lake Co. to Pacheco Pass and s. to cismontane S. Cal.; also in the delta lowlands of the lower Sacramento and San Joaquin rivers. May-Aug. Var. *JULIENSIS* Jepson n. var. Flower-whorls mostly remote; calyx-teeth as long as tube.—Springy spots in the mts., 2000 to 7000 ft., Sierra Nevada from Mariposa Co. to Fresno Co. (McKinley Grove, A. L. Grant 1198, type). July.

4. *S. pycnantha* Benth. Stem erect,  $\frac{3}{4}$  to  $1\frac{1}{4}$  ft. high; herbage mostly green but hirsute, the surface of the leaves somewhat granulate-glandular; leaves ovate to oblong-ovate, 1 to 4 in. long, obtuse or subcordate at base, mostly petioled; flowers in a dense cylindraceous bractless or nearly bractless spike 1 to 2 in. long; lowest whorls rarely separate; calyx-teeth deltoid, mucronate, commonly equaling the tube.—Near the coast, rather uncommon: Marin Co. to San Luis Obispo Co. July-Sept.

5. *S. ajugoides* Benth. Stem simple, mostly erect, 1 to 2 ft. high; herbage densely soft-pubescent but usually green, sometimes glabrate; leaves oblong or ovate, obtuse or subcordate at base, 1 to  $2\frac{1}{2}$  (or 4) in. long, petioled, the upper sessile; flower-whorls mostly distinct but not remote, or with 1 or 2 whorls below in the axils of the upper foliage leaves; calyx short-campanulate or turbinate, very silky-villous, often concealing the teeth; hairy ring below middle of corolla-tube very oblique, the tube slightly constricted below.—Everywhere common in low lands, wet valleys or springy cañons, 5 to 5000 ft., throughout cismontane Cal. May-Aug. Var. *STRICTA* Jepson. Small resin-glands abundant beneath the short pubescence on the leaves; leaves thinnish, ovate-lanceolate or oblong, 3 to  $3\frac{1}{2}$  in. long, only the uppermost sessile;

824. *Stachys chamissonis* Benth.; a, fl. stem  $\times \frac{1}{2}$ ; b, leaf  $\times \frac{1}{2}$ ; c, fl.  $\times 1$ ; d, sect. corolla-tube spread out, showing hairy ring inside  $\times 1\frac{1}{2}$ .

825. *Stachys bullata*  
Benth.; fl. branchlet  
x 1.

calyx-teeth erect or somewhat connivent around the tube of the corolla; upper lip of corolla very short; corolla-tube without evident constriction, the ring of hairs horizontal, not oblique.—Knights Valley, Sonoma Co. Var. *VELUTINA* Jepson. Pubescence short and close; leaves cordate-ovate; spike elongated, interrupted.—Suisun Marshes. Oct. This variety forms a transition to the preceding species.

6. *S. bullata* Benth. Fig. 825. Stem simple, or sometimes branched above, erect or ascending, 10 to 22 in. long; foliage densely or sparsely hispid, the stems retrorsely hispid, especially on the angles; leaves oblong-ovate, sometimes varying to elliptic, coarsely crenate, truncate or subcordate at base, 1 to 2 (or  $3\frac{1}{2}$ ) in. long, the lower on petioles 1 to 2 in. long; flowers about 6 in a whorl, the whorls rather remote (mostly 6 to 12 lines apart); calyx turbinate or campanulate-turbinate, the teeth triangular, cuspidate, in age spreading, somewhat indurated; corolla-tube 4 lines long, exserted about 1 line, bearing within at its middle an oblique ring of hairs interrupted on the upper side opposite the style and indicated exteriorly by a distinct although only partial constriction; filaments densely pubescent at the middle.—Low hills, 20 to 2500 ft.: Coast Ranges; coastal S. Cal. Mar.-Apr. When the flowers first open and the stamens stand erect, the lower pair of stamens are at that time distinctly although but slightly longer than the upper.

7. *S. verónicaefolia* Davy. Stem simple or branched from base,  $1\frac{1}{4}$  to 2 ft. high; herbage somewhat hispid; leaves elliptic or ovate-oblong, 1 to 2 in. long, the upper sessile, the lower on very short petioles; floral whorls remote; corolla-tube 4 lines long, usually exserted for nearly half its length, with an oblique hairy ring within below its middle.—Placer Co. to Shasta and Modoc Cos. May-Aug.

#### 18. *PYCNANTHEMUM* Michx. MOUNTAIN MINT

Glabrous or canescent perennial herbs with white flowers in densely crowded whorls, the whorls remote and leafy-bracted or the uppermost subtended by a pair of somewhat reduced leaves. Calyx oblong or tubular, its teeth equal. Corolla-tube little exceeding the calyx; upper lip almost entire, lower 3-cleft. Stamens 4, nearly equal. (Greek *pychnos*, dense, and *antheion*, flower, the inflorescence glomerate.)

1. *P. californicum* Torr. Stem simple, erect, 2 to  $3\frac{1}{2}$  ft. high; leaves ovate to ovate-lanceolate, serrulate along the sides, the acuminate apex and rounded or cordate base entire,  $1\frac{1}{2}$  to  $3\frac{1}{2}$  in. long; calyx pubescent, the tips of the teeth very woolly exteriorly; corolla white, sprinkled with resin dots, its throat hairy.—Chaparral slopes or mountain meadows, 2500 to 5300 ft.: San Jacinto and San Bernardino mountains; Sierra Nevada; e. to Nev. July-Aug. (*Koelia californica* Ktze.)

#### 19. *LAMIUM* L. HENBIT

Hairy herbs. Flowers in 1, 2 or 3 compact whorls. Calyx with 5 nearly equal awn-pointed teeth, much surpassed by the elongated corolla-tube. Corolla-tube much enlarged at the throat; upper lip erect or arched, entire or slightly notched; lower lip spreading, the middle lobe broad, the lateral lobes small and acute or tooth-like. Anthers hairy in ours. (Greek *laimos*, throat, the corolla gaping.)

1. *L. ampléxicáule* L. GIRAFFE HEAD. Low annual, decumbent at base; internodes below the inflorescence very long; leaves rounded, toothed or lobed, the lowest petioled and cordate, the floral sessile; corolla purplish-red, the upper lip bearded, the lower spotted.—Introduced from Eur., occasional: Ft. Bragg; Sonoma Co.; St. Helena; Mt. Eden; Little Arthur Creek, Gilroy; Columbia, Tuolumne Co.

**MOLUCCÉLLA LAËVIS** L. Shell-flower. *Molucca* Balm. Annual; leaves roundish, crenate; whorls 6-flowered; bracts spinose; calyx-base campanulate, nerved, expanded above into a very broad wing; corolla white, 2-lipped, shorter than the calyx.—Foothills, w. Colusa Co.; adv. from Eur.

## 20. **HÝPTIS** Jacq.

Herbs or shrubs. Calyx with 5 subequal teeth. Corolla short, the lobes of upper lip and lateral lobes of lower lip similar, flat, equal; middle lobe of lower lip with a transverse ridge or narrow fold at the contracted base and produced beyond into a bowl-shaped sac. Stamens 4, the upper pair shorter, all fertile, declined, included in the sac of the lower lobe. (Greek, *uptios*, turned back, referring to the lower lip.)

1. **H. émoreyi** Torr. BEE-SAGE. Shrub, the numerous straight erect slender stems forming a compact clump 4 to 8 or 12 ft. high; herbage fragrant, white scurfy-tomentose; leaves ovate, truncate at base, crenulate,  $\frac{1}{2}$  to 1 in. long, on petioles half as long; flowers in short-peduncled axillary clusters at the ends of the branchlets; pedicels nearly as long as calyx; calyx narrowly turbinate, white-scurfy or white-woolly with pinnately branched hairs; corolla violet, 2 lines long, the upper lip with its lobes turned back to back; upper pair of stamens with densely hairy filaments, lower pair glabrous or nearly so.—Desert valleys and cañon flats: e. Mohave Desert; Colorado Desert; e. to Ariz., s. to Mex.

## 21. **MONARDELLA** Benth.

Low herbs, for the most part pleasantly fragrant. Flowers in heads; heads terminal on the stems or branches, subtended by broad involucre bracts, which are often more or less colored. Calyx tubular, narrow, 15-nerved, the 5 teeth equal or nearly so. Corolla purple, lavender or dull white; upper lip erect, 2-cleft, the lower 3-parted, all the lobes linear or narrowly oblong. Stamens 4, all fertile, strongly or moderately unequal, exserted. (Diminutive of *Monarda*, on account of its resemblance to that genus.)

### A. FLOWERS LARGE AND RATHER LOOSE IN THE HEAD; COROLLA-TUBE MUCH LONGER THAN LIMB; PERENNIALS.

Corolla scarlet or yellowish,  $1\frac{1}{2}$  in. long, the tube greatly exceeding the calyx.....

Corolla white, yellowish or tinged with rose,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long, the tube little exceeding the calyx.....

### B. FLOWERS SMALLER, MORE DENSELY CAPITATE; COROLLA-TUBE BUT LITTLE LONGER THAN LIMB.

#### 1. *Perennials, often slightly woody at base.*

Bracts foliaceous; leaves toothed.

Leaves round-ovate to lanceolate, more or less toothed.

Leaves cinereous, not venulose; rare.....3. *M. cinerea*.

Leaves greenish and pubescent above, markedly venulose; common..4. *M. villosa*.

Leaves rhomboidal to oblong or oblanceolate, entire.

Leaves densely lanate below, moderately so above, strongly revolute...5. *M. lanata*.

Leaves lanate below, bright green above, not strongly revolute....6. *M. viridis*.

Bracts membranous, usually purplish or pinkish-tinged; leaves mostly entire.

Leaves strongly revolute, tomentose below with a close white felt....7. *M. hypoleuca*.

Leaves not strongly revolute; tomentose or white-puberulent covering, if present, not confined to the lower surface of the leaves.

Herbage more or less white-puberulent or uniformly covered with a fine silvery pubescence; leaves narrow, elongate.

Leaves 1 to 2 in. long, linear-lanceolate, distant, those subtending the head conspicuously longer than the floral bracts and flowers; bracts acute to somewhat acuminate.....8. *M. viminea*.

Leaves  $\frac{1}{2}$  to 1 in. long, linear to oblong or lanceolate, at least the lower close together, those subtending the head not longer than the floral bracts and flowers; bracts acute or obtuse.....9. *M. linoides*.

Herbage glabrous, pubescent or tomentose, not white-puberulent or silvery-pubescent; leaves broader.

Leaves plane.

Stems 6 to 18 in. high; leaves  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; bracts broadly ovate, acute.....10. *M. odoratissima*.

Stems 2 to 5 in. high; leaves smaller (3 to 7 lines long); bracts lanceolate-ovate, the upper acute, the lower acuminate.....

11. *M. australis*.

Leaves strongly undulate-margined.....12. *M. crispa*.

## 2. Annuals.

- Leaves strongly undulate-margined.....13. *M. undulata*.  
 Leaves plane.  
   Bracts greenish or purplish, membranous or somewhat foliaceous, not white or thin-transparent.  
     Leaves subtending the head longer than the acute bracts and the calyx.....14. *M. lanceolata*.  
     Leaves subtending the head, if present, not longer than the abruptly acuminate bracts and the calyx.....15. *M. pringlei*.  
 Bracts partly white or transparent-scarious.  
   Calyx-teeth white-tipped.  
     Bracts with white tips and margins; calyx-teeth acute.....16. *M. candicans*.  
     Bracts thin, transparent-scarious; calyx-teeth subulate, recurved.....17. *M. leucocephala*.  
   Calyx-teeth not white-tipped.  
     Bracts strongly fenestrate, the veins broad; calyx-teeth subulate-lanceolate...18. *M. douglasii*.  
     Bracts not strongly fenestrate, the veins narrow; calyx-teeth acute.....19. *M. breweri*.

1. *M. macrantha* Gray. Fig. 826. Stems simple or branched, 2 to 12 in. high, from creeping woody rootstocks; herbage more or less puberulent or

826. *Monardella macrantha* Gray; a, habit x  $\frac{1}{2}$ ; b, calyx x 1.

villous, often purplish; leaves ovate, obtuse, revolute, entire or sometimes slightly toothed, more or less hispid-pubescent, ciliate, lower surface punctate with dark dots,  $\frac{1}{4}$  to 1 in. long, petiolate; heads terminal, 2 to 18-flowered, the bracts leafy, narrowly ovate, acute or obtusish, 4 to 11 lines long, villous-ciliate; calyx 10 to 12 lines long, pubescent and somewhat glandular, sparsely villous within at the upper end, the 5 teeth nearly equal, subulate, the sinuses thickened; corolla scarlet, pubescent without, 1 to  $1\frac{1}{4}$  in. long, the tube narrowly funnelform, the lips  $2\frac{1}{2}$  lines long, the lobes of the lower linear, obtusish; stamens much exserted, the lower pair the longer, filaments sometimes sparsely pubescent. —Montane, 1000 to 4500 ft.: Monterey Co. to San Diego Co.; s. to L. Cal. May-Aug. Var. *LONGLOBA* Abrams. Corolla yellowish, the tube more slender, the lips  $3\frac{1}{2}$  or 4 lines long.—San Jacinto River and Mountains. Var. *PINETORUM* Hall. Stems 2 to 4 in. long; herbage ashy-pubescent; leaves 2 to 4 lines long, tending to

be crowded; corolla pale yellow to almost white, conspicuously pubescent; stamens not exserted beyond the corolla-lobes.—Mt. San Jacinto, 6000 to 8000 ft.

2. *M. nana* Gray. Stems from creeping rootstocks, woody at base, simple or somewhat branched, 4 to 10 in. high; corolla rose-tinged, white or yellowish, slender,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long, the lobes 3 lines long, the tube little exceeding the calyx; stamens little exserted.—Mts. of San Diego Co., 4000 to 8000 ft. June-Aug. Var. *TENUIFLORA* Abrams. About 3 in. high; leaves oblong or rotund, 2 to 4 lines long; flowers white or yellowish.—San Jacinto Mts. Var. *ARIDA* Abrams. Two to 3 in. high, densely branching from a woody base; leaves 2 to 4 lines long, much curled; bracts white, sometimes purplish-tinged.—Santa Rosa Mts.

3. *M. cinerea* Abrams. Dwarfish plant, the stems from a branching root-crown, 1 to 4 in. long, very leafy; leaves ovate, sparingly or obscurely serrate, 2 to 4 lines long, subsessile; heads 6 to 7 lines broad; corolla-tube not exserted.—San Antonio Mts., 7000 to 9000 ft.

4. *M. villosa* Benth. COYOTE MINT.

Fig. 827. Stems several from the base, mostly simple, tough or somewhat suffrutescent at base,  $\frac{3}{4}$  to  $1\frac{1}{2}$  ft. high; herbage pubescent or tomentose; resin dots more or less conspicuous on lower surfaces of leaves and bracts, or none; leaves round-ovate to lanceolate-ovate, commonly more or less serrate, glabrate or pubescent, veins conspicuous,  $\frac{1}{2}$  to 1 in. long; petioles 2 to 3 lines long; bracts ovate to lanceolate, foliaceous, pinnately veined; calyx 4 lines long, pubescent or hirsute-pubescent, the teeth and upper end of tube hairy within; corolla pubescent within and without, the tube exceeding the calyx, the limb more than half as long; stamens exserted, or about equaling the linear lobes of the corolla; filaments glabrous or sparsely hairy; flowers purple to pink or dull white.—Dry rocky hills, 300 to 2000 ft.: Coast Ranges from San Luis Obispo Co. to Siskiyou Co., thence se. in the Sierra Nevada to Amador Co. In typical form near the sea, Monterey Co. to San Francisco, but varying greatly in pubescence, foliage and general aspect. Var. *INTERIOR* Jepson. Leaves coarsely few-toothed, the teeth sometimes salient; heads large.—Vaca Mts. Var. *LEPTOSIPHON* Torr. Large-flowered, cinereous, with a finer pubescence; leaves nearly entire, ovate to ovate-oblong.—Mt. Tamalpais. Var. *TOMENTOSA* Jepson n. comb. Stems and lower surface of leaves (especially the upper) and bracts, also the calyx, covered with gray tomentum; bracts foliaceous; heads terminal or sometimes smaller ones in the upper axils.—Dry flats or hill slopes: Mt. Hamilton; Mt. Tamalpais; Napa Range; Mendocino Co. (*M. tomentosa* Eastw.) Var. *FRANCISCANA* Epling. Stems reclining or diffuse, more or less woolly-pubescent; leaves broadly ovate, serrate to entire, pubescent above, especially the upper ones, woolly-pubescent below,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long; heads densely flowered.—Coast from Pt. Reyes to San Luis Obispo. June-July. (*M. franciscana* Elmer.) Var. *SHELTONII* Jepson n. comb. Leaves oblong or ovate to lanceolate; bracts mostly foliaceous; corolla nearly glabrous within, the lobes of the lower lip much more than  $\frac{1}{2}$  the length of the tube, the upper lip cleft for more than  $\frac{1}{2}$  its length.—Montane, 3000 to 5000 ft.: Sierra Nevada from Mariposa Co. to Shasta Co., thence s. to Humboldt and Lake Cos. (*M. sheltonii* Torr.)

5. *M. lanata* Abrams. Stems branched, about 1 ft. high; herbage lanate below the inflorescence; leaves oblong to oblanceolate, obtuse, entire, revolute,  $\frac{1}{2}$  to 1 in. long, petioled, the veins inconspicuous; bracts 4 lines long, densely pubescent, villous-ciliate; calyx  $3\frac{1}{2}$  lines long, slightly villous above within; corolla pubescent, the tube equaling the calyx, the limb more than  $\frac{1}{2}$  as long; stamens exserted, the filaments pubescent.—Mts. of s. San Diego Co.

6. *M. viridis* Jepson. Stems diffuse, 1 to 3 ft. long, woody at base; leaves rhomboidal to oblong-obtusish, somewhat revolute, narrowed at base to a slender petiole, the whole  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long, bright green on the upper face, white-lanate on the lower, both faces conspicuously punctate with large dots; heads subglobose, 1 to  $1\frac{1}{8}$  in. broad, on long and almost naked peduncles; bracts thick, little differentiated from the leaves, deflexed; calyx glandular-dotted, the teeth somewhat hirsute; flowers lavender.—Dry foothills: Napa Range and n. to Lake Co. (*M. ledifolia* Greene.)

827. *Monardella villosa* Benth.; a, fl. stem  $\times 1$ ; b, fl.  $\times 1\frac{1}{2}$ ; c, calyx  $\times 1\frac{1}{2}$ .

7. *M. hypoleuca* Gray. Stems simple or somewhat branched, reddish-brown, pubescent, 1 to 2 ft. high; leaves ovate-lanceolate, revolute, entire, obtuse,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long, petioled, the lower surface densely white-tomentose, the upper green and glabrous, veins prominent; inflorescence a dense rounded head; bracts ovate, obtuse, pubescent, villous-ciliate, purplish, punctate below with resin dots,  $\frac{1}{2}$  in. long, longer than the calyx; heads 1 in. broad; calyx 3 lines long, villous without, glabrous within; corolla pubescent without, the tube equaling the calyx-tube, the limb more than  $\frac{1}{2}$  as long; filaments exerted, very sparsely hairy.—Mts. along the coast from Santa Barbara Co. to San Diego Co. Var. *SAXICOLA* Jepson n. comb. Stems  $\frac{1}{2}$  to 1 ft. high, stiffly branching from near the base, covered with a retrorse pubescence; leaves smaller, less strongly revolute, the lower surface densely puberulent; heads smaller, the bracts mostly shorter than the calyx.—San Antonio Mts. (*M. saxicola* Jtn.)

8. *M. viminea* Greene. Tall, at least 2 ft. high, the lower part of the stems woody; herbage puberulent; leaves linear-lanceolate, obtuse, distant, 1 to 2 in. long, the uppermost subtending the head and much longer than the bracts; bracts 7 lines long, ovate, acute to somewhat acuminate, pubescent, resinous-dotted, rather sparingly ciliate; calyx pubescent, resinous-dotted.—Mts. of San Diego Co.

9. *M. linoides* Gray. Stems in rather dense clusters, 8 to 12 in. high, from a woody base; herbage pale gray-green, evenly clothed with a very fine pubescence; leaves linear to narrowly oblong, obtuse, entire, 6 to 10 lines long, the upper sessile, the lower petioled; bracts varying greatly in size in a single head, broadly ovate to oblong-ovate, acute or obtuse, membranous, pale or pinkish-tinged, pinnately veined, ciliate, glandular; calyx  $3\frac{1}{2}$  lines long, pubescent, with few resinous dots, the teeth short, subulate, pubescent or somewhat villous without and within; corolla-tube pubescent within and without, the upper lip cleft nearly to base.—Montane, 5000 to 7000 ft., San Jacinto Mts. s. to San Diego Co. June-July. Var. *STRICTA* Parish. Branching from base with many short leafy sterile branchlets; herbage pale green, pubescent; leaves entire or remotely denticulate, linear-lanceolate, those on the main branches 6 to 10 lines long, those on the sterile branchlets much shorter; heads solitary, terminal or sometimes racemose; bracts ovate to lanceolate, acute or acuminate, often purplish-tinged; calyx pubescent, often somewhat hispid; corolla-tube strongly exerted, more or less hairy within; filaments more or less hairy toward base.—San Gabriel Mts.; San Bernardino Mts.; Providence Mts. Var. *ANEMONOIDES* Jepson n. comb. Stems thickly leafy below, above almost scape-like, the long-peduncled heads with somewhat enveloping petaloid bracts, thus giving the aspect of some 1-flowered species of *Anemone*.—Argus Mts.; Greenhorn Mts.; Mt. Pinos. (*M. anemonoides* Greene.) Var. *PALMERI* Jepson n. comb. Bracts obtuse; calyx-teeth linear-lanceolate.—Santa Lucia Mts. (*M. palmeri* Gray.)

10. *M. odoratissima* Benth. Stems several from the base, commonly simple, 6 to 12 in. high; herbage often pale, glabrous or finely pubescent; leaves narrowly ovate to lanceolate, entire, punctate with dark dots, the veins often obscure,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long, petiolate; bracts ovate to lanceolate or often attenuate above, membranous, pinkish or purplish-tinged, pubescent, resinous-dotted, 3 to 6 lines long, the lower often somewhat foliaceous, ciliate towards base, the upper membranous; calyx  $3\frac{1}{2}$  to  $4\frac{1}{2}$  lines long, more or less pubescent, the acute teeth white-hirsute without and within; corolla more or less pubescent below limb without and within, the expanded upper end of tube exerted from calyx, the lower lip 2 lines long, slightly exceeding the upper, about  $\frac{1}{2}$  the length of the tube, upper lip cleft for about  $\frac{1}{2}$  its length; stamens commonly slightly hairy at base, the longer pair exceeding the corolla-lobes.—Montane, 2300 to 9000 ft., from Tulare Co. to Siskiyou Co., thence s. to Humboldt Co.; n. to Wash., e. to Utah. June-Aug. Var. *OVATA* Jepson n. comb. Bracts thin and somewhat fenestrate, the subscarious portion purplish.—Siskiyou Co. (*M. ovata* Greene.) Var. *NEGLÉCTA* Jepson n. comb. Stem 2 to 8 in. high, glabrous or puberulent; leaves ovate, somewhat serrate, purplish, glabrous, 3 to 10 lines long; bracts and calyx purplish, nearly glabrous, the former ciliate, the latter with teeth hispidulous; corolla purple.—Tiburon hills, Marin Co. (*M. neglecta* Greene.)

11. *M. australis* Abrams. Stems decumbent, from a woody base, 2 to 5 in. high; herbage pubescent to hirsute, glandular; leaves 3 to 7 lines long, oblong to ovate, obtuse, entire or sparingly toothed; bracts 3 to 6 lines long, ovate, acute to broadly acuminate, glandular, ciliate, the lower somewhat foliaceous, the upper petaloid, greenish or purplish; calyx pubescent or hispid with spreading hairs, glandular, often purplish; corolla-tube exserted, the upper lip cleft about half way to base.—San Jacinto Mts., 9200 ft. July.

12. *M. crispa* Elmer. Stems about 1 ft. high, much branched from a woody base, tomentulose or the young parts white-tomentulose; leaves oblanceolate, obtuse, undulate, pubescent, punctate below,  $\frac{1}{2}$  to 1 in. long, petiolate; heads mostly solitary, compact, subglobose; bracts ovate, acute or obtuse, membranous; calyx villous-pubescent; corolla purple, the tube but little exserted.—Coast of Santa Barbara Co. at Surf. May.

13. *M. undulata* Benth. Stems erect, simple or loosely branched, 5 to 15 in. high, reddish-brown; herbage puberulent or often somewhat hispid; leaves thickish, oblong-ob lanceolate or linear, obtuse, narrowed at base, undulate-margined,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long; heads  $1\frac{1}{2}$  to 2 in. broad; bracts broadly ovate or almost round, thin and somewhat scarious, whitish or pinkish, obtuse or acute, without cross veinlets between the conspicuous parallel nerves; calyx-teeth triangular, or somewhat oblong, not cuspidate; corolla rose-purple.—Hills near the sea: Pt. Reyes; San Francisco; s. to S. Cal. June.

14. *M. lanceolata* Gray. MUSTANG MINT. Fig. 828. Stem  $\frac{1}{4}$  to  $2\frac{1}{2}$  ft. high, simple or branched, glabrous below, puberulent above; leaves oblong-lanceolate to lanceolate, obtuse, entire,  $\frac{1}{2}$  to 2 in. long; bracts ovate to ovate-lanceolate, acute, glandular, minutely ciliate, the lower foliaceous, the upper often purplish; calyx pubescent, the acute teeth ciliate; corolla rose-purple, its lobes long and narrow.—Hill slopes or valleys, 1500 to 4000 (or to 6000) ft.: Sierra Nevada foothills from Shasta Co. to Mariposa Co.; Monterey Co. to the San Bernardino and San Jacinto mountains and San Diego Co. Var. *MICROCÉPHALA* Gray. Much branched; heads much smaller; bracts not over  $\frac{1}{4}$  in. long.—San Diego Co. Var. *SANGUÍNEA* Jepson n. comb. More freely and divaricately branching; leaves more often elliptic-lanceolate; corolla well exserted, dark red-purple.—Montane, 5000 to 6000 ft.: Cuyamaca Mts.; San Jacinto Mts.; s. Sierra Nevada in Tulare Co. (*Madronella sanguinea* Greene.) Var. *GLANDULÍFERA* Jtn. Upper parts of the stems, also the leaves and bracts, covered with stalked glands; corolla dark red-purple, the tube and throat glandular.—Browns Flats, San Antonio Mts.

15. *M. pringlei* Gray. Stem simple or branched from the base, 10 to 12 in. high; herbage finely pubescent, sometimes glandular above; leaves oblong to broadly lanceolate, entire or remotely toothed,  $\frac{1}{2}$  to 1 in. long, tapering to a petiole; heads small, very compact, terminating the main stem and branches; bracts broadly ovate, abruptly acuminate, purple-tipped, strongly veined, without cross-veinlets, pubescent, ciliate,  $4\frac{1}{2}$  lines long; calyx pubescent, the teeth strongly hairy within; corolla-tube exserted.—Sandy soil, San Bernardino Valley.

828. *Monardella lanceolata* Gray; a, habit  $\times \frac{1}{2}$ ; b, bract of involucre  $\times 1\frac{1}{2}$ ; c, fl.  $\times 1\frac{1}{2}$ .

*M. ÉLMERI* Abrams. Puberulent; leaves lanceolate to narrowly ovate; calyx-teeth narrowly triangular-subulate, herbaceous or tinged with rose-purple (ex char.).—Acton, Los Angeles Co.

16. *M. cándicans* Benth. Stem simple below, somewhat branched above, 5 to 13 in. high; herbage puberulent; leaves lanceolate to oblong, obtuse, puberulent,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long, tapering to a slender petiole; bracts ovate, acute or obtuse, pubescent, greenish with white tips and margins, the parallel nerves with cross veinlets between; calyx-teeth more or less villous, the tips white.—Foothills, 500 to 2500 ft.: Sierra Nevada from Kern Co. to Eldorado Co. May-June. Var. *EXILIS* Gray. Bracts often purplish, the apex acuminate, this and the margins white.—Sandy flats, deserts or arid mts., 2500 to 4000 ft.: Mohave Desert and bordering mountain slopes; s. Sierra Nevada in Kern Co.

17. *M. leucocéphala* Gray. Stems branching, 6 to 7 in. high; herbage pubescent; leaves oblong- to ovate-lanceolate, 6 to 8 lines long, petiolate; heads many, small, terminal or axillary; bracts ovate to orbicular, acuminate, thin, white-scarious, the nerves pubescent; tips of calyx-teeth white, subulate, recurved, hispid.—Sandy soil, Merced plains. June.

829. *Monardella douglasii* Benth.; a, habit  $\times \frac{1}{2}$ ; b, bract of involucre  $\times 1\frac{1}{2}$ ; c, fl.  $\times 1\frac{1}{2}$ ; d, gland  $\times 12$ .

18. *M. douglasii* Benth. Fig. 829. Stems loosely branched, 4 to 12 in. high; herbage below bracts pubescent, often hispidulous; leaves narrowly oblong or lanceolate, short-petioled,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long, the upper somewhat resinous-dotted; heads on terminal or axillary peduncles; bracts ovate and ovate-lanceolate, cuspidate, resinous-dotted, with strong pinnate ribs confluent along the margin, the spaces between them silvery-scarious; calyx sparingly hirsute-pubescent, the teeth hirsute within; corolla deep purple, the tube little exserted beyond the cuspidate triangular-lanceolate calyx-teeth; lobes of upper lip ending in a cup-like gland.—Hill slopes, 1500 to 2500 ft.: Mt. Diablo, Mt. Hamilton and Pacheco Peak ranges from Contra Costa Co. to San Benito Co.; e. slope Santa Cruz Mts. It is remarkable for its fenestrate bracts. Var. *PARRYI* Jepson n. var. Stouter, about 6 in. high; bracts purplish, strongly hirsute-ciliate, broader, with larger fenestrae.—Chico, Butte Co. (C. C. Parry, type).

19. *M. breweri* Gray. Stem 6 in. high; herbage finely scabrous-pubescent; leaves oblong or narrowly ovate, short-petioled, the lower over 1 in. long; bracts broadly ovate, abruptly acuminate-cuspidate, whitish-scarious, the outer pianately 7 to 9-ribbed, the inner with the ribs parallel and converging to the point; calyx-teeth triangular-lanceolate, not cuspidate; corolla rose-color or rose-violet, the tube much surpassing the calyx.—Corral Hollow (inner South Coast Range).

## 22. *LYCOPUS* L. WATER HOREHOUND

Perennial herbs similar to *Mentha*, but bitter and much less aromatic. Flowers small, white or whitish, in sessile capitate glomerules, apparently whorled, the upper axils flowerless. Calyx campanulate, 4 or 5-toothed (naked in the throat). Upper lobe of corolla entire. Fertile stamens 2, the upper pair without anthers, the tips of the filaments in ours thickened. Nut-

lets with thickened margins. (Greek lukos, wolf, and pous, foot, perhaps on account of the shape of the leaves in the original species.)

Stems from creeping rootstocks, not bearing stolons; leaves petioled, irregularly and incisely toothed.....1. *L. americanus*.  
Stems from a root-crown, perennial by stolons; leaves sessile, regularly serrate.....2. *L. lucidus*.

1. *L. americanus* Muhl. Fig. 830. Stem erect, branching above, 2 to 3 ft. high, very acutely 4-angled, from creeping rootstocks, not bearing stolons; herbage nearly glabrous; leaves broadly or narrowly lanceolate, incisely toothed or lacinate-pinnatifid, 1 to 2 in. long, narrowed at base into a slender petiole; calyx-teeth acute; corolla-tube filled with horizontally spreading hairs which close the tube as with a fine mesh; rudiments of sterile stamens conspicuous; inner angle of nutlet granulose at apex.—San Bernardino Valley; lower Sacramento River; San Francisco; n. to B. C., e. to the Atlantic. Sept.-Oct. (*L. lacerus* Greene.)

2. *L. lucidus* Turcz. Stems stoutish, not so sharply angled as in no. 1, at base producing stolons; leaves broadly or narrowly oblong, coarsely and incisely toothed, sessile, the lower 3 in. long and  $\frac{3}{4}$  in. wide, the upper reduced; calyx-teeth attenuate-subulate.—Salt marshes and river bottoms: San Bernardino Valley; Los Angeles; San Francisco; Benicia; Suisun; n. to Wash.; ne. Asia. Aug.

830. *Lycopodium americanum* Muhl.; a, fl. stem  $\times \frac{1}{2}$ ; b, fl.  $\times 2\frac{1}{2}$ ; c, fruit and calyx  $\times 10$ ; d, nutlet, dorsal view  $\times 14$ ; e, nutlet, ventral view  $\times 14$ .

### 23. MENTHA L. MINT

Very odorous perennial herbs, mostly with slender creeping rootstocks, usually tomentose or hairy and with rather small flowers in whorls, which are either remote or spicate or capitate. Calyx campanulate or short-tubular, commonly 5-toothed, nearly regular, or 2-lipped. Corolla with a short tube; upper lip emarginate or entire, scarcely or not at all larger than the lobes of the lower lip. Stamens 4, erect and nearly equal. Nutlets smooth. (Ancient Greek name.)

Flower-whorls in the leaf axils, distinct.

Herbage commonly light green; branches leafy to the ends; calyx-teeth similar and equal or nearly so.....1. *M. arvensis*.

Herbage somewhat grayish; leaves toward the end of the branches reduced and inconspicuous; calyx-teeth dissimilar, the 2 lower lanceolate-subulate.....2. *M. pulegium*.

Flower-whorls in terminal spikes or some in the upper leaf axils.

Leaves petioled; spikes thick, dense or little interrupted.....3. *M. piperita*.  
Leaves sessile or nearly so; spikes slim, mostly interrupted.....4. *M. spicata*.

1. *M. arvensis* L. TULE-MINT. Fig. 831. Stems simple or much branched,  $1\frac{1}{2}$  to 4 ft. long, developing suckers at base; herbage tomentose-pubescent or hoary to greenish and almost glabrous; leaves ovate to oblong-lanceolate, sharply serrate, 1 to  $2\frac{3}{4}$  in. long, tapering at base into a short petiole; whorls of flowers often shorter than the petioles; calyx pubescent, its teeth  $\frac{1}{4}$  to  $\frac{1}{2}$  as long as the tube; stamens well exerted.—Common in marshes and meadows of valleys and mts.: e. to the Atlantic. Aug.-Sept. Cymes sometimes raised out of the axils on peduncles. (*M. canadensis* Fl. W. Mid. Cal.)

2. *M. pulegium* L. PENNYROYAL. Stems 1 to 2 ft. long, erect or prostrate and rooting at the joints; herbage pubescent with short white hairs; leaves elliptic-oblong-ovate, serrate or entire,  $\frac{1}{2}$  to 1 in. long, petioled; whorls

831. *Mentha arvensis* L.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, fl.  $\times 2\frac{1}{2}$ ; c, nuts  $\times 7\frac{1}{2}$ .

purple.—Adv. from Eur.: Mecca; San Bernardino; Fresno.

4. *M. spicata* L. SPEARMINT. Similar to no. 3; leaves sessile or subsessile; flower-whorls crowded; spikes very narrow, leafless, commonly interrupted; calyx campanulate, its teeth subulate, nearly as long as tube.—Nat. from Eur., rather common in wet places: Berkeley; Napa Valley; Lake Co.

*M. ROTUNDIFOLIA* Huds. Apple Mint. Stems producing leafy stolons; herbage woolly-pubescent, the leaves often white beneath; leaves broadly ovate or orbicular, serrate, subcordate at base, channeled on the upper side opposite the veins; calyx and corolla puberulent; corolla white.—Adv. from Eur.: San Bernardino Valley; Los Angeles River.

dense, the leaves smaller or inconspicuous towards the ends of the branches; 3 upper calyx-teeth triangular, acute, the 2 lower lanceolate-subulate, ciliate-bristly. — Nat. from Eur.: Sonoma Co.; Marin Co.; islands of the lower San Joaquin.

3. *M. piperita* L. PEPPERMINT. Stem erect, commonly strict and unbranched below the terminal inflorescence; herbage glabrous; leaves ovate-oblong to oblong-lanceolate, acute, sparsely and sharply serrate, distinctly petioled; spikes dense, scarcely interrupted; calyx resinous-glandular, the lower teeth subulate, the upper ones triangular-acute; corolla white with a pink tinge or purple; lobes of lower lip spreading, similar to the upper lip.—Nat. from Eur., along streamlets in low fields: Berkeley; Haywards; Alvarado. Sept.

*M. CITRATA* Ehrh. Bergamot Mint. Stems producing leafy stolons at base; herbage glabrous; lower leaves broadly ovate, truncatish at base; calyx and corolla glabrous; corolla

## SOLANACEAE. NIGHTSHADE FAMILY

Herbs or shrubs with alternate leaves. Flowers complete and regular. Peduncles terminal or axillary, bearing an umbel, cyme or panicle, or a solitary flower. Calyx 5-cleft or toothed, usually persistent. Corolla 5-lobed, the lobes valvate or imbricate and mostly plicate in the bud. Stamens 5, inserted on the corolla and alternate with its divisions. Ovary superior, 2-celled; style 1; stigma entire or sometimes 2-lobed. Fruit a berry or capsule.—*Datura* has a falsely 4-celled capsule. *Petunia* has the upper leaves opposite. (A family distinguished on the whole by its poisonous or acrid properties; includes such cultivated plants as *Chilies*, *Cayenné Pepper*, *Tomato*, *Potato*, *Ground Cherry*, *Bitter-sweet*, *Belladonna*, and *Petunia*.)

Fruit a capsule; corolla tubular or funnelform.

Flowers solitary in the axils; herbs.

Corolla very large; capsule spiny, falsely 4-celled.....1. *DATURA*.

Corolla very small; capsule smooth, 2-celled.....2. *PETUNIA*.

Flowers in a terminal panicle; capsule 2-celled, smooth.....3. *NICOTIANA*.

Fruit a berry.

Corolla funnelform; spiny shrubs.....4. *LYCIUM*.

Corolla rotate; herbs, or some species woody at base.

Anthers connivent, longer than the filaments; calyx remaining small.....5. *SOLANUM*.

Anthers not connivent, mostly shorter than the filaments.

Calyx herbaceous, not inflated, closely investing the berry.....6. *CHAMAESARACHA*.

Calyx in fruit becoming large and bladdery, and loosely enclosing the berry... 7. *PHYSALIS*.

1. *DATŪRA* L. THORN-APPLE

Coarse rank-smelling herbs. Leaves large, ovate, mostly sinuate-dentate, petioled. Flowers large, solitary on short peduncles in the forks of the branching stem. Calyx tubular, 5-toothed, in our species at length cutting through near the base, the lower part persisting as a collar or rim beneath the capsule. Corolla funnelform with ample limb, convolute-plicate in the bud. Stamens included; filaments long. Stigma bilamellate. Capsule prickly or spiny, 4-valved from the top or the valves indefinite. The placentae project from the axis into the middle of the cells and connect with the walls by a partition imperfect at the top and thus form a falsely 4-celled ovary and capsule. (The Hindoo name, dhatura.)

Calyx not prismatic; corolla large (6 to 8 in. long), its limb 3 to 6 in. wide; capsule nodding on the short recurved pedicel, bursting irregularly, the calyx-rim rotate; seeds light-colored, flat, smoothish, with a cord-like margin; perennial.....

1. *D. meteloides*.

Calyx prismatic; corolla small (2 to 4 in. long), its limb 2 in. wide or less; capsule definitely 4-valved, the calyx-rim reflexed; seeds dark-colored, finely rugose and roughly pitted; annual.

Capsule nodding, globose, pubescent as also the stout prickles.....2. *D. discolor*.

Capsule erect, glabrous.

Corolla purplish or bluish; prickles subequal.....3. *D. tatula*.

Corolla white; prickles very unequal.....4. *D. stramonium*.

1. *D. meteloides* DC. TOLGUACHA. Fig. 832. Erect branching plant 2 to 3 ft. high; herbage grayish; calyx with 5 lanceolate teeth; corolla white, tinged with violet, its limb 3 to 6 in. wide, provided with 5 slender teeth  $\frac{1}{2}$  to  $\frac{3}{4}$  in. long; anthers white, 6 lines long; capsule globose, 1 in. long, densely prickly, indefinitely valved or bursting irregularly; prickles short,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  lines long, dilated and pubescent at base.—Sandy valley lands, 20 to 4000 ft.: Sacramento and San Joaquin valleys to coastal S. Cal.; Inyo Co. to Colorado Desert; e. to Tex., s. to Mex. July-Sept.

2. *D. discolor* Bernh. Plants low, 1 to  $1\frac{1}{2}$  ft. high, more or less grayish-pubescent; leaves round-ovate, sinuately or laciniately few-toothed, 2 to 4 in. long; corolla white with indigo flush in throat, the limb with 5 slender subulate teeth; anthers white; capsule nodding.—Colorado Desert; e. to Ariz.; Mex.

3. *D. tatula* L. PURPLE THORN-APPLE. Plants 1 to 2 ft. high; stems purplish; corolla purplish; anthers purple, 2 lines long; capsule ovoid, with many very stout subequal prickles.—Nat. from trop. Am.; infrequent but widely distributed in the state.

4. *D. stramonium* L. STRAMONIUM. Similar to the preceding, but the stems greenish and the flowers white; capsule with few prickles, the lower much shorter than the very stout upper ones which are  $\frac{3}{4}$  in. long.—Introduced from trop. America and widely distributed in the state but infrequent. Also called Jamestown Weed and Jimson Weed.

832. *Datura meteloides* DC.; a, fl. branchlet; b, fr. x  $\frac{1}{4}$ .

2. *PETŪNIA* Juss.

Viscid herbs with small entire leaves, the upper disposed to be opposite. Flowers solitary in the axils. Calyx deeply 5-parted. Corolla funnelform. Stamens 5, conspicuously unequal, 2 long, 2 shorter and a fifth still shorter,

all inserted low in the corolla-tube. Hypogynous disk fleshy. Capsule ovoid, its valves elongating and separating from the partition. (Petun, an Indian name of tobacco.)

1. *P. parviflora* Juss. Diffusely branched from the base, the stems 4 to 13 in. long, prostrate; leaves oblong-oblancoate, 4 to 7 lines long; calyx-lobes linear; corolla purplish-red or purplish-blue,  $2\frac{1}{2}$  to 3 lines long, the lobes apiculate, the upper side with a white circular distended spot; fruiting calyx twice as long as the capsule; seeds reticulated.—Dried beds of pools and sandy stream bottoms: Santa Clara and Sacramento Cos. to Orange Co., thence to the Colorado River; e. to Tex. and Fla.; trop. Am.

### 3. NICOTIANA L. TOBACCO

Heavy-scented usually viscid-pubescent herbs (except one) with entire leaves. Flowers in panicles or racemes. Calyx persistent, more or less investing the fruit, 5-toothed or -lobed. Corolla funnelform or salverform. Filaments filiform, mostly included. Ovary 2-celled, with large and thick placentae. Fruit a smooth 2-celled capsule, septicidal, and the valves promptly 2-cleft at apex, thus seeming as if 4-valved. Seeds small, numerous. (Jean Nicot, French diplomat and author of the most ancient dictionary in the French language, but more celebrated as having introduced tobacco into France from Portugal.)

Herbage glaucous; shrub; flowers yellow.....1. *N. glauca*.  
Herbage viscid; annual herbs; flowers white to greenish.

Leaves auricled at the sessile base; flowers open during the day...2. *N. trigonophylla*.

Leaves petioled or sessile, rarely auricled; flowers open at night.

Corolla-limb 3 to 5 lines broad.

Calyx-lobes very unequal, the longer once to twice the length of the tube; leaves petioled or sessile.....3. *N. clevelandii*.

Calyx-lobes subequal, shorter than the tube; leaves petioled...4. *N. attenuata*.

Corolla-limb  $\frac{1}{4}$  to 1 in. broad; leaves tapering into a petiole or sessile.....

5. *N. bigelovii*.

1. *N. glauca* Graham. TREE TOBACCO. Soft-woody evergreen shrub 6 to 15 ft. high, very slender and loosely branching, with glabrous and glaucous herbage; leaves ovate, on petioles about half as long; flowers in terminal panicles; calyx unequally 5-toothed, 5 to 6 lines long; corolla  $1\frac{1}{2}$  in. long, its tube dilated above summit of the calyx, the stamens inserted at this point; throat of corolla constricted just below the short shallowly 5 (occasionally 4)-lobed limb; capsule oblong,  $\frac{1}{2}$  in. long.—Nat. from S. Am.: waste places about interior towns and along flood-beds of interior streams.

2. *N. trigonophylla* Dunal. Slender, 1 to 3 ft. high; leaves broadly oblong to ovate, acute, sessile and auricled, 2 to 5 in. long, the lower ones attenuate at base into a shortly winged petiole; flowers in nearly naked racemes; calyx cleft nearly half way into lanceolate lobes, about half as long as the corolla; corolla cream-white, 8 lines long, its limb  $3\frac{1}{2}$  to 5 lines broad; filaments hairy at very base, inserted at middle of the tube.—Desert washes: Inyo Co.; Mohave and Colorado deserts; e. to Tex., s. to Mex.

3. *N. clevelandii* Gray. Habit and leaves of *N. bigelovii*; corolla 5 to 9 lines long, its limb 4 to 6 lines broad; filaments equally inserted low on the corolla-tube, glabrous or slightly puberulent towards the base. — Summer-dry stream-beds, 100 to 1500 ft.: coastal S. Cal., n. to Santa Barbara, e. to Colorado Desert.

833. *Nicotiana attenuata* Torr.; a, fl. branchlet  $\times \frac{2}{3}$ ; b, leaf  $\times \frac{1}{2}$ ; c, corolla spread open  $\times 1$ .

4. *N. attenuata* Torr. COYOTE TOBACCO. Fig. 833. Stem branching, 2 to 4 ft. high; herbage glandular-pubescent, ill-smelling; lower leaves broadly ovate, the upper varying to narrowly lanceolate, all petioled; flowers many, racemously or paniculately disposed along the branches, vespertine; calyx-teeth lanceolate to subulate,  $\frac{1}{3}$  to as long as the tube; corolla-tube 1 to  $1\frac{1}{2}$  in. long, with narrow limb 3 to 5 lines broad; filaments equally or only slightly unequally inserted low in the tube, pubescent below the middle; capsule longer or commonly shorter than the calyx.—Dry stream-beds and sandy flats or valley floors, 100 to 4000 ft., common throughout Cal., especially towards the interior; e. to Utah and Tex. July-Sept.

5. *N. bigelovii* Wats. INDIAN TOBACCO. Fig. 834. Stem commonly branching,  $1\frac{1}{2}$  to 2 ft. high; herbage with glandular indument, very ill-smelling; basal leaves oblong-ovate, acute, petioled, the cauline similar or lanceolate, sessile or tapering to a shortly winged petiole; or the lower distinctly petioled; flowers fewer than in *N. attenuata*, mostly scattered racemously along the branches; calyx with slender teeth as long as the tube; corolla-tube  $1\frac{1}{2}$  in. long, the limb 1 in. wide; filaments unequally inserted high in the tube, glabrous; capsule obtuse, shorter than the calyx.—Flood-plains of rivers and open floors throughout the valleys and foothills; e. to Nev. and Ariz. This and *N. attenuata* were used by the Indians as a smoking tobacco; some of the tribes certainly cultivated these plants—their only strictly agricultural practice.

834. *Nicotiana bigelovii* Wats.; a, fl. branchlet  $\times \frac{2}{3}$ ; b, leaf  $\times \frac{1}{2}$ ; c, corolla-tube  $\times 1$ .

#### 4. LÝCIUM L. DESERT THORN

Shrubs, ours rough-spiny. Leaves small, entire, usually narrow, commonly with smaller ones fascicled in the axils. Flowers white, pale violet or lavender, pediceled, solitary or fascicled in the axils or terminal. Calyx 5 (or 4)-toothed or -lobed, persistent beneath the globular or oblong berry. Corolla funnelform, with 5 (or 4) lobes. Stamens 5 (or 4). (The country Lycia, in Asia Minor.)

Ovary and fruit without sutures; corolla glabrous (or glabrous with a hairy margin in no. 4); stamens exserted or nearly so; filaments hairy or pubescent at base, inserted low on the corolla-tube.

Corolla large, trumpet-shaped, its limb nearly as broad as the tube is long; calyx-lobes shorter than the tube; berry dull white or purplish.....1. *L. pallidum*.

Corolla smaller, tubular-funnelform; berry red.

Leaves thick and fleshy, that is, pear-shaped but a little flattened.

Corolla-tube little or not at all exceeding the calyx; calyx-teeth  $\frac{1}{2}$  to  $\frac{3}{4}$  length of the tube.....2. *L. californicum*.

Corolla-tube 2 to 3 times length of the calyx; calyx-teeth  $\frac{1}{2}$  length of the tube.....3. *L. andersonii*.

Leaves plane, not bulbous or pear-shaped; corolla-tube  $1\frac{1}{2}$  to 3 times length of the calyx.

Calyx-lobes  $\frac{1}{4}$  to  $\frac{1}{2}$  as long as the tube.

Corolla 3 to  $3\frac{1}{2}$  times as long as the calyx, its lobes with a tomentulose margin; herbage mostly glabrous.....4. *L. torreyi*.

Corolla  $1\frac{1}{2}$  to 2 times as long as the calyx, wholly glabrous; herbage puberulent.....5. *L. fremontii*.

Calyx-lobes equaling or exceeding the tube.....6. *L. richii*.

Ovary and fruit with a horizontal suture on each side just above the middle; corolla puberulent, the sides of its lobes revolute; stamens included or almost wholly included in the tube; filaments inserted high in corolla-throat, their free portion glabrous.....7. *L. cooperi*.

835. *Lycium pallidum* Miers.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, leaf  $\times \frac{1}{2}$ ; c, fl.  $\times \frac{1}{4}$ ; d, berry  $\times 1$ .

L. Cal. The leaves are often much thickened and as large as a grain of wheat.

3. *L. anderssonii* Gray. WATER JACKET. Fig. 836. Intricately branched, scraggly shrub with needle-like spines, 1 to 3 or 5 ft. high, usually glabrous; leaves spatulate or linear-spatulate, at least those of the fascicles pear-shaped but a little flattened, that is very thick and watery,  $1\frac{1}{2}$  to 3 or 6 lines long, on short almost filiform petioles  $\frac{1}{4}$  to  $\frac{1}{2}$  line long; flowers 1 or 2 in a place, either 4 or 5-merous on same branchlet; calyx very small,  $\frac{1}{2}$  to  $\frac{1}{4}$  length of corolla, its teeth almost minute; corolla white-lavender, aging buckskin-color, tubular-funnelform, glabrous (or the lobes very minutely ciliate), 4 to 6 lines long, the lower part of its tube about  $\frac{1}{4}$  line wide, the limb 2 to  $2\frac{1}{2}$  lines wide; stigma green; berry elliptic,  $1\frac{1}{2}$  to 2 lines long, red or at first chrome-yellow.—Dry stony hills, Mohave Desert, n. to Inyo Co.; e. to southern Nev. and Ariz. It is remarkable for its very small fleshy leaves, pear-shaped but a little flattened.

836. *L. anderssonii* Gray; fl.  $\times 1\frac{1}{2}$ .

837. *Lycium torreyi* Gray; a, fr. branchlet  $\times 1$ ; b, fl.  $\times 1\frac{1}{2}$ .

1. *L. pallidum* Miers. TOMATILLA. RABBIT THORN. Fig. 835. Densely branched excessively thorny shrub,  $1\frac{1}{2}$  to 3 ft. high and as broad, the branchlets flexuous; herbage glabrous; leaves slightly glaucous, oblanceolate,  $\frac{1}{2}$  to 1 in. long (the lower leaves of young plants spatulate-obovate, 1 to  $2\frac{1}{2}$  in. long); flowers pendulous from the under side of the spreading branches; calyx less than half the length of the corolla, its lobes oblong, spreading, equaling or exceeding the calyx-tube; corolla narrowly bell-shaped, pure white to lavender, fading to pale yellow, 7 to 9 lines long, its limb 7 to 9 lines broad; stamens exserted; berry slightly depressed-globose, purplish or greenish white, glaucous, 4 to 6 lines broad.—Dry stony hills, 2000 to 3000 ft.: central Mohave Desert; e. to N. Mex. Mar.-Apr.

2. *L. californicum* Nutt. Glabrous shrub; leaves fleshy, 1 to 3 lines long; flowers whitish, mostly 4-merous; calyx-teeth  $\frac{1}{4}$  to  $\frac{1}{2}$  length of tube; corolla 2 to 3 lines long, its limb nearly as broad, its tube not exceeding the calyx or only slightly.—Seacoast, Los Angeles Co. to San Diego Co.; s. to

4. *L. torreyi* Gray. SQUAW THORN. Fig. 837. Roughish but often sparingly thorny erect shrub 4 to 8 ft. high; herbage mostly glabrous; leaves oblanceolate or oblong, mostly narrowed below to a short petiole-like base,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long; flowers mostly 3 to 7 in a fascicle; calyx-teeth minute, puberulent; corolla lavender-purple,

tubular-funnelform, 5 to 6 lines long; its rotately spreading lobes with a well-defined tomentulose margin; berry bright red, globose, 3 lines broad.—Along washes and dry stream-bottoms: Mohave Desert; e. to Tex. and Mex. Var. *WRIGHTII* Jepson n. comb. Very leafy-fasciculate, the leaves thin, plane, narrow-oblongate,  $\frac{1}{2}$  to 1 in. long.—Riverside and San Diego Cos.; e. to Ariz. (*L. andersonii* var. *wrightii* Gray.)

5. *L. fremontii* Gray. Shrub 2 to 4 ft. high; leaves spatulate,  $\frac{1}{2}$  to  $\frac{3}{4}$  in. long; herbage and calyx viscid-puberulent; calyx cylindric with short-triangular teeth; corolla pale violet, similar to *L. torreyi*, glabrous (or the lobes sometimes minutely ciliate); berry oblong to globose,  $3\frac{1}{2}$  to 4 lines long.—Colorado Desert; e. to Ariz.

6. *L. richii* Gray. Shrub 4 to 8 ft. high, the branches slender, pliable or some rigid and spinescent; herbage glabrous or minutely viscid-puberulent; leaves oblanceolate or spatulate, 2 to 6 lines long; calyx about half the length of the corolla, its lobes linear or lanceolate, acute, equaling or exceeding the tube; corolla funnelform, 4 to 5 lines long, its lobes about half the length of the tube; stamens a little exserted.—Santa Catalina Isl.; San Diego; s. to L. Cal.

*L. PARISHII* Gray. Similar to no. 6; herbage and calyx puberulent; calyx-lobes mostly ovate and rather shorter than tube.—San Bernardino; Elsinore.

7. *L. cooperi* Gray. PEACH THORN. Fig. 838. Thorny compact densely leafy shrub 2 to 4 (or 6) ft. high, the branches and branchlets set mostly at right angles; bark smooth, whitish, or commonly dark red, in age black; herbage minutely pubescent and more or less viscid; leaves oblanceolate or oblong, narrowed to a short petiole,  $\frac{1}{2}$  to 1 in. long; calyx cylindric or in fruit enlarged and bowl-shaped, rather densely glandular-hispidulose with short spreading hairs, its broad lobes  $\frac{1}{2}$  to as long as the tube; corolla greenish-white, funnelform, minutely and rather weakly puberulent, rarely quite glabrous, 5 to 6 lines long, about twice the length of the calyx, its lobes rotate, later recurving, the sides revolute in such a way as to give a horn-like effect to each lobe; ovary with a horizontal sutural depression on each side above the middle; fruit short-cylindric or a little contracted at apex, subglobose, 3 to 4 lines high, hard or bony at maturity.—Desert mesas and mountain slopes, 2000 to 5000 ft.: Colorado Desert; Mohave Desert; Inyo Co.; e. to southern Nev.

838. *Lycium cooperi* Gray; a, fl.; b, fr. x  $1\frac{1}{2}$ .

## 5. SOLANUM L. NIGHTSHADE

Herbs or sometimes suffrutescent. Flowers in umbels on short lateral or terminal peduncles. Calyx 5-parted. Corolla rotate, 5-lobed, with scarcely any tube. Anthers almost sessile, lightly connate into a cylinder surrounding the style, opening by 2 small pores at the apex or longitudinally dehiscent. Fruit a berry with several seeds. (Latin name of the Nightshade, from solamen, quieting.)

### Stems unarmed.

Peduncles longer than the pedicels; corolla small, 5-cleft.

Annual; flowers 2 to  $2\frac{1}{2}$  lines broad. . . . . 1. *S. nigrum*.

Perennial; flowers 3 to  $5\frac{1}{2}$  lines broad. . . . . 2. *S. douglasii*.

Peduncles much shorter than the pedicels or almost none, thickened into a cupulate node at the insertion of the pedicels; corolla larger, 5-angled or lobed, with greenish glands at base; perennial.

Leaves mostly hastate at base. . . . . 3. *S. tenuilobatum*.

Leaves not hastate.

Herbage viscidulous; hairs unbranched.

Leaves crenate; coastal. . . . . 4. *S. wallacei*.

Leaves entire; mostly of the interior. . . . . 5. *S. xanthii*.

Herbage not viscid; leaves entire; hairs branched; coastal. . . . . 6. *S. umbelliferum*.

### Stems armed with long straight prickles.

Perennial; berry not enclosed in the calyx; calyx not prickly. . . . . 7. *S. elaeagnifolium*

Annual; berry wholly enclosed by the prickly calyx. . . . . 8. *S. rostratum*

839. *Solanum nigrum* L.; a, umbel;  
b, fr. branchlet.  $\times \frac{1}{2}$ .

lanceolate and ciliolate toward the apex; filaments and style pubescent; fruiting peduncles 6 to 11 lines long, bearing 3 to 5 berries on more or less recurved pedicels; berries blue-black, 2 to 3 lines in diameter, poisonous.—Nat. from Eur.: waste ground, commonly in shade or moist places, flowering through the summer into early winter.

**S. VILLOSUM** Hill. Like no. 1 but villous and somewhat viscid; leaves small, conspicuously angular-dentate; berries yellow.—Santa Monica; adv. from Eur.

**2. S. douglasii** Dunal. Similar to *S. nigrum*, but perennial; herbage lightly puberulent; leaves triangular-ovate, shortly acuminate,  $1\frac{1}{2}$  to 2 in. long, on petioles  $\frac{1}{2}$  to  $\frac{3}{4}$  as long; corollas 3 to 7 lines broad; fruiting peduncles  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long; berries 3 to 4 lines in diameter.—Monterey Co. to coastal S. Cal., thence through the deserts to Death Valley and Ariz.

**3. S. tenulobatum** Parish. Stems woody at base, slenderly angled; herbage glabrate below, hirsutulous above; leaves linear to narrowly oblong, all except the uppermost linear-hastate at base; corolla 6 to 7 lines broad.—W. Colorado Desert.

**4. S. wallacei** Parish. Bush, 2 to 3 ft. high, the stems with tawny viscid hairs; leaves thickish, cordate or the upper ovate, crenate; corolla 1 to  $1\frac{3}{4}$  in. broad; berry dark purple.—Seacoast from San Luis Obispo Co. to Los Angeles Co.; Santa Barbara Isla. Var. *viride* Parish. Herbage glabrate, or hispidulous above.—Coast from Marin Co. to Monterey Co.

**5. S. xanthii** Gray. Stems herbaceous, several to many from a woody root-crown, erect or decumbent, mostly simple, slender and sparsely leaved,  $1\frac{1}{2}$  to 2 ft. long; herbage typically gray-pubescent, sometimes green, the hairs simple, short, those of the stem spreading and somewhat viscid; leaves thin-nish, elliptic-ovate, at base obtuse, truncate or subcordate, on petioles 2 to 7 lines long; flowers few in an umbel; corolla light azure or fading darker blue, 5 to 10 lines broad.—Foothills and mts., 100 to 4000 ft.: cismontane Cal.; w. side Mohave Desert. Var. **INTERMEDIUM** Parish. Leaves cordate or subcordate at base.—Coastal S. Cal. and n. to Sonoma Co. Var. **GLABRESCENS** Parish. Leaves small, more or less attenuate at base, mostly narrow.—Throughout Cal.

**6. S. umbelliferum** Esch. **BLUE WITCH**. Fig. 840. Stems more or less woody at base, deep green, mostly 5-angled or -ridged, 2 to 3 ft. high; herbage finely pubescent-tomentose, the hairs branched; leaves elliptic-ovate, rarely pinnatifid at base, 1 to 2 in. long or less, thickish, on petioles 2 to 3 lines long; peduncles short or almost none; corolla blue, sometimes white, 10 lines broad, shallowly 5-lobed with 5 pairs of greenish glands near the base; berry, when fully ripe, dull white with a greenish zone toward the base, 4 to 8 lines in diameter.—Hill country, especially along gulches or in cañons: Coast Ranges near the coast from Mendocino Co. to Santa Barbara Co. May-June, but often flowering at all seasons.

840. *Solanum umbelliferum* Esch.; sect. of  
fl. branchlet  $\times \frac{1}{2}$ .

**7. S. elaeagnifolium** Cav. **BULL NETTLE**. **TROMPILLO**. Stem branching, 1 to 3 ft. high, prickles very slender, copious or wanting; herbage silvery-canescens.

cent; leaves linear to oblong, entire or sinuate,  $1\frac{1}{4}$  to 2 in. long, disposed to be somewhat conduplicate; calyx-lobes subulate, as long as the tube; corolla violet or blue; ovary white-tomentose; berry dull yellow; lower stamen much longer than the other 4.—Introduced from the Great Plains: Imperial Valley; Riverside; Los Angeles; San Pedro; Red Bluff.

**S. S. rostratum** Dunal. BUFFALO-BUR. Stem erect, branched,  $\frac{1}{2}$  to  $2\frac{1}{2}$  ft. high; herbage stellate-pubescent; leaves pinnately but irregularly 5 to 7-lobed, the lobes entire or again 2 to 5-lobed; corolla yellow; calyx wholly enclosing the berry, densely prickly, the prickles long and slender.—Native of the Great Plains, locally adventive: Santa Monica; Los Angeles; Yreka.

## 6. CHAMAESARACHA Gray

Low perennial herbs, the stems few to several from the branched crown of a cord-like taproot. Leaves entire or pinnatifid, their petioles margined. Flowers 1 or 2 on axillary pedicels. Calyx herbaceous, neither ribbed nor angled, somewhat enlarged in fruit, closely investing the berry but open at the top. Corolla white or yellowish-white, rotate, 5-angulate, with 5 pairs of tomentose spots at base alternate with the stamens. Pedicels recurved in fruit, the berries hugging the ground or hiding against it. Seeds reniform, flattened, rugose or pitted. (Greek chamae, low, and Saracha, a Solanaceous genus of Cent. Am. and S. Am.)

1. **C. nana** Gray. Fig. 841. Stems 1 to 3, erect,  $2\frac{1}{2}$  to 4 (or 8) in. high; herbage puberulent; leaves ovate, acute, 1 to 2 in. long, rather abruptly tapering into petioles half to as long; peduncles shorter than the petiole; corolla white, with 5 large greenish spots at base,  $\frac{3}{4}$  to 1 in. broad; fruiting calyx hemispherical, its teeth distinct, subulate; berry dull white or when fully ripe yellowish, 5 to 6 lines in diameter; seeds smoothish.—Sandy flats in the mts. or opens in pine woods, 5000 to 6000 ft.: e. slope Sierra Nevada from Nevada Co. to Siskiyou Co.; n. to southern Ore.

841. *Chamaesaracha nana* Gray;  
a, habit  $\times \frac{1}{2}$ ; b, anther  $\times 2$ .

## 7. PHYSALIS L. GROUND-CHEERRY

Herbs with solitary axillary flowers. Corolla rotate from a short-campanulate base, yellow or yellowish, its limb 5-angled or 5-lobed. Stamens not connivent. Calyx in fruit membranous and bladdery-inflated, its teeth mostly connivent, completely and loosely enclosing the juicy berry. Seeds in ours smooth but finely pitted. (Greek, phusalis, a bladder, referring to the calyx.)

Annual; anthers commonly purplish or purplish-tinged.

Herbage glabrous or nearly so, not viscid.

Corolla small (1 to  $1\frac{1}{2}$  lines broad).....1. *P. lanceifolia*.

Corolla larger (5 to 7 lines broad).

Fruiting calyx shorter than the pedicels; corolla yellow without an eye.....

2. *P. wrightii*.

Fruiting calyx much longer than the pedicel; corolla yellow with a purplish eye.....3. *P. ixocarpa*.

Herbage not glabrous.

Stems and leaves puberulent.....4. *P. pubescens*.

Stems and petioles short-pilose.....5. *P. greenii*.

Perennial; leaves or some of them cordate; anthers commonly yellow.

Pedicels shorter than the flowers; herbage with branched or stellate hairs.....

6. *P. fendleri*.

Pedicels long and filiform; herbage more or less minutely puberulent but without stellate hairs.

Herbage green and seemingly glabrous.....7. *P. crassifolia*.

Herbage grayish pubescent.....8. *P. hederacifolia*.

1. *P. lanceifolia* Ness. Similar to *P. wrightii* but the leaves narrower and less toothed; calyx-teeth triangular, shorter than the tube; corolla narrowly campanulate,  $1\frac{1}{2}$  lines broad.—Rare, Ft. Yuma; e. to Tex., s. to S. Am.

2. *P. wrightii* Gray. Eight to 13 in. high; herbage subglabrous; leaves coarsely or somewhat saliently toothed, 1 to  $2\frac{1}{2}$  in. long, on long petioles; calyx-teeth triangular-lanceolate, rather longer than the tube; corolla yellow, 5 to 6 lines broad, its tube glabrous; fruiting calyx ovate-globose,  $\frac{3}{4}$  to 1 in. long, 10-nerved, equaling or somewhat shorter than the pedicels.—Rare, Colorado Desert; e. to Tex.

3. *P. ixocarpa* Brot. TOMATILLO. Fig. 842. Much-branched,  $1\frac{1}{2}$  to 2 ft. high, the stems angular; herbage glabrous or the younger parts finely pubescent; leaves ovate, toothed or a few sub-entire,  $\frac{1}{2}$  to  $2\frac{1}{2}$  in. long; flowers on very short (1 to  $1\frac{1}{2}$  lines long) pedicels; calyx-teeth short-triangular; corolla lemon-yellow, with 5 brown spots towards base, its limb rotate,  $\frac{1}{2}$  in. broad, its tube short and open, very hairy with white hairs which conceal 5 shallow pits alternating with the purple filaments; fruiting calyx globose-ovate,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long, little angled.—Orchard weed, nat. from Mex.: s. San Benito Co.; Ojai Valley; Pomona; San Bernardino; Winchester.

4. *P. pubescens* L. HUSK TOMATO. Slender, diffuse, pubescent throughout or at least the stems scantily soft-pubescent; leaves thin, ovate, apiculate, nearly entire, often equaling the petioles; calyx-teeth lanceolate, equaling the tube; corolla 3 to 5 lines broad, yellow with dark center; fruiting calyx exceeding its pedicel.—Introduced from the se. U. S.: Ft. Yuma; Visalia.

5. *P. grœnei* Vasey & Rose. Erect-spreading, 1 to  $1\frac{1}{2}$  ft. high; herbage viscid, the stems and petioles short-pilose, the blades puberulent; pedicels about 1 in. long; flowers 5 lines long; calyx-teeth acute or acuminate,  $\frac{2}{3}$  as long as the tube; corolla greenish-yellow; fruiting calyx globose-ovate, the angles hispidulose.—Rare in coastal S. Cal.: Elsinore; Ysidora; s. to L. Cal.

6. *P. fendleri* Gray var. *cordifolia* Gray. Similar to *P. crassifolia*; pubescence or most of it branching; leaves cordate-ovate, 1 to  $2\frac{1}{2}$  in. long; pedicels shorter than the flowers; calyx-teeth  $\frac{1}{2}$  to  $\frac{1}{2}$  as long as the tube, acute; fruiting calyx globose-ovate.—Providence Mts., e. Mohave Desert; e. to southern Utah.

842. *Physalis ixocarpa* Brot.: a, fl. branchlet x 1; b, stamen x  $2\frac{1}{2}$ ; c, fr. calyx x 1.

843. *Physalis crassifolia* Benth.: a, fl. branchlet; b, fr. calyx x  $\frac{2}{3}$ .

7. *P. crassifolia* Benth. Fig. 843. Stem diffusely branching, forming plants 1 to 3 ft. broad and  $1\frac{1}{2}$  to 1 ft. high; herbage minutely puberulent; leaves broadly ovate,  $\frac{1}{2}$  to 1 (or  $1\frac{1}{2}$ ) in. long, repandly few-toothed or entire, mostly truncate or subcordate at base and usually with one side decurrent on the petiole; pedicels 2 to 3 times length of flower; calyx-teeth triangular-acute,  $\frac{1}{4}$  to  $\frac{1}{3}$  as long as the tube; corolla pale buckskin-yellow, with recurving limb 6 to 7 lines broad, its tube exceeding the short-cylindric calyx and with 5 hairy bands at summit, one opposite each lobe; filaments with branched spreading hairs; fruiting calyx 1 to  $1\frac{1}{4}$  in. long.—Washes or cañon beds, rather common in the desert ranges: Death Valley; e. Mohave Desert; Colorado Desert; s. to Mex.

S. *P. hederaefolia* Gray. Stem branching, 8 to 10 in. high; herbage finely pubescent (or "viscid-pubescent"), somewhat grayish on the young parts; leaves ovate, subentire to sinuate-toothed; pedicels shorter than the flowers; calyx-teeth lanceolate, as long as the tube.—E. Mohave Desert: New York Mts.; Leastalk; e. to Tex.

### SCROPHULARIACEAE. FIGWORT FAMILY

Ours herbs excepting *Diplacus* and some species of *Pentstemon* and *Castilleja*. Leaves simple, entire or toothed, rarely parted or pinnatifid. Flowers complete. Stamens 4, in 2 pairs (one pair shorter than the other), or one pair sterile, or stamens 2 only, always inserted on the corolla. *Verbascum* has 5 perfect stamens and in several genera the fifth stamen is present as a sterile filament or rudiment. Corolla commonly 2-lipped (sometimes nearly regular and 4 or 5-lobed); upper lip 2-lobed or with a snout-like, hooded or hooked prolongation (galea); lower lip 3-lobed, frequently 3-saccate. Calyx synsepalous or sometimes chorisepalous. Ovary superior, 2-celled; style 1; stigma 2-lobed or entire. Fruit a 2-celled, 2-valved capsule, with septicidal or loculicidal dehiscence, or opening near the apex by pores; seeds numerous or often few, with a minute mostly straight embryo in abundant endosperm.—An interesting family biologically, the species in California numerous, many of them the showiest of West-American plants.

#### A. Anther-bearing stamens 5; leaves alternate.

Corolla nearly regular, rotate, with short tube; filaments (or some of them) very hairy.—  
Tribe VERBASCEAE.....1. VERBASCUM.

#### B. Anther-bearing stamens less than 5.

1. COROLLA WITH A SPUR OR SAC AT BASE OF TUBE ON LOWER SIDE OR GIBBOUS AT BASE, OFTEN WITH A PROMINENT PALATE (SEE ALSO GENUS 11, NO. 16); CAPSULE OPENING NEAR THE APEX, USUALLY BY PORES OR CHINKS.—Tribe ANTIRRHINEAE.

Stamens 4, all with anthers.

Corolla-tube with a sac at base; palate closing the throat.....2. ANTIRRHINUM.

Corolla-tube with a spur at base; palate seldom closing the throat.....3. LINARIA.

Stamens 2, their anthers borne under the arched ridge of the upper lip.....4. MOHAVEA.

2. COROLLA WITHOUT SPURS OR SACS AT BASE OF TUBE, 2-LIPPED TO NEARLY REGULAR; CAPSULE VALVATE.

a. Upper lip of corolla not galeate; leaves opposite (except no. 20), or the upper sometimes alternate.

Stamens with anthers 4; fifth stamen present as a sterile filament, scale, or mere gland.—  
Tribe CHELONEAE.

Annuals; fifth stamen present as a rudiment or gland.

Corolla strongly declined, strongly 2-lipped; middle lobe of lower lip folded lengthwise into a sac enclosing the stamens and style.....5. COLLINSIA.

Corolla minute, little declined, the lobes rotately spreading; some cauline leaves ternately divided or parted.....6. TONELLA.

Perennials.

Corolla short, inflated, with 4 lobes erect and 1 reflexed; sterile stamen reduced to a scale adnate to upper lip.....7. SCROPHULARIA.

Corolla tubular, from strongly to obscurely 2-lipped; sterile filament conspicuous, about equaling the fertile ones.

Seeds not winged; anthers woolly or glabrous.....8. PENTSTEMON.

Seeds with a broad membranous wing; anthers woolly.....9. CHELONE.

Stamens 4 or 2; fifth stamen wholly absent.

Leaves opposite, at least the lower.

Corolla 2-lipped (3 lobes in lower lip, 2 in upper) or subregular and 5-lobed.—

Tribe GRATIOLEAE.

Stamens 4, all with anthers (except no. 12); corolla 2-lipped.

Calyx tubular or campanulate, 5-toothed.

- Corolla tubular or funnelform, often elongated.  
 Calyx 5-angled, plicate-carinate or prismatic.  
 Shrubs ..... 10. *DIPLACUS*.  
 Herbs ..... 11. *MIMULUS*.  
 Calyx not prismatic, slightly 5-sulcate; stamens 4, 2 fertile;  
 annual ..... 12. *MIMETANTHE*.  
 Corolla open-campanulate; stems creeping, bearing tufts of leaves  
 and flower-scapes; diminutive annual... 13. *LIMOSELLA*.  
 Calyx 5-parted or -divided.  
 Stems erect or ascending; anther-cells separate and stipitate.....  
 14. *STEMODIA*.  
 Stems creeping; anther-cells united..... 15. *BACOPA*.  
 Stamens with anthers 2; sterile pair present or none; corolla tubular, little  
 or not at all 2-lipped; calyx of 5 almost distinct sepals.  
 Corolla-lips nearly equal; sterile filaments short or none... 16. *GRATIOLA*.  
 Lower lip of corolla larger than upper; sterile filaments forked.....  
 17. *ILYSANTHES*.  
 Corolla 4-lobed, little or not at all 2-lipped; calyx 4-parted.—Tribe VERONICEAE.  
 Stamens 4, 2 sterile; corolla broadly campanulate; leaves in a basal tuft....  
 18. *SYNTHYRIS*.  
 Stamens 2; corolla subrotate; leaves mainly cauline..... 19. *VERONICA*.  
 Leaves alternate; flowers in a one-sided raceme; stamens 4.—Tribe DIGITALEAE.....  
 20. *DIGITALIS*.  
 b. Upper lip of corolla galeate.—Tribe EUPHRASIEAE.  
 Anther-cells unequal, separated; leaves alternate.  
 Calyx 2-cleft or 4-cleft; bracts mainly with colored tips.  
 Calyx tubular, cleft before and behind; upper lip of corolla long and narrow,  
 very much longer than the small 3-toothed lower lip; perennials except  
 two ..... 21. *CASTILLEJA*.  
 Calyx tubular-campanulate, 4-cleft; upper lip of corolla narrow, not so greatly  
 or not at all exceeding the inflated 3-saccate lower lip; annuals except  
 three ..... 22. *ORTHOCARPUS*.  
 Calyx of 2 distinct divisions, or the upper division wanting; corolla lips of nearly  
 equal length; bracts never colored; annuals..... 23. *CORDYLANTHUS*.  
 Anther-cells equal, parallel and approximate.  
 Leaves opposite; calyx campanulate, deeply cleft before and behind; anther-cells  
 mucronate; annuals.  
 Corolla white and pink; anther-cells near margins densely short-hairy; lateral  
 calyx-lobes notched..... 24. *BELLARDIA*.  
 Corolla yellow; anthers pilose; lateral calyx-lobes deeply divided.....  
 25. *PARENTUCHELLIA*.  
 Leaves alternate or basal; calyx narrowly campanulate, cleft in front, sometimes  
 behind, unequally 2 to 5-toothed; anther-cells not mucronate; perennial  
 herbs ..... 26. *PEDICULARIS*.

### 1. *VERBASCUM* L. MULLEIN

Usually biennial herbs with tall virgate stems and alternate leaves. Flowers ephemeral, in spikes or racemes. Calyx 5-parted. Corolla rotate, with 5 nearly equal segments, ours commonly yellow. Stamens 5, all with anthers; all of the three posterior filaments woolly-bearded. Stigma undivided or bilamellate. Capsule septicidally 2-valved, the valves cleft at apex and the septa parting from the persistent axis, releasing many pitted or roughened seeds. (Corrupted from *Barbascum*, the old Latin name.)

Plants very woolly; flowers sessile..... 1. *V. thapsus*.  
 Plants with green herbage; flowers pediceled.

Flowers usually solitary; pedicels longer than calyx..... 2. *V. blattaria*.  
 Flowers clustered; pedicels not longer than calyx..... 3. *V. virgatum*.

1. *V. thapsus* L. COMMON MULLEIN. Stout, densely woolly, 3 to 6 ft. high; basal leaves 6 to 12 in. long, obovate-lanceolate or -oblong; cauline leaves oblong, entire or crenate, crowded, the stem winged by their very decurrent bases; flowers in a very long dense simple spike; spike 1 to 3 ft. long, 1¼ in. thick, sometimes with one to several short spikes at base; lower filaments mostly naked; seeds pitted, the pits in rows.—Flats, valleys, mountain ridges or dry stream beds, nat. from Eur.: very common in the Sierra Nevada pine belt; North Coast Ranges.

2. *V. blattaria* L. MOTH MULLEIN. Slender, 2 to 4 ft. high; herbage green and glabrous, the inflorescence glandular-pubescent; leaves not decurrent, 4 in. long or less; upper leaves ovate or ovate-lanceolate, dentate, cordate-clapsing; lower leaves oblong, more coarsely toothed or pinnatifid, the basal ones narrowed to a short winged petiole; flowers yellow or white, 1 in. broad, in a long loose simple raceme; pedicels longer than the calyx; filaments all bearded with violet woolly hairs.—Foothills and valleys throughout Cal., not common; nat. from Eur.

3. *V. virgatum* Stokes. Simple or branching above, 3 to 4 ft. high; herbage pubescent, the raceme glandular; leaves lanceolate, sessile, clasping, crenate,  $1\frac{1}{2}$  to 3 in. long, the lower oblong-lanceolate, coarsely crenate or pinnately cleft, 6 to 12 in. long, petioled; spike interrupted, the bracts small; pedicels often in 2s or 3s, not longer than the linear or lanceolate calyx-lobes; otherwise very like a taller form of no. 2.—Roadsides and waste places near Los Angeles, nat. from Eur., not common: Alhambra; Eagle Rock Valley; Pomona; Sierra Madre; El Monte.

## 2. *ANTIRRHINUM* L. SNAPDRAGON

Annual or perennial herbs. Leaves opposite or whorled, the upper usually alternate. Flowers in terminal racemes or solitary in the upper axils. Corolla gibbous or saccate at base on lower side; palate often closing the throat. Fertile stamens 4, the filaments often dilated toward apex, the fifth stamen commonly represented by a gland. Capsule dehiscent by irregular apertures or pores at the base of the style; style deciduous or persistent. (Greek anti, like, and rhinon, nose, because of the snout-like flowers.)

### A. Perennials.

Shrubby; persistent style bent backwards.....1. *A. speciosum*.  
Not shrubby; persistent style straight or bent forwards.

Stems climbing by slender tortile petioles and axillary peduncles; sepals equal, longer than the globular capsule; flowers scattered, on long peduncles; corolla 6 to 10 lines long, the prominent palate nearly closing the orifice; style straight..

2. *A. maurandoides*.

Stems erect, in no way climbing; sepals unequal; flowers racemose-spicate; corolla 6 to 7 lines long, the palate closing the orifice; style bent forward.

Glabrous throughout; leaves linear or linear-lanceolate; racemes more or less secund, the flowers discrete or nearly so; lower pair of filaments with dilated tips.....3. *A. virga*.

Glandular-pubescent and viscid throughout; leaves lanceolate; racemes dense, not secund; filaments all moderately dilated upwards. 4. *A. glandulosum*.

### B. Annuals.

Stems erect, in no way climbing; calyx-segments equal; style persistent, indurated, stout at base.....5. *A. cornutum*.

Stems climbing.

Peduncles filiform, elongated, naked, prehensile, the plant climbing exclusively by them; calyx-segments about equal; style persistent or deciduous; capsule equal or nearly so; stems very slender with remote leaves.

Stems often nearly simple; calyx and outside of corolla glabrous; corolla violet-purple, gibbous at base; style persistent, straight.....6. *A. strictum*.

Stems at length much-branched; calyx and outside of corolla somewhat pubescent; corolla yellow or white, saccate at base; style deciduous, or if persistent, much curved.....7. *A. filipes*.

Axillary branchlets slender, tortile (the plant climbing by means of them); calyx-segments unequal; persistent style or its base bent forward.

Glabrous up to the inflorescence; flowers in a spike or dense raceme; bracts minute or lacking; 3 upper sepals slightly longer than the others....

8. *A. coulterianum*.

Usually somewhat hirsute or pubescent below; flowers scattered to densely racemose, but leafy-bracteate; upper sepal longer than the others.

Nearly glabrous above, hairy at base; leaves narrowly lanceolate to linear; Inyo Co.....9. *A. kingii*.

More or less pubescent throughout; leaves lanceolate or ovate to oblong-ovate. Corolla-tube gibbous or gibbous-saccate at base; seeds longitudinally

cristate-costate; S. Cal. ....10. *A. nuttallianum*.

Corolla-tube saccate at base; seeds not cristate-costate.

Leaves acute or obtuse at apex.

Stems slender; leaves alternate, dark green, acute or obtuse at base; upper sepal 2 to 4 lines long; common....

11. *A. vagans*.

Stems stout; leaves mainly opposite, light green, subcordate or nearly so at base; upper sepal 4 to 6 lines long, very conspicuous and leaf-like; rare.....

12. *A. subcordatum*.

Leaves mostly retuse and with a corneous spot at apex, sessile or nearly so; rare.....13. *A. ovatum*.

1. *A. speciosum* Gray. Evergreen shrub 3 to 8 ft. high, not climbing, glabrous below, hairy at nodes, pubescent above; leaves opposite or in 3s, oval to oblong, obtuse or acutish, mucronate, coriaceous, 1 to  $1\frac{1}{2}$  in. long, shortly petioled; sepals lanceolate, nearly equal, 4 lines long; corolla scarlet, pubes-

cent, tubular, saccate, 3 times as long as the sepals, its lips about equal,  $\frac{1}{2}$  the length of the tube; palate prominent, but not closing the throat; filaments hairy at base, dilated above; gland lobed; capsule opening by irregular perforations at apex; seeds costate, the ribs winged.—Santa Catalina and San Clemente islands.

2. *A. maurandioides* Gray. Stems very slender,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  ft. long, climbing by petioles and peduncles; herbage glabrous; leaves alternate, triangular-hastate or the lower cordate-hastate, the lateral lobes often with a posterior tooth; sepals lanceolate, acute; corolla purple or sometimes white, 6 to 10 lines long, hairy within, gibbous at base; fertile stamens with filaments dilated above, hairy especially at base, the fifth stamen with short filament and abortive anther; seeds corky-ribbed.—Providence Mts., e. Mohave Desert.

3. *A. virga* Gray. Stems erect, virgate, several from the base,  $2\frac{1}{2}$  to 5 or 7 ft. high; leaves linear to linear-lanceolate, sessile, 2 to  $3\frac{1}{2}$  in. long; flowers red-purple in a mostly secund raceme, with subulate bracts; sepals ovate, acute, moderately unequal, scarcely  $\frac{1}{2}$  the length of the corolla; corolla purple, 6 to 7 lines long, the sac at base mammaeform; filaments all geniculate at the very base and all hairy, especially at the geniculation, the gland truncate.—Mountain ridges, 2000 to 3000 ft., in chaparral or chamise: Miyakma and Napa ranges and e. to Mt. Konocti. The known stations are few.

4. *A. glandulosum* Lindl. Stems several from the root-crown, stout, woody at base, 3 to 5 ft. high, very leafy; leaves lanceolate, sessile, 1 to  $2\frac{1}{2}$  in. long, those of the short lateral sterile shoots mostly linear, about half as long, gradually diminishing into the bracts of the inflorescence; bracts commonly conspicuous; sepals oblong-lanceolate, the posterior one equaling, the others shorter than the oblong corolla-tube, this 4 to 5 lines long, saccate near base; corolla pink, pubescent without and within, 6 to 9 lines long; upper lip parted into two lobes, the lobes turned backward so as to be conduplicate; palate yellow, forming a prominent inverted sac; filaments geniculate at base, hairy especially at geniculation, dilated above; gland small, capitate; seeds closely and irregularly fimbriate-cristate.—Mountain slopes, 2000 to 4000 ft.: Santa Cruz and Santa Lucia mountains; San Gabriel and San Bernardino mountains; central Sierra Nevada foothills in Calaveras and Tuolumne Cos.

5. *A. cornutum* Benth. Simple or branching, 12 to 15 in. high, viscid-villous; leaves linear-oblong or oblanceolate, obtuse, 1 in. long, the lower petiolate; flowers axillary, sessile or nearly so; sepals not longer than the ovate-globular capsule; corolla 3 to 4 lines long, yellowish or purplish, the sac prominent, the lips nearly equaling the tube, the palate glandular, hairy; filaments nearly glabrous, dilated at apex, the longer strongly so and curved; gland small, capitate.—Infrequent or rare: inner North Coast Ranges from Napa Co. to Shasta Co., thence s. in the Sierra Nevada foothills to Mariposa Co. Var. *VENOSUM* Jepson n. var. Stem 6 to 12 in. high, simple or much branched, more slender, very floriferous; herbage glandular-villous; leaves smaller and narrower; flowers  $3\frac{1}{2}$  to  $4\frac{1}{2}$  lines long, solitary in the axils of all the leaves; corolla dull white, closely purple-veined, a thickly glandular-hairy band extending from the palate into the throat; filaments somewhat hairy on one side.—N. Napa Co. to w. Lake Co. (Scott Valley, Tracy 2377, type).

6. *A. strictum* Gray. Stem 1 to 2 (or 3) ft. high, erect, simple or branching, often becoming weak and lax and climbing by tortile filiform peduncles, hairy below, the herbage otherwise glabrous; lowest leaves  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long, often filiform,  $\frac{1}{4}$  to  $\frac{1}{2}$  as long as the peduncles; calyx-segments linear-lanceolate, little unequal; corolla violet-purple, 5 to 6 lines long, the hairy prominent palate nearly closing the throat; filaments dilated above; gland small, acute; fruiting calyx about equaling the crustaceous capsule; the style of equal length.—Near the coast, Marin Co. to San Diego Co. Mar.-May.

7. *A. filipes* Gray. Stems hairy below, similar to but more slender than in *A. strictum*, 2 to 4 ft. high, climbing by filiform peduncles 2 to 3 in. long; lower leaves ovate or oblong, the upper linear to lanceolate; corolla  $\frac{1}{2}$  in. long, with saccate base and hairy palate, bright yellow (in depauperate specimens small, white); early flowers often cleistogamous; filaments some-

844. *Antirrhinum coulterianum* Benth.; a, infl. x  $\frac{1}{2}$ ; b, leaf x  $\frac{1}{2}$ ; c, fl. x  $1\frac{1}{2}$ ; d, capsule x 2.

what dilated upwards; gland minute; capsule nearly membranous; seeds with corky-winged ribs.—Colorado Desert; n. to the central Mohave Desert. Apr.-May.

8. *A. coulterianum* Benth. Fig. 844. Stems erect,  $1\frac{1}{2}$  to 4 ft. high, glabrous below the inflorescence; basal leaves narrowly ovate,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long, petioled, the cauline linear or lanceolate, shortly petioled or sub-sessile, distant; raceme rather loose, spike-like, virgate, naked or with minute bracts, often producing tendril-like branchlets, villous-pubescent, viscid and sometimes glandular; calyx 2 lines long, exceeding the pedicels, the segments linear or lanceolate; corolla 4 to 5 lines long, purplish to white with yellowish hairy palate; palate prominent but not closing throat; lower lip broad, 3 to 4 lines long, at least twice as long as the upper; upper lip deeply lobed, the lobes rounded, divergent; corolla-tube longer than the calyx, gibbous at base, the gibbosity almost as broad as the tube, obtusely conical and slightly directed upwards; filaments all dilated upwards; gland minute; style persistent, bent forward at base; seeds tubercu-

late-favose.—Foothills and valleys, Los Angeles Co. to San Diego Co. Var. *NEVINIANUM* Jepson n. comb. Seeds longitudinally cristate-costate.—Coast of Orange Co. (*A. nevinianum* Gray.)

9. *A. kingii* Wats. Slender, erect or somewhat twining, 9 to 12 in. high, more or less hairy at base, above nearly glabrous, lower leaves narrowly linear to narrowly lanceolate,  $\frac{1}{2}$  to 1 in. long; upper leaves minute; calyx somewhat glandular, at length equaled or exceeded by pedicels; corolla white, purple-veined, 2 to 3 lines long, the tube slightly gibbous at base,  $\frac{1}{2}$  the length of the posterior sepal and about equaling the others, the throat closed, the lips small, about equal; longer pair of filaments dilated upwards; gland minute; style persistent, short, subulate; capsule globular, slightly oblique; seeds favose-tuberculate.—Cañons in the desert, 3000 to 5000 ft.: Inyo Co.; e. through Nev. to Utah.

10. *A. nuttallianum* Benth. Stem simple or at length much-branched and diffuse, 1 to 3 ft. high; herbage viscid-pubescent or glabrous below; leaves broadly ovate to subcordate,  $\frac{1}{2}$  to 1 (or 2) in. long, mostly petiolate; pedicels slender, the lower somewhat tortile, often longer than the flowers; corolla blue or violet, with a white blue-reticulated spot on lower lip; lower lip somewhat longer and much larger than upper lip, broadly oblong, emarginate, erect but with the sides turned backward; corolla-tube 2 to 3 lines long, equaled by the posterior sepal, gibbous at base; palate closing throat, very prominent, with two hairy lines running down into throat; filaments somewhat dilated above; gland minute or lacking.—Coastal S. Cal., 100 to 2000 ft.: s. slope foothills of the San Gabriel and San Bernardino mountains; s. to San Diego Co. Var. *EFFUSUM* Gray. Stems slender, climbing by tortile leafy branchlets, 4 to 5 ft. high; peduncles filiform, mostly twice as long as the leaves; ribs of seeds less wing-like.—Cismontane S. Cal. Var. *SUBSESSILE* Jepson n. comb. Stem erect, stout, somewhat branched but less diffuse; leaves  $\frac{1}{2}$  in. long, ovate, sessile or nearly so; peduncles shorter than the flowers, sometimes shorter than the calyx; earlier flowers white, scarcely exceeding the calyx; cleistogamy common.—Cismontane S. Cal. (*A. subsessile* Gray.)

845. *Antirrhinum vagans* Gray; a, leaf  $\times \frac{1}{2}$ ; b, fl. branchlet  $\times \frac{1}{2}$ ; c, fl.  $\times 1\frac{1}{2}$ ; d, capsule  $\times 2\frac{1}{2}$ .

second; seeds densely muriculate.—Morrison Cañon, Niles (Jepson, type). Var. *BREWERI* Jepson. Slender and less diffuse, the leaves linear-oblong to ovate,  $\frac{1}{2}$  to 1 in. long; raceme often second; corolla smaller (3 to 5 lines long), considerably exceeding the less unequal sepals.—North Coast Ranges from Napa and w. Solano Cos. to Siskiyou Co., thence s. in the Sierra Nevada foothills to Tuolumne Co. July-Sept.

12. *A. subcordatum* Gray. Stems stout,  $2\frac{1}{2}$  to 3 ft. high, climbing by prehensile axillary branchlets (these commonly sterile and nearly naked), white-bristly below, glandular hispid above and on the branchlets; leaves mainly opposite, broadly ovate, mucronate, entire, entirely glabrous (or very sparsely ciliate at base), 1 to  $1\frac{1}{4}$  in. long, subsessile, the lowermost alternate and petioled; flowers in a dense but somewhat interrupted leafy-bracteate spike-like raceme (or a few solitary in the lower axils and on the branchlets); pedicels 1 to 2 lines long, becoming somewhat elongated in fruit; calyx-lobes hispid, unequal, the posterior 4 to 6 lines long, leaf-like, the others  $3\frac{1}{2}$  lines long, subulate-lanceolate, nearly equaling the tube of the corolla; corolla 6 to 7 lines long, hairy without and within, the tube 4 lines long, saccate at base, longer than the lips; upper lip shallowly 2-lobed, surpassed by the lower; filaments hairy at base, the shorter pair slightly, the longer pair much dilated towards the apex, the anthers free or either or both pairs connivent; sterile stamen represented by a small somewhat lobed capitate gland; capsule unequal-sided, the style persistent, bent downward; seeds numerous, favose-fimbriate.—Foothills, w. side Sacramento Valley in Glenn and Colusa Cos.

13. *A. ovatum* Eastw. Simple or branching,  $\frac{1}{2}$  to  $1\frac{1}{2}$  ft. high, glandular-hairy; leaves ovate, 5 lines long, obtuse or retuse, with a glabrous corneous spot at apex; flowers axillary on short peduncles; posterior calyx-segment large, oblong, leaf-like; corolla 6 to 9 lines long, the tube somewhat curved, prominently saccate at base, throat open, the upper lip pink, the lower white; stamens with filaments dilated above, free or the longer pair connivent; gland somewhat capitate.—E. San Luis Obispo Co.

11. *A. vagans* Gray. Fig. 845. Stem at first simple and erect, at length branching and very diffuse, the branches  $\frac{1}{2}$  to  $1\frac{1}{2}$  ft. long; branchlets slender; herbage varying greatly from copiously to sparingly glandular-hirsute; leaves ovate, mostly 3 to 5 lines long, oblong to lanceolate and mostly  $\frac{3}{4}$  to 1 in. long, the uppermost (especially those of the prehensile branchlets) reduced and 1 line long or less; calyx-segments very unequal, linear, except the large uppermost one, this oblong or elliptic-oblong, 2 to 4 lines long, nearly equaling the corolla-tube; corolla purple to whitish,  $4\frac{1}{2}$  to 6 lines long, the lips not strongly unequal, the palate glandular-pubescent, the tube saccate or shortly spurred; filaments dilated at apex; gland obtuse; style slender, as long as the capsule; seeds muriculate-roughened or muriculate-reticulate to fimbriate-favose.—Open or brushy slopes in the foothills, 500 to 2500 ft.: Eldorado Co. to Tuolumne Co.; Coast Ranges from Lake Co. to Los Angeles Co. Var. *RIMORUM* Jepson n. var. Lower part of stem with spreading white bristles; raceme dense,

A. *EMARGINATUM* Eastw. Apparently close to no. 13; upper leaves induplicate, the notch at apex subtended by a peculiar gland forming a gusset (ex char.).—Fresno.

### 3. *LINARIA* Juss.

Annual herbs. Lower leaves opposite and the upper alternate, entire in ours. Flowers in terminal racemes. Calyx 5-parted. Corolla 2-lipped, its tube with a lower spur at base on the lower side; upper lip erect; lower lip spreading, its prominent palate sometimes closing the throat, the middle lobe the smallest. Stamens 4. Capsule dehiscent below the summit by pores or slits, many-seeded. (Name derived from *Linum*, flax.)

1. *L. canadensis* Dum. **TOAD FLAX.** Annual or biennial; flowering stems one or several, erect, 6 to 18 in. high; leaves linear, mostly alternate or the lower ones and especially those of the procumbent basal shoots opposite or whorled and often broader; racemes loose; pedicels erect, short; corolla blue, 1 to 2 (or 4) lines long, the spur 2 lines long, upper lip greatly exceeding the lower.—Sandy soil, rather uncommon, but widely scattered through the state; N. Am., S. Am.

### 4. *MOHAVEA* Gray

Annual with lanceolate leaves. Flowers solitary in the axils on short pedicels but the internodes short and so forming a dense leafy spike. Sepals lanceolate, distinct. Corolla pale cream-yellow, much exceeding calyx, with very short tube and very ample limb which is somewhat campanulate and seemingly 2-petaled, but really composed of two fan-shaped lips; upper lip distinctly 2-lobed, lower lip shallowly 3-lobed, its strongly inflated but small palate with a central elevated yellow short-hairy crest and a depression either side of it. Stamens 2, connivent by their anthers over the curved tip of the style, all under the arched ridge of the upper lip. Capsule thin-chartaceous, the equal cells bursting irregularly at apex. (Named for the Mohave River where collected by Capt. Fremont.)

Corolla pale cream-yellow, its lobes erose-denticulate.....1. *M. confertiflora*.  
Corolla lemon-yellow, its lobes mostly entire.....2. *M. breviflora*.

1. *M. confertiflora* (Benth.) Hel. Erect, 3 to 13 in. high, simple or branching, viscid-pubescent; leaves opposite or the upper alternate, tapering to base, acuminate at apex, entire, 1 to 2½ in. long; sepals 5 lines long; corolla 10 to 14 lines long, both lips penciled with fine dots in lines; capsule 5 to 6 lines long; seeds with a flattish crest or margin on back and an involute wing forming a cavity on the ventral side.—Rocky desert slopes, 500 to 2500 ft.: Colorado Desert; e. Mohave Desert. Apr.-May. (*Antirrhinum confertiflorum* Benth. *Mohavea viscida* Gray.)

2. *M. breviflora* Cov. Two to 5 in. high; leaves narrowly ovate, attenuate, ¾ to 1½ in. long; corolla sulphur-yellow, 6 to 9 lines long, less dotted than in no. 1; palate pubescent over its entire surface.—Inyo Co.

### 5. *COLLINSIA* Nutt.

Annuals with simple opposite leaves. Flowers whorled, forming a raceme, or axillary and scattered. Calyx campanulate, 5-cleft. Corolla declined (the proper tube very short and the abruptly expanded or gibbous throat forming an angle with it), deeply 2-lipped; upper lip 2-cleft, with erect lobes; lower lip larger, 3-lobed, the middle lobe conduplicate or keel-shaped and enclosing the 4 declined stamens and style. Filaments long and filiform, the lower pair inserted higher on the corolla than the others; the gland at base of corolla represents the fifth stamen. Capsule septicidal, the valves soon 2-cleft. (*Zaccheus* Collins, American botanist, of Philadelphia, 1764-1831.) The corolla is a striking imitation of the papilionaceous type.

A. *Flowers short-pedicled or almost sessile, crowded in whorl-like clusters.*

Filaments (commonly only the upper pair) and often the interior of corolla bearded.

Calyx-lobes acute, upper lip of corolla nearly as long as the lower, the saccate throat oblique to the tube.....1. *C. bicolor*.

Calyx-lobes somewhat obtuse; upper lip of corolla short.

Herbage staining brownish; saccate-ventricose throat forming a right angle with the tube of the corolla.....2. *C. tinctoria*.

Herbage not staining brownish.

- Stem commonly strict and erect; flower-clusters 2 to 5; upper corolla-lip conspicuous ..... 3. *C. bartsiaefolia*.  
 Caespitose, branching from base and diffuse or decumbent; flowers mainly in a solitary capitate cluster; upper corolla-lip almost obsolete ..... 4. *C. corymbosa*.

Filaments beardless or nearly so.

- Glabrous; calyx-tube and lower portion of calyx-lobes white; lower corolla-lip equaling the upper; interior of corolla-tube somewhat bearded ..... 5. *C. davidsonii*.  
 Glandular-puberulent; calyx uniformly green; lower corolla-lip about twice as long as the upper; interior of corolla-tube glabrous ..... 6. *C. greenii*.

*B. Flowers long-pedicelated, solitary or the upper in whorls.*

Filaments (commonly only the upper pair) hirsute.

- Herbage minutely viscid-pubescent above; upper leaves ovate or ovate-lanceolate; flowers 8 to 12 lines long ..... 7. *C. franciscana*.

- Herbage glabrous or slightly puberulent, not at all viscid; upper leaves oblong or linear; flowers 3 to 6 (or 8) lines long ..... 8. *C. sparsiflora*.

Filaments glabrous (the upper pair in nos. 11 and 12 sometimes slightly hairy).

Inflorescence not glandular or viscid.

- Calyx nearly equaling corolla, lobes of the latter entire ..... 9. *C. parviflora*.

- Calyx scarcely more than  $\frac{1}{2}$  length of corolla, lower lobes of the latter retuse or emarginate.

- Calyx-lobes broadly subulate; flowers 6 to 9 lines long; seeds smooth ..... 10. *C. grandiflora*.

- Calyx-lobes obtuse; flowers 3 to 4 lines long; seeds reticulate ..... 11. *C. parryi*.

Inflorescence glandular or viscid.

- Cauline leaves oblong to acutely ovate; calyx broad and square at base, the lobes acute ..... 12. *C. callosa*.

- Cauline leaves linear to oblong-lanceolate; calyx roundish at base, the lobes acute or obtuse.

- Leaves thinnish, the cauline oblong or oblong-lanceolate, mostly obtusely serrate; corolla-throat longer than lips, these about equal ..... 13. *C. chlidii*.

- Leaves thickish, the cauline linear or oblong-linear, mostly entire; corolla-throat shorter than lower lip, this surpassing the upper ..... 14. *C. torreyi*.

1. *C. bicolor* Benth. CHINESE HOUSES. Fig. 846. Simple or branching from

846. *Collinsia bicolor* Benth.; a, infl. x  $\frac{3}{4}$ ; b, lower leaf x  $\frac{3}{4}$ ; c, cauline leaf x  $\frac{3}{4}$ ; d, stamen of lower pair x  $2\frac{1}{2}$ ; e, stamen of upper pair x  $2\frac{1}{2}$ .

the middle,  $\frac{1}{2}$  to  $1\frac{1}{2}$  ft. high, glabrous or finely pubescent and often viscid above; leaves broadly oblong, or the upper with the broad base narrowed to the apex, serrulate, 1 to 2 in. long; pedicels shorter than the oblong-acute or lanceolate calyx-lobes; corolla rather less than 1 in. long, with lower lip violet or rose-purple, the upper lilac or white, a little shorter than the lower, the lobes recurved-spreading and with low but distinct crests at the point of junction with the tube; saccate throat very oblique to the tube, bristly within, usually with 3 longitudinal purple lines beneath each lobe of the upper lip; whole corolla sometimes varying to white; gland conical; seeds reticulate-rugose, about 6 in each cell.—Very common in the edges of woods in the foothills, 50 to 2800 ft., throughout cismontane Cal. from San Diego Co. to Tulare, Calaveras, Shasta and Humboldt Cos. Apr.-June. Var. *CONCOLOR* Jepson n. comb. Leaves linear or oblong-linear; calyx-tube hoary with long villous arachnoid pubescence, the segments obtuse; flowers smaller.—San Diego Co. (*C. concolor* Greene.)

2. *C. tinctoria* Hartw. Fig. 847. Stems stoutish, simple or diffusely branching,  $\frac{1}{2}$  to 2 ft. long; herbage glandular-viscid

above, at least on the branches, and imparting a brownish stain; lower leaves oblong to lanceolate, with short petioles, the upper ovate or triangular-lanceolate, sessile by a broad or subcordate base, serrate or entire, 1 to 3 or 4 in

long; calyx-lobes linear or oblong, obtuse; corolla white to yellowish, declined a little below the horizontal; upper lip very short with 2 transverse purple lines and a transverse ridge or crest; lower lip with longitudinal pencillings or lines; throat as broad as long, very strongly saccate-ventricose, forming a right or obtuse angle with the tube; upper pair of filaments bearded on upper side; gland conical; seeds small, smoothish.—Wooded hill-sides, 500 to 3700 ft.: Sierra Nevada from Shasta Co. to Kern Co.; Napa and Hoods Peak ranges to Mt. Diablo. June. The herbage gives an iodine-like stain to the hands. Var. *STRICTA* Jepson n. comb. Stem slender; foliage and flowers smaller than in the species; segments of upper lip of corolla very acute and replicate as well as reflexed.—Calaveras Co. foothills. (*C. stricta* Greene.)

3. *C. bartsiaefolia* Benth. Stem erect, 4 to 9 in. high; herbage finely puberulent and often glandular; leaves thickish or even fleshy, ovate or ovate-oblong to linear, about 1 in. long; flower-clusters 2 to 5; calyx usually white-villous, its lobes broad and obtuse; corolla whitish, the lower lip tinged with lilac or purple, less declined than in no. 1, the upper lip with few purple lines or dots above, about the length of the curved gibbous throat, with a transverse callous ridge or crest at its origin; lateral lobes of the lower lip often emarginate or obcordate; upper portion of throat of corolla pubescent inside; upper pair of filaments bearded on the upper side to the middle or above; gland sessile and elongated.—Sands near the seashore: Mendocino Co. to San Francisco and s. to S. Cal.; also San Joaquin Valley. Apr.-June.

4. *C. corymbosa* Herder. Stems several from the base, diffuse, 2 to 5 in. high; herbage almost glabrous; leaves oblong or oval, rather fleshy; corolla straightish, white or yellowish, its upper lip blue or bluish, the lobes almost obsolete; lobes of lower lip entire; gland small, short-stipitate; seeds 4 or 5 in each cell, rugose-reticulated.—Central Mendocino coast.

5. *C. davidsonii* Parish. Stem erect or ascending, 4 to 8 in. high, cymosely few-branched; leaves ovate or oblong; calyx-tube and lower portion of the obtuse lobes white; upper lobe of corolla pale blue or nearly white, transversely callous, the ample lobes few-toothed; lower lip with lateral lobes violet, keel white with dark tip; filaments beardless or the upper pair often somewhat bearded; gland stipitate; capsule not surpassing calyx-lobes; ovules 4 in each cell; seeds rugose.—Antelope Valley, w. Mohave Desert.

6. *C. grœnei* Gray. Stem slender, diffusely branched, 6 to 8 in. high; herbage puberulent below, glandular-puberulent above; leaves linear, or tapering to apex, entire or obscurely dentate; pedicels sometimes as long as the calyx; corolla deep azure-blue; upper lip much shorter than the oblong throat, about half the length of the lower, and very prominently wing-crested or toothed at its origin; lateral lobes of lower lip small; gland small; filaments glabrous.—Rocky places in the North Coast Ranges, 2000 to 5000 ft., from ne. Sonoma Co. to Lake and Humboldt Cos. June.

7. *C. franciscana* Bioletti. Stem simple or branching,  $\frac{1}{2}$  to  $1\frac{1}{2}$  ft. high, erect or reclining on other plants; leaves 1 to 2 in. long, oblong or ovate to lanceolate, coarsely toothed, the lower or lowest roundish, entire, dentate or

847. *Collinsia tinctoria* Hartw.; a, infl. x  $\frac{1}{2}$ ; b, corolla x  $1\frac{1}{2}$ ; c, stamen of upper pair x  $2\frac{1}{2}$ ; d, stamen of lower pair x  $2\frac{1}{2}$ .

848. *Collinsia sparsiflora* F. & M.; a, fl. branchlet  $\times 1$ ; b, lower leaves  $\times 1$ ; c, fl.  $\times 1\frac{1}{2}$ .

3-parted; pedicels of varying length; calyx-teeth acute or obtuse, the tube with 2 linear-oblong submembranous spots below each lobe; upper lip of corolla white, purple-spotted at base, throat longer than wide, closed; gland subulate; seeds rugulose.—San Francisco and San Mateo Cos.

8. *C. sparsiflora* F. & M. Fig. 848. Stem slender, branched from near the base, 4 to 18 in. high; herbage subglabrous or slightly puberulent, reddish; lowest leaves elliptical, 3 to 9 lines long, with 1 or 2 teeth on each side, on petioles nearly as long, the upper oblong to linear, remotely serrate or entire,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long, becoming gradually sessile; corolla 4 to 6 lines long; upper lip bluish or sometimes yellowish at base, purple-dotted at throat, hardly shorter than the lower lip; lateral lobes of lower lip purple; upper lip with an evident transverse ridge or crest; keel sometimes yellowish externally, more or less pilose-pubescent; upper pair of filaments pubescent on the upper side; gland conical or somewhat elongated; seeds concave on one side and convex on the other, acutely margined, about 2 in each cell.—Common in low fields or in wet places on hillsides, 50 to 2000 ft.: Coast Ranges from Santa Clara

Co. to Siskiyou Co., thence se. in the Sierra Nevada foothills to Placer Co. Apr.-May. Var. *ARVENSIS* Jepson. Seven to 12 in. high; nearly glabrous except the setulose-hairy leaves and minutely setulose-ciliate calyces; corolla 6 to 8 lines long.—Grainfields: Lake, Sonoma and Marin Cos.

9. *C. parviflora* Dougl. Diffuse or spreading, 3 to 9 in. high; herbage minutely puberulent; leaves commonly lanceolate, varying to oblong or oblong-ob lanceolate, mostly entire (or remotely denticulate), mostly 1 to  $1\frac{1}{2}$  ( $\frac{1}{2}$  to  $1\frac{1}{2}$ ) in. long, the floral often in whorls of 3 to 5; pedicels solitary or, above 2 to 5 in a whorl, usually longer than the flowers; calyx-lobes lanceolate and acute, or triangular-subulate, hardly longer than the mature capsule; corolla blue or partly white, the oblong gibbous throat longer than the limb; gland small, short-stipitate; seeds thickish, marginless.—Montane, 4500 to 8500 ft.: San Jacinto Mts.; Sierra Nevada from Tulare Co. to Shasta Co.; North Coast Ranges, 2500 to 4500 ft., from Humboldt Co. to Siskiyou Co.; n. to B. C., e. to Ariz. and Ont. Var. *COLLINA* Jepson n. var. Leaves small (3 to 6 lines long), narrow, mostly crenate; calyx-teeth spinulose-ciliate.—Nevada Co. foothills (Penn Valley, Jepson, type).

10. *C. grandiflora* Dougl. Stem erect, branching, 6 to 15 in. high; herbage minutely puberulent, as also the pedicels, the calyces glabrous; lower leaves rounded, serrate or entire, 4 to 6 lines long, petioled, the upper oblong to linear, entire,  $\frac{3}{4}$  to  $1\frac{3}{4}$  in. long, sessile; flowers in whorls of 3 to 8; calyx-tube commonly whitish or membranous, the lobes broadly subulate; corolla 5 to 8 lines long, white or purple with lower lip deep blue or violet; saccate throat as broad as long; upper lip 2-callous; lobes of the larger lower lip retuse or emarginate; capsule shorter than calyx.—Montane, 1500 to 4000 ft.: Plumas Co. to Modoc Co.; Mendocino Co. to Humboldt Co.; n. to B. C. and Ida. Var. *PUSILLA* Gray. Small form, 6 to 8 in. high; corolla 4 to 5 lines long, more blue or violet throughout.—Weaverville, Trinity Co.

11. *C. parryi* Gray. Stem erect, simple or branched from base, 7 to 13 in. high; herbage puberulent; leaves 7 to 12 lines long, the upper lanceolate or linear, obtuse, mostly entire, sessile, the lower ovate or oblong, crenate, petiolate; pedicels as long as flowers, much elongated in fruit; calyx-

lobes equaling throat of the deep blue corolla, also equaling or slightly exceeding the capsule; lips of corolla almost equal, the lobes emarginate.—Foot-hills on the s. side of the San Gabriel and San Bernardino mountains. June.

12. *C. callōsa* Parish. Stem stout, erect, branched, 4 to 11 in. high; herbage glabrous, the inflorescence glandular-puberulent; leaves ovate to linear-oblong, mostly entire, somewhat revolute, subcordate at the sessile base or shortly petioled,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; flowers solitary or in 2s or 3s; corolla light blue, 2 to 4 lines long, the lips about equaling the moderately gibbous throat, the lobes entire and equal, the lower lip with prominent internal folds or callosities below the sinuses; gland filiform; capsule shorter than calyx-lobes.—Montane, 2500 to 6500 ft.: desert ranges of Inyo Co.; Sierra Nevada (Inyo and Kern Cos.) and sw. to the mts. of Ventura Co. and the San Gabriel Mts.

13. *C. childii* Parry. Stem erect, branching, 4 to 12 in. high, subglabrous or puberulent below, glandular-pubescent above; lower leaves obovate-rotund or oblong, 3 to 12 lines long, the upper oblong-lanceolate with narrowed base, 1 to  $2\frac{1}{4}$  in. long; inflorescence glandular-pubescent; calyx-lobes lanceolate or oblong, obtuse; corolla 2 to 3 lines long, light blue or whitish lilac, its lobes of about equal length and entire or emarginate.—Montane, 5000 to 6000 ft.: s. Sierra Nevada in Tulare and Kern Cos.; San Bernardino and San Antonio mountains; s. to Cuyamaca Mts. The herbage stains brown.

14. *C. tórreyi* Gray. Stem erect, simple or usually widely branching, 2 to 11 in. high, puberulent below, glandular above; upper leaves linear to lanceolate, entire or serrulate, narrowed at base, ( $\frac{1}{2}$  or) 1 to  $2\frac{1}{2}$  in. long, the lower spatulate or oblong and petioled; flowers in whorls of 3 to 6, the pedicels glandular; calyx lobes linear, obtusish; corolla 3 to  $3\frac{1}{2}$  lines long, deeply blue or violet, rather strongly declined, 3 times the length of the calyx; upper lip equaling, the lower longer than the ventricose throat; seeds 1 in each cell, smooth.—High montane, 3000 to 8000 ft.: Sierra Nevada; high North Coast Ranges. Var. *LINEARIS* Jepson n. comb. Larger,  $\frac{1}{2}$  to 1 ft. high; cauline leaves  $1\frac{1}{2}$  to 3 in. long; calyx-lobes acute; flowers dull white or light blue, 5 lines long, the lips longer than throat and tube; ovary-cells 3-ovuled.—N. Humboldt Co. and n. to southwestern Ore. (*C. linearis* Gray.) Var. *RATTANII* Jepson n. comb. Eight to 12 in. high; cauline leaves 6 to 14 lines long; calyx-lobes broad, lanceolate, obtusish; corolla violet, 3 lines long, lips equal to throat and tube; gland subulate; cells of ovary with 1 to 3 ovules; capsule equaling calyx; seeds meniscoidal, margined.—Humboldt Co. (*C. rattanii* Gray.) Var. *WRIGHTII* Jtn. Three or 4 in. high; leaves linear, oblong or lanceolate, entire, 1 to  $1\frac{1}{2}$  in. long; flowers axillary or the uppermost in a naked umbel; calyx 2 lines long, lobes obtusish; corolla but little longer, the tube and throat shorter than the lobes, the lower lip blue, the upper yellowish; capsule equaling or shorter than the calyx, 2-seeded; seeds oblong, nearly terete with a deep ventral sulcus.—San Antonio Mts.; Mt. Pinos; Sierra Nevada from Kern Co. to Mariposa Co. (*C. wrightii* Wats.) Var. *BRACHYSIPHON* Jepson n. comb. Simple,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  in. high; cauline leaves linear-lanceolate, about 1 in. long; calyx-lobes obtuse, about twice the length of tube; corolla small, the throat twice as long as wide; lateral divisions of lower lip almost twice as long as keel; gland sessile; capsule slightly longer than calyx; seeds 2.—Mt. Lassen to Placer Co. (*C. brachysiphon* Eastw.)

## 6. *TONÉLLA* Nutt.

Slender branching annuals. Leaves opposite, entire, dentate or ternately divided. Flowers small, almost like those of *Collinsia*. Corolla scarcely declined, in ours 2-lipped; lower lip consisting of one somewhat fan-shaped lobe; upper lip of 4 equal oblong lobes, the lateral ones narrower. Filaments thickened upward, the upper third microscopically glandular. Fifth stamen represented by a small gland. Seeds 1 to 4 in each cell. (Origin of name unknown.)

1. *T. tenélla* (Benth.) Hel. Stem erect, branching, almost filiform, 5 to 12 in. high; leaves heteromorphic, the lowest rotund to ovate, entire or with a deep notch on each side near the apex, 2 to 4 lines long, on petioles longer than the blade, the upper palmately 3-parted or -divided into oblong segments, the middle segment longest; bracts entire, shorter than the pedicels;

849. *Scrophularia californica* Cham.; a, leaf  $\times \frac{1}{2}$ ; b, inf.  $\times \frac{1}{2}$ ; c, fl.  $\times 2$ ; d, upper lip  $\times 2$ .

pedicels in 2s or 3s, as much as 1 in. long; corolla minute, little exceeding the calyx, white or very pale blue, the lobes of some of them with a few purple dots; lower lip slightly concave; capsule exceeding the calyx; seeds 1 to each cell.—Openly wooded slopes, 500 to 2700 ft.: Santa Clara Co. to Siskiyou Co., thence se. to Butte Co.; n. to Ore. Mar.-Apr. (*T. collinsoides* Nutt. *Collinsia tenella* Benth.)

#### 7. *SCROPHULARIA* L. FIGWORT

Rank perennial herbs with opposite leaves. Flowers small, dull reddish, cymose, the cymes disposed in a narrow terminal panicle. Calyx 5-parted into broad lobes. Corolla with a somewhat globular tube, the two upper lobes longer than the two lateral, all erect except the short deflexed lower one. Stamens with anthers 4, the fifth sterile and adnate to the tube of the corolla, appearing like a scale under the upper lip. Capsule septicidal, many-seeded. (Latin *scrofulae*, the plant a one-time remedy for scrofula.)

#### 1. *S. californica* Cham. Fig. 849.

Tall, 3 to 6 ft. high, glabrous except the finely glandular-pubescent inflorescence; leaves ovate, cordate at base, serrate or incised-serrate; corolla about 4 lines long, with a nectar-disk at base of flower.—Moist slopes or along gulches in the hills, 100 to 6000 ft.: throughout Cal.; Nev. to Ore. May-June. Var. *FLORIBUNDA* Greene. Panicle with very flexuous branches.—Dry hills, w. Solano Co. Var. *CATALINA* Jepson n. var. Stout, 4 or 5 ft. high; upper parts viscid, densely clothed with long glandular hairs.—Santa Catalina Isl. (T. Brandegee, type). Var. *LACINIATA* Jepson n. var. Rather stout; stems and leaves pubescent; leaves ovate or ovate-lanceolate, deeply cut into lacinate divisions, these sharply serrate.—Tehachapi Valley (Davy 2158, type); Riverside.

#### 8. *PENTSTEMON* Mitch.

Perennial herbs or suffrutescent plants of hilly districts. Leaves opposite, the upper sessile. Flowers mostly showy, in racemes, panicles, or cymes. Calyx 5-parted. Corolla tubular and often inflated, the limb either slightly or strongly 2-lipped; upper lip 2-lobed, the lower 3-cleft. Stamens with anthers 4, declined at base, ascending above; fifth stamen represented by a conspicuous sterile filament which is often dilated or bearded. Capsule septicidal (the valves cleft at apex through the persistent base of the style), many-seeded. Seeds angled. (Greek *pente*, five, and *stemon*, stamen.)

**A.** Anther-cells joined at apex, soon spreading or divaricate, slit from the base to apex or  $\frac{1}{2}$  the way to apex, when completely slit the anther-cells confluent and soon explanate.

I. ANTHERS DENSELY LONG-WOOLLY; LOW BUT WOODY AT BASE, THE LEAVES CORIACEOUS. Corolla blue or lavender; upper lip with the anther pairs well concealed under it, its lobes divergent; throat open; leaves mostly entire; var. *dauidsonii* of... 1. *P. menziesii*. Corolla crimson; upper lip with the anthers well-protruded or exerted, its lobes parallel; throat narrow; leaves mostly serrate..... 2. *P. newberryi*.

II. ANTHERS GLABROUS OR SLIGHTLY HAIRY, NEVER LONG-WOOLLY.

1. Filaments all bearded and pubescent at base; anthers glabrous; shrubs or bushes.

Corolla red, tubular, the lips much shorter than the long and narrow tube. Leaves in opposite pairs.

- Sterile filament densely bearded above; leaves mostly subcordate at base.....  
3. *P. cordifolius*.
- Sterile filament bearded its whole length; leaves acute or subacute at base.....  
4. *P. corymbosus*.
- Leaves chiefly in whorls of 3; sterile filament bearded.....5. *P. ternatus*.
- Corolla yellow or yellowish or white, the widely spreading lips longer than the short tube.  
Flowers in a panicle; corolla strongly gaping.  
Sterile filament not bearded; upper lip of corolla longer than tube.  
Corolla pinkish-white; upper lip strongly arched with a small apiculation or minute tooth on the back below the notch, not constricted below apex; leaves  $\frac{3}{4}$  to  $2\frac{3}{4}$  in. long.....6. *P. breviflorus*.
- Corolla yellow; upper lip inarched, slightly notched, constricted a little beneath the apex; leaves 3 to 8 lines long.....7. *P. antirrhinoides*.
- Sterile filament densely bearded above; upper lip of corolla shorter than tube....  
8. *P. lemmonii*.
- Flowers solitary in the axils of the reduced upper leaves; corolla not gaping, the lips shorter than the narrow tube.....9. *P. rothrockii*.
2. Fertile filaments not bearded at base, the upper pair sometimes obscurely puberulent at base.
- a. Flowers  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long, commonly borne in a strict narrow or racemose panicle; herbage glabrous.
- Anther-cells slit from base to apex, the cells confluent at apex.  
Corolla strongly or at least markedly 2-lipped.  
Pedicels and calyx glandular-puberulent; leaves narrowly ovate to lanceolate or oblong, dentate or denticulate.  
Upper leaves broadly sessile.  
Corolla-tube shorter than calyx or scarcely ( $\frac{1}{2}$  to 1 line) longer, abruptly and conspicuously campanulate-inflated into a very wide throat; sterile filament densely bearded; corolla white or purplish or pink-tinted.....10. *P. palmeri*.
- Corolla-tube longer than calyx; sterile filament glabrous; leaves glaucous; corolla pink or pink-red.....11. *P. floridus*.
- Upper leaves cordate-clasping; corolla-tube shorter than calyx.12. *P. rattanii*.
- Pedicels and calyx glabrous and non-glandular.  
Leaves ovate or oblong, serrate (except the lower), connate-perfoliate; sterile filament glabrous; corolla red-purple.....13. *P. spectabilis*.
- Leaves linear or narrow-oblongeolate, entire, not connate-perfoliate; sterile filament hairy; corolla white or pale pink.....14. *P. fruticiformis*.
- Corolla nearly regular or at least not markedly 2-lipped, red or scarlet, its lobes short, roundish, subequal.  
Leaves sharply dentate, the upper or some of them commonly connate-perfoliate.  
Corolla 8 to 9 lines long; sterile filament hairy, rarely glabrous; w. side Colorado Desert .....15. *P. clevelandii*.
- Corolla 11 to 13 lines long; sterile filament glabrous; e. side Colorado Desert.  
16. *P. pseudospectabilis*.
- Leaves all distinct, entire; sterile filament glabrous; leaves ovate to lanceolate, entire or serrulate.  
Corolla scarlet, tubular; abundant.....17. *P. centranthifolius*.
- Corolla red, narrow, the throat funnelform-dilated; uncommon.18. *P. parishii*.
- Anther-cells slit towards but not quite to apex.  
Corolla red.  
Sterile filament with a tuft of bristles at apex; corolla barely 2-lipped.....  
19. *P. eatonii*.
- Sterile filament glabrous; corolla strongly 2-lipped.....20. *P. labrosus*.
- Corolla blue or blue-purple; sterile filament bearded or not bearded.....21. *P. glaber*.
- b. Flowers 5 to 8 lines long, glomerate, the glomerules more or less whorl-like.
- Leaves entire.  
Apex of leaves not mucronulate.  
Sepals green or greenish.  
Herbage glabrous; pedicels and calyx glabrous; calyx-lobes scarious-margined and denticulate or lacerate.  
Flowers sessile or nearly so in dense whorls; sterile filament bearded; herbage green; high montane, common.....22. *P. confertus*.
- Flowers on pedicels 1 to 4 lines long, in loose whorls; sterile filament glabrous; herbage glaucous; deserts, rare in Cal.....  
23. *P. acuminatus*.
- Herbage densely or minutely cinereous, the inflorescence viscid-villous; sepals glandular-pubescent, narrowly lanceolate-attenuate, in age glabrate and finely lineate longitudinally; sterile filament densely yellow-hairy at least half-way to base.  
Inflorescence 3 to 6 in. long, leafy-bracteate; corolla 6 to 8 lines long...  
24. *P. divergens*.
- Inflorescence  $\frac{1}{2}$  to  $\frac{3}{4}$  in. long, with small bracts; corolla 4 to 6 lines long.....25. *P. calcareus*.
- Sepals with narrow scarious or white margins; sterile stamen glabrous; deserts.  
Leaves conspicuously white-margined.....26. *P. albomarginatus*.
- Leaves wholly green; var. *thurberi* of.....27. *P. ambiguus*.
- Apex of leaves mucronulate; herbage cinereous; sterile filament bearded; var. *californicus* of.....28. *P. linarioides*.

Leaves dentate or denticulate.

Corolla yellowish or dull white; sterile filament glabrous; herbage and inflorescence glabrous, sometimes pilose ..... 29. *P. deustus*.

Corolla purple-blue; sterile filament hairy or glabrous; herbage glabrous; inflorescence glandular-puberulent. .... 30. *P. ovatus*.

**B. Anthers sagittate or horseshoe-shaped, the cells joined at apex and there dehiscent by a slit which extends only  $\frac{1}{2}$  to  $\frac{3}{4}$  the way down the cells, the lower or basal portion remaining closed or saccate, never woolly, sometimes hairy; margins of anther-cells denticulate or ciliate, unchanged in position (not becoming divaricate); leaves all entire.**

Sterile filament lightly bearded; corolla blue, slender-funnelform, moderately 2-lipped, 6 lines long; inflorescence viscid-pubescent. .... 31. *P. gracilentus*.

Sterile filament glabrous; corolla ventricose-funnelform, strongly 2-lipped, 9 to 15 lines long. Corolla blue to purple.

Inflorescence glandular-pubescent.

Leaves 3 to 8 times as long as broad; herbage, or at least the stems, finely cinereous-puberulent; flowers in an open panicle. .... 32. *P. laetus*.

Leaves, at least the lower, broader than long or nearly as broad as long.

Herbage glabrous and glaucous; panicle open, broad. .... 33. *P. caesioides*.

Herbage densely canescent; panicle racemose. .... 34. *P. purpusii*.

Inflorescence not glandular; panicle racemose.

Herbage glabrous and blue-glaucous; middle cauline leaves commonly very much unlike those of the sterile basal shoots. .... 35. *P. jaffrayanus*.

Herbage minutely cinereous-puberulent, sometimes glabrous; leaves all essentially alike. .... 36. *P. heterophyllum*.

Corolla scarlet-red, tubular-funnelform, very strongly 2-lipped. .... 37. *P. bridgesii*.

1. *P. menziesii* Hook. var. *dauidsonii* Piper. Stems prostrate, forming a

leafy mat from which arise the leafy-bracted peduncles; peduncles 1 to 2 (or 4 or 5)-flowered; the flowers spreading horizontally; basal leaves ovate and obtusish, or the lowest orbicular, entire, glabrous, 2 to 5 lines long, on short petioles; sepals lanceolate, glandular-puberulent, 4 to 5 lines long; corolla blue-purple,  $1\frac{1}{4}$  to  $1\frac{1}{2}$  in. long, its lobes very short, its throat ventricose on the lower side, a hairy band running down from middle lobe of lower lip; upper lip recurving, lower lip erect (extended in direction of tube); sterile filament densely bearded at tip, much shorter but not "half-shorter" than the other filaments; anthers long-woolly.

—High montane, 7000 to 12,000 ft.: Sierra Nevada from Tulare Co. to Lassen Co.; Siskiyou Co.; e. to western Nev., n. to Wash. (*P. dauidsonii* Greene.)

2. *P. newberryi* Gray. MOUNTAIN PRIDE. Fig. 850. Stems simple, arising from a woody base, 8 to 20 in. high; leaves orbicular to round-ovate, serrulate, coriaceous or elliptic,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long; racemes short, sessile or rather short-peduncled; sepals narrowly lanceolate; corolla crimson or bright red, 1 to  $1\frac{1}{2}$  in. long, its lips

850. *Pentstemon newberryi* Gray; a, fl. branchlet  $\times \frac{1}{2}$ ; b, stamen  $\times 2$ ; c, sterile filament  $\times 2$ .

nearly equal; upper lip erect, the lower with equal recurving lobes; lower lip with two densely bearded folds; anthers slightly exserted, densely woolly; sterile filament bearded at apex.—Montane, on rocky ledges, 4000 to 10,000 ft.: Mt. Shasta to Lassen, Nevada and Tulare Cos.; North Coast Ranges. June-July. (*P. sonomensis* Greene. *P. newberryi* var. *sonomensis* Jepson.)

3. *P. cordifolius* Benth. Fig. 851. Stems long and straggling, 3 to 8 ft. long, half-climbing over shrubs, very leafy; leaves ovate, subcordate or truncatish at base, serrate, veiny,  $\frac{1}{2}$  to 1 or 2 in. long, on short slender petioles or sessile; panicle short and leafy, mostly 1-sided, its branches short, horizontal or declined; sepals ovate-lanceolate; corolla scarlet, tubular,  $1\frac{1}{4}$  to  $1\frac{1}{2}$  in. long; upper lip erect, notched, nearly  $\frac{1}{2}$  as long as the tube; lower lip spreading, cleft to the middle, the lobes dilated at tip; filaments flattened with narrow-oblong dilations at base, the dilations short-hispid on the margins; sterile filament densely bearded above on one side. — Cañons and hill slopes, 500 to 2000 ft.: coastal S. Cal. from San Luis Obispo and Ventura Cos. to San Diego Co.; Santa Barbara Isls.; s. to L. Cal.

4. *P. corymbosus* Benth. Stems 10 to 16 in. high, arising from depressed or low shrubby evergreen mats; herbage glabrous except the glandular-pubescent inflorescence; leaves oblong and acute at both ends or narrowly ovate or the lower obovate, denticulate or entire,  $\frac{1}{4}$  to  $1\frac{1}{4}$  in. long, short-petioled; flowers in terminal corymbs; sepals linear or somewhat narrowed

851. *Pentstemon cordifolius* Benth.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, fl.  $\times 1$ ; c, anther before dehiscent  $\times 3$ ; d, anther after dehiscent  $\times 3$ ; e, sterile filament  $\times 1\frac{1}{2}$ .

852. *Pentstemon breviflorus* Lindl.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, fl.  $\times 1$ ; c, anther  $\times 3$ ; d, sterile filament  $\times 1\frac{1}{2}$ .

above; corolla scarlet, tubular, 2-lipped, 1 to  $1\frac{1}{4}$  in. long; lower lip abruptly spreading, 3-parted into oblong lobes, the upper lip erect, 2-cleft; filaments all pubescent at the very base, the sterile one bearded its whole length on one side. — Rocky ledges and cliffs, 500 to 5000 ft.: Coast Ranges from Mt. Hamilton Range, Santa Cruz Mts., Lake Co. and Mendocino Co. to Shasta and Siskiyou Cos. (*P. intonsus* Hel.) Var. *PUBERULENTUS* Jepson n. var. Leaves tending to be elliptic; herbage puberulent. — Butte Co. (Richardson Sprs., Hall 6763, type).

5. *P. ternatus* Gray. Straggly bush 4 to 6 ft. high, the flowering stems virgate, arising from the older woody base; herbage, pedicels and calyx glabrous, the stems glaucous; old bark fissured into long narrow deciduous strips; leaves linear-lanceolate (or the lowest ovate), serrulate,  $\frac{3}{4}$  to 2 in. long, subsessile, borne in 3s, except the lower; flowers in an elongated raceme-like thyrsus; corolla terra-cotta color, or pale scarlet, tubular, 1 in. long, 2-lipped, the lips 2 to 3 lines long; upper lip erect, shortly notched; lobes of the lower lip linear-oblong or ovate,

spreading; fertile filaments bearded at base; sterile filament densely bearded along its whole upper side.—Montane, 1500 to 7000 ft.: San Diego Co. to the San Jacinto, San Bernardino and San Gabriel mountains; n. to the southern Sierra Nevada in Kern Co. Aug.

6. *P. breviflorus* Lindl. Fig. 852. Stems simple, elongated, from a branched woody base, 3 to 6 ft. high; herbage glabrous and glaucous, the pedicels, calyx and corolla glandular-pubescent; leaves lanceolate, oblong-lanceolate, or linear, denticulate (or the lowest entire),  $\frac{3}{4}$  to  $2\frac{3}{4}$  in. long; panicle ample, 6 to 9 in. long; sepals ovate, acuminate, 2 lines long; corolla 6 to 7 lines long, white with pinkish marking, deeply 2-lipped, the upper lip oblong, erect, galeate, notched (with a small reflexed tooth in the notch), longer than the tube, beset with viscid hairs; lower lip with widely spreading oblong lobes; filaments approximate in center so as to close tube, glabrous, abruptly dilated at base, the dilation oblong, densely hispidulose-margined above; sterile filament glabrous; stamens exserted.—Dry hills, 1000 to 6500 ft.; inner Coast Ranges from Ventura and San Luis Obispo

853. *Pentstemon antirrhinoides* Benth.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, fl.  $\times 1$ ; c, anther  $\times 5$ ; d, sterile filament  $\times 2$ .

854. *Pentstemon lemmonii* Gray; a, lower leaves  $\times \frac{1}{2}$ ; b, infl.  $\times \frac{1}{2}$ ; c, fl.  $\times 1$ ; d, anther  $\times 3$ ; e, sterile filament  $\times 1\frac{1}{2}$ .

Cos. to Shasta Co., thence s. in the Sierra Nevada to Tulare Co.; e. to western Nev.

7. *P. antirrhinoides* Benth. Fig. 853. Much-branched evergreen shrub 1 to 8 ft. high; herbage minutely puberulent or subglabrous; leaves linear or oblong, 3 to 8 lines long, on a short but slender petiole; panicle ample, leafy; sepals round-ovate, acute; corolla yellow, very broad, 9 to 10 lines long, strongly gaping, its tube short and broad, shorter than the lips; upper lip erect, cleft, strongly incurved-arched, very slightly notched; lower lip deeply parted, its lobes turned downward; stamens exserted; filaments somewhat dilated at the middle, arising from an oblong dilation, the dilation densely short-hairy on its upper margins; sterile filament densely bearded on one side at apex.—Mesas, valley flats and cañons, 1000 to 3000 ft.: coastal S. Cal. from the San Bernardino foothills to San Diego Co.; s. to L. Cal. Apr.-May.

8. *P. lemmonii* Gray. BUSH BEARD-TONGUE. Fig. 854. Bush 2 to 4 ft. high, with vigorous erect glaucous stems from a woody base, rather remotely

leaved; leaves ovate or ovate-lanceolate, acute, sparsely serrulate or entire, light green, glabrous,  $\frac{1}{2}$  to 2 in. long; sepals narrowly ovate, acuminate; corolla brownish-buff or purplish and dull yellow, small ( $\frac{1}{2}$  in. long), with short tube, campanulate-dilated throat and spreading lips; lower lip with 5 longitudinal purple lines running down into throat; sterile filament strongly bearded on one side of the curved apex; capsule 2 lines long.—Along streams in cañons, 800 to 5000 ft.: Coast Ranges from Santa Clara Co. to Siskiyou Co., thence s. in the Sierra Nevada to Placer Co. July-Aug.

9. *P. rothrockii* Gray. Woody at base, forming a bush 10 to 20 in. high and twice as broad; stems of the season and calyces glandular-puberulent; leaves ovate or ovate-oblong, mostly subcordate at base, subentire or undulate-dentate, 3 to 6 lines long, subsessile; flowers sessile in the upper axils of the simple stems, the inflorescence thus spike-like, leafy below; corolla dull yellow or yellowish-white, sometimes purple-tinted outside, sparsely pubescent, 5 to 6 lines long; upper lip arched, notched, about half the length of the tube, the lower lip shorter than the upper, its lobes broadly oblong, recurving; filaments dilated at base, somewhat pubescent at base; sterile filament glabrous, pubescent at base.—Mountain slopes, 6000 to 8000 ft.: s. Sierra Nevada in Tulare, Inyo and Kern Cos.; San Jacinto Mts. (*P. scabridus* Eastw. *P. jacintensis* Abrams.)

10. *P. pámeri* Gray. Stems  $1\frac{1}{2}$  to 3 ft. high, woody at base; herbage glabrous, often glaucous, the peduncles, pedicels and calyx sparingly glandular-puberulent; leaves narrowly ovate to lanceolate (or the lowest obovate), sharply or spinulose-dentate,  $1\frac{1}{2}$  to 4 in. long, shortly petioled or subsessile; sepals ovate; corolla dull or cream-white, streaked or tinted with violet-purplish or pink markings, 1 to  $1\frac{1}{4}$  in. long, the short tube not longer than the calyx, rather abruptly expanded into the broadly ventricose-campanulate throat; lips short, the upper lip erect, 2-lobed, lower lip widely spreading, hairy on the palate; filaments glabrous or the upper pair obscurely puberulent at base; sterile filament densely yellow-hairy at tip, slightly exserted; style with rusty short hairs below.—Mountain slopes and flats, 2100 to 8000 ft.: mts. of coastal S. Cal.; n. in inner Coast Ranges to San Benito Co.; Mohave Desert; s. Sierra Nevada in Kern and Tulare Cos.; e. to southern Utah. June-July.

11. *P. flóridus* Bdg. Stem simple,  $1\frac{1}{2}$  to 3 ft. high; herbage glabrous, somewhat glaucous; leaves oblong to ovate or lanceolate,  $1\frac{1}{2}$  to 3 in. long; panicle virgate, the pedicels and calyx glandular-pubescent; corolla pink or pink-red, 11 to 12 lines long, its tube 3 to 4 lines long, the throat abruptly and strongly ventricose on the lower side, the upper side of the corolla nearly straight, the mouth a little constricted; upper lip erect or slightly bent backward, deeply cleft; lower lip deeply cleft, its lobes subequal, deflexed-curving; all the lobes very short (1 to 2 lines long) and very obtuse; sterile stamen glabrous.—Mountains bordering the northern Owens Valley in Inyo Co., 6000 to 8000 ft.: e. slope Sierra Nevada; White Mts.

12. *P. ráttanii* Gray. Stems several from the branched root-crown, erect,  $1\frac{1}{4}$  to  $1\frac{1}{2}$  ft. high; herbage glabrous, the inflorescence glandular-puberulent; basal leaves ovate, dentate,  $\frac{1}{2}$  to 4 or 7 in. long, on petioles  $\frac{1}{2}$  to as long; cauline leaves oblong- or more commonly triangular-ovate, subcordately clasping,  $\frac{1}{2}$  to  $2\frac{1}{4}$  in. long; flowers loosely glomerate in an open panicle, the glomerules long-peduncled from the axils; corolla slightly oblique, strongly 2-lipped, lavender or pale purple, 9 to 11 lines long, the throat campanulate-dilated above the narrow tube; lower lip hairy on the palate; sterile stamen sparsely hairy.—Cañons, 3000 to 4500 ft.: Mendocino Co. to Trinity Co. July. Var. *minor* Gray. Inflorescence spike-like; flowers 6 to 7 lines long; sepals attenuate.—Del Norte Co. Var. *kleei* Gray. Sepals oblong.—Ben Lomond, Santa Cruz Mts.

13. *P. spectábilis* Thurber. Fig. 855. Stems slender, simple, 3 to 4 ft. high; herbage glabrous even to the calyx and corolla; leaves ovate to oblong, acutely dentate, coriaceous, glaucous, 2 to  $3\frac{1}{4}$  in. long, sessile or the lowest petioled, the upper connate-perfoliate; panicle open and elongated, 6 to 17 in. long; sepals oval, subacute; corolla blue or blue-purple, moderately 2-lipped, the

855. *Pentstemon spectabilis* Thurber; a, portion of leafy stem  $\times \frac{1}{2}$ ; b, infl.  $\times \frac{1}{2}$ ; c, fl.  $\times 1$ ; d, anther  $\times 3$ ; e, sterile filament  $\times 1$ .

montane slopes, 4000 to 6000 ft.: Panamint Mts.; Argus Mts. May-June. Var. *SPICIFORMIS* Jepson n. var. Flowers in glomerate whorls, the inflorescence thus spike-like, the peduncles and pedicels only 1 to 2 lines long; corolla-lobes erosulate.—Upper Kern River (near Trout Mdws., 6300 ft., Jepson 1045, type). Var. *INCERTUS* M. & J. Leaves 1 to  $1\frac{1}{2}$  lines wide; pedicels and calyces glandular-puberulent; proper corolla-tube twice as long as calyx.—Southern Sierra Nevada in Inyo Co. and Kern Co. (*P. incertus* Bdg.)

15. *P. clevelandii* Gray. Stems slender, 1 to  $2\frac{1}{2}$  ft. high; herbage glabrous throughout or essentially so; leaves fleshy or coriaceous, oblong to ovate, commonly truncatish or subcordate at base, denticulate, 1 to  $2\frac{1}{2}$  in. long, the lower petioled, the upper or some of them connate-perfoliate or sometimes distinct; panicle virgate, rather densely flowered,  $\frac{3}{4}$  to  $1\frac{1}{4}$  ft. long; sepals ovate, acute,  $1\frac{1}{2}$  to 2 lines long; corolla red, tubular-funnelform, 8 to 9 lines long, the throat narrow but a little distended on the lower side, the lobes subequal, quadratish, spreading or sometimes closely reflexed; sterile filament moderately hairy at the dilated apex, rarely glabrous; capsule ovoid, twice as long as the calyx.—Easterly slopes and cañons, 1000 to 4000 ft.: Santa Rosa Mts. s. to Cuyamaca Mts. and L. Cal. Apr.-May. Var. *CONNATUS* M. & J. Upper leaves connate-perfoliate; sterile filament densely bearded.—Cañons on w. side Colorado Desert. Var. *STEPHENSII* M. & J. Upper leaves connate-perfoliate; sterile filament glabrous.—Providence Mts. (*P. stephensii* Bdg.)

16. *P. pseudospectabilis* Jones. Very near no. 15; stems erect, 3 to 4 ft. high; herbage glabrous and glaucous, the inflorescence sparingly glandular-puberulent; leaves oblong-ovate, sharply dentate, sessile or the lower petioled, or the upper connate-perfoliate,  $1\frac{1}{2}$  to 4 in. long; panicle narrow, strict, the glomerules distinct, the bracts very small or foliaceous; corolla pink, tubular-funnelform, 11 to 13 lines long; sterile filament glabrous.—Chuckwalla Mts., e. Colorado Desert; e. to western Ariz.

17. *P. centránthifolius* Benth. SCARLET BUGLER. Fig. 856. Stems slender, simple, 1 to 4 ft. high, ending in a virgate panicle; herbage glabrous and

throat red-purple to lilac, 10 to 15 lines long, the tube narrow, twice as long as the calyx, then abruptly dilated into the campanulate or ventricose throat; corolla-lobes truncatish or roundish, subequal, spreading,  $2\frac{1}{2}$  to 3 or 4 lines long; upper lip deeply cleft; sterile stamen glabrous.—Dry hills and valleys, 2000 to 4500 ft.: San Luis Obispo Co. to coastal S. Cal., thence e. to N. Mex. Var. *GILMANII* Jepson n. var. Leaves entire; corolla narrower.—Mt. San Jacinto (M. F. Gilman 744, type).

14. *P. fruticiformis* Cov. Stems 1 to 3 ft. high, only slightly woody at base; leaves lanceolate to linear, entire, sessile or shortly petioled,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  (or the lowest to  $5\frac{1}{2}$ ) in. long; herbage glabrous throughout, a little glaucous; panicle open but somewhat narrow; corolla white or pale pink with deeper pink or lavender lobes, the throat ventricose-dilated on the lower side, the upper side of corolla nearly straight above the short (2 lines long) proper tube, the tube shorter than the calyx; lips widely gaping, the lower lip spreading, white-hairy at base; upper lip notched, erect; sterile filament hairy at the dilated tip.—Arid

glaucous; leaves ovate to elliptic or oblong-lanceolate or lanceolate, entire, sessile or subcordate-clasping; panicle virgate; pedicels very slender,  $\frac{1}{4}$  to  $\frac{3}{4}$  in. long; sepals round-ovate; corolla bright vermilion, tubular, 1 in. long, the lobes nearly equal, turned backward in sets of 2 and 3 and in this way obviously 2-lipped; sterile filament glabrous; capsule 6 to 7 lines long.—Cliffs, sandhills or sandy flats, 600 to 4700 ft.: coastal S. Cal.; n. to San Carlos Range, e. Contra Costa Co. and Vaca Mts.; Mohave Desert; Colorado Desert; e. to Ariz. and southern Utah. Apr.-June. (*P. subulatus* Jones.)

18. *P. parishii* Gray. Stems slender, virgate, 2 to 3 ft. high, from a woody base; herbage glabrous throughout; leaves ovate to oblong or lanceolate, entire or serrulate,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  in. long, the upper auriculate-clasping, the lower sessile, the lowest short-petioled; panicle narrow, elongated; sepals ovate, acute; corolla red, tubular-funnelform, glabrous, 10 to 12 lines long, its lobes roundish,  $1\frac{1}{2}$  to 2 lines long; anthers slit from end to end, not denticulate; sterile filament glabrous.—Plains, flats and valleys, 1000 to 3000 ft.: s. side San Gabriel and San Bernardino mountains to e. San Diego Co. Apr.-May.

19. *P. eatonii* Gray. Stem simple, 1 to 2 ft. high; herbage glabrous throughout; leaves ovate to linear-lanceolate, sessile or clasping,  $1\frac{1}{2}$  to 4 in. long, the lower ovate to narrowly obovate or broadly oblong, 1 to 2 in. long, on petioles  $\frac{1}{2}$  to as long; panicle virgate; corolla vermilion, tubular, obscurely 2-lipped, 1 to  $1\frac{1}{8}$  in. long, its subequal lobes broad and rounded,  $1\frac{1}{2}$  to 2 lines long; fertile filaments glabrous, the upper ones dilated at base; sterile filament with a tuft of bristles at apex; anthers scrobiculate, cleft from the base  $\frac{3}{4}$  of the way to the apex, the margin denticulate.—Mountain slopes bordering or in the deserts, 4000 to 6000 ft.: n. side Colorado Desert; Mohave Desert; e. to southern Nev. and Utah. May-June.

*P. münzii* Jtn. Corolla red, funnelform-tubular, its lower lip reflexed; sterile filament glabrous (ex char.).—Providence Mts.

20. *P. labrösus* Hook. Stems simple, slender, erect,  $1\frac{1}{4}$  to  $2\frac{1}{2}$  ft. high, ending above in a virgate panicle; herbage glabrous throughout; leaves mostly basal or sub-basal, narrowly linear to oblanceolate, glaucous, entire, 2 to  $4\frac{1}{2}$  in. long, gradually narrowed at base (especially the lower) to a broad petiole; sepals ovate, acute, the margin denticulate, flowers spreading or horizontal; corolla crimson, tubular, little enlarged upward, 1 to  $1\frac{5}{8}$  in. long, its equal lips  $\frac{1}{2}$  or over  $\frac{1}{2}$  the length of the tube; upper lip erect, cleft about  $\frac{1}{4}$  its length; lobes of lower lip widely spreading, linear, 5 to  $6\frac{1}{2}$  lines long; sterile filament glabrous.—In chaparral and forest, the leafy bases matting the ground in opens, 4000 to 6000 ft.: Mt. Pinos and Ojai Valley s. through the San Bernardino, San Gabriel, and San Jacinto mountains to L. Cal.

21. *P. gläber* Pursh. Stems several from a vertical rootstock, erect,  $1\frac{1}{2}$  to 2 ft. high, the leaves chiefly basal; herbage, pedicels and calyces glabrous, rarely minutely puberulent; leaves narrow-oblanceolate, drawn down to a long petiole-like base, 2 to 4 in. long, the upper ones oblong to linear, sessile;

856. *Pentstemon centranthifolius* Benth.; a, portion of leafy stem and infl.  $\times \frac{1}{4}$ ; b, fl.  $\times 1$ ; c, anther  $\times 3$ ; d, sterile filament  $\times 1\frac{1}{2}$ .

glomerules sessile or shortly peduncled along the main axis, the inflorescence thus spike-like; sepals ovate, scarious-margined, acuminate; corolla bright blue or purple, 1 to 1½ in. long, the throat funnelform, enlarged above the tube; anthers dehiscent not quite to apex; sterile stamen densely hispid at apex or glabrous.—Mountain slopes and flats bordering the deserts, 2800 to 8500 ft.: n. slope San Bernardino and San Gabriel mountains; Mt. Pinos; Tehachapi Mts.; White Mts.; Sierra Nevada from Tulare Co. to Sierra Co. and n. to Siskiyou and Modoc Cos.; e. to Nev. and Wyo., n. to Ore. May-July. Var. *UTAHENSIS* Wats. Herbage pruinose-puberulent, as also the pedicels and calyces.—E. slopes or summits of Sierra Nevada in Nevada and Eldorado Cos.; e. to Utah.

22. *P. confertus* Dougl. Stems from a root-crown; herbage glabrous; leaves entire; flowers glomerate, the glomerules forming whorls; calyx-lobes denticulate or lacerate at apex; corolla yellow, the lower lip with a densely hairy patch in center; sterile filament densely yellow-hairy at apex.—Wash. and Ore. Represented with us only by the following varieties: Var. *PROCERUS* Cov. Stems few from the branching root-crown, 1¼ to 1¾ ft. high, the leaves basal and cauline, the cauline leaves only moderately reduced upwards, their blades longer than those of the basal leaves; inflorescence glabrous (in ours) or glandular-pubescent; basal leaves oblong or obovate, mostly acute at both ends, 1 to 2 in. long, gradually narrowed to a petiole ½ to ⅔ as long or sometimes subsessile; cauline leaves oblong to oblong-lanceolate or lanceolate, sessile by an acute or broad base, 1 to 3 in. long; glomerules forming

857. *Pentstemon confertus* var. *caeruleo-purpureus* Gray; a, base of plant  $\times \frac{1}{2}$ ; b, fl. stem  $\times \frac{1}{2}$ ; c, fl.  $\times 1\frac{1}{2}$ ; d, lower lip spread open and 4 stamens  $\times 1\frac{1}{2}$ .

3 to 5 distinct and often remote whorls, the whorls thus interrupted-spicate; calyx-lobes denticulate or lacerate at apex; corolla blue, tubular, slightly 2-lipped, 6 to 8 lines long, the lips about 1 line long.—Mountain slopes, 5000 to 8000 ft., uncommon in Cal: Sierra Nevada from Fresno Co. to Nevada Co.; n. to Wash. (*P. procerus* Dougl.). It passes by intergrades into the var. *caeruleo-purpureus*. Var. *RIGIDUS* Jepson n. var. Stems several from the branched crown of a stout vertical root, erect, rigid, 10 to 13 in. high; whorls of inflorescence condensed, capitate-oblong, ¾ to 1 in. long.—E. side Sierra Nevada in Eldorado Co. (Brockway, Lake Tahoe, Jepson 7742, type). Var. *CAERULEO-PURPUREUS* Gray. Fig. 857. Stems several or many in tufts from a horizontal rootstock, 6 to 15 in. high, the foliaceous bases often forming a loose leafy mat; pedicels and calyx glabrous or sometimes minutely glandular-puberulent; basal leaves narrowly obovate, ½ to 1¼ in. long, on petioles ½ as long; cauline leaves linear to linear-oblong or oblong-lanceolate, 1¼ in. long; flowers in 2 to 4 distinct and often remote whorls; corolla 4 to 6 lines long, blue-purple to pale blue, the tube red-purple.—High montane slopes and ridges, 7000 to 10,000 ft.; common: White Mts.; Sierra Nevada from Tulare Co. to Modoc Co.; Yollo Bolly Mts. to Siskiyou Co.; n. to Wash. (*P. heterodoxus* Gray.) Var. *GENICULATUS* Jepson n. comb. Much condensed, 1½ to 2 (or 4) in. high, the inflorescence reduced to 1 (or 2) whorls.—Alpine in the Sierra Nevada, 9000 to 12,100 ft., from Tulare Co. to Mariposa Co. (*P. geniculatus* Greene.) Var. *MODESTUS* Jepson n. comb. Stems 6 to 8 in. high; inflorescence usually dense (the whorls congested), ¾ to 1¼ in. long; corolla

very small ( $3\frac{1}{2}$  lines long).—East side Sierra Nevada in Lassen Co.; e. to Nev. (*P. modestus* Greene.)

23. *P. acuminatus* Dougl. Stems few from the branched root-crown, 9 to 18 in. high, leafy below the inflorescence to the base; herbage, pedicels and calyces glabrous and glaucous; cauline leaves lanceolate to oblong-lanceolate or ovate, commonly with rounded or subcordate sessile base, 1 to 3 in. long, the lower or basal linear or oblanceolate, commonly very much narrower, more or less petioled; flowers in whorled glomerules, the axis with 5 to 7 distinct and mostly approximate but loose whorls; bracts subcordate, mostly broader than long; corolla lilac or blue, tubular-funnelform, very moderately 2-lipped, 7 to 8 lines long; sterile filament dilated and densely yellow-hairy.—Plains and valleys, 4000 to 6000 ft.: rare, Inyo Co.; n. to eastern Ore. and Wash.

24. *P. divergens* Jones. Stems few or several from a thick heavy root-stock, 7 to 10 in. high; herbage densely or minutely cinereous, the inflorescence densely viscid-villous; leaves oblong-ovate to elliptic, entire, coriaceous, 1 to 3 in. long, the cauline sessile or nearly so, the uppermost ovate-lanceolate, the lower ones on petioles  $\frac{1}{2}$  to 1 in. long; flowers in dense whorl-like barely discrete glomerules, the inflorescence thus spike-like and only a little interrupted, 3 to 6 in. long; sepals narrowly lanceolate-attenuate; corolla red, narrow-campanulate above the short tube, 6 to 8 lines long; sterile filament densely yellow-hairy.—Desert ranges, 5000 to 6000 ft., Inyo Co.: Coldwater Cañon, White Mts.; Bishop; Hunter Ranch Mts.; Darwin. (*P. monensis* Hel.)

25. *P. calcareus* Bdg. Stems tufted on a woody root-crown,  $1\frac{1}{2}$  to 3 in. high; herbage densely puberulent, becoming purplish in age; pedicels and calyces glandular-villous; leaves ovate to elliptic or lanceolate or oblanceolate, entire or with a few remote minute teeth,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long, the petioles  $\frac{1}{2}$  to as long; flowers in a small panicle, the panicle dense, viscid-villous,  $\frac{1}{2}$  to  $\frac{3}{4}$  in. long; sepals narrowly lanceolate-attenuate; corolla pink, nearly tubular, 4 to 6 lines long; sterile filament hairy.—Providence Mts., e. Mohave Desert.

26. *P. albomarginatus* Jones. Stems several from the root-crown, erect, 5 to 9 in. high; herbage glabrous, shining; leaves obovate to oblanceolate, entire, white-margined, drawn down to a short petiole-like base,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long; panicle spike-like, leafy, the whorls distinct; sepals lanceolate, narrowly white-margined; corolla pink, tubular-funnelform, 5 to 7 lines long, its palate densely yellow-bearded; sterile stamen glabrous.—Deserts, rare: e. Mohave Desert (Lavic); e. to southern Nev.

27. *P. ambiguus* Torr. var. *thürberi* Gray. Stems erect, branching, 2 to 5 ft. high, woody at base; herbage glabrous; pedicels and calyx glabrous; leaves very narrowly linear, entire, sessile,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long; panicle narrow; sepals with narrow scarious margins,  $\frac{3}{4}$  to 1 line long; corolla rose-color or pink, tubular-funnelform, 5 lines long, with ample limb; sterile stamen glabrous.—W. edge of Colorado Desert in San Diego Co. (San Felipe); Ariz. to N. Mex.

28. *P. linarioides* Gray var. *californicus* M. & J. Stems several from the branched root-crown, ascending, 4 to 9 in. high; herbage silvery-canescens; leaves oblanceolate, mucronulate, 3 to 5 lines long, drawn down to a short petiole; corolla purple or lilac, 6 to 7 lines long; sterile filament bearded.—Dry rocky hillsides, 4000 to 5000 ft., rare: San Jacinto Mts.

29. *P. deustus* Dougl. Stems several to many from the branched root-crown, simple, erect, 5 to 12 in. high; herbage and inflorescence glabrous, the pedicels and calyces scantily and minutely puberulent or sometimes a little glandular; leaves ovate to linear-oblong or oblong-lanceolate, sharply serrate,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long, sessile or the lower drawn down to a very short petiole; flowers glomerate in the opposite axils and thus whorl-like, the whorls discrete, forming a spike-like panicle 3 to 7 in. long, bracteate above, leafy at base; corolla blue, 4 to 5 lines long; filaments rather markedly dilated; sterile stamen glabrous; anthers glabrous, the margins not ciliate.—High montane, 4500 to 7000 ft., n. Cal.: Nevada Co. to Tehama and Modoc Cos., thence w. to

Siskiyou and n. Humboldt Cos.; n. to Ore. June-July. Var. *ARENARIUS* Jepson n. comb. Herbage pilose, rarely glabrous, the pedicels and calyx viscid-pilose; sterile filament glabrous or a little hairy.—Lassen Co.; also Esmeralda Co., Nev. (*P. arenarius* Greene. *P. sudans* Jones.)

30. *P. ovatus* Dougl. Flowering stems 1 to 2¼ ft. high, somewhat leafy, arising from a basal cluster of short leafy shoots; herbage glabrous, the inflorescence glandular-puberulent; basal leaves oblong-ovate to lanceolate-ovate, denticulate, 1½ to 2¾ in. long, on petioles ½ to ¾ as long; cauline leaves 2 or 3 pairs, remote, ovate or ovate-lanceolate, mostly subcordate at the sessile base, 1 to 3 in. long; flowers in dense whorls, the whorls discrete or sometimes remote; corolla purple-blue, 6 to 7 lines long, its lobes short, obtuse or subacute, the upper and lower lips equal or nearly so; lower lip with a few sparse hairs; fertile filaments glabrous, the sterile much longer than the fertile, glabrous or plainly hairy but the hairs discrete.—Montane slopes, 6000 to 7000 ft.: Yollo Bolly Mts. and n. Humboldt Co. to Siskiyou Co.; n. to Wash.

31. *P. gracilentus* Gray. Stems slender, erect from a woody base, 10 to 18 in. high, leafy at base or on lower portion, the upper portion of the stem with reduced leaves or nearly naked; herbage glabrous, the pedicels and rachis minutely glandular-puberulent; leaves linear-oblongate or oblanceolate-oblong, or linear-oblong to linear, entire, 1½ to 2½ in. long, narrowed below to petiole ¼ to ½ as long; flower-clusters remote, forming a narrow thyrsus or loose panicle; corolla blue, 6 to 8 lines long, tubular, but enlarged upward a little, 2-lipped, the lips short (1¼ to 2 lines long); upper lip notched, the lower lip parted into 3 oblong lobes; sterile filament yellowish-hairy on one side above the middle, as long as the stamens; anthers deeply sagittate, cleft only at apex, glabrous.—Open forest slopes, 7000 to 7500 ft.: n. Sierra Nevada from Nevada Co. to Siskiyou and Modoc Cos.; nw. Nev. to s. Ore. July-Aug. Var. *URSURUM* Jepson n. var. Leaves glaucous; corolla-throat more dilated (3 lines broad).—Bear Valley, Nevada Co., 4500 ft. (Jepson, type).

32. *P. laetus* Gray. Fig. 858. Stems of the season erect or ascending, 4 to 14 in. high, borne on an abbreviated woody base; herbage cinerulous or minutely puberulent, the pedicels and calyces minutely and rather sparingly glandular-puberulent; leaves oblanceolate to linear or lanceolate, entire, sessile, ½ to 3 in. long; panicle racemose, loose; sepals linear or lanceolate to narrowly ovate; corolla funnelform, 9 to 16 lines long, blue to bluish-purple with 2 oblong white patches on throat below sinuses of lower lip; lobes of lower lip oblong, 1½ lines long, those of the upper round-ovate; sterile filament glabrous; anthers commonly hairy at point of insertion on the filament.—Open dry slopes or flats, 3200 to 8000 ft.: n. Ventura Co.; Sierra Nevada from Kern Co. to Siskiyou Co., thence s. to Humboldt Co.; w. Nev. to s. Ore. June-July. (*P. cinerascens* Greene.) Var. *LEPTOSÉPALUS* Greene. Leaves glabrous; sepals linear-attenuate, 4 to 5 lines long.—Lassen Peak. Var. *ROEZLI* Jepson n. comb. Sepals acuminate; corolla 6 to 7 lines long.—Montane, 5000 to 6500 ft., Placer Co. to Trinity Co. (*P. roezlii* Regel.)

33. *P. caesi* Gray. Stems erect from a branched woody base, 12 to 15 in. high, the leaves mostly basal or sub-basal; herbage glabrous and glaucous,

858. *Pentstemon laetus* Gray; a, fl. branchlet x ½; b, lower lip x 1; c, anther x 4.

the pedicels and calyx glandular-puberulent; leaves ovate or orbicular, coriaceous, 4 to 12 lines long, the petioles half to as long; upper leaves oblanceolate; panicle open, rather broad, 4 to 10 in. high; corolla tubular, blue, 10 to 11 lines long; sterile stamen glabrous.—Rocky montane flats or rocky slopes, 6500 to 9800 ft.: San Gabriel Mts.; San Bernardino Mts.; s. Sierra Nevada in Tulare Co.

34. *P. purpusii* Bdg. Stems diffuse or ascending from a woody base, 4 to 6 in. high; herbage, especially the leaves, densely white-canescens; leaves oval or roundish-ovate, very obtuse, 2 to 3 lines long, abruptly drawn down to a petiole  $\frac{1}{2}$  as long; upper leaves obovate or oblanceolate, scarcely petioled, 4 to 5 lines long; inflorescence spike-like, 1 to 3 in. long, glandular-pubescent; sepals linear; corolla violet, tubular-funnelform, 1 to  $1\frac{1}{2}$  in. long; sterile filament glabrous; anthers hairy in the sinus.—Yolli Bolly Mts. to high mts. of n. Lake Co. (Mt. Sanhedrin, Snow Mt.). July.

35. *P. jaffrayanus* Hook. Stems several, erect from a woody base, 9 to 14 in. high; herbage glabrous and blue-glaucous; lower leaves obovate or spatulate, gradually drawn down to a narrow or petiole-like base, 1 to  $1\frac{1}{2}$  in. long; middle cauline leaves commonly elliptic, broadly ovate or rarely ovate-lanceolate,  $\frac{1}{2}$  to 1 (or  $1\frac{1}{4}$ ) in. long, sessile, sometimes a little subcordate at base; flowers in a narrow panicle, the lower clusters on peduncles commonly 6 to 9 lines long; corolla lilac or purplish-blue,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long, the throat campanulate; sterile stamen glabrous.—Rocky ridges or slopes, 5000 to 7000 ft.: Sierra Nevada from Tulare Co. to Butte and Shasta Cos.; inner North Coast Ranges from Lake Co. to Siskiyou Co. July-Aug. Var. *PARVULUS* Jepson n. comb. Leaves 6 to 8 lines long; corolla 6 to 7 lines long.—High montane: Tulare Co.; Siskiyou Co. (*P. azureus* var. *parvulus* Gray.)

36. *P. heterophyllus* Lindl. Fig. 859. Stems erect or ascending, many from the base, often reddish,  $\frac{3}{4}$  to 2 ft. high; herbage, pedicels and calyx minutely puberulent, sometimes glabrous and green; leaves narrowly linear to lanceolate or oblanceolate, 1 to 3 in. long, mostly  $\frac{1}{4}$  to 2 lines wide; flowers spreading or horizontal, solitary in the axils of the opposite bracts and thus forming a strict or spike-like panicle, the lower clusters on peduncles commonly 2 to 6 lines long; sepals ovate, acuminate; corolla blue or purple, rather abruptly ventricose-dilated above the narrowly tubular base,  $\frac{7}{8}$  to  $1\frac{3}{8}$  in. long; upper lip short, more or less reflexed, the lower longer, spreading; sterile filament glabrous. — Open places, rocky hillslopes, flats in the hills or mountain valleys or in beds of winter streams, 200 to 5500 ft.: Sierra Nevada foothills from Amador Co. to Mariposa Co.; Coast Ranges from Mendocino and w. Colusa Cos. to San Luis Obispo Co.; s. to Ventura and San Diego Cos. May-June. Var. *AZUREUS* Jepson n. comb. Herbage cinereous-puberulent, often glaucous; leaves mostly 1 to  $3\frac{1}{2}$  lines wide.—Sierra Nevada foothills and middle altitudes, Mariposa Co. to Butte Co. (*P. azureus* Benth.)

37. *P. bridgesii* Gray. Flowering stems simple, 1 to  $2\frac{1}{4}$  ft. high, arising from short woody bases; leaves linear or narrow-oblanceolate to oblong, acute or obtuse, 1 to 3 in. long, narrowed below to a short petiole; lowest leaves spatulate-obovate,

859. *Pentstemon heterophyllus* Lindl.; a, sect. of stem with leaves  $\times \frac{1}{2}$ ; b, infl.  $\times \frac{1}{2}$ ; c, anther  $\times 4\frac{1}{2}$ .

rather short; herbage glabrous, the pedicels and calyx glandular-puberulent; panicle narrow or virgate, more or less secund; corolla red or scarlet, 1 to  $1\frac{1}{4}$  in. long, tubular-funnelform, markedly 2-lipped, the lips  $\frac{1}{3}$  to  $\frac{2}{5}$  as long as the tubular portion; upper lip erect, notched; lower lip spreading or recurving, with 3 broadly linear or oblong lobes; sterile filament glabrous.—Talus or rock outcrops, 4500 to 8500 ft.: high coastal mts. of S. Cal. and n. to northern Ventura Co.; Tehachapi Mts.; Sierra Nevada from Kern Co. to Tuolumne Co.; White Mts.; e. to Col. and Ariz. June.

### 9. CHELONE L.

Perennial herbs. Leaves opposite, acutely serrate. Flowers large. Anthers long-woolly. Sterile filament conspicuous. Seeds surrounded by a broad membranous wing. (Greek chelone, tortoise, the corolla resembling the head of that pedestrian.)

1. *C. nemorosa* Dougl. Stems simple,  $1\frac{1}{2}$  to 2 ft. high; herbage glabrous up to the inflorescence, this more or less glandular-pubescent; leaves ovate to lanceolate,  $1\frac{1}{2}$  to 2 in. long, petiolate; flowers pediceled in an open 3 to 12-flowered panicle with lanceolate bracts; calyx 5 lines long, the sepals lanceolate, about equal; corolla violet-purple, 1 in. long, with widely open orifice; upper lip short, 2-cleft, the lower spreading, 3-cleft; sterile filament hirsute at apex, the fertile filaments glabrous or pubescent above, hirsute at base.—Along wooded mountain streams: Marble Mt., Siskiyou Co.; n. to Wash.

### 10. DIPLACUS Nutt.

Evergreen glutinous shrubs with branching pubescence, one species an herb with mainly simple hirsute-glandular pubescence. Leaves opposite, revolute in the bud. Flowers red or yellow, solitary in the axils. Calyx tubular, 5-angled, 5-toothed. Corolla with funnelform tube and rather broad 2-lipped limb. Stamens 4. Stigma of two flat lobes, closing together when irritated. Capsule firm-coriaceous, ovate-oblong to linear-oblong, included in the calyx, with a woody enlargement at the pointed apex, opening down the upper suture only or mainly, the valves spreading out nearly flat and bearing the placentae on their middle. (Greek, di, double, and plakous, a cake, referring to the placentae.)

Herb; pubescence hirsute-glandular with mainly simple hairs; corolla golden-yellow. . . . .

1. *D. clevelandii*.

Shrubs; more or less glutinous, the pubescence almost none to dense, of mainly branched hairs.

Corolla cream-color to salmon-color.

Corolla-throat broad, somewhat gibbous, abruptly narrowed to slender tube. . . . .

2. *D. longiflorus*.

Corolla-throat narrow-funnelform, gradually narrowed to tube.

Pedicels rather fleshy, about  $\frac{1}{4}$  in. long; calyx-teeth spreading. . . . . 3. *D. aridus*.

Pedicels slender, about  $\frac{1}{2}$  in. long; calyx-teeth mainly erect. . . . .

4. *D. aurantiacus*.

Corolla red or shaded with red.

Leaves linear-lanceolate . . . . . 5. *D. puniceus*.

Leaves ovate or rhombic-ovate. . . . . 6. *D. parviflorus*.

1. *D. clevelandii* (Bdg.) Greene. Stems several, erect, simple, herbaceous, 1 to 2 ft. high from a woody base; herbage yellowish-green, glandular-hirsute with mainly simple hairs; leaves oblong to lanceolate, acute, more or less serrate along upper half, sessile,  $\frac{3}{4}$  to 3 in. long; pedicels slender, scarcely 2 lines long; calyx narrow-campanulate, constricted just above the ovary, 10 to 11 lines long, increasing a little in fruit, the lanceolate lobes becoming somewhat foliaceous; corolla golden-yellow,  $1\frac{1}{2}$  in. long, the tube included, narrow at base, expanding gradually into a long open throat, the lobes rounded, entire, nearly equal; capsule 5 to 6 lines long, ovate-oblong.—High ridges, 4000 to 6000 ft., w. Riverside Co. and San Diego Co. May-July.

2. *D. longiflorus* Nutt. Much branched shrub 1 to 3 ft. high; leaves lanceolate to linear-lanceolate or -oblong, plane to revolute, entire or more or less evidently toothed, pubescent beneath, 1 to 3 in. long, with smaller leaves frequently fascicled in the axils; younger branches, pedicels, and calyces

villous with branched hairs; calyx with expanding throat, its teeth narrow, obtuse; corolla salmon yellow,  $1\frac{3}{4}$  to  $2\frac{3}{4}$  in. long, the throat broad, somewhat gibbous at base, funnelform, the tube slender; capsule oblong, somewhat acuminate, 8 to 10 lines long.—Foothills, 500 to 5000 ft.: San Luis Obispo Co. to cismontane S. Cal.; s. to L. Cal. Var. *CALYCINUS* Jepson n. comb. Leaves commonly broader, obovate to oblong, obtuse; herbage with more conspicuous pubescence, the hairs longer, very fine and somewhat matted; calyx-teeth broader, somewhat foliaceous.—Foothills, 1000 to 2500 (or 6000) ft.: Fresno Co. to Tehachapi Mts. Apr.-July. (*D. calycinus* Eastw.) Var. *GRANDIFLORUS* Jepson n. comb. Lower than the species, the branches ascending, 8 to 10 in. or rarely 2 ft. high; branches and pedicels puberulent with some glandular hairs, and with few long simple hairs, the latter more abundant at the upper nodes; leaves oblong to obovate, obtuse, slightly toothed or entire, somewhat revolute, essentially glabrous, more or less coated with a glossy resin, the larger 1 to 2 in. long, 5 to 8 lines wide; corolla very pale salmon-color to pale cream-color.—Foothills, 2000 to 3500 ft.: Plumas Co. to Nevada Co. June-July. (*D. grandiflorus* Groenl.)

3. *D. áridus* Abrams. Decumbent, the short leafy branches 6 to 9 in. high, resinous-glandular, the cortex yellow; leaves oblanceolate to oblong,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long, remotely toothed, revolute-margined; pedicels slightly fleshy, glabrous, about 3 lines long; calyx tubular below, constricted at throat, the plicate teeth abruptly spreading; corolla pale buff to yellow,  $1\frac{3}{4}$  to 2 in. long, the slender tube 1 in. or a little more, exserted, abruptly expanding to a wide throat, the limb short, its lobes rounded, slightly notched.—Dry hills, San Diego Co.: Jacumba; El Cajon.

4. *D. aurantiacus* Jepson n. comb. BUSH MONKEY-FLOWER. Fig. 860. Low shrub 2 to 4 ft. high; leaves oblong-lanceolate,  $1\frac{1}{2}$  to 5 lines wide, revolute, denticulate, deep green and nearly glabrous above, pubescent beneath with branching hairs; pedicels slender, commonly glandular-puberulent, about  $\frac{1}{2}$  in. long; calyx tubular, the plicate throat spreading but little, the orifice margined with branching hairs; corolla buff or salmon-color,  $1\frac{1}{2}$  to  $1\frac{3}{4}$  in. long, the throat narrow-funnelform, the lower lip shorter than upper, the lobes emarginate, with more or less irregular margin; capsule linear-oblong, 5 to 9 lines long.—Dry hills and cañon sides, 20 to 1500 ft.: Ventura Co. to Del Norte Co.; Sierra Nevada foothills from Tuolumne Co. to Placer Co. Apr.-Sept. (*Mimulus aurantiacus* Curtis. *Diplacus glutinosus* Nutt.)

860. *Diplacus aurantiacus* Jepson; a, sect. of fl. branchlet  $\times \frac{3}{4}$ ; b, leaf  $\times 1$ ; c, capsule  $\times 1\frac{1}{4}$ .

5. *D. puniceus* Nutt. Shrub  $1\frac{1}{2}$  to 5 ft. high; leaves linear-lanceolate, obtuse, firm, with revolute margins; calyx narrow-cylindric, the teeth not spreading; corolla brick-red, varying to yellow faintly shaded with red,  $1\frac{1}{2}$  to 2 in. long, the lobes quadrate, notched or toothed; capsule cylindric, obtuse, nearly as long as calyx.—Dry hillsides, Ventura Co. to San Diego Co.; s. to L. Cal. Some forms approach *D. aurantiacus*, others *D. longiflorus*.

6. *D. parviflorus* Greene. Rigidly shrubby,  $\frac{1}{4}$  to 2 ft. high; leaves narrowly ovate or rhombic-ovate, the larger 6 to 11 lines wide, serrate; calyx tubular, the lobes somewhat spreading, especially the upper; corolla brick-red, nearly tubular, 1 to  $1\frac{1}{2}$  in. long, the small entire quadrate lobes but little spreading; stamens exserted.—Santa Cruz and Santa Rosa islands. Jan.-Aug.

11. *MIMULUS* L. MONKEY-FLOWER

Herbs with opposite leaves. Herbage glabrous or with simple hairs. Flowers mostly showy, yellow or red, solitary and axillary, or in terminal racemes. Calyx prismatic, 5-angled, 5-toothed. Corolla tubular to funnelform, strongly 2-lipped or with slightly unequal lobes, a pair of bearded or naked ridges running down the lower side of the throat. Stamens 4. Stigma mostly of 2 flat lobes closing together when irritated. Capsule dehiscent by both sutures, dehiscent on one side only, or cartilaginous and indehiscent. Seeds many. (Diminutive of the Latin *mimus*, a comic actor, on account of the gaping or grinning corolla.)

## A. PEDICELS INCONSPICUOUS, 1 LINE LONG OR LESS.

1. *Calyx-lobes connivent over capsule in fruit; capsule cartilaginous.*

Plants glabrous or nearly so; corolla very large for the size of the plant; capsule ovate to oblong-obtuse.

Corolla with well developed lower lip; calyx-lobes foliaceous.

Corolla-tube ending in short throat and limb spreading abruptly; capsule short-ovate, not flattened ..... 1. *M. angustatus*.

Corolla-tube expanding into long open-funnelform throat and limb spreading gradually; capsule oblong, obtuse at apex, flattened ..... 2. *M. tricolor*.

Corolla with lower lip almost none; calyx-lobes short in flower, thickened, continuing from prominent calyx-ribs ..... 3. *M. douglasii*.  
Plants usually viscid-puberulent; corolla of moderate size for size of plant, with lower lip  $\frac{1}{2}$  as long as upper.

Capsule arcuate-gibbous ..... 4. *M. latifolius*.

Capsule oblong-linear ..... 5. *M. kelloggii*.

2. *Calyx-lobes not connivent over capsule in fruit.*

Inflorescence with leaves or bracts not exceeding flowers.

Calyx increasing conspicuously in fruit.

Calyx-teeth at first oblong-linear,  $\frac{1}{4}$  to  $\frac{1}{2}$  the length of calyx-tube, widening to triangular as ovules develop and calyx-tube increases.

Corolla-tube and throat thrice the length of calyx; herbage scentless; corolla commonly crimson ..... 6. *M. nanus*.

Corolla-tube and throat about twice the length of calyx; herbage strong-scented; corolla yellow ..... 7. *M. mephiticus*.

Calyx-teeth triangular acute to acuminate from opening of bud; corolla-limb red or pink.

Branches slender.

Calyx-teeth acuminate; capsule long-pointed, exserted ..... 8. *M. layneae*.

Calyx-teeth triangular; capsule obtuse or abruptly pointed, more or less exserted ..... 9. *M. torreyi*.

Stems, and branches (if any) stout; calyx-teeth unequal.

Capsule exceeding calyx-teeth; corolla-tube slender ..... 10. *M. bigelovii*.

Capsule not exceeding calyx-teeth; corolla-tube rather wide ..... 11. *M. bolanderi*.

Calyx increasing but little in fruit.

Corolla-limb not white-mottled or bordered; calyx not gibbous.

Inflorescence not subsecund.

Capsule much exserted ..... 12. *M. rattanii*.

Capsule usually shorter than calyx-teeth ..... 13. *M. fremontii*.

Inflorescence subsecund; capsule about equaling calyx-teeth.

..... 14. *M. subsecundus*.

Corolla-limb white-mottled or bordered; calyx gibbous.

Stem not dense with flowers and fruit ..... 15. *M. pictus*.

Stem dense with flowers and fruit ..... 16. *M. mohavensis*.

Inflorescence with leaves greatly exceeding the flowers; corolla 3 to 4 lines long; calyx-teeth triangular ..... 17. *M. leptaleus*.

## B. PEDICELS CONSPICUOUS, MORE THAN 2 LINES LONG.

1. *Corolla regular to slightly 2-lipped.*

Capsule not splitting at apex.

Herbage with evident pubescence.

Perennial from creeping rootstock ..... 18. *M. moschatus*.

Annuals.

Stems flexuous or slender; fruiting calyx chartaceous.

Calyx more or less villous; stems very leafy ..... 19. *M. floribundus*.

Calyx glabrous to minutely hispid; cauline leaves few and smaller ..... 20. *M. arenarius*.

Stems rigid, usually 6 to 10 in. high; fruiting calyx dense.

Corolla yellow and white or orange ..... 21. *M. bicolor*.

Corolla reddish purple ..... 22. *M. biolettii*.

Herbage apparently glabrous; annuals, 2 to 6 in. high.

Calyx-teeth equal ..... 23. *M. pulsiferae*.

Calyx-teeth unequal ..... 24. *M. latidens*.

Capsule with supra-placental tissue splitting at apex.

Annuals.

Herbage viscid-pubescent to apparently glabrous.

Calyx-teeth unequal; cauline leaves ovate.....25. *M. inconspicuus*.

Calyx-teeth equal; cauline leaves linear or oblong to lanceolate.

Corolla 2 to 3 lines long.....26. *M. rubellus*.

Corolla 6 to 10 lines long.

Corolla crimson to purple.....27. *M. palmeri*.

Corolla yellow, red-dotted or partly crimson....28. *M. montioides*.

Herbage slimy-villous; corolla pale pink, only the limb exerted..29. *M. parishii*.

Perennial with pubescent stolons and glabrous rootstocks; pedicels scape-like; corolla yellow.....30. *M. primuloides*.

## 2. Corolla strongly 2-lipped.

Herbage minutely pubescent or apparently glabrous.

Leaves palmately veined.

Plants with distinctly basal leaves as well as cauline leaves.

Corolla 2 to 8 lines long.

Leaves rhombic-orbicular, shallowly erose-dentate, all petioled.....31. *M. alsinoides*.

Leaves lyrate to deeply lacinate or pinnatifid, all, except the highest floral, petioled.....32. *M. laciniatus*.

Corolla 9 to 15 lines long; leaves orbicular to oblanceolate, the upper sessile or short-petioled, the basal petioled, often with ragged lobes at base.....33. *M. guttatus*.

Plants with cauline leaves only; leaves never lobed at base; stems from coralloid rootstocks.

Leaves thin, not slimy; calyx campanulate.....34. *M. tilingii*.

Leaves thickened, clammy or slimy; calyx broad-campanulate, purple-dotted.

35. *M. implexus*.

Leaves pinnately veined; stems 10 to 12 in. high from slender rootstocks.....36. *M. dentatus*.

Herbage markedly viscid-pubescent; stems erect, commonly 1 to 2 ft. high.

Corolla yellow; leaves lanceolate; capsule stout-walled, coriaceous....37. *M. brevipes*.

Corolla scarlet or pink; capsule chartaceous.

Corolla scarlet; leaves ovate to obovate-lanceolate.....38. *M. cardinalis*.

Corolla rose-pink; leaves lanceolate to oblong.....39. *M. lewisii*.

1. *M. angustatus* Gray. Leaves and flowers in a basal tuft (the tuft sessile on the root-crown); herbage glabrous; leaves linear,  $\frac{1}{2}$  to 1 in. long; calyx 3 to 4 lines long, the teeth very little unequal, green-foliaceous, oblong, acute; corolla crimson, purple and yellow-dotted, the filiform tube 1 to  $1\frac{1}{2}$  in. long, 4 to 6 times the length of the short-funnelform throat; limb broad, the upper lip exceeding the lower; capsule short-ovate, not flattened, almost as long as thick; seeds favose-pitted.—Gravelly stream borders, 1500 to 3500 ft.: Napa Co. to Mendocino Co.; Mariposa Co. to Modoc Co. (*Eunanus pulchellus* Drew.) *M. PYGMAEUS* Grant. Perhaps a reduced form.—Egg Lake, Modoc Co.

2. *M. tricolor* Hartw. Fig. 861. Dwarf plant, the stem  $\frac{1}{4}$  to  $\frac{1}{2}$  in. high, erect or the branches 3 to 4 in. long and decumbent; leaves lanceolate to oblanceolate-oblong, entire or remotely toothed,  $\frac{3}{4}$  to 1 in. long; calyx 6 to 8 lines long with green-foliaceous lobes; corolla rose-purple,  $1\frac{1}{2}$  to 2 in. long, with little unequal lips and broadly funnelform throat bearing markings of crimson and yellow; capsule oblong, slightly gibbous, compressed.—Edges of vernal pools, plains and valley floors, 50 to 500 ft.: San Benito Co.; e. side San Joaquin Valley, rare; Sacramento Valley, common; Sonoma and Lake Cos.; n. to Ore. Apr.-May.

3. *M. douglasii* Gray. Dwarf plant about  $1\frac{1}{2}$  in. high, the leaves and flowers in a tuft on the ground or on a very short stem; leaves rhombic-ovate to oblong, 2 to 4 lines long, entire or crenate-toothed; calyx 4 to 5 lines long, membranous and sulcate between the ribs, the ribs thickened and ending in short blunt un-

861. *Mimulus tricolor* Hartw.; habit x 1.

equal teeth; corolla crimson or red-purple,  $1\frac{1}{2}$  in. long, the slender tube twice or thrice the length of the calyx, the throat oblong-urnshaped or campanulate; upper lip conspicuous, erect; lower lip reduced to a narrow 2 or 3-crenate border or consisting of a more prominent tooth-like middle lobe and the lateral lobes obsolete; capsule oblong, acute, 2 to 4 lines long, very gibbous.—Wet hillsides in the foothills, 500 to 2500 ft.: Monterey Co. to Humboldt Co.; Tulare Co. to Butte Co.; n. to Ore. (*M. subuniflorus* Jepson.)

4. *M. latifolius* Gray. Stem erect, seldom branched, 1 to 3 in. high; herbage viscid-pubescent; leaves ovate, 2 to 6 lines broad; calyx oblong with oblique throat; corolla reddish-purple, 9 to 15 lines long, the upper lip erect, twice as long as the lower; capsule arcuate-gibbous, pointed, laterally compressed, 3 to 5 lines long, 1 to 2 lines broad at base.—Santa Cruz Isl., S. Cal. coast; Guadalupe Isl., L. Cal.

5. *M. kelloggii* Curran. Fig. 862. Stem erect, simple, 1 to 5 in. high, or occasionally 7 or 8 in., with several branches from the base; herbage viscid-pubescent; leaves broadly ovate to oblong (the lowest elliptic-ovate), mostly attenuate at base to a petiole,  $\frac{1}{2}$  to 1 in. long, generally dull purple beneath; calyx narrowly cylindrical (6 lines long and 1 line broad), sometimes strongly gibbous, white-membranous and sulcate between the purplish ribs so as to appear striped, very oblique, the teeth very short and obtuse; corolla-tube very long and slender, twice as long as the calyx, expanding into the short-funnel-form throat and broad limb, the lower lip only  $\frac{1}{2}$  as long as the upper and more spreading; capsule 4 to 5 lines long, slender, bisulcate, slightly curved outwardly (with the calyx), or sometimes contorted, simulating that of *Oenothera micrantha*.—Hillslopes, 800 to 3000 ft.: North Coast Ranges; Sierra Nevada foothills from Tulare Co. to Eldorado Co. Apr.

6. *M. nanus* H. & A. Stem  $\frac{3}{4}$  to 4 in. high, simple or freely branched from below with upper internodes usually reduced so that inflorescence is crowded; herbage viscid-puberulent; leaves obovate to lanceolate, entire, or crenate at apex,  $\frac{1}{4}$  to 1 in. long; flowers usually in pairs; calyx at first about 2 lines long, about  $\frac{1}{3}$  the length of corolla-tube and throat, increasing as ovary matures, the linear teeth  $\frac{1}{4}$  the length of calyx-tube, widening to triangular; corolla red with yellow markings in throat, 5 to 8 lines long, the throat gradually narrowing to a long slender tube; anthers hispid; stigma broad, crimson, exserted.—Granite sand in the mts., 5000 to 11,000 ft.: Sierra Nevada from Tulare Co. to Nevada Co. and n. to Siskiyou Co.; n. to Wash.

7. *M. mephiticus* Greene. Stem simple, slender, later often densely branched above with crowded inflorescence, 2 to 6 in. high; herbage viscid-puberulent, strongly scented; leaves oblong-lanceolate to linear, commonly entire; calyx at first about two lines long with nearly linear teeth, later as ovary develops, increasing to 3 (or rarely 5) lines long and widening, white-membranous between the green ribs, the teeth becoming triangular; corolla yellow, 5 to 7 lines long, the throat sometimes reddish-dotted; capsule oblong-ovate, 3 to  $3\frac{1}{2}$  lines long (in rank individuals longer), exserted.—Montane, 5000 to 11,000 ft., Sierra Nevada from Plumas Co. to Tulare Co. July-Sept.

862. *Mimulus kelloggii* Curran; a, base of fruiting plant  $\times 1$ ; b, fls.  $\times \frac{3}{4}$ ; c, fr. calyx  $\times 1\frac{1}{2}$ ; d, capsule  $\times 1\frac{1}{2}$ .

863. *Mimulus torreyi* Gray; *a*, habit  $\times \frac{2}{3}$ ; *b*, pair of stamens  $\times 7$ .

8. *M. layneae* Greene. Stem at first simple, later with many spreading branches, 4 to 7 in. high, viscid-pubescent and somewhat nigrescent; leaves narrowly ovate to oblong, acute at base and apex, about 6 or 7 lines long; calyx 4 lines long, its teeth sharply acute, slender, exceeding  $\frac{1}{2}$  line; corolla red, tubular-funnelform, 6 to 10 lines long, the tube tapering to a narrow base, 2 to 3 lines long, much exserted; anther-cells minutely hispid; capsule acute, exserted.—Valley or montane flats, 500 to 5000 ft.: Napa Co. to Siskiyou Co.; Fresno Co. to Lassen Co. June-July.

9. *M. torreyi* Gray. Fig. 863. Stem at first low, simple, single-flowered, 1 to 2 in. high, later becoming evenly branched, many-flowered and 3 to 10 in. high, with rather long internodes; herbage viscid-pubescent; leaves oblanceolate, entire or subdentate, 6 to 9 or 12 lines long; calyx at first less than  $\frac{1}{3}$  the length of the corolla but increasing in age; corolla pink-purple with a purple-dotted cream-color area between throat-folds, 6 to

8 lines long, the throat funnelform, gradually widening into the limb; capsule coriaceous, more or less exserted at maturity.—Montane, 4500 to 6000 ft., Sierra Nevada from Fresno Co. to Plumas Co. June-Aug.

10. *M. bigelovii* Gray. Stems 1 to 4 from the base, nearly erect, simple or with a pair or more of ascending branches, 2 to 6 in. high; herbage viscid-pubescent; leaves oblong to lanceolate (sometimes ovate-acuminate); calyx 3 lines long in flower, increasing in fruit, cleft into acute subulate teeth for  $\frac{1}{2}$  its length, most deeply cleft in front; corolla crimson with yellow purple-dotted throat,  $\frac{1}{2}$  to 1 in. long; capsule oblong-lanceolate, exserted.—Arid or desert mountain slopes or flats, 500 to 6000 ft.: w. side Colorado Desert; n. side San Bernardino Mts.; San Gabriel Mts.; Mt. Pinos; Tehachapi Mts.; Mohave Desert; Inyo Co.; e. to southern Utah. Apr.-June. (*M. johnstonii* Grant, a mature or fruiting form.)

864. *Mimulus bolanderi* Gray; *a*, fl. branchlet  $\times \frac{1}{2}$ ; *b*, capsule  $\times 1\frac{1}{2}$ .

11. *M. bolanderi* Gray. TOBACCO MIMULUS. Fig. 864. Stem simple or much branched with erect branches, 5 to 16 in. high; herbage glandular-pubescent and very viscid; leaves lanceolate or oblong, sometimes obovate, sparingly denticulate at apex, 1 to  $1\frac{3}{4}$  in. long, sessile; calyx 2 to 3 lines broad, 5 to 6 lines long, strongly plicate-angled, somewhat contracted at the very oblique orifice, its teeth acute, the upper much the longest; corolla dark red or sometimes with the palate dotted red and white, 6 to 9 lines

long, the tube not slender, moderately exserted; limb about 4 lines broad, the lips of nearly equal length; capsule not exceeding the calyx-teeth, slender, and narrowed to the pointed apex, about 5 lines long, 1 line broad.—Coast Ranges, 2500 to 4500 ft. from Monterey Co. to Mendocino and Lake Cos. July.

12. *M. rattánii* Gray. Stem erect, branched from the base, 4 to 5 in. high; herbage glandular-viscid with a nigrescent indument; leaves obovate, oblong or oblanceolate, mostly tapering above and below, 6 lines long or less; corolla-tube scarcely exserted from the narrowly campanulate or in age somewhat urnshaped calyx; calyx-teeth little unequal; apex of capsule narrow, somewhat curved, exserted.—Montane, rare: Santa Cruz Mts.; Mt. Diablo; Mt. Tamalpais; Lake Co.; w. Colusa Co.

13. *M. fremóntii* Gray. Stem at first shorter than the flowers, becoming much-branched, rather spreading from the base, 2 to 6 in. high, more leafy than in no. 12; herbage viscid-hispid; leaves oblong, 4 to 9 lines long, or the lowest sometimes longer, entire or toothed near the apex; calyx hardly oblique, not quite  $\frac{1}{2}$  as long as corolla, increasing but little in fruit, teeth rather short, triangular; corolla crimson, 7 to 9 lines long, the throat gradually funnelliform; capsule usually shorter than calyx-teeth.—Foothills, 1000 to 5300 ft.: South Coast Ranges from Mt. Diablo to the San Carlos Range; s. to the mts. of coastal S. Cal. on both the desert and inner sides from Tehachapi Mts. and n. Ventura Co. to San Diego Co. May. Var. *viscidus* Jepson n. comb. Corolla with shorter limb, often paler pink, the palate sometimes bearing a white spot.—Sierra Nevada, 2000 to 5500 ft., from Calaveras Co. to Fresno Co. and s. to Tehachapi Mts. (*M. viscidus* Congdon. *M. subsecundus* var. *constrictus* Grant.)

14. *M. subsecundus* Gray. Stems few to several from the base, 3 to 5 in. high; herbage viscid-pubescent; leaves oblong, the lower less than 1 in. long, the upper shorter than the fruiting calyces; branches of inflorescence elongated with flowers rather subsecund and spicately disposed; calyx somewhat plicate with acute to acuminate teeth,  $2\frac{1}{2}$  lines long, becoming  $3\frac{1}{2}$  to 4 lines long in fruit; corolla deep red with nearly regular limb, about  $\frac{1}{2}$  in. long; capsule cylindric, taper-pointed.—Foothills, 1500 to 2000 ft.: Contra Costa Co. to San Luis Obispo Co.; s. Sierra Nevada in Tulare Co.

15. *M. pictus* (Curran) Gray. Stem nearly erect, lightly wing-angled, 4 to 12 in. high; herbage viscid-pubescent; leaves obovate to oblong,  $\frac{1}{2}$  to  $\frac{3}{4}$  in. long; flowers numerous, not densely crowded; calyx rather viscid-villous, oblong, gibbous, the teeth obtuse, very unequal; corolla reddish-purple, 5 to 6 lines long, scarcely exceeding the calyx; capsule linear-oblong, pointed, the apex splitting, about equaling calyx-teeth,  $6\frac{1}{2}$  lines long, slightly constricted above a flat base, on a somewhat contorted pedicel.—Rare: Tehachapi Mts.; n. to foothills of Tulare Co.

16. *M. mohavénsis* Lem. Dwarf plants; stem simple, 1 to  $2\frac{1}{2}$  in. high, or well-branched, 5 in. high; herbage minutely pubescent, somewhat viscid; lower leaves oblong-lanceolate, 6 to 11 lines long; inflorescence dense, spicate; calyx strongly plicate, with triangular acuminate teeth, about 4 lines long in flower, increasing in fruit to 6 lines; floral bracts shorter than calyx; corolla with white-bordered limb and crimson throat, the throat saccate on the lower side at the point of insertion of the stamens, the proper tube short.—Desert flats or valleys, 2000 to 3000 ft., central Mohave Desert: Barstow; Calico Mts.; Ord Mts.

17. *M. leptaleus* Gray. Stem freely branched from the base, erect, 2 to 4 in. high, leafy throughout, bearing flowers in all the axils except the lowest, or towards the ends of the branches the flowers congested and the leaves reduced to bracts; plants sometimes simple-stemmed dwarfs; leaves oblong-oblanceolate to linear or lanceolate, 4 to 8 lines long, the lowest narrowed to short petioles; bracts linear, about equaling flowers; calyx in flower cylindric, a little more than 2 lines long, the lanceolate teeth 1 line long, in fruit becoming campanulate; corolla crimson or yellow,  $3\frac{1}{2}$  lines long with oblique limb, cylindric throat and narrow tube; capsule cylindric, bluntly pointed, sometimes slightly curved, about equaling calyx-teeth.—Montane, 7000 to 8000 ft.: Sierra Nevada from Lassen Peak to Tulare Co.

18. *M. moschatus* Dougl. Stems weak, but ascending or erect, 6 to 10 in. high, from a perennial creeping rootstock which often ends in short tuber-like joints (shortened internodes), pubescent, the lower portion of stems and petioles of lower leaves woolly with long white hairs. musk-scented, slimy-viscid; leaves oblong-ovate, denticulate, 1 to 2 in. long, apparently pinnately veined, all petioled; calyx tubular-campanulate, with unequal ovate-acute teeth, becoming plicate-angled, a little more than half as long as the corolla-tube; pedicels in the axils of the upper leaves ascending, 1 in. long; corolla yellow, 9 to 12 lines long, slightly 2-lipped but the lobes nearly equal, rounded or slightly emarginate; capsule sessile, oblong-ovate, abruptly acuminate to the base of the persistent style, half as long as the calyx. — Stream banks and springy places, 10 to 7500 ft.: mts. throughout Cal.; n. to B. C. and Mont. (Var. *longiflorus* Gray.) Var. *SESSILIFOLIUS* Gray. Fig. 865. Stems weaker or reclining, sometimes

865. *Mimulus moschatus* Dougl. var. *sessilifolius* Gray; a, fl. branchlet  $\times \frac{1}{2}$ ; b, fl.  $\times 1$ ; c, long. sect. of corolla  $\times 1$ .

slender with long internodes, rooting at the nodes, 1 to 2 ft. long, from perennial creeping rootstocks; herbage commonly more clammy and viscid than in the species; leaves sessile or on very short petioles; calyx-teeth lanceolate, 1 to 3 lines long, sometimes  $\frac{1}{2}$  the length of the tube; corolla yellow, twice the length of the calyx; capsule ovate, acute. — Beside streams and springs, 10 to 4000 ft.: Santa Cruz Co. to Lake and Humboldt Cos.

19. *M. floribundus* Dougl. Annual; stems slender, at first erect, later diffuse, (2 or) 5 to 15 in. long; herbage more or less slimy-viscid and musk-scented, more or less pubescent with cobweb-like hairs; leaves ovate,  $\frac{1}{2}$  to 1 in. long, dentate, short-petioled; pedicels mainly longer, sometimes shorter than the leaves; calyx narrowly campanulate (in fruit urnshaped), more or less villous, 2 to 3 lines long, the teeth acute (or in Sierra Nevada plants acuminate to subulate),  $\frac{1}{2}$  line long, hardly unequal; corolla light yellow, exceeding the calyx, mostly twice as long; capsule globose-ovate, obtuse to acute. — Springy places and stream shores in foothills or the mountains, 2000 to 8000 ft.: almost throughout Cal.; e. to Col., n. to B. C. May-June.

20. *M. arenarius* Grant. Stems slender, one to several from base, pubescent, somewhat purplish, viscid,  $1\frac{1}{2}$  to 8 in. high; leaves 3 to 6 lines long, the basal orbicular-elliptic, petioled, the upper ovate-acute to lanceolate, subsessile; pedicels slender, divaricate, ascending, usually twice as long as the leaves; calyx narrow-campanulate, in fruit slightly urnshaped, sometimes purple-mottled, minutely hispid or almost glabrous except for the finely ciliate margins of the short, somewhat subulate calyx-teeth; corolla yellow, 5 to 7 lines long; capsule oblong-acute,  $\frac{1}{2}$  to  $\frac{3}{4}$  as long as calyx, apex not splitting. — Sandy banks and lake margins, 5000 to 7000 ft.: Sierra Nevada from Mariposa Co. to Fresno Co.

21. *M. bicolor* Hartw. Stem rather robust, simple to much branched, 6 to 10 (or  $1\frac{1}{2}$  to 10) in. high; herbage viscid-pubescent; calyx usually narrowly campanulate, strongly plicate-angled, often purplish-dotted, with acuminate somewhat subulate teeth, becoming hardened and thickened in fruit; corolla with upper lip usually white, lower yellow, the throat well bearded with yellow scale-like hairs and commonly red-dotted; capsule somewhat narrowly

rhomboidal,  $\frac{1}{2}$  to  $\frac{3}{4}$  as long as calyx, its walls chartaceous, somewhat wrinkled, much thinner than the closely fitting calyx; style entire, persistent, supra-placental tissue not splitting.—Montane, 2000 to 5000 ft.: Sierra Nevada from Fresno Co. to Butte Co.

22. *M. biolétii* Eastw. Similar to *M. bicolor* in every way, except the corolla reddish-purple, blotched with red and with yellow patches in throat.—Montane, 3400 to 6000 ft., Tuolumne Co. to Mariposa Co.

23. *M. pulsiferae* Gray. Stem simple or loosely branching with rather long internodes for the size of the plant, 2 to 6 in. high; herbage viscid but hardly pubescent; leaves ovate to lanceolate, slightly repand-dentate, 3 to 9 lines long, often purplish, contracted at base into margined petioles; calyx cylindric-campanulate, shortly toothed, 2 lines long, in fruit with tube somewhat dilated and summit contracted, 3 to 4 lines long; corolla yellow, 5 lines long; capsule oblong-ovate, equaling the calyx-tube, not splitting at apex.—Gravel bars and meadow margins, 2000 to 4500 ft.: Napa Co. to Siskiyou Co., thence se. to Plumas Co.; n. to Wash.

24. *M. látidens* Greene. Stem simple or branched from base, erect or diffuse, 2 to 12 in. high, the internodes rather long; herbage glandular, apparently glabrous though usually minutely puberulent, especially on the narrowly wing-angled stems and branches; leaves ovate to lanceolate, entire or shallowly erose-dentate, 2 to 12 lines long, the cauline usually sessile, the basal petioled; calyx cylindric, strongly plicate, the angles purplish, 2 to 3 lines long in flower, in fruit expanding below and teeth somewhat contracting, becoming inflated and ovate in outline, the teeth short, unequal, often somewhat subulate; fruiting pedicels 3 to 9 or (in rank specimens) 10 lines long; corolla nearly white or somewhat yellowish to flesh-color or pinkish, little exserted, its lobes small, almost regular; capsule elliptic, shorter than calyx, apex not splitting.—Wet depressions, foothills and valleys, 50 to 1000 ft.: Sacramento and Napa valleys to San Diego Co.

25. *M. inconspicuus* Gray. Stem rather slender, somewhat flexuous, 1 to 9 in. high, somewhat wing-angled; herbage glabrous or minutely glandular-puberulent; leaves ovate,  $\frac{1}{2}$  to 1 in. long, shallowly erose-dentate, the cauline sessile, the basal short-petioled; calyx-teeth acute; corolla pale pink to rose-color, 4 to 10 lines long, well exserted, its lobes deeply emarginate; capsule narrowly elliptic, the apex splitting.—Higher foothills, 2000 to 5000 ft.: Sierra Nevada from Mariposa Co. to Tulare Co.

866. *Mimulus rubellus* var. *breweri* Jepson; a, habit  $\times \frac{1}{2}$ ; b, fl.  $\times 2$ ; c, stamen  $\times 6$ ; d, capsule  $\times 2$ .

26. *M. rubellus* Gray. Stem erect, with branches rather strictly ascending,  $1\frac{1}{2}$  to 8 in. high; herbage somewhat viscid-pubescent, rather reddish; leaves linear or lanceolate, usually entire,  $\frac{1}{2}$  to  $\frac{3}{4}$  in. long; calyx oblong-campanulate, the reddish ribs often continued in short apiculae at the summit of the teeth, the teeth short, linear to triangular; corolla rose-color or yellow, only slightly irregular, 2 to 3 lines long; capsule oblong with abruptly acuminate summit, hardly longer than the calyx-teeth; style slender, splitting, the lower or basal part often persistent on the supra-placental tissue which divides at apex of capsule.—Montane, 6000 to 9600 ft.: San Jacinto, San Bernardino and San

Gabriel mountains; Sierra Nevada; Yollo Bolly Mts. to n. Humboldt Co.; n. to B. C., e. to N. Mex. Var. *BRÉWERI* Jepson n. comb. Fig. 866. Commonly more viscid-pubescent, 2 to 10 in. high; flowers rose-color.—Montane, 4800 to 10,000 ft.: Sierra Nevada from Tulare Co. to Siskiyou Co. (*M. breweri* Cov.)

27. *M. pálmeri* Gray. Stem more or less branching, 3 to 10 in. high; herbage nearly glabrous to finely pubescent, viscid; leaves lanceolate, entire or crenate, 4 to 9 lines long; pedicels slender, longer than the leaves; calyx cylindric-campanulate, 3 lines long, the teeth short, obtuse or (sometimes in same plant) acute with a subulate apex; corolla crimson to purple with yellow and purple throat markings, 6 to 10 lines long; capsule oblong, shorter than the calyx, with persistent bases of splitting style forming points at summit, the supra-placental tissue splitting.—Foothills and middle altitudes, 1000 to 5800 ft.: Sierra Nevada from Mariposa Co. to Kern Co.; s. to the San Gabriel, San Bernardino, San Jacinto, Palomar and Cuyamaca mountains.

28. *M. montioides* Gray. Stem simple or with a few lateral branches, usually weaker,  $\frac{1}{2}$  to 3 or 4 in. high; herbage viscid, but so minutely pubescent as to be apparently glabrous; leaves oblong to oblanceolate, 2 to 9 lines long; calyx cylindric-campanulate with short usually blunt subulate teeth, sometimes with purple markings; pedicels slender, nearly erect in flower, curving or even decumbent as fruit matures; corolla showy, yellow, commonly purple-dotted, 6 to 8 lines long, its lobes emarginate; capsule oblong with supra-placental tissue splitting at the acute summit, the splitting base of the style often persistent.—Montane, 6000 to 11,000 ft.: Sierra Nevada from Tulare Co. to Tuolumne Co.; n. to nw. Nev.

29. *M. parishii* Greene. Stems 2 in. to 2 ft. high; herbage villous, slimy-viscid; leaves lanceolate, erose-dentate, all but the basal clasping,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; calyx tubular-campanulate, becoming somewhat plicate, its teeth equal, short, triangular, somewhat subulate; corolla pale pink, the tone deeper in center of each lobe, or white, sometimes 2 yellow lines in open throat, 2-lipped, only the limb exerted, the equal rounded lobes emarginate; capsule oblong-ovate, equaling the calyx-tube, the supra-placental tissue splitting as also, at times, the base of the style.—Arid mts., 3000 to 6000 ft.: mostly desert bases or desert slopes of San Gabriel, San Bernardino and San Jacinto mountains; s. to L. Cal.

30. *M. primuloides* Benth. Fig. 867. Plants  $1\frac{1}{2}$  to 4 (or 5) in. high, with pubescent surface stolons and glabrous creeping underground rootstocks, the stems  $\frac{1}{2}$  to 3 in. high; herbage more or less hairy-pubescent; leaves orbicular-elliptic to oblong, obovate or oblanceolate,  $\frac{1}{4}$  to  $1\frac{1}{2}$  in. long; calyx campanulate, rather plicate and often a little urnshaped, glabrous except the ciliate teeth and sparsely pubescent ribs, the short-triangular teeth slightly subulate; capsule oblong, shorter than the calyx, dehiscent loculicidally, the supra-placental tissue splitting and sometimes, also, the persistent style-base.—Montane meadows, 4000 to 10,000 ft.: San Jacinto and San Bernardino mountains; Mt. Pinos; Sierra Nevada from Kern Co. to Plumas Co.; n. Lake Co. to Siskiyou Co.; n. to Ore. June-Aug.

31. *M. alsinoides* Dougl. Stems weak, becoming slightly angled, simple or diffusely branching at base, 1 to 8 in. high; herbage apparently glabrous,

867. *Mimulus primuloides* Benth.; a, habit  $\times \frac{1}{2}$ ; b, stamen  $\times 7$ ; c, pistil  $\times 1\frac{1}{2}$ .

glandular; leaves rhombic-orbicular, all shallowly erose-dentate, 1 in. long, narrowed below to a petiole; pedicels becoming  $\frac{1}{2}$  to 1 in. long; calyx cylindric, with blunt apiculate unequal teeth, expanding in fruit; corolla yellow, 2-lipped, with a red-purple spot in center of lower lip, well exserted, 6 to 7 lines long.—Wet banks and rocks in streams, Humboldt Co.; n. to B. C.

32. *M. laciniatus* Gray. Stem slender, ascending, at first weak, solitary, less than 6 in. high, later stems several to many, becoming rigid from a somewhat woody base, 8 to 12 in. high; herbage mostly glabrous except on the petioles of the leaves; leaves on younger stems  $\frac{1}{2}$  to 1 in. long, lyrate with 1 or 2 pair of basal lobes, on older stems  $1\frac{1}{2}$  to 3 in. long, deeply lacinate to pinnatifid; flowers on slender curving pedicels; calyx campanulate, sharply toothed, the upper tooth largest, in fruit with the lower teeth curving toward the upper so that the calyces become gibbous; corolla yellow, 2 to 5 lines long.—Sandy beds of former streams, 4000 to 5500 ft.: Sierra Nevada from Tuolumne Co. to Tulare Co.

33. *M. guttatus* DC. COMMON MONKEY-FLOWER. Fig. 868. Annual or perennial by the production of stolon-like stems at base; stems simple or sometimes branching, one to several from the base, about 1 to 2 ft. high; herbage glabrous or slightly pubescent; leaves more or less elliptical, thin-

868. *Mimulus guttatus* DC.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, leaves  $\times \frac{1}{4}$ ; c, pistil  $\times 1$ ; d, capsule  $\times \frac{1}{2}$ ; e, cross sect. of capsule  $\times 2\frac{1}{2}$ .

nish, irregularly serrate or dentate, the lower petioled, the upper sessile; petioles mostly shorter than the blades; flowers in a terminal raceme; pedicels shorter than or equaling the flower; calyx in anthesis 3 to 5 lines long, in fruit often nodding, somewhat longer and nearly or quite twice as broad; calyx-teeth often disposed to be approximate or connivent in age, the upper the longer; corolla yellow, with purple or brown dots in throat,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long; capsule ovate, its walls thin-chartaceous.—Moist rich soil along streams and ditches, 20 to 6000 ft.: throughout Cal.; e. to Mont. and N. Mex., n. to Alas. Apr.-Aug. (*M. langsдорфii* Donn.) It is a highly variable but exceedingly interesting species, which in our region has developed a remarkable array of forms. Var. *DEPAUPERATUS* Grant. Like the species but dwarfed, with slender stems 2 to 12 in. high; leaves smaller; corolla  $\frac{1}{4}$  to  $\frac{3}{4}$  in. long.—Stream margins and meadows, 2000 to 6000 ft.: San Jacinto Mts.;

Sierra Nevada from Tulare Co. to Lassen Co.; n. to Wash., e. to Wyo. (*M. luteus* var. *depauperatus* Gray.) Var. *GLAUCESCENS* Jepson n. comb. Upper most leaves orbicular, becoming connate-perfoliate, these and adjacent cauline leaves more or less glaucous, basal leaves green.—Foothills of Sierra Nevada from Nevada Co. to Tehama Co. (*M. glaucescens* Greene.) Var. *ARVENSIS* Grant. Herbage usually more reddish or purplish; lower leaves often with several pairs of small leaflets near the main blade; floral leaves sometimes soft-villous; orifice of the mature calyx broad-campanulate, commonly truncate.—Low wet fields, 100 to 2500 ft.: w. Alameda Co. to Napa Valley and n. to western Colusa Co. and to Mendocino Co. Apr. (*M. langsдорфii* var. *arvensis* Jepson.) Var. *NASUTUS* Jepson n. comb. Stems  $\frac{1}{2}$  to  $1\frac{1}{2}$  ft. high; herbage usually reddish or purplish; teeth of the calyx in mature fruit often very strongly turned towards the upper one which is thrice the length of the others.—Rivulets and springs, valleys and mountains, throughout Cal. (*M. langsдорфii* var. *nasutus* Jepson.)

34. *M. tilingii* Regel. Stems usually several from coralloid rootstocks, 3 to 7 in. high; herbage sometimes moist but not slimy; leaves ovate to orbicular, dentate, thin, the lower ovate to cuneate, long-petioled, the upper orbicular, sessile; pedicels slender, 1 to 2 in. long; calyx campanulate; corolla 1 in. long, the middle lobe of lower lip twice the size of the lateral ones.—Mdws. and stream banks, 6000 to 9000 ft.: San Jacinto Mts.; San Bernardino Mts.; Sierra Nevada from Tulare Co. to Plumas Co.; n. to Ore., e. to Col. (*M. corallinus* Greene.)

35. *M. impléxus* Greene. Similar to no. 34; stems usually much tufted, arising from a mass of coralloid rootstocks,  $\frac{1}{2}$  to 6 in. high; herbage clammy or slimy; leaves thicker; pedicels usually as long or longer than stems; calyx spreading-campanulate, 4 lines broad, the dorsal tooth 1 line longer than the other 4, these latter with the tube 5 lines long, conspicuously purple-dotted.—On rocks in alpine stream beds, 9000 to 11,000 ft.: Sierra Nevada from Tulare Co. to Calaveras Co. and Mt. Shasta; n. to Ore.

36. *M. dentatus* Nutt. Stems flexuous, arising from long slender perennial rootstocks, 7 to 15 in. high; herbage finely pubescent to glabrous; leaves ovate-acute, evenly and strongly serrate, 1 to  $2\frac{1}{2}$  in. long, the lower petioled, the upper sessile or subsessile, pinnately veined, lateral veins about 2 pair, tending to be parallel with midrib; pedicels somewhat shorter than the leaves; calyx campanulate-spreading, cleft  $\frac{1}{2}$  its length into subequal acute teeth; corolla 1 to  $1\frac{1}{2}$  in. long, deep yellow, the throat bearded and purple-dotted; capsule elliptic-oblong, a little shorter than calyx-tube.—Redwood belt from Humboldt Co. to Del Norte Co.; n. to Wash.

37. *M. brevipes* Benth. Stem erect, simple or branching, 1 to 2 ft. high; herbage pubescent, viscid; leaves lanceolate, the lower often broadly so, dentate or subdentate, sometimes nearly glabrous, the upper leaves narrow-to linear-lanceolate, entire; pedicels and calyces heavily pubescent; calyx sharply cleft into acuminate segments, the upper segment much exceeding the lower 4; corolla yellow, 1 to  $1\frac{1}{2}$  in. long; capsule ovate-acuminate, stout-walled, coriaceous, loculicidal, splitting through the axis.—Foothills and mesas, 1000 to 2000 ft.: Santa Barbara and Ventura Cos. to San Diego Co.; s. to L. Cal.

38. *M. cardinalis* Dougl. Stems usually simple, 2 to 4 ft. high, arising from a perennial rootstock; herbage heavily pubescent, viscid; leaves erose-dentate, the upper ovate, acute, the lowest obovate-lanceolate; pedicels 1 to 3 in. long; calyx long-campanulate, its lobes nearly equal, acute; corolla scarlet,  $1\frac{1}{2}$  to 2 in. long, the upper lip erect with revolute lobes, the lower lip reflexed; stamens with anther-cells adorned with scale-like hairs; capsule ovate-acuminate, firm-walled, dehiscent.—Along streams and ditches, foothills and middle altitudes in the mts., 100 to 5000 ft.: almost throughout Cal.; n. to Ore., e. to Utah and Ariz.

39. *M. lewisii* Pursh. Fig. 869. Stems simple, usually several from an underground rootstock, 1 to 2 ft. high; herbage viscid-pubescent; upper leaves lanceolate, remotely repand-dentate, the very lowest oblong, scale-like; pedicels  $1\frac{1}{2}$  to 4 in. long; calyx campanulate, its lobes acuminate; corolla rose-pink with lobes very regularly spreading; anther-cells with scale-like hairs; capsule walls less firm than in no. 38.—Moist places, 7000 to 8500 ft.: Sierra Nevada from Tulare Co. to Eldorado Co.; n. to B. C., e. to the Rocky Mts.

869. *Mimulus lewisii* Pursh; a, fl. branchlet  $\times \frac{1}{2}$ ; b, anther  $\times 4$ .

12. **MIMETÁNTHE** Greene

Low white-villous annual. Flowers small, yellow. Calyx short-campanulate, deeply 5-cleft, its tube slightly 5-sulcate, not prismatic-angled or even carinate. Corolla obscurely 2-lipped, its lobes plane. Stamens 4, 2 fertile, or all 4 fertile. Capsule pointed, loculicidal, dehiscent the whole length of the upper side and on the lower side along the apical attenuation; placentae tardily separating, borne on the shortly 2-cleft valves. (Greek *mimetes*, an imitator, and *anthos*, blossom, on account of the resemblance to *Mimulus*.)

1. ***M. pilosa*** (Benth.) Greene. Stem erect, at length much branched, leafy, flowering from near the base, mostly about 8 to 10 in. high; herbage glandular-viscid and with disagreeable solanaceous odor; leaves lanceolate or narrowly oblong-ovate, entire, sessile; flowers on slender pedicels, the lower pedicels surpassing the leaves; upper tooth of calyx often longer than the others, equaling the tube; corolla bright yellow, its lower lobe usually with brown spots, slightly exceeding the calyx, 3 to 4 lines long; capsule oblong-ovate, attenuate.—Moist summer beds of winter streams, 100 to 2500 ft.: throughout Cal.; Ore. to Nev. and Ariz. July-Sept. (*Mimulus pilosus* Wats. *M. exilis* Dur.)

13. **LIMOSÉLLA** L. MUDWORT

Diminutive tufted annuals. Stems creeping in the mud (never ascending), bearing at intervals clusters of leaves and scapes. Leaves narrow, entire, fleshy. Scapes naked, 1-flowered. Calyx 5-toothed. Corolla nearly regular, open-campanulate, 5-cleft. Stamens 4, all fertile. Style short. Capsule globose, 2-celled only at base, many-seeded. (Latin *limus*, mud, and *sella*, seat, the species growing in moist localities.)

1. ***L. aquática*** L. Tufts 1 to 2 in. high; leaves exceeding the scapes, narrowly oblong, 3 to 6 lines long, on long petioles ( $\frac{1}{2}$  to  $1\frac{1}{2}$  in.); corolla very small (less than 1 line long), white or purplish.—Muddy shores of lakes and ponds, mostly near the coast, from Marin Co. to Kern Co. and San Jacinto Mts. It is found in all continents, the most widely distributed species of the family. June-July. Var. *TENUIFOLIA* Hoffm. Leaves narrowly linear (no distinction of blade and petiole).—San Bernardino Mts.

14. **STEMÓDIA** L.

Viscid-pubescent herbs with opposite or whorled leaves. Flowers solitary in the axils, sometimes becoming spicate or racemose at the ends of the stems. Calyx deeply 5-parted, the lobes narrow and nearly equal. Corolla with short cylindric tube, the upper lip 2-lobed, the lower 3-parted. Stamens 4, included. Anther-cells separate and stipitate. Stigma 2-lobed. Capsule with valves entire or at length 2-parted, the placentae left in the axis. Seeds numerous. (Abbreviated from Greek *stemon*, stamen, and *diakra*, two tips, in reference to the separated anther-cells.)

1. ***S. durantifolia*** Swartz. Annual or perennial; stems simple or branched below, 8 to 14 in. high; herbage glandular-pubescent; leaves opposite or whorled, lanceolate, serrate, narrowed below and with a dilated partly clasping base,  $\frac{1}{2}$  to 1 in. long; inflorescence spike-like, densely glandular; calyx with 2 bractlets; corolla purplish, 3 to 4 lines long, hairy within.—Wet ground, San Diego to w. side Colorado Desert; s. Ariz.; trop. Am.

15. **BACÔPA** Aublet

Perennial herbs with opposite leaves and solitary axillary flowers. Calyx of 5 almost distinct imbricated sepals, the upper broadest. Corolla campanulate, its upper lip emarginate or 2-lobed, the lower 3-lobed. Stamens 4, all fertile. Capsule thin, 2-valved, the valves 2-parted. Placentae remaining united in the axis, the valves of the capsule separating from them. (Thought to be an aboriginal name.)

1. ***B. rotundifolia*** (Michx.) Wettst. Stems succulent, creeping, 10 to 14 in. long, villous-pubescent or almost glabrous; leaves rotund, sessile, flabellately many-nerved from the base,  $\frac{1}{2}$  in. long; pedicels 1 or 2 in the axils, longer than the white flowers; corolla little irregular.—Aquatic or in muddy situations: San Joaquin Valley (Stockton to Fresno); e. to Tex., thence n. to Ill. (*Herpestis rotundifolia* Pursh. *Monnieria rotundifolia* Michx.)

16. *GRATIOLA* L.

Low annual with opposite sessile leaves. Flowers solitary in the axils, peduncled. Calyx of 5 almost distinct unequal sepals. Corolla tubular, the tube yellow, the white lips short; upper lip entire or bifid, the lower 3-cleft. Anther-bearing stamens 2, posterior; anterior pair none or reduced to sterile rudiments. Stigma dilated or with 2 flat lobes. Capsule 4-valved, the valves separating from the placenta-bearing axis. (Latin *gratia*, grace or esteem, in reference to its medicinal virtues.)

Calyx with a pair of foliaceous bractlets close to it; corolla about 2 times as long as the calyx ..... 1. *G. virginiana*.  
Calyx without bractlets; corolla shorter than or equaling the calyx. .... 2. *G. ebracteata*.

1. *G. virginiana* L. Stems 3 to 6 in. high, erect, branched from below, puberulent, somewhat viscid; leaves glabrous, oblong-lanceolate, acute, entire or toothed, glabrous, 1 to 1½ in. long; corolla yellow with white lips, 4 lines long; stamen rudiments minute or none; capsule ovate, about equaling the calyx.—Montane, 5500 to 6500 ft.: rare, Placer Co.; e. to the Atlantic. July.

2. *G. ebracteata* Benth. WALLOW-HYSSOP. Stems somewhat succulent, ascending, 2 to 5 in. high; herbage obscurely glandular-pubescent; leaves lanceolate, entire, 3 to 8 lines long; sepals lanceolate, 2 to 3½ lines long, surpassing the globular and somewhat 4-angled capsule; upper corolla lip shortly bifid, with a patch of short glandular hairs beneath the notch, the lobes of the lower lip short and broad, notched.—Wet soil, 200 to 5000 ft.: North Coast Range valleys; Sierra Nevada from Tuolumne Co. to Lassen Co.; n. to Wash.

17. *ILYSANTHES* Raf.

Small annuals with opposite sessile leaves. Flowers small, axillary, on filiform naked peduncles (or the upper becoming racemose). Calyx of 5 almost distinct sepals. Corolla tubular; upper lip short, erect, 2-cleft; lower lip larger, spreading, 3-cleft. Fertile stamens 2, posterior, inserted low down; anterior stamens sterile, inserted high in the throat, forked, one of the divisions glandular and obtuse, the other acute and sometimes bearing the rudiment of an anther. Stigma 2-lobed. Capsule many-seeded, septicidal or septifragal. (Greek *ilus*, mud, and *anthos*, flower, the species a denizen of wet places.)

1. *I. dubia* Barnh. Stems one to several from the base, very slender, diffusely branching, 3 to 5 in. high; herbage essentially glabrous; leaves ovate or oblong, 4 to 7 lines long, sparingly denticulate or entire; peduncles long and slender, several times longer than the flowers, solitary in the axils or subracemose above by the reduction of the subtending leaves to bracts; calyx 1 line long; corolla 3 to 4 lines long, bluish.—Moist stream bottoms or valley lowlands, 10 to 4000 ft., rare in Cal.: lower Sacramento and San Joaquin valleys; Yosemite; e. to Atlantic; S. Am. July-Sept. (*I. gratioides* Benth.)

18. *SYNTHYRIS* Benth.

Perennial herbs from rootstocks with the rounded petioled leaves in a basal tuft. Flowers racemose. Calyx 4-parted. Corolla with very short tube and 4-lobed rotate-campanulate limb. Stamens 2, inserted close to the upper sinuses, exserted. Anther cells parallel, not confluent. Capsule compressed, loculicidal. (Greek *sun*, together, and *thuris*, a little door, re-

870. *Synthyris rotundifolia* Gray; a, habit x ½; b, capsule x 1½; c, sect. of capsule x 1½

871. *Synthyris reniformis* Benth.; a, fl. branchlet  $\times \frac{2}{3}$ ; b, leaf  $\times \frac{2}{3}$ ; c, capsule  $\times 2$ ; d, long. sect. of capsule  $\times 2$ .

ferring to the continued adherence of the base of the valves to the placentae.)

Herbage appressed-scabrulose; capsule divaricately 2-lobed; seeds 2 in each cell.....1. *S. rotundifolia*.  
Herbage glabrous; capsule emarginate; seeds more than 2 in each cell.....2. *S. reniformis*.

1. *S. rotundifolia* Gray. Fig. 870. Plants  $2\frac{1}{2}$  to 5 in. high; herbage appressed-scabrulose; leaves roundish-or ovate-cordate, doubly crenate,  $\frac{1}{2}$  to 2 in. long, shorter than the petioles; peduncles scarcely longer than the leaves; inflorescence loosely corymbose-racemose, the bracts small and the pedicels, at least the lower, several times longer than the flowers; corolla white, 2 lines long, its tube

hairy within.—North Coast Ranges from Marin Co. to Humboldt Co.; n. to Ore. Mar.-May.

2. *S. reniformis* Benth. Fig. 871. Flowering stems 4 to 9 in. high, bearing several bract-like fanshaped leaves; basal leaves persistent, orbicular-reniform, 1 to 2 in. wide, crenate and crenately incised, the lobes sharply toothed; petioles stout, 2 to 4 in. long; raceme dense; pedicels slender, exceeded by the subtending lanceolate bracts; calyx-lobes lanceolate, somewhat unequal, about 1 line long; corolla blue changing to purple, 3 lines long, its tube seldom hairy within; capsule truncate, emarginate.—Modoc Co.; n. to Wash. and Ida. July.

#### 19. VERÓNICA L. SPEEDWELL

Ours herbs with cauline leaves and flowers in axillary or terminal racemes, or solitary. Pedicels without bractlets. Calyx in ours 4-parted. Corolla subrotate, deeply 4-cleft, the upper lobe commonly broader than the lateral lobes or the lower one. Stamens 2, one on each side of the upper corolla-lobe, exserted. Stigma entire. Capsule flattened, emarginate, obcordate or 2-lobed, septicidal. Seeds few to many. (Name thought to be in memory of St. Veronica.)

A. *Perennials from rootstocks or stolons; leaves opposite; flowers borne in racemes.*

Racemes several, axillary; corolla pale blue, often purple-striped.

Leaves all or mostly short-petiolate.....1. *V. americana*.

Leaves all sessile.

Racemes loose and elongate, commonly from opposite axils; capsule orbicular, emarginate, many-seeded; seeds compressed or plano-convex.....2. *V. anagallis*.

Racemes filiform, flexuous, commonly from alternate axils; capsule biscutelliform, deeply emarginate, several-seeded; seeds very flat.....3. *V. scutellata*.

Raceme one, terminal.

Pedicels longer than bracts.....4. *V. cusickii*.

Pedicels equaling or shorter than the bracts.

Pedicels shorter than bracts; stamens close to the upper sinuses; capsule elliptical, emarginate.....5. *V. alpina*.

Pedicels equaling or shorter than bracts; stamens borne midway between the upper sinuses and the base of the corolla-tube; capsule somewhat orbicular, obcordate.....6. *V. serpyllifolia*.

B. *Annuals; leaves alternate or the lowest opposite; flowers solitary in the axils of the leaves, or the inflorescence appearing racemose above by the reduction of the upper leaves to bracts.*

Pedicels longer than the leaves; lobes of capsule strongly divergent.....7. *V. buzbaumii*.

Pedicels shorter than the leaves; capsule obcordate, its lobes not divergent.

Stem and branches erect; lower leaves oblong or oval, entire or dentate.8. *V. peregrina*.

Stem and branches soon spreading; lower leaves ovate, crenate.....9. *V. arvensis*.

1. *V. americana* Schwein. AMERICAN BROOKLIME. Fig. 872. Stems branching, erect or ascending,  $\frac{1}{2}$  to  $2\frac{1}{2}$  ft. high; herbage glabrous, leaves ovate or oblong, serrate, 1 to 3 in. long; pedicels filiform, exceeding the linear-oblong

bracts and much longer than the rotund capsule; calyx-segments 1 to  $1\frac{1}{2}$  lines long; corolla bright blue with white center, 2 lines broad; capsule biconvex, slightly emarginate at the apex,  $1\frac{1}{2}$  lines long; seeds many, flat, borne on a short placental surface at the center of the axis. —Springs and rivulets in the hills and mountains, throughout cismontane Cal.; far e. and n. June-Sept.

2. *V. anagallis* L. Stem 6 to 10 in. high, simple or branching; herbage glabrous or the inflorescence glandular-puberulent; leaves lanceolate, remotely serrate, 1 to 2 in. long; racemes short, few-flowered; peduncles and pedicels filiform, the latter 2 to 4 lines long, exceeding the lanceolate bracts; calyx-segments barely 1 line long, exceeded by the corolla-lobes; corolla blue or purplish-striped. —Rivulets or swamps, rare in Cal.; Shasta Co.; N. Am.; Eur., Asia. May.

3. *V. scutellata* L. Fig. 873. Stems slender, 3 to 16 in. high, simple or somewhat branched; herbage glabrous or sparingly hairy; leaves linear or linear-lanceolate, remotely denticulate or entire,  $\frac{1}{2}$  to  $2\frac{1}{2}$  in. long; racemes equaling or exceeding the leaves; bracts lanceolate, 1 line long, exceeding the calyx-segments; pedicels several times as long as the bracts, slender, spreading; corolla blue, its lobes 2 lines long, equal; stamens inserted between upper sinuses and base of corolla-tube; capsule  $1\frac{1}{2}$  lines long; seeds 6 to 8 in each cell; placental surface located toward upper end of axis. —Common in wet places: Sierra Nevada; North Coast Ranges; n. to B. C., e. to Lab.; Eur., Asia. June-July.

873. *Veronica scutellata* L.; a, sect. of fl. branchlet  $\times \frac{1}{2}$ ; b, capsule  $\times 1\frac{1}{2}$ .

4. *V. cusickii* Gray. Stems slender, simple, erect, 8 or 9 in. high; herbage glabrous or pubescent; leaves sessile, suborbicular below, ovate or oblong above, entire, 4 to 8 lines long; raceme 3 to 9-flowered; bracts  $1\frac{1}{2}$  to 2 lines long, equaling calyx-segments; corolla 4 to 5 lines broad, with ample rounded lobes; stamens borne in upper sinuses, exerted together with the filiform style; capsule elliptical, emarginate; seeds many. —Siskiyou Co.; n. to Ore. Aug.

5. *V. alpina* L. var. *unalaschensis* C. & S. ALPINE SPEEDWELL. Stems slender,  $4\frac{1}{2}$  to  $10\frac{1}{2}$  in. high, erect or procumbent at base; herbage hirsute-pubescent to glabrate; leaves ovate or oblong, crenulate-serrate to entire, obtuse, sessile,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; raceme simple, dense or interrupted below; pedicels shorter than calyx-lobes; corolla light blue, 2 to 3 lines broad; stamens and style included; placental surface centrally located on axis; seeds numerous. —Montane meadows, 4000 to 8000 ft.: Sierra Nevada from Tulare Co. to Lassen Co.; n. to Alas., e. to N. Eng. July-Sept.

6. *V. serpyllifolia* L. THYME-LEAF SPEEDWELL. Stems 2 to 11 in. high, simple or branching at base; herbage glabrous or pubescent; leaves sessile or petiolate, ovate or oblong, entire or crenulate, 3 to 10 lines long; raceme loose, few to many-flowered; bracts ovate to linear; pedicels erect, filiform, as long as the calyx; calyx-lobes 1 to  $1\frac{1}{2}$  lines long; corolla pale blue (with darker stripes) to almost white, 2 lines broad; stamens together with the filiform style exerted; stigma capitate; capsule  $1\frac{1}{2}$  lines long; seeds many,

872. *Veronica americana* Schwein.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, capsule  $\times 1\frac{1}{2}$ .

874. *Veronica peregrina* L.; a, habit  $\times \frac{1}{2}$ ; b, capsule  $\times 1\frac{1}{2}$ .

flat, oblong, borne on placentae located at center of axis.—Montane, 3000 to 6000 ft.: throughout Cal.; n. to Alas., e. to Lab. and Ga.; S. Am., Eur., Asia. May-Aug.

7. *V. buxbaumii* Tenore. Stems branched from the base,  $\frac{1}{2}$  to 1 ft. long, diffuse or procumbent; herbage pubescent with spreading hairs; leaves roundish or oval, often broader than long, 5 to 7 lines long, on petioles 1 to 3 lines long, rather deeply toothed above the base; corolla blue with a small white center,  $2\frac{1}{2}$  to 3 lines broad, its short tube closed with a barrier of hairs; upper and lateral lobes subequal, larger than the lower lobe; filaments thick-fleshy; capsule 4 lines broad, with two strongly divergent lobes, appearing as if twins; placentae near the upper end of the axis; seeds about 9 in each cell, oblong or roundish, wrinkled, with a fissure on one side, 1 line long.—Native of Eur., escaped from gardens: Eel River valley; Woodland; Newark; San Bernardino. Apr.

8. *V. peregrina* L. NECKWEED. Fig. 874. Stem erect, 4 to 12 in. high, simple or branched from the base; herbage finely puberulent; leaves alternate or the lowest opposite, oblong,  $\frac{1}{2}$  to 1 in. long, entire or dentate, only the lowest petioled; flowers solitary in the axils of the alternate leaves, sometimes in one of the axils of the opposite leaves, appearing racemose above by the reduction of the upper leaves to bracts; pedicels shorter than the small flowers or capsules; corolla white; stamens and short style not exerted; capsule orbicular,  $1\frac{1}{2}$  lines long; seeds oblong, flat, 8 or 10 in a cell; placentae central to axis. — Low places in valley fields, 50 to 4000 ft.: throughout Cal.; N. Am., S. Am. Mar.-July.

9. *V. arvensis* L. CORN SPEEDWELL. Fig. 875. Stems slender, simple or branched, erect or slightly decumbent at base, 3 to 10 in. long; herbage pubescent; leaves ovate to lanceolate, 3 to 4 lines long; calyx-segments lanceolate,  $1\frac{1}{2}$  lines long, glandular-hairy; corolla shorter than calyx; capsule 1 to  $1\frac{1}{2}$  lines long, ciliate; placentae above center of axis; seeds numerous, flat.—Native of Eur., an escape from gardens: Humboldt Co.; Siskiyou Co. Mar.-June.

875. *Veronica arvensis* L.; a, lower cauline leaves  $\times 2$ ; b, capsule  $\times 6$ .

## 20. DIGITALIS L.

Tall biennial with alternate leaves, topped by long terminal commonly 1-sided racemes of showy flowers. Calyx 5-parted. Corolla with inflated tube and very short limb. Stamens 4, included. (Latin *digitalis*, referring to the fingers of a glove, which the tubular corollas remotely resemble.)

1. *D. purpurea* L. FOXGLOVE. Stem stout, 3 to 4 ft. high; herbage pubescent; leaves oblong-lanceolate, crenate, 3 to 7 (or 8) in. long; corolla white or purple, declined,  $1\frac{1}{2}$  in. long.—European garden plant, naturalized on the Humboldt and Mendocino coasts.

## 21. CASTILLEJA Mutis

By ELSIE M. ZEILE

Root-parasitic herbs or sometimes suffrutescent plants, of hilly districts. Leaves alternate, sessile, entire or more commonly lacinate. Flowers dull yellowish or greenish, in terminal spikes (sometimes pediceled). Bracts and calyx-lobes scarlet, red or yellow, commonly more showy than the dull yellow, red or greenish corolla. Calyx tubular, flattened laterally, cleft before and usually behind (in one species on the side), the divisions entire, emarginate or 2-cleft. Upper lip (galea) of the corolla long and narrow, flattened laterally (or conduplicate) and enclosing the style and the 4 unequal stamens. Lower

lip very short, 3-lobed or -toothed. Anther cells unequal, the outer versatile, the inner pendulous. Capsule many-seeded. (D. Castillejo, Spanish botanist.)

**A. Annuals; upper bracts linear, red, longer than flowers; leaves linear-lanceolate; flowers pedicelate; calyx about equally cleft before and behind.**

Corolla 1 to 1½ in. long; galea well exerted beyond the calyx, equaling the corolla-tube; lower lip exposed. .... 1. *C. stenantha*.

Corolla ½ to ¾ (or 1) in. long; galea slightly exerted, about ½ as long as the corolla-tube; lower lip not or scarcely protruding beyond the cleft of the calyx. .... 2. *C. minor*.

#### B. Perennials.

Calyx about equally cleft before and behind (but see no. 3).

Galea included or somewhat exerted, the lower lip never or scarcely exposed.

Spikes strict; leaves mostly lacinate.

Calyx cleft at the sides deeper than before or behind, floccose-tipped, its lobes 2-cleft, the inner or lower lobes shorter than the outer or upper ones; S. Cal. .... 3. *C. plagiótoma*.

Calyx equally cleft before and behind, not floccose-tipped, its lobes equally cleft ½ the length of calyx; Marin Co. .... 4. *C. neglecta*.

Spikes broad.

Plants 2 to 8 in. high from a thick caudex; galea very short, shorter than corolla-tube; high montane.

Leaves mostly entire; herbage pubescent; upper leaves 1-nerved. .... 5. *C. culbertsonii*.

Leaves mostly lacinate; herbage hispid; upper leaves 3-nerved. .... 6. *C. breweri*.

Plants mostly over 8 in. high; galea about equaling tube.

Calyx-lobes mostly 2-cleft to the middle, or rarely 2-toothed; upper bracts deeply cleft.

Calyx cleft to middle; herbage villous-hirsute (puberulent in var.) . . . 7. *C. parviflora*.

Calyx cleft ½ or less its length.

Herbage pilose-hispid; leaves mostly lacinate; mostly of Great Basin or of desert region. .... 8. *C. angustifolia*.

Herbage cinereous; leaves mostly entire, lanceolate; n. Cal. .... 9. *C. pruinosa*.

Calyx-lobes entire or with slightly 2-lobed summit.

Leaves oval or obovate (or broadly lanceolate in var.); herbage viscid-pubescent; calyx cleft to middle; coastal. .... 10. *C. latifolia*.

Leaves linear to lanceolate; calyx cleft ½ or less its length; suffrutescent; herbage white-woolly.

Galea scarcely exerted; common throughout Cal. .... 11. *C. foliolosa*.

Galea somewhat exerted; Santa Barbara Isls. .... 12. *C. hololeuca*.

Galea conspicuously exerted (but tardily exerted in no. 15), about equaling the tube, the lower lip usually exposed; montane.

Bracts much longer than calyx; spikes showy, broad; calyx cleft a little deeper before than behind, the lobes deeply linear-cleft. .... 13. *C. miniata*.

Bracts about equaling calyx; spikes long and narrow (broadened at top in no. 15); calyx equally cleft, the lobes 2-toothed.

Leaves mostly entire, linear to oblong-linear, 1 to 3-nerved; bracts narrow; Sierra Nevada and n. .... 14. *C. pinetorum*.

Leaves mostly trifid, broadly linear to ovate, 3 to 5-nerved; bracts broad; S. Cal. .... 15. *C. oblongifolia*.

Calyx much more deeply cleft before than behind; galea well exerted, the lower lip exposed; leaves mostly entire (except in var.) .... 16. *C. affinis*.

1. **C. stenantha** Gray. Stem simple, erect, virgate, 1¼ to 2½ ft. high, the whole plant glandular-pubescent and wet as if with dew; leaves ascending, linear-lanceolate, 1½ to 3 in. long, all entire; lower leaves with long linear tips, these coiling spirally when wilting; bracts linear, entire, the uppermost with scarlet tips; lower flowers pedicellate; calyx equally cleft or cleft slightly deeper behind; calyx-lobes incisely 2-cleft at apex; corolla wholly green (except the lower lip) or sometimes slightly yellowish, straight, well-exserted from calyx-tube, exposing the bright scarlet teeth of the lower lip; corolla-tube equaling the galea.—Moist rivulets in the mts., 1000 to 7000 ft.: Lake and Napa Cos.; Ventura Co. to w. Riverside Co.

2. **C. minor** Gray. Similar to no. 1 but not so tall; corolla shorter, the galea only slightly exerted.—Montane, 5000 to 7500 ft.: Mariposa and Tulare Cos.; Inyo Range.

3. **C. plagiótoma** Gray. Stems erect or spreading, 1 to 1¼ ft. high; herbage more or less woolly-pubescent, the inflorescence white-woolly; lowest

leaves linear, the upper divided to the middle into 3 linear lobes, the middle lobe broadest; spikes narrow; flowers ascending, distant; upper bracts green, shorter than the calyx, cleft more than half way, the middle lobe broadest; calyx floccose-tipped, about equaling the corolla; corolla yellow, 6 to 8 lines long, the upper lip emarginate; galea not or scarcely protruding, as long as the tube.—Montane, 3500 to 5500 ft.: w. side Mohave Desert; San Gabriel Mts.

4. *C. neglecta* Zeile n. sp. Near no. 10 but the herbage puberulent, not viscid, and the spikes erect, slender and narrow; leaves linear to ovate, laciniate; upper bracts broad, yellow, often tipped with red, deeply cleft, the middle lobe broadest; lower flowers pediceled; calyx-lobes broadly cleft  $\frac{1}{3}$  the length of calyx; corolla frequently red; galea scarcely exerted, shorter than the tube.—Hillsides, Tiburon, Marin Co. (K. Brandege, type).

5. *C. culbertsonii* Greene. Stems erect, simple from the base, solitary or when several a little remote; leaves linear,  $\frac{1}{2}$  to 1 in. long, somewhat appressed to the stem; spikes and flowers large for the size of the plant, the spikes as if forked at the apex; floral bracts thin, longer than the flowers, cleft to middle or below, the lobes red, middle lobe broad, lateral lobes linear; galea not or scarcely exerted, not much longer than the lower lip and very much shorter than the corolla-tube.—Alpine or montane meadows, 10,000 to 11,000 ft.: Tulare Co. to Mariposa Co.

6. *C. breweri* Fer. Erect alpine plants 4 to 6 in. high, the few lowest leaves entire, the upper divided into 3 lobes, the middle lobe broadest; galea scarcely exerted, very short, scarcely half as long as tube.—High montane, 10,500 to 11,000 ft.: Mariposa Co.; Modoc Co.

7. *C. parviflora* Bong. var. *douglasii* Jepson. INDIAN PAINT BRUSH. Stems from base rather few; herbage villous-hirsute; leaves linear, varying to linear-lanceolate or -oblong,  $1\frac{1}{2}$  to  $3\frac{1}{2}$  in. long, entire or with a few linear-lacinate lobes, the lower often entire; bracts petal-like above, equally 3-parted or the middle lobe somewhat larger and 3-cleft at summit; spikes lax below; calyx-lobes colored red, rarely yellow, laciniately 2-cleft at summit or to below the middle; corolla straight, the galea about as long as tube, little or not at all exerted.—Wooded cañons, 100 to 7000 ft.: Los Angeles and Ventura Cos. to Humboldt Co.; Placer Co. to Shasta, Modoc and Siskiyou Cos. Var. CALIFORNICA Zeile n. comb. Stems erect, slender, 8 to 15 in. high; herbage puberulent; spikes compact, 1 in. long in flower, as much as 6 in. long in fruit, the capsules distant; calyx cleft almost to middle, each lobe 2-toothed; corolla subfalcate, galea a little shorter than tube.—Coastal mts. of S. Cal. (*C. californica* Abrams.)

8. *C. angustifolia* G. Don. Stems erect, mostly simple, 7 to 12 in. high, arising from a caudex; herbage pilose-hispid; leaves cleft mostly to below the middle into linear lobes, tending to spread widely; calyx cleft  $\frac{1}{3}$  its length, the lobes 2-toothed; upper bracts cleft to or below the middle, the outer lobes linear, the middle lobe broad and often 3-cleft, spikes dense, 1 to  $1\frac{1}{2}$  in. long; galea slightly exerted, about equaling tube; capsules 4 to 5 lines broad, 6 to 9 lines long.—Desert ranges and arid slopes of mts. bordering the deserts, 2800 to 6000 ft.: Colorado and Mohave deserts; n. Sierra Nevada; Inyo Co.; e. to Great Basin.

876. *Castilleja latifolia* H. & A.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, two views of fl.  $\times 1$ ; c, fl. with calyx removed  $\times 1$ ; d, capsule  $\times 1$ .

9. *C. pruinosa* Fer. Stems erect, mostly simple, sometimes branching above, 12 to 16 in. high; herbage pubescent-cinereous; leaves entire, linear to lanceolate, 1 to 3 in. long; bracts 3-lobed above the middle, longer than the calyx; calyx equally cleft  $\frac{1}{2}$  its length, lobes 2-cleft not quite to middle; galea exserted, almost equaling the tube, the lower lip not protruding.—Siskiyou Co.

10. *C. latifolia* H. & A. SEASIDE PAINTED CUP. Fig. 876. Stems  $\frac{1}{2}$  to  $1\frac{1}{2}$  ft. high; herbage viscid-pubescent; leaves thick, oval or obovate or sometimes narrower, mostly less than 1 in. long, or the upper larger and 3-lobed at apex; bracts sometimes yellow, shorter than flowers, broad (about 9 lines long and 5 lines wide) with oblong lobes, the middle lobe twice as large as the lateral; calyx-lobes broad, entire or notched at apex, almost equaling the corolla; corolla 9 to 12 lines long; lower lip very short.—Sea cliffs and rocky headlands along the coast, 10 to 500 ft.: Monterey Co. to Mendocino Co. Var. *wightii* Zeile n. comb. Stems more or less densely branched above, very leafy, herbage more densely viscid-pubescent; spikes erect, narrower and longer than in the species; flower structure similar to the species, but the bracts and calyx tipped with yellow.—Near coast, San Mateo Co. (*C. wightii* Elmer.)

877. *Castilleia foliolosa* H. & A.; a, fl. stem  $\times \frac{1}{2}$ ; b, fl.  $\times 1$ ; c, fl. with calyx removed  $\times 1$ .

11. *C. foliolosa* H. & A. WOOLLY PAINTED CUP. Fig. 877. Suffrutescent, with many stems from the base, mostly 10 to 18 in. high, white-woolly throughout; leaves linear and entire, rather crowded below and fascicled in the lower axils, 4 to 12 lines long, the upper cauline and bracts 3-parted into linear lobes; bracts with lobes spatulate-dilated at apex, the middle lobe largest and again shallowly 3-lobed; spikes dense; flowers about 9 lines long, only slightly curved; galea protruding from calyx only 1 or 2 lines, shorter than or as long as tube of corolla; calyx-lobes truncate or merely retuse; capsule 5 to 7 lines long; seeds bluish-green.—Dry hills, 200 to 4500 ft., mostly in rocky situations or gravelly soil, in some places exceedingly abundant, occupying many acres of open hillside: San Diego Co. to Solano and Mendocino Cos.; Amador Co. to Eldorado Co. Apr.-May.

878. *Castilleia miniata* Dougl.; a, fl. branchlet  $\times 1$ ; b, fl.  $\times 1$ ; c, fl. with calyx removed  $\times 1$ ; d, anther  $\times 3$ .

12. *C. hololeuca* Greene. Shrubby, 2 to 4 ft. high, densely white-woolly; leaves  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; bracts

narrow, entire or the upper ones 3-cleft; calyx 8 lines long, cleft deeper on the upper side; galea shorter than tube.—San Clemente, Santa Rosa, Santa Cruz, and Santa Catalina islands.

13. *C. miniata* Dougl. Fig. 878. Stems erect, branched above, 1 to 3 ft. high; herbage pubescent to nearly glabrous; leaves 1 to 2 in. long, acuminate; inflorescence hairy; spikes dense and short, 1 to 2½ in. long in flower, lengthening in fruit, showy; calyx-lobes deeply cleft into linear lobes; corolla 1 to 1½ in. long, falcate, the galea exserted, longer than tube.—Montane, in wet places, 3500 to 10,000 ft.: San Jacinto Mts.; San Bernardino Mts.; San Gabriel Mts.; Sierra Nevada from Tulare Co. to Plumas Co., thence to Siskiyou and Humboldt Cos.; n. to Alas., e. to Col. (*C. montana* Congdon. *C. oreopola* Greenm.)

14. *C. pinetorum* Fer. Fig. 879. Stems erect, often branching above, 6 to 12 in. high from a woody caudex; herbage pilose-glandular; leaves oblong-linear, entire or sometimes trisected, ½ to 1 in. long; spikes narrow; bracts divided to middle, the 2 outer linear, the middle lanceolate, all about equaling the calyx; calyx cleft equally ¼ or ½ its length, the lobes 2-toothed; galea about equaling the tube.—Montane, 4000 to 9000 ft.: Sierra Nevada from Plumas Co. to Tulare Co., s. to the San Gabriel, San Jacinto and Cuyamaca mountains. (*C. trisecta* Greene.) Var. *FRAGILIS* Zeile n. comb. Stems very slender, branched from base and above; leaves entire or laciniate into 3 lobes at apex, prominently 1 to 3-ribbed beneath; spikes very narrow, 2 to 5 lines broad.—Siskiyou Co. (*C. fragilis* Eastw.)

879. *Castilleja pinetorum* Fer.; a, fl. stem  $\times \frac{1}{2}$ ; b, fl.  $\times 1$ ; c, fl. with calyx removed  $\times 1$ .

15. *C. oblongifolia* Gray. Similar to no. 14; herbage less viscid; leaves 1 to 2 in. long, 3 to 8 lines broad, mostly divided nearly to the middle into 3 spreading lobes, the middle one broadest; bracts thin, similarly cleft, equaling calyx or a little longer; calyx equally cleft before and behind, about ½ its length, the lobes 2-toothed; galea equaling or slightly longer than tube, lower lip at length exserted.—Montane, San Diego and San Bernardino Cos. (*C. martini* Abrams.)

16. *C. affinis* H. & A. SCARLET CUP. Stems 1 to 2 ft. high, with few virgate branches from the base, rather leafy below; herbage nearly glabrous, somewhat villous, or slightly scabrous-puberulent; leaves linear to lanceolate, entire, 1 to 4 in. long, the lower with 3 strong callous nerves; raceme loose below; bracts scarlet, very long, 3-parted, the lobes rather narrow, not broader above, the middle lobe largest and 3-cleft at apex; flowers pediceled, 1¼ in. long; calyx-lobes notched or 2-cleft at apex, the teeth acute; corolla yellowish, falcate, much exserted from the anterior cleft of the scarlet or scarlet-tipped calyx, and exposing the lower lip; galea about as long as tube, villous, bearded towards apex on the back.—Borders of woods, 10 to 500 ft.: San Diego Co. to Napa and Humboldt Cos.: extending e. to Kern Co. and ascending to 8300 ft. Var. *LINARIAEFOLIA* Zeile n. comb. Stems simple, erect from a woody crown; herbage glabrous, inflorescence a little pubescent; leaves linear, ½ to 3 in. long, the upper in fascicles, sometimes divided to below the middle into 3 linear lobes.—Montane, 4000 to 8500 ft.: Sierra Nevada from Modoc Co. to Kern Co. and s. to Los Angeles Co. (*C. linariaefolia* Benth.)

## 22. ORTHOCARPUS Nutt. OWL'S CLOVER

Annual herbs, or 3 species perennial. Leaves sessile, mainly alternate, entire, incised or laciniate, the floral frequently colored. Flowers in terminal

spikes. Calyx tubular or short-campanulate, 4-cleft, or cleft before and behind and the divisions 2-lobed. Corolla tubular, the upper lip (galea) snout-like, but not greatly (or not at all) exceeding the lower one. Lower lip more or less 3-saccate, inflated, often very conspicuous. Stamens 4; anthers 1 or 2-celled. (Greek *orthos*, upright, and *karpos*, fruit.)

**A. Perennials; lower lip of corolla not saccate or only slightly so; anthers 2-celled.**—Subgenus COLACUS.

Leaves entire or mostly so; rare.

- Middle lobe of bracts spatulate-dilated, very obtuse; S. Cal. .... 1. *O. cinereus*.  
 Middle lobe of bracts lanceolate, acute; Siskiyou Co. .... 2. *O. achizotrichus*.  
 Leaves cleft or divided; common. .... 3. *O. pilosus*.

**B. Annuals; lower lip of corolla saccate.**—Subgenus EUORTHOCARPUS.

1. ANTHERS 1-CELLED.

Seeds with a close coat.

Stamens in anthesis exerted from galea; flowers not more than  $\frac{1}{2}$  in. long.

- Stems 2 to 4 in. high, weak; flowers scattered, the corolla 2 to 3 lines long, dark red, inconspicuous. .... 4. *O. pusillus*.  
 Stems 5 to 12 in. high, more vigorous; flowers mostly in dense spikes, the corolla 6 lines long, cream-color or yellow. .... 5. *O. floribundus*.  
 Stamens in anthesis not exerted from galea (except in a var. of no. 7); flowers mostly more than  $\frac{1}{2}$  in. long.  
 Herbage greenish; corolla yellow or white, the galea whitish. .... 6. *O. faucibarbatulus*.  
 Herbage more or less purplish; galea purple.  
 Corolla sulphur-yellow. .... 7. *O. erianthus*.  
 Corolla white or pink or parti-colored; vars. of. .... 7. *O. erianthus*.  
 Seeds with a loose cellular coat; corolla golden yellow with purple galea. .... 8. *O. bidwelliae*.

2. ANTHERS 2-CELLED.

a. Corolla more or less 3-saccate.

Bracts herbaceous.

- Bracts entire. .... 9. *O. campestris*.  
 Bracts cleft into linear or lanceolate lobes.

Lower lip of corolla very broad, the sacs  $2\frac{1}{2}$  to 3 lines deep, deeper horizontally than long. .... 10. *O. lithospermoides*.

Lower lip of corolla less broad, the sacs not deeper horizontally than long.

Galea densely white-villous; corolla 1 in. long. .... 11. *O. lasiorhynchus*.

Galea not white-villous; corolla  $\frac{1}{2}$  to  $\frac{3}{4}$  in. long.

Sacs barely 1 line deep, longer than deep; infrequent. .... 12. *O. hispidus*.

Sacs  $1\frac{1}{2}$  lines deep, nearly as deep as long.

Flowers lemon-yellow; divisions of leaves and bracts narrowly linear; common. .... 13. *O. lacerus*.

Flowers white and purplish; divisions of leaves and bracts broader or the leaves entire; rare. .... 14. *O. rubicundulus*.

Bracts with purplish or whitish tips.

Corolla with lower lip conspicuously 3-saccate, the teeth minute or small.

Galea subulate; sacs longer than deep. .... 15. *O. linearilobus*.

Galea truncate at tip; sacs deeper than long. .... 16. *O. gracilis*.

Corolla with lower lip plicate-saccate or moderately 3-saccate, the teeth conspicuous, erect (in *O. purpurascens* small).

Filaments glabrous; galea nearly straight, pubescent.

Spikes virgate, lax below; flowers dull white; stigma not exerted from galea. .... 17. *O. attenuatus*.

Spikes stout, often subcapitate, dense; flowers purple and white; stigma exerted from the tip of galea.

Leaves 1 to  $2\frac{1}{2}$  in. long, mainly with a pair of lanceolate divisions; stem simple or little branched. .... 18. *O. densiflorus*.

Leaves  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long, entire or with linear divisions; stem usually with many ascending branches. .... 19. *O. castilleioides*.

Filaments hairy; galea long, hooked at apex, densely bearded; flowers pinkish purple; stigma exerted from galea below its tip. .... 20. *O. purpurascens*.

b. Corolla simply saccate or nearly so.

Bracts herbaceous, somewhat similar to the leaves, palmately 3-lobed, the middle lobe cuneate-lanceolate.

Corolla golden-yellow; lower lip not much broader than the upper. .... 21. *O. luteus*.

Corolla rose-purple; lower lip much broader than the upper. .... 22. *O. bracteosus*.

Bracts colored, strikingly different from the leaves, roundish to elliptic, commonly with a lanceolate tooth on each side.

Bracts mostly dilated above and rounded at the apex; galea incurved at tip. .... 23. *O. tenuifolius*.

Bracts not dilated above, acute at apex; galea straight or nearly so. .... 24. *O. pachystachyus*.

1. *O. cinereus* Jepson n. comb. Stems several from the perennial root-crown, ascending or diffuse, 7 to 9 in. high; herbage cinereous-pubescent; leaves nar-

rowly linear-lanceolate, entire or the upper sometimes divided into 3 linear lobes, erect or somewhat appressed to the stem, 3 to 9 (or 12) lines long, sessile; spikes rather dense,  $\frac{1}{2}$  to 2 in. long; bracts (at least the upper) 3-lobed, the lateral lobes narrow, the middle one very broad and very obtuse or truncatish (or spatulate-dilated), yellow, viscid; calyx equally 4-cleft; lower lip almost as long as galea; calyx and corolla yellowish; corolla 5 to 6 lines long; stigma large, conspicuously exserted.—San Bernardino Mts., 6000 to 7200 ft. (*Castilleia cinerea* Gray.)

2. *O. schizotrichus* Jepson n. comb. Stems many from a perennial root-crown, erect, 3 to 7 in. high; stems whitish-lanate, the leaves and bracts dusky lanate; leaves narrowly linear-lanceolate, acuminate, entire or sometimes 3-divided above, 1 to  $1\frac{1}{2}$  in. long; spikes dense; bracts 3-cleft below middle, the outer lobes linear and shorter than the broader lanceolate middle lobes; calyx equally 4-cleft; lower lip of corolla shortly 3-lobed, a little shorter than the galea.—Marble Mt. region, Siskiyou Co. (*Castilleia schizotricha* Greenm.)

3. *O. pilosus* Wats. Fig. 880. Stems numerous from the crown of a stout perennial root, leafy, 6 to 8 in. high; herbage soft-villous to hirsute-pubescent; leaves pinnately 3 to 5-parted into linear lobes, or the lower entire; bracts from yellowish or whitish to dull crimson; calyx deeply cleft into linear lobes; flowers white, pink or reddish; lower lip only slightly saccate, strongly 3-toothed, the teeth white; galea purplish, somewhat recurved at tip, a little longer than the lip; stigma very large and black, just exserted from tip of galea.—Montane, 5000 to 10,000 ft.: Sierra Nevada from Tulare Co. to Nevada Co.; n. to Mt. Shasta; Ore. July-Aug. Var. *MONENSIS* Jepson n. var. Somewhat diffuse,  $2\frac{1}{2}$  to  $3\frac{1}{2}$  in. high; racemes very dense; galea twice as long as the large lower lip.—High montane, 9500 to 10,600 ft., Mono Co.: Mono Pass; Bloody Cañon (Jepson 4431a, type). Var. *ARACHNOIDEUS* Jepson n. comb. Stems many from the perennial root-crown, erect, 3 to 7 in. high; herbage and inflorescence thinly arachnoid; leaves 3-lobed, 1 to  $1\frac{1}{2}$  in. long, the segments narrowly linear or filiform, entire or the middle one incised or cleft; bracts broad, cleft to below middle; lower lip a little inflated.—

880. *Orthocarpus pilosus* Wats.; a, habit  $\times \frac{1}{3}$ ; b, fl.  $\times 1\frac{1}{2}$ ; c, bract  $\times \frac{1}{2}$ ; d, stamen  $\times 4$ .

Marble Mt., Siskiyou Co. to Salmon Mt., Trinity Co. (*Castilleia arachnoidea* Greenm.)

4. *O. pusillus* Benth. Stem slender and weak, 2 to 4 in. high; herbage purplish, sparingly hispidulous-pubescent; leaves pinnately cleft into linear or filiform divisions; bracts longer than the scattered inconspicuous dark red flowers; corolla 2 to 3 lines long.—Hillsides and fields, 10 to 1500 ft., coloring moist spots with a dull red hue: Santa Clara Co. to Humboldt Co.; n. to Ore. Mar.-Apr. It is often parasitic on grasses.

5. *O. floribundus* Benth. Stem erect, somewhat corymbosely branched from near the base or the middle, 5 to 12 in. high; herbage nearly glabrous; leaves (especially the upper) pinnately parted into linear-filiform divisions, some again parted; spikes short and dense, the upper bracts not surpassing the calyx; corolla white or cream-color, 6 lines long, its tube much exceeding the calyx; lower lip with 2 hairy lines within.—Hillsides near the coast, 10 to 500 ft.: San Francisco Co. to San Mateo Co.

6. *O. faucibarbat* Gray. Fig. 881. Plants 7 to 20 in. high, commonly with ascending branches from the middle; herbage greenish, glabrous, or puberulent above; leaves oblong or ligulate at base, pinnately cleft above into several linear divisions; spikes at length elongated and lax; bracts shorter than the flowers, palmately cleft or parted into lanceolate segments; corolla sulphur-yellow or pinkish white or white, 9 to 10 lines long, its tube whitish, very slender, pubescent, twice the length of the calyx; sacs of lower lip nearly 2 lines deep, deeper than high; folds of throat bearded within; anthers connivent.—Low moist fields in the Coast Range valleys, 10 to 1500 ft.: Monterey Co. to Del Norte Co. Apr.-May.

7. *O. erianthus* Benth. JOHNNY-TUCK. Fig. 882. Stem commonly branching, 4 to 10 in. high; herbage, particularly the bracts and stems, reddish; leaves pinnately divided into filiform divisions; spikes slender, flat-topped; bracts much shorter than the flowers; corolla 8 to 9 lines long and sulphur-yellow except the dark purple subulate galea, its filiform tube at least twice the length of the calyx; sacs of the lower lip 2 lines deep, deeper than

881. *Orthocarpus faucibarbat* Gray; a, fl. branchlet  $\times 1$ ; b, leaf  $\times 1$ ; c, cross sect. of ovary  $\times 5$ .

882. *Orthocarpus erianthus* Benth.; a, habit  $\times \frac{1}{4}$ ; b, flower  $\times 1\frac{1}{2}$ .

high, each sac commonly with 2 greenish yellow spots at the base of the tooth; folds of the throat densely bearded; anthers connivent.—Low hills and valleys, 10 to 2000 ft., throughout cismon-tane Cal.; also sw. Ore. It is very abundant on the plains of the Sacramento and San Joaquin valleys, in the Sierra Nevada foothills and on the low hills of the Coast Ranges, often coloring wide stretches with streamer-like bands of yellow in Apr. and May. Var. *MICRANTHUS* Jepson n. comb. Smaller, about 4 in. high; corolla-tube much shorter; stamens early exserted from galea, the anthers not connivent.—Foothills and plains: Madera Co.; Fresno Co.; w. to eastern Monterey Co. (*O. micranthus* Greene.) Var. *GRATIÖSUS* Jepson & Tracy n. var. Two lateral sacs white, the middle one yellow, the galea and throat dark.—Sandhills, Humboldt Co. (Eureka, Tracy 2035, type). Var. *VERSICOLOR* Jepson. Popcorn Beauty. Corolla white, excepting the purple galea, often with a transverse purple band across the throat below the sacs; otherwise like the species.—San Francisco. Var. *ROSEUS* Gray. Corolla rose-color.—San Francisco sand hills. Var. *INOPINUS* Jepson n. var. Upper leaves and bracts fan-shaped with linear divisions; sacs of

corolla very large, rose-purple with a yellow spot above.—Mendocino (H. E. Brown 700, type).

8. *O. bidwélliae* Gray. Very similar to *O. erianthus*, but the foliage less pubescent, the corolla tube more slender, 6 to 7 lines long; lower lip rather smaller, golden-yellow, the throat and galea dark purple; seeds with loose cellular arilliform coat.—Foothills, Butte Co. to Placer Co.

9. *O. campéstris* Benth. Stem 2 to 4 in. high, simple or few branched; herbage glabrous below; leaves and bracts narrowly linear, entire or nearly so; spike thickish, dense above; calyx markedly hirsute; corolla white, 6 to 9 lines long, the galea subulate, the sacs ample, very ventricose, 2 lines deep, the teeth scarious, slender, rather conspicuous; capsule ovate.—Fields, Butte and Plumas Cos. to Modoc Co.

10. *O. lithospérmoides* Benth. CREAM SACS. Stem erect and simple, rarely with a few branches above the base, 8 to 12 (or 14) in. high; herbage hirsute-pubescent above, less so below; lower leaves lanceolate, entire; upper oblong, with a few slender lobes; spike very dense and thick; bracts nearly equaling the flowers, the upper large, almost as broad as long, concealing the calyx, dilated at the base, palmatifid into 7 or more narrow lobes; corolla rich cream-color, 9 to 13 lines long, strongly 3-saccate, the tube dilated upwards; capsule ovate.—Plains and low hills, 20 to 1500 ft.: Coast Ranges from Santa Clara Co. to Humboldt Co.; Sacramento Valley and bordering foothills. Var. *bicolor* Jepson n. comb. Flowers white, turning rose-pink.—Butte Co. foothills. (*O. bicolor* Hel.)

11. *O. lāsiorhynchus* Gray. Stem 3 to 15 in. high, simple or sparingly branched; herbage soft-hirsute; leaves linear-lanceolate, attenuate, entire or 3-parted,  $\frac{1}{2}$  to  $\frac{3}{4}$  in. long; spike cylindric, loose, rather few-flowered; bracts 4 or 5-cleft, exceeded by the flowers; corolla yellow, 8 to 10 lines long; galea narrowly subulate, surpassing lower lip, densely white-villous; teeth of the lip very short; capsule 3 lines long; seeds many, with loose reticulated coat.—Montane, 5000 to 6500 ft.: San Bernardino and San Jacinto mountains.

12. *O. hispídus* Benth. Stem simple or sparingly branched, 4 to 12 in. high; herbage soft-hirsute; leaves entire or with few slender divisions,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; spike lax; bracts palmately cleft into 3 or more lanceolate divisions; calyx 4 to  $5\frac{1}{2}$  lines long, the teeth lanceolate; corolla pale yellow (or white), 5 to 8 lines long, the tube filiform; lower lip surpassed by galea, teeth short, sacs longer than deep, throat with dark dots, folds hairy within; capsule ovoid, obtuse, longer than the calyx-tube; seeds obovoid, dark gray.—Montane, 3000 to 5000 ft., infrequent: Palomar Mt.; both slopes Sierra Nevada from Tulare Co. to Modoc and Siskiyou Cos.; n. to B. C. June.

883. *Orthocarpus lacerus* Benth.; a, habit  $\times \frac{1}{2}$ ; b, fl.  $\times 1\frac{1}{2}$ ; c, calyx spread open  $\times 1\frac{1}{2}$ ; d, stamen  $\times 3\frac{1}{2}$ .

13. *O. lácerus* Benth. Fig. 883. Stem 3 to 8 in. high, erect, simple or sparingly branched; herbage soft-hirsute, viscid above; leaves  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long, alternate or the lowest opposite, linear-lanceolate, entire or pinnately 3-parted; spike loose, cylindric, few to many-flowered; bracts palmately 3 to 7-cleft into narrow divisions; calyx 3 lines long, cleft into lanceolate divisions; corolla bright or lemon yellow, 6 to 8 lines long, the lip  $1\frac{1}{2}$  lines deep, 2 lines long; galea gla-

brous or puberulent on back; lower lip often dark-dotted; teeth short, surpassed by galea; capsule 3 lines high.—Foothills and middle altitudes, 700 to 4700 ft., common: Sierra Nevada from Tuolumne Co. to Modoc Co. May-July.

14. *O. rubicundulus* Jepson n. sp. Stem simple or branched above, 4 to 9 in. high, pilose; leaves lanceolate, entire or 3-cleft, hispid, 1 in. long; inflorescence dense above, lax below; bracts all green, 7 to 9 lines long, broad at base, 3 to 5-cleft into lanceolate divisions, hispid or somewhat pilose; calyx 4 lines long, cleft for nearly half its length into subulate segments; corolla white, turning a light rosy-pink, 9 lines long; sacs conspicuous, 2 lines deep, as deep as high, each sac with a deep longitudinal crease so deep as to make each one almost 2 distinct sacs; main folds of the sacs inside very hairy-pubescent; 2 yellow spots at base of saccate lower lip; teeth very short (the apices of the sacs rising above them), with greenish-yellow spots on the inside at apex, surpassed by the straight subulate galea.—Inner North Coast Range montane valleys from Lake Co. (Indian Valley, Jepson 9001, type) to ne. Napa Co. May.

15. *O. linearilobus* Benth. Stem 6 to 9 in. high, simple or branched; herbage hirsute or nearly hispid; leaves alternate, 1 to 2 in. long, lanceolate, entire or pinnately parted into long slender divisions; spike dense; bracts nearly equaling the flowers, the long slender divisions sometimes purplish-tipped; calyx-lobes much longer than the tube; corolla 7 to 9 lines long, white or yellowish-white, commonly with a few purple dots on the sacs; galea exceeding lower lip, teeth short, sacs deeper at upper part, narrowing gradually downward; capsule 4 lines long; seeds many, with loose reticulated coat.—Sierra Nevada foothills, Yuba Co. to Mariposa Co. Apr-May.

16. *O. gracilis* Benth. Stem 4 to 10 in. high, simple or branched from the base; herbage glabrous below, minutely pubescent above; leaves mostly 3-parted, linear-filiform; spike rather dense, slender; upper bracts shorter than the flowers, purplish-tinged at tip; corolla scantily puberulent, purplish, 6 to 7 lines long; tube slender, twice the length of the calyx; galea little exceeding the purple teeth of the lower lip, truncate at tip; sacs white, changing to purple, deeper than long, somewhat conical; lower anther-cell mostly imperfect; capsule oblong, obtuse.—Santa Lucia Mts. to San Diego Co.

17. *O. attenuatus* Gray. VALLEY TASSELS. Stem slender, strict or more rarely with a few branches, 5 to 12 in. high; herbage hirsute-pubescent; leaves linear-lanceolate, attenuate, entire or the upper with one or more filiform lobes above the middle, 1 to 3 in. long or less, mostly 1, or sometimes 5, lines wide; spikes slender, loose below, denser above; bracts with white tips or almost wholly herbaceous; calyx-lobes 4, filiform, the divisions of nearly equal depth; corolla dull white, sometimes yellow, not deeply 2-lipped; lower lip shallowly saccate, purple-dotted, its lanceolate teeth large for the size of the corolla, almost as long as the saccate portion and nearly or quite equaling the galea; capsule oblong, about 3 lines long; seeds white.—Valleys and foothills, 10 to 2100 ft.: Coast Ranges from Santa Barbara Co. to Siskiyou Co.; Tehachapi Mts.; Sacramento Valley; Sierra Nevada foothills from Tuolumne Co. to Butte Co. May.

18. *O. densiflorus* Benth. OWL'S CLOVER. Stem strict or strictly branched, 5 to 15 in. high, finely pubescent; leaves oblong-lanceolate to linear, 1 to 2½ in. long, with mainly a pair of filiform or slender divisions; spike dense, 4 in. long or less; bracts 3-cleft with purple and white tips; calyx-segments spatulate-dilated, purple; corolla 8 to 10 lines long, purple and white; lower lip with large crimson dots, the conspicuous purple (sometimes white) teeth nearly as long as the rather short galea.—Valley fields and low hills, 20 to 2500 ft., common: Coast Ranges from Mendocino and Solano Cos. to San Luis Obispo Co. and s. to San Diego Co.; Mariposa Co. foothills. Apr-June.

19. *O. castilleioides* Benth. JOHNNY-NIP. Stem corymbosely branched from the base, commonly 6 to 11 in. high; herbage somewhat hirsute-pubescent; leaves shorter and mostly broader than in *O. densiflorus*, mostly 1 to 4 lines wide, entire or with lacinate linear divisions; spikes short and dense, or even subcapitate, the bracts with white or yellowish tips; calyx-segments linear; corolla 6 to 10 lines long, dull white with purple marks or the sacs

884. *Orthocarpus purpurascens* Benth.; a, inf. x  $\frac{3}{4}$ ; b, fl. with calyx removed x 1; c, capsule x 1.

yellow; galea scarcely longer than the bright rose purple teeth; capsule oblong, 5 to 6 lines long, obtuse or emarginate; seeds oblong or longer, dark brown.—Marshy ground near the coast, 10 to 200 ft.: Monterey Co. to Napa and Humboldt Cos.; n. to Wash. June. Var. *INSALUTATUS* Jepson n. var. Leaves and bracts broader and shorter; bracts mostly 3-parted, the middle lobe broad and very blunt; sacs of lower corolla-lip broad and very protuberant.—Monterey Co. (Pacific Grove, Jepson, type).

20. *O. purpurascens* Benth. ESCOBITA. Fig. 884. Stem erect or frequently much branched from the base with ascending branches, 4 to 15 in. high; herbage villous-pubescent; leaves parted into many linear or filiform divisions, which are often brownish-tinged; spike thick and dense, 2 to 4 in. long; bracts dilated at base, palmately cleft into filiform or narrowly linear lobes, the upper with crimson or purple spatulate-dilated tips, as also the calyx-lobes; calyx more deeply cleft behind than before; corolla crimson or purplish,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long; lower lip white-tipped, with yellow and purple dots or markings; galea densely purple-bearded on the back, incurved at tip, exceeding the lower lip; capsule ovate, acute, 5 to 6 lines long; seeds orbicular to ovate, white, somewhat winged.—Valleys and low hills, common, 10 to 2000 (or 5000) ft.: cismontane S. Cal.; Monterey Co. to Napa Co.; lower San Joaquin Valley; Sacramento Valley; n. Sierra Nevada foothills from Tuolumne Co. to Nevada Co. Apr.-May. Var. *MULTICAULIS* Jepson n. var. Stems several from the base, ascending, 4 to 5 in. high; lobes of the bracts very short and broad.—Ft. Bragg (W. C. Mathews, type). Var. *ORNATUS* Jepson n. comb. Three to 4 in. high; purple ends to bracts showy; tips of sacs deep yellow.—Central Mohave Desert. (*O. ornatus* Hel.)

21. *O. luteus* Nutt. Stem 3 to 11 in. high, simple or above sparsely branched; herbage more or less hispid, glandular-pubescent; leaves  $\frac{1}{2}$  to 1 in. long, linear-lanceolate, entire, or the upper 3-parted; spike elongate, dense, becoming lax below; bracts  $3\frac{1}{2}$  to 4 lines long, wholly herbaceous, 3-parted, the lobes lanceolate, acute; calyx 2 to  $2\frac{1}{2}$  lines long, the teeth acute or obtusish; corolla 4 to  $4\frac{1}{2}$  lines long, well-exserted, golden-yellow, pubescent, the tube exserted from the calyx, the galea uncinately, equaled by the lower lip, this not constricted below the teeth which are merely incurved; anthers 2-celled, the cells bearded.—East slope Sierra Nevada from Mono Co. to Modoc Co.; n. to B. C., e. to Col. Aug.-Sept.

22. *O. bracteatus* Benth. Stem 3 to 18 in. high, strict, simple or branched; herbage somewhat hirsute, glandular-pubescent; leaves  $\frac{1}{2}$  to 2 in. long, lanceolate, entire or 3-lobed, the lobes acute; spike cylindric, dense or becoming lax below; bracts 4 to 6 lines long, shorter than the flowers, 3-lobed, the lobes lanceolate, acute; calyx  $2\frac{1}{2}$  to 3 lines long, the 4 lanceolate teeth  $\frac{1}{2}$  as long as the tube; corolla narrow-funnelform, rose-purple, 6 to 7 lines long; galea hooked at apex, hardly longer than the much-dilated 3-saccate lower lip; anthers 2-celled, the cells ciliate; capsule ovoid, 2 to 3 lines long; seeds costate.—Modoc Co.; n. to B. C.

23. *O. tenuifolius* Torr. Stem 5 to 13 in. high, somewhat pubescent or hirsute, branched above; leaves lanceolate, entire or with narrow lateral lobes,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long; spike dense, cylindric; bracts 5 to 6 lines long.

quadratis-elliptic, entire, or with a short narrow lateral lobe on each side, rounded at apex or sometimes sharply acute; calyx deeply cleft, the lobes shallowly 2-cleft; corolla purplish, often with yellow sacs, puberulent,  $\frac{1}{2}$  in. long, the tube much longer than the calyx; galea incurved at tip, surpassing the 3 inconspicuous teeth; anther-cells oblong, sparsely pubescent.—Humboldt, Trinity and Shasta Cos.; n. to B. C. July-Aug.

24. *O. pachystachyus* Gray. Stem 6 to 11 in. high, slightly hirsute, simple or somewhat branched above; leaves linear-lanceolate, entire or 3-parted into lanceolate divisions; bracts imbricated in the thick spike, elliptic to ovate, abruptly acute, entire or with a lanceolate lobe on each side toward the base, 7 to 8 lines long, more or less hispid-ciliate toward the base, the tips purplish; calyx  $4\frac{1}{2}$  lines long, hispid, deeply 2-cleft, its lobes cleft to the middle into subulate divisions; corolla glandular-pubescent, 1 in. long, dark purple with yellowish sacs, the long galea nearly straight, greatly exceeding the lower lip, the teeth conspicuous.—Siskiyou Co. June. Var. *CUSPIDATUS* Jepson n. comb. Bracts smaller; corolla 5 to 6 lines long, the short blunt galea but little longer than the lower lip.—Montane, 5000 to 7000 ft.: Sierra Nevada from Mariposa Co. to Siskiyou Co.; n. to Ore. (*O. cuspidatus* Greene.)

### 23. *CORDYLANTHUS* Nutt. BIRD'S BEAK

Branching annuals. Leaves alternate, narrow, either entire, pinnatifid or 3 to 5-parted into linear divisions. Bracts and calyx seldom colored. Flowers scattered along the branches or in terminal clusters or heads. Calyx spathe-like. Corolla tubular, enlarged a little upwards, 2-lipped, the lips of nearly equal length; upper lip incurved at apex, hooding the stamens and pistil; lower lip entire or obtusely 3-toothed. Stamens 4 or 2; anthers 2 or 4-celled, the cells unequal, ciliate or minutely bearded. Capsule flattened; seeds with a loose coat. (Greek cordule, club, and anthos, flower, in reference to the shape of the corolla.) *ADENOSTEGIA*.

Bracts and floral leaves (at least some of them) gland-tipped; flower scattered or borne in terminal heads; filaments villous (except in *C. capitatus*).—Subgenus *ADENOSTEGIA*.

Stamens 2; filaments nearly glabrous; anthers 1-celled.....1. *C. capitatus*.

Stamens 4; filaments villous; anthers 2-celled (1-celled in no. 6).

Flowers in dense terminal heads, these few to many-flowered (some of the flowers scattered in var. of no. 2).

Heads of many flowers; bracts more or less hirsute-ciliate, all except the uppermost 3-parted into linear divisions.....2. *C. rigidus*.

Heads of few flowers; bracts not hirsute-ciliate, all except the uppermost fan-shaped, obtusely 3 to 5-lobed.....3. *C. pringlei*.

Flowers more or less scattered along the stems, these terminated by single flowers or by loose clusters of 2 to 5.

Lower bracts 5 to 7-parted into long narrowly linear divisions...4. *C. ramosus*.

Lower bracts entire or 3-toothed or -parted.

Anthers 2-celled; corolla equaled or exceeded by at least some of the lower bracts, these entire, 3-toothed or -parted...5. *C. pilosus*.

Anthers 1-celled; corolla usually far exceeding the 3-parted lower bracts.

6. *C. nevadensis*.

Bracts and floral leaves not gland-tipped; flowers borne in dense spikes; filaments glabrous.

—Subgenus *HEMISTEGIA*.

Some of the leaves pinnatifid; stamens 2; anthers 2-celled.....7. *C. mollis*.

Leaves entire; stamens 4, the anthers of the longer 2-celled, of the shorter 1-celled...

8. *C. maritimus*.

1. *C. capitatus* Nutt. Stem 7 to 12 in. high, more or less branched; herbage pubescent with long soft white hairs, somewhat glandular; leaves 3 to 12 lines long, linear, entire or 3-parted; flowers in small heads, or some scattered; lower bracts linear, entire or 3-parted; uppermost bract entire, 5-nerved, purplish, acute, curving outward; calyx cleft to base anteriorly, 2-nerved, 2-cleft at apex posteriorly, shorter than corolla; corolla 6 lines long, purplish, lips nearly equal, the lower entire, rounded; stamens 2, the filaments nearly glabrous, dilated above base and forming a U-shaped curve toward the apex; anthers 1-celled, ciliate.—Lassen Co.; n. to Wash. and Ida.

2. *C. rigidus* (Benth.) Jepson. MULE-WEED. Stem erect, paniculately branched, 1 to 2 or 3 ft. high; herbage finely puberulent, sometimes hispid or glabrous below; lower leaves linear, entire, upper 3 to 5-parted into linear divisions, their tips dilated and retuse; flowers crowded in terminal heads,

the uppermost bract entire, the others 3-parted into linear divisions with dilated tips, these (together with the calyx) hispid-ciliate, sometimes purplish or purple-dotted; calyx obliquely parted on the anterior side nearly to base; corolla dull white or yellowish and purplish, 7 lines long, often densely pubescent within, the upper lip slightly longer than the lower; filaments villous on lower side; anther-cells ciliate.—Hills and cañons, 500 to 3000 (or 6500) ft.: cismontane S. Cal.; n. to the Santa Cruz Mts. and Mt. Hamilton Range. Var. *SYLVATICUS* Jepson n. var. Puberulent; leaves and bracts more broadly linear, entire or less deeply 2-parted, the upper ones from hispid-ciliate to minutely ciliate; heads large.—Near the coast from Santa Lucia Mts. (Cold Spr., Jepson 2590, type) to Santa Barbara Co.; mts. of Tulare Co. Var. *LITTORALIS* Jepson n. comb. About 1 ft. high, diffusely much-branched; herbage puberulent; leaves entire or 3-parted,  $\frac{3}{4}$  in. long; bracts 3-parted into linear divisions, not hispid-ciliate; flowers mostly in small terminal heads, some scattered.—Monterey Co. (*A. littoralis* Ferris.) Var. *BREVIBRACTEATUS* (Gray) Mcbr. Herbage glabrous or puberulent below inflorescence; bracts hispid-ciliate with short bristles, also shorter and fewer; heads small, the flowers shorter and fewer.—Tulare and Kern Cos. (*C. filifolius* var. *brevibracteatus* Gray.)

3. *C. pringlei* Gray. About  $1\frac{1}{4}$  ft. high, diffusely branched, glabrous or puberulent below, the inflorescence finely pubescent; leaves linear-filiform, 4 to 6 lines long; lower bracts fan-shaped, obtusely 3 to 5-lobed, the uppermost bract and the calyx oblong, bifid, equaling the corolla, the 4 or 5 nerves closely beset with wart-like glandular protuberances; flowers in capitate clusters of 3 to 5, terminating the stem and branches; corolla 4 to 5 lines long, about equaling the calyx.—Montane summits, Lake Co., very local: Cobb Mt.; Snow Mt.

4. *C. ramosus* Nutt. Stem 5 to 10 in. high, much-branched; herbage pubescent, the apical glands obscure; leaves 1 to  $1\frac{1}{2}$  in. long, mostly 3 to 7-parted into filiform divisions; some of the flowers scattered, most of them in loose terminal clusters of 3 to 5; bracts mostly longer than the flowers, rather sparsely hispid and hispid-ciliate, all except the uppermost 5 to 7-parted for more than  $\frac{3}{4}$  their length into linear divisions, the tips not dilated; calyx cleft to base anteriorly, bidentate at tip, longer than the corolla; filaments villous, anther-cells ciliate.—Lassen Co.; n. to Ore., e. to Rocky Mts. July.

5. *C. pilosus* Gray. Stem paniculately branched, 2 to 3 ft. high, pilose or soft-pubescent; leaves linear, somewhat fascicled below,  $\frac{1}{4}$  to 1 in. long, the upper and floral often with 1 to 3 callous-glandular teeth at the broadly dilated tip or sometimes 3-parted into linear divisions; flowers 2 or 3 together at the ends of the branchlets, or only 1; calyx equaling or exceeding the corolla, often sharply bifid at apex, anteriorly cleft to base; corolla 6 to 8 lines long, yellowish or purplish, the lower lip rather broad below, shorter than the upper; stamens 4; anthers 2-celled, free, the cells often ciliate; filaments villous.—Dry hills, 50 to 2000 (or 5200) ft.: Coast Ranges from Colusa and Sonoma Cos. to Santa Clara Co.; s. to Ventura Co. Sept. Var. *TRIFIDUS* Rob. & Greenm. Slender,  $\frac{1}{2}$  to 2 ft. high, branching; herbage white-pilose, more or less glandular; leaves  $\frac{1}{4}$  to 1 in. long, the larger linear, entire, the smaller and the bracts commonly pinnately divided near the base into 3 divisions, the lateral divisions much shorter than the middle one; bracts dilated and notched at the tips.—Mariposa Co. Var. *BOLANDERI* Gray. Commonly lower, less pilose, more viscid and glandular; flowers all scattered, the bracts often 3-parted into linear divisions with dilated tips.—Napa Co. to Siskiyou Co., thence to Modoc and Amador Cos. Var. *TENUIS* Jepson n. comb. One to 2 ft. high, more slender, seldom pilose or glandular; leaves narrower, entire, scarcely or not at all dilated at tips; bracts entire, sometimes 3-parted, the tips slightly or not at all dilated.—Sierra Nevada from Fresno Co. to Lassen Peak; n. Lake Co. (*C. tenuis* Gray.) Var. *BRUNNEUS* Jepson n. var. About  $1\frac{1}{4}$  ft. high, glabrous below, diffusely and subdivaricately branched, branches very slender and wiry, dark brown or mahogany-color; leaves filiform, 6 lines long, the floral somewhat callous-tipped; branchlets and inflorescence sparsely and minutely glandular-hispid; flowers few, solitary, terminating the stem and branches; calyx narrow, bifid; corolla white or greenish-

white, marked with purple at the middle, 4 to 5 lines long; capsule oblique at summit, beaked.—Montane summits, Napa and Lake Cos.: Howell Mt.; Mt. St. Helena (Jepson, type); Mt. Hanna.

6. *C. nevinii* Gray. Stem loosely much-branched,  $\frac{1}{2}$  to 2 ft. high; herbage villous-pubescent, glandular; leaves linear, entire or 3-parted, the tips often glandular-dilated and toothed; flowers scattered along the slender branchlets or 1 to 3 at the apices, usually much exceeding the subtending bracts; lower bracts linear, mostly 3-parted, the tips dilated, glandular, often whitish; uppermost bract sheathing at base, rounded at apex, short-bristly or somewhat muriculate-scabrous; calyx tubular at base or obliquely cleft or parted on the anterior side nearly to base, soft-ciliate, glandular-bristly or somewhat muriculate-scabrous; corolla yellowish or purplish, 5 to 9 lines long, tubular at base, becoming broadly expanded above the middle, narrowing abruptly to a point at the tip, the lips about 2 lines long, nearly equal; stamens 4, borne on a densely pilose yoke-shaped ridge which separates the tube anteriorly from the expanded portion of the corolla, the filaments villous; anthers free or connivent in pairs, 1-celled, the cell ciliate, the second cell sometimes rudimentary; seeds nearly smooth, scarious-apiculate.—Montane, 6000 to 7000 ft.: San Gabriel, San Bernardino and San Jacinto mountains; s. to Cuyamaca Mts. Aug.-Sept.

7. *C. mollis* Gray. Simple or branched,  $\frac{1}{2}$  to 1 ft. high, villous-pubescent, the bracts densely villous-hirsute; leaves 4 to 8 lines long, linear or oblong, entire, or the upper leaves and the bracts saliently few-toothed or pinnatifid; flowers borne in thick spikes  $1\frac{1}{2}$  to  $3\frac{1}{2}$  in. long; calyx anteriorly cleft entirely to base; corolla 8 to 9 lines long, the tube gibbous at base, widening upward, the lips  $2\frac{1}{2}$  lines long, the lower deeply 3-crenate, the upper incurved; stamens 2; anthers 2-celled, connivent; filaments glabrous; anther-cells hairy at base; style long, hooked at apex, exserted; seeds reniform, reticulate-favose.—Salt marshes bordering San Francisco Bay and its arms. Aug.

8. *C. maritimus* Nutt. Corymbosely branched, 5 to 12 in. high; herbage glaucous and more or less hoary-pubescent; leaves linear or lanceolate to oblong, 1 in. long, entire; flowers in short rather thick spikes, about as long as the loosely imbricated entire or unequally 2 or 3-cleft bracts; calyx sheath-like, cleft to the base anteriorly, entire or notched at apex; corolla purplish, pubescent without, 2-lipped at summit, the lips about equal, the lower lip deeply 3-crenate, the upper incurved at apex, the tube narrow; stamens 4 in very unequal pairs; anthers of the longer pair connivent, 2-celled, of the shorter pair free with only the lower small cell, the other cell usually represented by a filamentous or somewhat flattened process, all the cells hairy at the base; filaments glabrous or the shorter pair somewhat pubescent; style hooked at apex, exserted; seeds reticulate-favose.—Salt marshes or saline meadows: cismontane S. Cal. and n. along the coast to Humboldt Co. July. Var. *CANESCENS* Jepson n. comb. Canescent with soft villous pubescence; corolla white.—E. side Sierra Nevada: Owens Lake; Modoc Co. (*C. canescens* Gray.) Var. *PARRYI* Jepson n. comb. A taller more branching form with the upper leaves and bracts narrower, lanceolate, entire.—Honey Lake Valley. (*C. parryi* Wats.)

## 24. *BELLÁRDIA* All.

Erect finely pubescent annual with opposite leaves. Flowers in a dense terminal spike, solitary and sessile in the axils of broad imbricated bracts. Calyx campanulate, deeply cleft before and behind into 2 shortly notched lobes. Corolla strongly 2-lipped, the upper lip galeate, a little shorter than the lower; lower lip very broad, shallowly 3-lobed, the palate with 2 narrowly-inflated longitudinal folds. Stamens 4, with broad filaments, the lower pair slightly longer; anthers densely short-hairy near the margins of the valves. Ovary white-hairy. Capsule turgid. (C. A. L. Bellardi, 1740-1826, Professor of Botany in Turin University.)

1. *B. trixágo* (L.) All. Stems  $\frac{1}{2}$  to  $1\frac{1}{2}$  ft. high, retrorsely pubescent; leaves lanceolate or linear-lanceolate, coarsely toothed; spike dense, thick, somewhat 4-sided; bracts ovate-cordate, attenuate; corolla white, or the

galea pink, 8 to 9 lines long, the calyx half as long.—Nat. from Eur. in old fields: Pacheco; East Oakland; Berkeley; Napa. May.

## 25. PARENTUCÉLLIA Viv.

Erect annual herbs with toothed leaves. Flowers in a terminal leafy spike. Calyx campanulate, deeply 4-cleft, the front and back sinuses a little deeper than the lateral. Corolla 2-lipped, the upper helmet-shaped, the lower 3-lobed. Stamens 4. Anther-cells approximate, mucronate at base. Capsule lanceolate, loculicidal. (Meaning obscure.)

1. *P. viscosa* (L.) Car. Stem slender, simple or somewhat branching,  $\frac{3}{4}$  to 2 ft. high; leaves oblong-lanceolate, sessile,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long; corolla yellow, 8 to 9 lines long.—Native of s. Eur., introduced in valley lands from Arcata to Blue Lake, Humboldt Co.

## 26. PÉDICULARIS L. LOUSEWORT

Perennial herbs. Leaves alternate or basal, pinnatifid or pinnate (or simple in *P. racemosa*). Flowers in a bracteate raceme or spike. Calyx 2 to 5-cleft or -toothed. Corolla strongly 2-lipped; upper lip galeate, strongly arched; lower lip of 3 small rounded lobes or teeth, the middle lobe the smallest. Stamens 4, under the galea; anthers with equal cells. Capsule flattened, oblique at apex, loculicidally 2-valved. (Latin pediculus, a louse; of uncertain application.)

Calyx split to the base in front, 2-toothed behind; galea beaked; stems branching; leaves not divided, merely crenulate.....1. *P. racemosa*.  
Calyx 5-cleft or -toothed; stems strictly simple, usually several from the root-crown; leaves pinnatifid or pinnate.

Stems without basal leaves; galea shortly beaked.....2. *P. howellii*.  
Stems always with a basal tuft of leaves.

Upper lip of corolla blunt and beakless; raceme or spike little surpassing or shorter than the simple leaves.

Corolla red; flowers in a raceme raised on a stem.....3. *P. densiflora*.

Corolla yellow; flowers in a spike (or spike-like raceme) on the ground.....4. *P. semibarbata*.

Upper lip of corolla produced above the galea into a slender curving proboscis-like beak; flowers in a spike, much exceeding the leaves, these chiefly in a short basal tuft.

Calyx-teeth  $\frac{1}{2}$  to as long as the tube; beak closely recurved on the galea; spike woolly.....5. *P. attollens*.

Calyx-teeth very short; beak curving forward beyond the galea and then upward; spike glabrous.....6. *P. groenlandica*.

1. *P. racemosa* Dougl. Stems 8 to 20 in. high, many from a woody root-crown, with very slender branches; herbage glabrous; leaves lanceolate, narrowed at base into a petiole, minutely and doubly crenulate,  $1\frac{1}{4}$  to  $3\frac{1}{2}$  in. long; flowers on short pedicels, in a leafy-bracteate loose raceme; calyx split to the base in front, 2-toothed behind, 3 lines long; corolla pink or white, 7 to 9 lines long; lower lip 6 lines broad, twice as broad as long; upper lip strongly incurving and prolonged into a tapering hooked beak which nearly touches the lower lip; anthers sagittate.—Montane, 6000 to 7000 ft.: Placer Co. to Trinity and Siskiyou Cos.; n. to B. C., e. to Rocky Mts.

2. *P. howellii* Gray. Stems 12 in. high, simple, several from the scaly buds of the root-crown, naked below, leafy above, ending in a dense short-cylindric spike 1 in. long; herbage glabrous; leaves pinnate with 5 (or 3) serrate leaflets, the lateral oblong-ovate, 8 to 9 lines long, the terminal leaflets much larger; uppermost leaves simple; bracts entire or obscurely lobed, villous on lower half, shorter than the flowers; calyx villous, its lobes very short, mostly toothed; corolla white, 4 lines long, strongly arched, with a short recurved beak; lobes of the lower lip very small, equal, denticulate; filaments glabrous.—Dry ridges, Siskiyou Mts., 6000 ft.

3. *P. densiflora* Benth. INDIAN WARRIOR. Fig. 885. Stems simple, erect, 9 to 12 in. high, commonly several from the scaly root-crown; herbage soft-pubescent or nearly glabrous; leaves pinnately divided or parted, the segments oblong and doubly serrate-toothed or incised; flowers in a dense raceme; bracts linear, ciliate or serrulate towards the apex, mostly shorter

than the flowers. crimson or crimson-tipped; calyx-teeth broadly lanceolate,  $1\frac{1}{2}$  to 2 lines long, half as long as the tube; corolla crimson, bent downward above the calyx, 10 to 12 lines long; galea large, slightly broader upwards, strongly arched; lower lip very small, of 3 rounded teeth; anther-cells acute at base.—Wooded hills: Coast Ranges from Humboldt Co. to Santa Clara Co., s. to the San Gabriel and San Bernardino mountains.

4. *P. semibarbata* Gray. Stems few, short and mostly subterranean, arising from the root-crown and bearing on the ground a few short spikes (or spicate racemes) surrounded by a rosette of leaves; leaves twice pinnatifid, 2 to 6 in. long, their petioles equaling or exceeding the spikes; corolla yellowish, purplish-tinted, 9 to 10 lines long; upper lip rounded, little longer than the lower lip; lower filaments villous above the middle, the upper pair only slightly so.—Mountain forests, 5000 to 7200 ft.: Sierra Nevada from Nevada Co. to Tulare Co.; Mt. Pinos; San Gabriel, San Bernardino and Santa Rosa mountains.

885. *Pedicularis densiflora* Benth.; a, habit  $\times \frac{1}{4}$ ; b, fl.  $\times 1$ ; c, lower lip of corolla  $\times 2$ .

5. *P. attollens* Gray. ELEPHANT SNOUTS. Fig. 886. Stems simple, 6 to 13 in. high, one or several from a cluster of slender-fusiform roots; herbage glabrous or somewhat woolly above; leaves mostly in a basal cluster (the cauline few and more or less reduced), pinnately divided with toothed segments; corolla white or pink with purplish markings; upper lip strongly saccate-galeate, the sac produced into an abruptly and rather closely upturned slender proboscis, this 2 to 3 lines long; middle lobe of lower lip very small, half the size of the lateral.—Wet meadows, 8900 to 12,000 ft.: Sierra Nevada; White Mts.; San Bernardino Mts.

886. *Pedicularis attollens* Gray; a, fl. stem  $\times \frac{2}{3}$ ; b, leaf  $\times \frac{1}{2}$ ; c, fl.  $\times 1\frac{1}{2}$ .

6. *P. groenlandica* Retz. ELEPHANT HEADS. Stems 6 to 14 (or 25) in. high; corolla crimson; herbage glabrous; upper lip galeate, produced into a long beak at first bent downward but soon curving forward and upward; galea more or less covering the middle lobe of lower lip, its beak 4 to 5 lines long, much longer than the lower lip; lower lip with 3 short roundish lobes.—Wet meadows, 7500 to 10,600 ft.: Sierra Nevada from Fresno Co. to Tehama Co.; Humboldt Co. to Siskiyou Co.; n. to B. C., thence e. to Lab.

#### BIGNONIACEAE. BIGNONIA FAMILY

Trees or shrubs. Corolla large and showy, usually 2-lipped. Stamens 4, in 2 sets. Style 1, stigmas 2. Fruit a large woody 2-valved capsule resembling a silique, the valves separating from the broad partition which bears the large winged seeds. Ovary superior, in ours 2-celled.

1. **CHILÓPSIS** G. Don

Leaves simple, linear. Flowers in a terminal raceme. Corolla funnelform, bilabiate 5-lobed, the lobes broad, spreading, erose. Stamens 4; also a fifth as a rudiment. Capsule long-linear, terete. Seeds with the wing at each end dissected into long hairs. Seeds long-hairy. (Greek cheilos, lip, and opsis, resemblance.)

1. **C. linearis** DC. DESERT WILLOW. Stems 2 to 10 in. in diameter, few to many from a common base, sprawling, ascending or erect, forming a broad crown (8 to 25 ft. high) resting on the ground; leaves alternate or the lower opposite or whorled, linear or linear-lanceolate, falcately curving,  $3\frac{1}{2}$  to 6 in. long; calyx inflated, usually deeply 2-lipped, the upper lip minutely 3-toothed, the lower 2-toothed; corolla pink,  $1\frac{1}{2}$  in. long, its long throat curving horizontally from the short tube; pods 4 to 8 in. long.—Sandy washes or near springs, mostly in the deserts, 10 to 2000 ft.: e. Mohave Desert; Colorado Desert; San Jacinto Valley; Redlands; e. to Tex., s. to Mex. Apr.-May.

**MARTYNIACEAE. MARTYNIA FAMILY**

Herbs with trailing or ascending stems. Leaves simple, chiefly opposite. Flowers perfect, irregular, ours in racemes. Calyx 4 to 5-cleft or -parted, sometimes split to the base on the lower side. Corolla 2-lipped, the 2 lobes in upper lip and 3 lobes in lower lip nearly equal. Stamens 4, 2 long and 2 short, perfect, or the upper pair sterile. Ovary superior, in ours 1-celled with 2 parietal placentae, each expanded into 2 broad intruded plates. Style slender; stigma 2-lobed, very sensitive. Seeds flattened; endosperm none.

1. **MARTYNIA** L. UNICORN PLANT

Calyx-lobes mostly unequal. Corolla gibbous, funnelform-campanulate. Capsule 4-celled by the extension of the placentae, curved, beaked, loculicidally 2-valved, the outer part fleshy, the inner part woody-fibrous, crested below or also above; beak longer than the body, splitting into 2 elastically diverging curving spines. (John Martyn, 1693-1768, Professor of Botany in Cambridge University.)

Pod with the endocarp crested on the upper (posterior) side. . . . . 1. *M. proboscidea*.  
Pod with the endocarp crested on both sides. . . . . 2. *M. althaeafolia*.

1. **M. proboscidea** Glox. UNICORN PLANT. Annual, roughish puberulent; leaves roundish cordate, shallowly lobed or nearly entire,  $1\frac{1}{4}$  to 4 or more in. broad; corolla deep yellowish or reddish,  $1\frac{1}{4}$  to  $1\frac{3}{4}$  in. long; body of fruit 3 or 4 in. long, the long curving claw about twice as long.—Mexican species, an escape or possibly naturalized in a few places: Keene, Kern Co.; Inert, Ignacio Valley; Sacramento Valley. Also called Devil's Claw.

**M. fragrans** Lindl. Perennial, less stout; leaves roundish to oblong-cordate, 1 to 2 in. broad; corolla nearly campanulate, 1 to  $1\frac{1}{4}$  in. long and as broad, reddish purple.—Mexico; apparently also at Agua Caliente, Colorado Desert.

2. **M. althaeafolia** Benth. Small low perennial, the stems 6 to 10 in. long; leaves roundish-cordate or -ovate, sinuately 3 to 7-lobed,  $\frac{3}{4}$  to 3 in. broad; corolla yellowish or brownish, 1 to  $1\frac{1}{2}$  in. long.—Colorado Desert: Chocolate Mts. (Milpitas); Vallecito.

**LENTIBULARIACEAE. BLADDERWORT FAMILY**

Ours aquatic insectivorous plants. Calyx 2-lipped. Corolla deeply 2-lipped, the lower lip larger, 3-lobed, spurred at the base. Stamens 2, anterior. Ovary superior, 1-celled, with a free central placenta bearing several ovules. Fruit a 2-valved capsule. Seed with a straight embryo and no endosperm.

1. **UTRICULARIA** L. BLADDERWORT

Leaves capillary-divided and bearing little bladders which possess a kind of valve-like opening. Scape with minute auricled scales, 1 to several-flowered. Flowers (in ours) yellow. Calyx-lips entire. Corolla with a projecting palate on the lower lip, often closing the throat; upper lip erect.—The bladders are provided with a valve opening inward, so that small aquatic animals

having entered are unable to escape. (Latin utriculus, a little skin or leathern bottle.)

Pedicels recurved in fruit; scapes 5 to 12-flowered; leaves with bladders.

- Spur nearly as long as the lower lip; bladders numerous.....1. *U. vulgaris*.  
 Spur very short or almost none; bladders few.....2. *U. minor*.  
 Pedicels erect in fruit; scapes 1 to 4-flowered; bladders few, on short root-like branches,  
 not on the leaves .....3. *U. intermedia*.

1. *U. vulgaris* L. COMMON BLADDERWORT. Immersed stems 1 to 2½ ft. long, sparingly branched; leaves bi- or tri-pinnately divided, 7 to 10 lines long, bearing many bladders; scapes 5 to 15-flowered; corolla closed, 6 to 9 lines broad, the lower lip a little longer than the upper; spur conical, upwardly curved, somewhat shorter than the lower lip.—Widely distributed in Cal. but rather infrequent: Bear Valley, San Bernardino Mts.; Kern River; Bouldin Isl.; Olema; Santa Rosa; Tuolumne Mdws.; Lake Tahoe; Honey Lake; Alturas; n. to Alas.; Eur., Asia.

2. *U. minor* L. LESSER BLADDERWORT. Stems creeping on the bottom in shallow water; leaves with few divisions, bearing 1 to 5 bladders each; some larger leaves sometimes with flat segments and without bladders; scape 3 to 6 (or 8)-flowered; upper lip of corolla minute (1 to 2 lines long), the lower twice as long; spur short, saccate.—Rare in Cal.: Plumas Co.; n. to Alas., thence circumpolar.

3. *U. intermedia* Hayne. Stems creeping on the bottom in shallow water, giving rise at one end to the erect scapes; leaves without bladders, very much crowded on the stems, 2-ranked, 2 to 3 times divided, 2 to 3 lines long, the linear-subulate divisions microscopically bristle-toothed; bladders large, borne on separate leafless branches; scape 1 to 4-flowered; upper lip of corolla 2½ to 3 lines long, half as long as the lower (which is 7 to 8 lines broad), the conical-subulate spur about ¾ as long as the lower lip.—Mountain swamps, 4500 to 5000 ft., rare in Cal.: Plumas Co.; n. to B. C., e. to Newf.; Eur., Asia.

#### OROBANCHACEAE. BROOM-RAPE FAMILY

Root-parasitic herbs, destitute of green color, with alternate scales in place of leaves. Flowers complete. Calyx persistent. Corolla tubular, more or less 2-lipped, the upper lip 2-lobed or entire, the lower 3-lobed. Stamens 4, didynamous, inserted on the tube of the corolla. Ovary superior, 1-celled, pointed with a long style which is curved at the apex. Capsule ovoid, 2 to 4-valved, each valve bearing on its face 1 or 2 placentae. Seeds numerous, very small, with endosperm; embryo minute.

- Stamens not hairy at base; anther-cells separated from below upward, mucronate at base; capsule 2-valved .....1. OROBANCHE.  
 Stamen-filaments with a dense tuft of hairs at base, as if forming a ring in corolla-tube; anther-cells parallel, blunt at base; capsule 4-valved.....2. BOSCHNIAKIA.

#### 1. OROBANCHE L. BROOM-RAPE

Low commonly viscid-pubescent plants with violet-purple or yellow flowers. Calyx 5-cleft into acute or acuminate lobes. Corolla tubular, curved, obscurely or manifestly 2-lipped; upper lip erect or arching inwards, in ours 2-lobed; lower lip 3-lobed, spreading. Stamens included. Style deciduous; stigma petate or with anterior and posterior lobes. Placentae 4, 2 on each valve of the capsule. (Greek orobos, vetch, and anchone, choke.)

Flowers in a raceme, or subspicate, or thyrsoïd, each with 2 bractlets; corolla manifestly 2-lipped; placentae in contiguous pairs.

Herbage light colored or somewhat purplish; flowers pedicelate; calyx equally cleft.

Lobes of lower lip spreading; corolla commonly yellow or purplish.

Corolla-lobes 3 to 6 lines long; pedicels long.....1. *O. comosa*.

Corolla-lobes 2 to 2½ lines long; pedicels short.....2. *O. californica*.

Lobes of lower lip nearly erect; upper lip dark purple, the corolla otherwise yellow or nearly purplish .....3. *O. coopert*.

Herbage dark reddish brown; flowers subsessile or short-pedicelated; stems with a thickened tuber-like base.

Puberulent with very short stiff hairs; spikes of the inflorescence short and dense; not infrequent .....4. *O. tuberosa*.

Puberulent with soft or curly hairs; spikes of the panicle open, loose; very rare...  
 5. *O. pinorum*.

Flowers on long slender peduncles from a short more or less subterranean caudex, without bractlets; corolla obscurely 2-lipped; placentae not closely approximate in pairs. Peduncles few or one; corolla bluish or purplish; calyx-lobes subulate. . . . 6. *O. uniflora*. Peduncles many; corolla commonly yellow; calyx-lobes broader. . . . 7. *O. fasciculata*.

1. *O. comosa* Hook. Low (2 in. high); herbage glandular-puberulent, as also the calyx and corolla; flowers in a corymb or corymbose raceme; bractlets on the pedicel or at the base of the flower; calyx parted into filiform-subulate lobes  $\frac{1}{2}$  to  $\frac{3}{4}$  as long as the corolla; corolla dull white or pinkish, 1 to  $1\frac{1}{4}$  in. long, its lips about 6 lines long; upper lip erect, 2-cleft to the middle with a narrowly V-shaped sinus; lower lip 3-parted into subulate lobes, the lip at base of the sinuses developed into tubular folds which project within the corolla; anthers woolly-pubescent.—Montane, 6000 ft., Eldorado Co.; n. to Wash. Var. *VIOLACEA* Jepson n. comb. Fig. 887. Inflorescence capitate-corymbose; calyx-lobes linear-subulate; corolla lurid purple to

887. *O. comosa* var. *violacea* Jepson; fl. x 1.

dark violet,  $1\frac{1}{2}$  to 2 in. long; upper lobes mostly obtusish; lower lobes narrowly ovate or linear; palatal folds narrow or laminate, projecting into the throat, truncate at the end.—Slopes or headlands facing the sea, Mendocino Co. to San Mateo Co. (Aphyllon violaceum Eastw.) Var. *VALLICOLA* Jepson n. var. Yerba Amargor. Stout and very compact, 3 or 4 to 12 in. high, glandular-puberulent; flowers in racemes, the racemes 2 to 7 in. long, the pedicels  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long or the uppermost sometimes only 2 to 4 lines long; calyx deeply parted into long linear-attenuate lobes  $\frac{2}{3}$  as long as or nearly equaling the corolla; corolla whitish, pinkish or purplish, brownish tinged or veined, 1 to  $1\frac{1}{2}$  in. long, upper lip recurving, notched or bifid, lower lip spreading, 3-parted into narrow or lanceolate lobes; anthers woolly.—Dry hills or low valleys, 100 to 5500 (or 7500) ft., parasitic on *Artemisia* and other shrubs: Colusa Co. to San Joaquin Co.; Santa Clara Co. (Coyote, on *Baccharis douglasii*, Jepson 6196, type) to Riverside Co.; Inyo Co.

2. *O. californica* C. & S. Stems usually simple, 2 to 6 in. high; viscid-pubescent; flowers crowded in a dense raceme; pedicels 1 to 3 (or the lower 6 to 12) lines long; calyx-segments linear-lanceolate,  $\frac{1}{2}$  to  $\frac{3}{4}$  as long as the corolla; corolla yellowish or purplish,  $\frac{7}{8}$  to 1 in. long, its lobes shorter and less spreading than in *O. comosa*; upper lip erect, lower lip slightly spreading; anthers glabrous or only slightly hairy.—Open hills, 2000 to 7000 ft.: coastal S. Cal.; inner Coast Ranges; Sierra Nevada; n. to Wash., e. to Nev. The following additional characters may be noted: corolla rather more slender and less membranous than in *O. comosa*; lips about 2 to  $2\frac{1}{2}$  lines long, in *O. comosa* about 3 to 4 (or 8) lines long; notch in upper lip often V-shaped and the lobes obscurely emarginate; palatal folds tubular, probably always appearing as if inside the corolla throat. The observed distinctions between this species and *O. comosa* var. *vallicola* tend to fade out, apparently, in specimens from certain areas. Var. *PARISHII* Jepson n. var. Calyx and bracts submembranous, with many parallel nerves.—Bear Valley, San Bernardino Mts. (Parish, type).

3. *O. cooperi* (Gray) Hel. Plants 6 to 9 in. high, the stem stout or fleshy-tuberous and often scaly-imbricate, ending in a single spike or raceme, or branched into many such; flowers sessile or (especially the lower) pediceled, mostly 9 to 12 lines long; calyx-lobes barely half the length of the corolla; upper lip of corolla purple, the remainder yellow, purplish, or purplish inside; upper lip erect, 2-lobed; lower lip little spreading, all the lobes acute; palatal folds yellow; anthers very slightly hairy.—Desert mesas, 25 to 2700 ft.: Mohave and Colorado deserts; e. to Ariz. Apr.-May.

4. *O. tuberosa* (Gray) Hel. Stout dark-colored plant 3 to 4 in. high, puberulent or (especially on the bracts) somewhat hoary-scabridulous; inflorescence a dense pyramidal thyrsoïd or globose cluster of short spikes or racemes; calyx unequally cleft, the lobes as long as or longer than the tube; corolla yellowish, dark purple, bluish or brown, 5 to 7 lines long, its lobes 1 line long, scarcely

spreading; anthers very white, glabrous or after dehiscence somewhat hairy.—Summits of peaks and ridges, 500 to 4000 ft.: inner Coast Ranges from Mendocino and Solano Cos. to Monterey Co.; s. to San Bernardino Mts. and Santa Rosa Isl.; foothills Sierra Nevada from Eldorado Co. to Tuolumne Co. It is parasitic on *Adenostoma fasciculatum* and other shrubs. May. The white anthers and pruinose puberulence are distinctive.

5. *O. pinorum* Geyer. Four to 6 in. high, softly puberulent; inflorescence a panicle of loose spicate racemes; calyx about half the length of the corolla, its slender teeth mostly shorter than the calyx-tube; corolla 5 to 6 lines long.—Mountain valleys, e. Humboldt Co., 1000 ft.; n. to Wash. and Ida. It is parasitic on conifers.

6. *O. uniflora* L. NAKED BROOM-RAPE. Peduncles few or one, slender, 1½ to 5 (or 9) in. high from a short scaly nearly subterranean stem; calyx-lobes subulate, often attenuate, longer than the tube; corolla violet-tinged or blue-purple, 6 to 8 (or 12) lines long (twice the length of the calyx or more), the lobes obovate and rather large.—Sierra Nevada, 2000 to 7600 ft., from Tuolumne Co. to Modoc and Siskiyou Cos.; Napa Range, about 1000 ft.; n. to B. C., e. to the Atlantic.

7. *O. fasciculata* Nutt. Fig. 888. Scaly stem emerging from the ground 1 or 2 in. and bearing numerous fascicled peduncles 3 to 4 or 9 in. long; plants more pubescent and glandular than in no. 6; calyx-lobes broadly or triangular-subulate, usually shorter than but often exceeding the tube; corolla yellow, sometimes purple or reddish tinted, 1 to 1½ in. long.—Montane, 2000 to 9000 ft.: throughout cismontane Cal. It is parasitic on *Eriogonum*, *Phacelia*, *Artemisia* and other plants. June.

889. *Boschniakia tuberosa* Jepson; a, habit x ½; b, fl. x 1½; c, cross-sect. of ovary x 5½; d, pistil x 1.

888. *Orobanche fasciculata* Nutt.; a, habit x ½; b, anther x 6; c, pistil x 1; d, cross sect. of ovary x 3.

## 2. BOSCHNIAKIA C. A. Mey.

Stems thick, simple, arising from rather large globose tubers which are developed at the point of attachment of the parasite to the root of the host plant. Flowers without bractlets, sessile or pedicellate, more or less concealed by scaly subtending bracts, the whole forming a dense spike. Calyx short, cup-shaped, truncate behind and with teeth in front, or entirely truncate. Corolla ventricose; upper lip erect or fornicate, entire or bifid; lower 3-parted. Stamens slightly exserted. Stigma bilamellate, the lobes right and left, or 4-lobed. Capsule 4-valved, each valve with 1 placenta. (Boschniakia, a Russian botanist.)

1. *B. tuberosa* Jepson n. comb. Fig. 889. Plants 6 to 10 in. high; tubers 2 to 3 in. in diameter, bearing 1 to 13 spikes; spikes deep red-brown in age; scales (bracts) much imbricated, very broad and obtuse; lower flowers rarely with bractlets; calyx truncate or with 1 to 4 teeth anteriorly and laterally disposed; upper lip of corolla entire, emarginate, or bifid; filaments densely bearded at base.—Ridges, 3000 to 9000 ft.: San Jacinto, San Bernardino and San Gabriel mountains; Coast Ranges from Monterey Co. to Siskiyou Co. (where abundant); South Yuba River, Sierra Nevada; n. to B. C. It is commonly parasitic on *Arctostaphylos* or *Arbutus* roots. May. (*B. strobilacea* Gray. *Orobanche tuberosa* Hook.)

#### ACANTHACEAE. ACANTHUS FAMILY

Ours shrubs with opposite undivided leaves. Flowers complete, perfect, ours with a pair of bractlets at the base of the 5-parted calyx. Corolla 2-lipped. Stamens 4 or (in ours) 2. Ovary superior, 2-celled, the ovules few. Fruit a 2-celled capsule. Seeds without endosperm.

##### 1. BÉLOPERONE Nees

Shrubs, ours with opposite leaves. Flowers in rather dense clusters, but really solitary in the axils of the small opposite bracts and thus forming a 4-rowed raceme. Calyx deeply 5-parted, subtended by a pair of small bractlets. Corolla tubular, 2-lipped, the upper lip erect, the lower spreading, 3-lobed. Stamens inserted on the lower side of the corolla; anthers 2-celled, the cells separated, the lower one with a small but distinct spur at base; connective broad. Capsule clavate, having a long empty stalk-like base; cells 2-seeded. (Greek *belos*, an arrow or dart, and *perone*, something pointed.)

1. *B. californica* Benth. Stems at last becoming leafless and somewhat rush-like; herbage minutely canescent; leaves ovate, 5 to 8 lines long, on petioles about 1 line long; calyx-lobes lanceolate, 2 lines long; corolla dull red,  $1\frac{1}{2}$  to  $1\frac{1}{2}$  in. long, the lips  $\frac{1}{2}$  to  $\frac{3}{4}$  in. long; lower lip 3-lobed; upper lip bearing a pair of longitudinal ridges, emarginate at apex; stamens exerted from the tube, minutely puberulent.—Western Colorado Desert; s. to L. Cal. Apr.-May.

#### PLANTAGINACEAE. PLANTAGO FAMILY

Low herbs with the flowers borne on scapes and the leaves all basal. Leaves 1 to several-ribbed or -nerved. Flowers complete, regular, 4-merous, the scarious and veinless sympetalous corolla commonly withering-persistent. Ovary 2 to 4-celled, superior; style long-stigmatose, simple and filiform.

##### 1. PLANTAGO L. PLANTAIN

Flowers perfect or polygamo-dioecious, each subtended by a bract, disposed in spikes or heads which are raised on a leafless scape. Sepals 4, persistent. Corolla small, salverform, with a short tube, or nearly rotate. Stamens 4, or sometimes 2, alternating with the lobes of the corolla and borne on its tube. Ovary 2 or falsely 4-celled, with 1 or more ovules in each cell. Capsule circumscissile, the seeds attached to the face of the loose partition which falls away with the lid. Seed-coat mucilaginous. (Latin name of the Plantain.)

*A. Perennials; stamens 4; seeds not hollowed in the face (except no. 4).*

Corolla-lobes closed over the mature capsule, forming a sort of beak; spike 6 to 12 in. long; leaves oblong-ob lanceolate . . . . . 1. *P. hirtella*.

Corolla remaining expanded, not closed over the mature capsule.

Leaves ovate, lanceolate, or oblanceolate to obovate; corolla glabrous.

Ovules 8 to 18; leaves ovate, not fleshy . . . . . 2. *P. major*.

Ovules fewer (1 or 2 in each cell); leaves lanceolate to narrowly ovate.

Leaves somewhat fleshy; bracts roundish; ovules 4, 2 in each cell . . . . . 3. *P. eriopoda*.

Leaves not fleshy; bracts attenuate into a long point; ovules 2, 1 in each cell . . . . . 4. *P. lanceolata*.

Leaves linear, fleshy; corolla-tube externally pubescent; capsule 2 to 4-seeded . . . . . 5. *P. maritima*.

Leaves linear, fleshy; corolla-tube externally pubescent; capsule 2 to 4-seeded . . . . . 5. *P. maritima*.

Leaves linear, fleshy; corolla-tube externally pubescent; capsule 2 to 4-seeded . . . . . 5. *P. maritima*.

Leaves linear, fleshy; corolla-tube externally pubescent; capsule 2 to 4-seeded . . . . . 5. *P. maritima*.

Leaves linear, fleshy; corolla-tube externally pubescent; capsule 2 to 4-seeded . . . . . 5. *P. maritima*.

Leaves linear, fleshy; corolla-tube externally pubescent; capsule 2 to 4-seeded . . . . . 5. *P. maritima*.

Leaves linear, fleshy; corolla-tube externally pubescent; capsule 2 to 4-seeded . . . . . 5. *P. maritima*.

Leaves linear, fleshy; corolla-tube externally pubescent; capsule 2 to 4-seeded . . . . . 5. *P. maritima*.

Leaves linear, fleshy; corolla-tube externally pubescent; capsule 2 to 4-seeded . . . . . 5. *P. maritima*.

Leaves linear, fleshy; corolla-tube externally pubescent; capsule 2 to 4-seeded . . . . . 5. *P. maritima*.

Leaves linear, fleshy; corolla-tube externally pubescent; capsule 2 to 4-seeded . . . . . 5. *P. maritima*.

Leaves linear, fleshy; corolla-tube externally pubescent; capsule 2 to 4-seeded . . . . . 5. *P. maritima*.

Leaves linear, fleshy; corolla-tube externally pubescent; capsule 2 to 4-seeded . . . . . 5. *P. maritima*.

Leaves linear, fleshy; corolla-tube externally pubescent; capsule 2 to 4-seeded . . . . . 5. *P. maritima*.

Leaves linear, fleshy; corolla-tube externally pubescent; capsule 2 to 4-seeded . . . . . 5. *P. maritima*.

Leaves linear, fleshy; corolla-tube externally pubescent; capsule 2 to 4-seeded . . . . . 5. *P. maritima*.

Leaves linear, fleshy; corolla-tube externally pubescent; capsule 2 to 4-seeded . . . . . 5. *P. maritima*.

Leaves linear, fleshy; corolla-tube externally pubescent; capsule 2 to 4-seeded . . . . . 5. *P. maritima*.

Leaves linear, fleshy; corolla-tube externally pubescent; capsule 2 to 4-seeded . . . . . 5. *P. maritima*.

Leaves linear, fleshy; corolla-tube externally pubescent; capsule 2 to 4-seeded . . . . . 5. *P. maritima*.

Leaves linear, fleshy; corolla-tube externally pubescent; capsule 2 to 4-seeded . . . . . 5. *P. maritima*.

Leaves linear, fleshy; corolla-tube externally pubescent; capsule 2 to 4-seeded . . . . . 5. *P. maritima*.

*B. Annuals (or perhaps biennial in no. 6); leaves linear or oblanceolate.*

Stamens 4; capsule 2-seeded.

Spikes pendulous in flower, at least at first, erect in fruit; posterior sepals keeled; seeds glaucous . . . . . 6. *P. coronopus*.

- Spikes always erect; sepals not keeled; seeds hollowed on the face, boat-shaped, not glaucous.
- Bracts linear, not scarious-margined.....7. *P. xerodea*.
- Bracts ovate, scarious, with central midrib.
- Seeds reddish or brown, smooth, shining; herbage mostly silky.....8. *P. insularis*.
- Seeds brown, punctulate; herbage pubescent, less commonly hirsute.....9. *P. erecta*.
- Stamens 2; spikes linear or slender.
- Seeds winged; capsule commonly 4-seeded; saline marshes or alkaline flats.....10. *P. bigelovii*.
- Seeds not winged.
- Capsule commonly 4-seeded; scapes filiform, mostly erect.....11. *P. pusilla*.
- Capsule 10 to 28-seeded; scapes stout, flexuous or ascending...12. *P. heterophylla*.

1. *P. hirtella* H.B.K. Plants 8 to 24 in. high; scapes commonly stoutish, from thick roots; herbage roughish-pubescent, especially the scapes and leaf-ribs; leaves oblong-oblongate to narrowly oblong or obovate, acute, tapering below into a broad petiole, 3 to 12 in. long and  $\frac{5}{8}$  to  $1\frac{3}{4}$  in. wide; spikes 6 to 12 in. long, dense except at the base; corolla persistent, its lobes closed over the capsule, forming a sort of beak; seeds 3, flattish on one side.—Clay banks along the coast, Humboldt Co. to San Diego Co.

2. *P. major* L. COMMON PLANTAIN. Fig. 890. Plants 6 to 12 in. high; herbage glabrous; leaves narrow- to round-ovate, 3 to 6 in. long, entire or toothed, prominently 5 to 7-ribbed, the ribs converging at base into a broad petiole 4 to 5 in. long; scapes commonly curved-ascending, not as long as the leaves, rarely longer, bearing an elongated spike 3 to 6 in. long; sepals green in the middle, the edges scarious; capsule 2-celled with 4 to 8 seeds in each cell, circumscissile near the middle.—Nat. from Eur., common in low fields and waste places. It is called by the Indians "White Man's Foot," since it has closely followed the advance of civilization, springing up about the earliest frontier settlements. Var. ASIÁTICA Dec. Leaves thin, upright; scapes erect, surpassing the leaves; spike below less dense; capsule circumscissile near the base and well within the calyx.—Stockton; Sierra Nevada.

890. *Plantago major* L.; a, habit x  $\frac{1}{2}$ ; b, pistillate flower, showing pistillate stage, followed by staminate stage, c, x 3.

3. *P. eriopoda* Torr. Plants 4 to 13 in. high, the scapes exceeding the leaves; root-crown usually with a mass of brownish wool; leaves oblong-lanceolate to oblong-ovate, fleshy-coriaceous, mostly glabrous, 3 to 7-nerved on stout, rather short petioles, 3 to 5 in. long; scapes mostly puberulent; spikes dense or sparsely flowered,  $\frac{3}{4}$  to 4 in. long; bracts broadly ovate or roundish, scarious-margined, sometimes pubescent-ciliate; capsule ovoid, 2 lines long, slightly exceeding the calyx; ovules 2 in each cell; seeds as many or fewer.—Moist saline soil, Humboldt and Siskiyou Cos.; n. to Can.

4. *P. lanceolata* L. RIBWORT. ENGLISH PLANTAIN. Erect, 14 to 28 in. high, the scapes sulcate and angular, longer than the leaves; herbage somewhat villous with short hairs, often rusty-pilose; leaves erect or spreading, oblong-lanceolate, tapering at base into a slender petiole strongly 3 to 5-ribbed,  $3\frac{1}{2}$  to 8 in. long; spike short-cylindric,  $\frac{3}{4}$  to  $1\frac{1}{2}$  (or  $2\frac{1}{2}$ ) in. long; bracts ovate, abruptly attenuate into a point half as long to as long; sepals scarious, the two lower often combined into one; corolla nearly rotate; stamens twice as

long as the corolla; capsule 2-seeded.—Moist agricultural lands throughout Cal.; nat. from Eur.

5. *P. maritima* L. GOOSE-TONGUE. Low, 2 to 9 in. high, the many leaves and the scapes borne on a stout taproot; leaves linear or narrowly linear, thick and fleshy, 2 to 3 (or 8) in. long; spike cylindrical,  $1\frac{1}{4}$  to 2 in. long; sepals somewhat carinate; corolla-tube pubescent externally; capsule 2 to 4-seeded.—Ocean shore from Monterey Co. to Humboldt Co.; n. to Alas.; Eur., Asia. Also called Sea Plantain.

6. *P. corònopus* L. Plants 8 to 10 in. high, the scapes much exceeding the leaves; herbage coarsely hairy, very densely hairy at the summit of the scapes, more or less glabrate; leaves narrowly oblanceolate, sparingly and saliently incised, 3 to 5 in. long, the root-crown woolly-pilose between the leafy bases; spikes slender-cylindric, very dense, 3 to  $3\frac{1}{4}$  in. long, at first pendulous, erect in fruit; bracts ovate, attenuate or long-acuminate; sepals ovate, ciliate, the 2 posterior keeled on the back; corolla-lobes broadly lanceolate, the tube pubescent; seeds 3, glaucous.—Sea cliffs: Santa Cruz and Monterey Cos.; sparingly introduced from Eur.

7. *P. xeròdea* Morris. Stems few to many from the base, 1 to 4 in. high; herbage very silky when young, pilose when older; spikes dense, the bracts  $\frac{3}{4}$  to  $1\frac{1}{2}$  times longer than the flowers; sepals oblong, the outer very narrowly scarious-margined, the inner more broadly and the two sides often unequally margined; corolla-lobes ovate, acute.—Desert plains and mesas, 2500 to 4500 ft.: Mohave and Colorado deserts; Panamint Range.

8. *P. insulàris* Eastw. Habit and spikes of *P. erecta*; herbage more or less silky; bracts ovate, scarious with brown midribs, the midribs pubescent or villous; seeds red or yellowish, smooth and shining.—Coastal S. Cal. Var. *FÁSTIGIÀTA* Jepson n. comb. Scapes and leaves from a short stem, very leafy; leaves 2 to 3 lines broad; herbage densely silky; seeds red-brown.—Colorado Desert, about sea level. (*P. fastigiata* Morris.) Var. *SCARIÒSA* Jepson n. comb. Habit and spikes of *P. erecta*; leaves and scapes basal; bracts glabrous or only the midrib puberulent; seeds smooth, red or yellow.—Mohave and Colorado deserts and bordering mts., 2000 to 4000 ft.; upper San Joaquin Valley, 500 ft.: San Diego. (*P. scariosa* Morris.)

891. *Plantago erecta* Morris;  
a, habit x 1; b, fl. x  $4\frac{1}{2}$ .

9. *P. erécta* Morris. Fig. 891. Plants  $2\frac{1}{2}$  to 5 (or 12) in. high, commonly very erect but sometimes spreading, the scapes few to many; herbage soft-pubescent and green, or the scapes sometimes silky at summit at first; spikes oblong, sometimes very short (capitate) or sometimes elongated,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long, 4 to 5 lines wide; bracts ovate, the green midrib with a scarious border; sepals roundish or ovate, obtuse, scarious with broad central midrib, the midribs more or less hairy but the scarious border usually glabrous; seeds 2.—Common on hillsides and grassy flats: valleys and foothills of central and n. Cal., 25 to 1500 ft.; S. Cal., up to 4500 ft. Apr.-May; fr. June.

10. *P. bigelòvii* Gray. Similar to *P. pusilla* but stouter; plants 2 to 7 in. high; leaves narrowly oblanceolate to linear-filiform,  $\frac{1}{2}$  to as long as the scapes; spikes  $\frac{1}{4}$  to  $1\frac{1}{8}$  in. long, 2 to  $2\frac{1}{2}$  lines wide; bracts commonly fleshy-keeled; seeds 4 (1 to 7), black, winged at one end or narrowly all around, or the wing scarcely evident.—Low valleys, 10 to 500 ft.: Sacramento and San Joaquin valleys; Contra Costa Co. to Monterey Co. Apr.-May.

11. *P. pusilla* Nutt. Inconspicuous plant 1 to  $3\frac{1}{4}$  in. high, the scapes very slender; scapes and leaves erect; leaves filiform to linear,  $\frac{1}{4}$  to  $\frac{1}{2}$

as high as the plant; spikes very slender, 1 to 4 in. long, 1 to 1½ lines wide; bracts with thickened or fleshy keel; sepals obovate; corolla minute; stamens 2; seeds 4, dark-brown or black, coarsely pitted, not winged.—W. San Diego Co.; said to be introduced from Atlantic coast.

12. *P. hétérophýlla* Nutt. Small slender annuals 1 to 3 in. high; herbage puberulent; leaves very narrowly linear, 1 to 2 in. long, occasionally with a few denticulations or divergent lobes; spikes slender, 2 to 5 in. long; capsule conical-oblong and at length considerably surpassing the bract and calyx, 10 to 28-seeded; seeds oblong, usually angled by mutual pressure, obscurely rugose-pitted.—Low sandy ground, rare in Cal.: Deer Creek, Tulare Co. foothills; Tex. to Fla. and N. J.

### RUBIACEAE. MADDER FAMILY

Shrubs or herbs with opposite or whorled entire leaves. Flowers perfect or polygamous, rarely unisexual. Calyx, corolla and stamens 4-merous (5-merous in *Sherardia*). Calyx coherent with the ovary, its limb sometimes obsolete. Stamens alternate with the lobes of the corolla and inserted on its tube. Ovary in ours 2-celled, in fruit splitting into 2 (or 4) indehiscent 1-seeded portions; styles 1 or 2. Embryo in fleshy or horny endosperm.—A very large family including the Cinchona and Coffee Plant.

Herbs or slightly suffrutescent plants.

Flowers in cymes or solitary, pediceled.

Corolla rotate; leaves in apparent whorls.....1. *GALIUM*.

Corolla funnelform; leaves opposite.....2. *KELLOGGIA*.

Flowers in involucrate heads; corolla funnelform.....3. *SHERARDIA*.

Large shrub; corolla tubular-funnelform; flowers in dense globose long-peduncled heads...4. *CEPHALANTHUS*.

### 1. *GALIUM* L. BEDSTRAW. CLEAVERS

Herbs or some species slightly suffrutescent, with slender square stems. Leaves in apparent whorls; stipules large and leaf-like, resembling the blade of the leaves, so that the leaves appear to be placed several in a whorl. Flowers cymose, peduncled. Calyx-limb obsolete. Corolla rotate, 4 (or 3)-cleft. Stamens 4, short. Ovary 2-lobed, 2-celled, 2-ovuled; styles 2. Fruit didymous, of two globular halves, dry or fleshy, separating when ripe into 2 seed-like indehiscent 1-seeded carpels. (Greek gala, milk, certain species being used to curdle milk.)

#### A. LEAVES 6 TO 8 IN A WHORL; FRUIT HISPID OR RUGOSE-PAPILLATE.

Slender plants, the stems with filiform diffuse branches; leaves linear, 2 to 3 lines long; fruit hispid; annual.....1. *G. parisiense*.

Coarser plants, the stems mostly simple, commonly erect, sometimes diffuse or reclining or branching; leaves oblanceolate, ½ to 1 in. long.

Fruit large (2 lines in diameter), papillate-rugose, on short stout recurved pedicels; annual.....2. *G. tricorné*.

Fruit small (½ to 1¼ lines in diameter), on slender straight pedicels, hispid (sometimes subglabrous in no. 4).

Annual, with a taproot; flowers 1 to few, cymose on long axillary peduncles or more numerous and becoming cymose-paniculate; fruit hispid.....3. *G. aparine*.

Perennial, from slender creeping rootstocks, often arising from a taproot.

Flowers many to numerous, cymose-paniculate; fruit hispid with short scattered hairs or nearly glabrous.....4. *G. asperillum*.

Flowers 2 or 3, cymose, the cymes on axillary peduncles; fruit densely white-hispid with long hairs.....5. *G. triflorum*.

#### B. LEAVES IN WHORLS OF 4 (SOMETIMES 5 OR IN NO. 6 REDUCED TO 2).

##### 1. Plants from slender or filiform roots.

Annual, 3 to 5 in. high; upper leaves often reduced to 2; fruit hispid.....6. *G. bifolium*.  
Perennial; leaves in whorls of 4 or 5; fruit glabrous.

Slender erect plants 5 to 18 in. high; fruit on elongated capillary pedicels, the pedicels 2½ to 6 lines long.....7. *G. trifidum*.

Low matted plants 2 to 4 in. high; fruit on short thick pedicels, the pedicels 1 to 1½ lines long.....8. *G. brandegei*.

##### 2. Plants from woody rootstocks; perennial.

Fruit glabrous or sparsely hairy with short hairs.

Mature fruit fleshy or berry-like, large (or small in no. 11).

Plants forming low dense tufts (2 to 5 in. high); stems densely leafy.

Leaves narrowly linear-subulate, acrose, glabrous.....9. *G. andrewsii*.

Leaves narrowly linear, abruptly acute, cuspidate, hairy...10. *G. ambiguum*.

- Plants with the stems more open, always taller, rarely tufted.  
 Stems slender at the base; herbage hispid-ciliate; leaves small, ovate, 2 to 5 lines long ..... 11. *G. californicum*.  
 Stems often coarse woody at the base.  
 Fruit glabrous; plants glabrous to decidedly scabrous.  
 Flowers in cymes, the cymes paniculate; plants  $\frac{1}{2}$  to 1½ ft. high.  
 Leaves oblong-lanceolate or oblong; flowers purple ..... 12. *G. bolanderi*.  
 Leaves broadly ovate; flowers white ..... 13. *G. sparsiflorum*.  
 Flowers on axillary peduncles, mostly solitary; long woody climbers 2 to 5 ft. long ..... 14. *G. nuttallii*.  
 Fruit sparsely hispid or hispidulose (or glabrous in age); flowering branchlets open, the cymes few-flowered or reduced to one; cinereous-pubescent throughout ..... 15. *G. pubens*.  
 Mature fruit dry.  
 Flowers solitary or in few-flowered cymes, terminal or borne in the uppermost axils of very leafy much compacted branchlets; Santa Barbara Isls. .... 16. *G. catalinense*.  
 Flowers numerous in a compact panicle; sterile branchlets below very leafy, very conspicuous; n. Cal. .... 17. *G. boreale*.  
 Fruit, at least when mature, densely hispid with hairs longer than or equaling the diameter of the fruit.  
 Leaves linear to lanceolate.  
 Plants erect or tufted; leaves linear, dark green.  
 Leaves usually 6 to 14 lines long, glabrous or scabrous on the margin. .... 18. *G. angustifolium*.  
 Leaves 2 to 6 or 8 lines long, hispid throughout ..... 19. *G. siccatum*.  
 Plants diffuse with long woody branches; leaves lanceolate-acuminate, 2 to 4 lines long, light green ..... 20. *G. stellatum*.  
 Leaves ovate.  
 Plants diffuse, reclining, with long woody branches ..... 21. *G. hallii*.  
 Plants erect or tufted, herbaceous.  
 Fruit  $1\frac{1}{2}$  to 2 lines in diameter, the hairs whitish or tawny, considerably longer than the body; leaves broadly ovate, 4 to 7 lines long ..... 22. *G. multiflorum*.  
 Fruit 1 line or less in diameter, the hairs white, about equaling the body in length; leaves ovate, 2 to 3 lines long.  
 Plants 8 to 12 in. high, usually glabrous (except in var.) ..... 23. *G. matthewsii*.  
 Plants dwarf, less than 6 in. high, densely scaberulous-pubescent throughout ..... 24. *G. parvifolium*.

892. *Galium aparine* L.; a, fr. branchlet  $\times \frac{1}{2}$ ; b, fl.  $\times 4$ ; c, fr.  $\times 4$ .

1. *G. párisiense* L. WALL GALIUM. Stem branched from the base, the branches and particularly the branchlets very slender or almost filiform, 6 to 10 or 12 in. high, finely scabrous; leaves in whorls of 6, oblong-spatulate or linear-lanceolate or linear-oblong, acute, 2 to 3 lines long; cymes several-flowered, paniculate, the peduncles and pedicels filiform; flowers whitish, very small,  $\frac{1}{4}$  to  $\frac{1}{2}$  line broad; fruit small, less than  $\frac{1}{2}$  line long, decidedly hispid. — Humboldt and Mariposa Cos.; nat. from Eur. Var. *ANGLICUM* Huds. Diffusely branching, 6 to 18 in. high, very leafy below; leaves 3 to 5 lines long; fruit merely granulate, not hispid. — Native of Eur.; introduced into Sonoma, Humboldt and Eldorado Cos.

2. *G. tricorne* Stokes. CORN GALIUM. Stems stout, rather simple, 6 to 18 in. long, the angles callous, with stoutish recurved prickles; leaves in whorls of 6 to 8, narrowly oblanceolate or linear, callous-margined and thickly beset with recurved prickles 6 to 9 lines long;

axils mostly fruit-bearing throughout; fruit on stout recurved pedicels (4 to 6 lines long), mature fruit comparatively large,  $1\frac{1}{2}$  lines long, 2 lines or more broad, papillate-rugose, not hairy.—Grain fields, Sonoma Co. and Mariposa Co.; nat. from Eur. Fr. June.

3. *G. aparine* L. GOOSE GRASS. Fig. 892. Stems with a slender taproot, diffuse or climbing over herbaceous plants, 1 to 2 or 3 ft. long, forming rather thick coarse mats, or sometimes erect and only 6 in. high in dry situations; whole herbage setulose or hispidulous-roughened; stems acutely quadrangular, internodes  $1\frac{1}{2}$  to 3 (or sometimes 4) in. long; leaves 6 to 8 in a whorl, oblong-oblancheolate to almost linear, obtuse, or the upper acute, mucronate, tapering to a narrow base,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long, decidedly scabrous-roughened; flowers usually few, 1 or 2 in a cyme on long axillary peduncles (1 to 2 in. long), or more numerous and becoming cymose-paniculate; fruit  $1\frac{1}{2}$  to  $1\frac{3}{4}$  lines in diameter, densely hispid with short stiff hooked bristles which are usually shorter than the body.—Half-shaded or grassy places, foothills and montane valleys, 100 to 4500 ft., throughout Cal., introduced from Eur.; Atlantic coast; Eur., Asia.

4. *G. asperrimum* Gray. Stems diffuse or reclining,  $1\frac{1}{2}$  to 3 ft. high, from a weak slender rootstock, smooth or minutely scabrous on the margins, the internodes 2 to 3 in. long; leaves 6 to 8 in a whorl, broadly linear to oblanceolate, obtuse or acute, abruptly mucronulate,  $\frac{1}{2}$  to 1 in. long, tapering to a narrow base, scabrous along the margins and midrib, or glabrous, rather thin in texture; flowers many to numerous, cymose-paniculate, borne on axillary or terminal branchlets; fruit less than 1 line in diameter, hispid with short scattered hairs (shorter than the body) or almost glabrous.—Shady places in the foothills, 1700 to 3000 ft.: Santa Clara Co. to Humboldt Co.; Mariposa and Plumas Cos.: n. to Ore., e. to Nev.

5. *G. triflorum* Michx. SWEET BEDSTRAW. Fig. 893. Stems slender, erect or reclining, 8 to 18 in. high, leafy, smooth or somewhat scabrous on the angles, arising from a slender creeping rootstock, the fibrous rootlets often red in color; internodes about  $1\frac{1}{4}$  to 2 in. long; leaves in whorls of 6, ovate-oblong to broadly obovate, 6 to 14 lines long (those on the branches sometimes 4 lines long), cuspidate, very thin in texture and usually glabrous or minutely scabrous on the margins and midrib; flowers 2 or 3 in a cyme, the cymes borne on axillary peduncles 1 to  $1\frac{1}{2}$  in. long; fruit small,  $\frac{3}{4}$  to 1 line broad, densely covered with soft white slightly hooked hairs which exceed the body in length.—Woody thickets, 200 to 6300 ft.: San Bernardino Mts.; Coast Ranges from San Mateo Co. to Siskiyou Co.; Sierra Nevada from Fresno Co. to Placer Co. and n. to Modoc Co.; e. to Atlantic and n. to Can.

6. *G. bifolium* Wats. Stem erect, simple or slightly branching, glabrous, unarmed, 3 to 5 in. high; leaves oblanceolate to nearly linear, mostly in whorls of 4, the large pair about  $\frac{1}{2}$  in. long (5 to 7 lines), the alternate ones smaller, or the uppermost whorls with leaves reduced to a single pair; pedicels axillary and terminal, 1-flowered, in fruit about equaling the leaves; fruit 1 to  $1\frac{1}{2}$  lines in diameter, hispid with whitish hooked bristles.—Montane, 5000 to 8000 ft.: Trinity and Humboldt Cos. to Siskiyou Co.; Sierra Nevada from Fresno

893. *Galium triflorum* Michx.; a, fr. branchlet x 1; b, fl. x 4; c, fr. x 6.

894. *Galium trifidum* L.; a, fl. stem  $\times 1$ ;  
b, fl.  $\times 3$ ; c, fr.  $\times 4$ .

tane, 5200 to 8500 ft., rare: Sierra Nevada from Mariposa Co. to Modoc Co.; e. to N. Mex.

9. *G. andr  wsii* Gray. Fig. 895. Plants commonly densely matted, the leafy flowering stems erect, 2 to 4 in. high, the prostrate stems rooting at the joints; herbage grayish, glabrous or sparsely scabrous; leaves in whorls of 4, crowded, subulate, pungent, rigid, cuspidate-acuminate, 2 to 4 lines long; flowers solitary or in 3s, terminating the branchlets, very small, perfect; corolla white; fruit on short somewhat recurved pedicels, 1 to  $1\frac{1}{2}$  lines wide, glabrous, berry-like, purple in age.—High dry ridges, 1500 to 4600 ft.: Coast Ranges, mostly the inner, from Lake Co. to San Luis Obispo Co.; s. to San Diego Co.

10. *G. ambigu  m* Wight. Caespitose, 2 to 5 in. high, the branches densely clothed with stiffish leaves; herbage dark green, sparsely hairy; leaves narrowly linear, abruptly acute, cuspidate, 3 to 6 lines long; flowers apparently few, solitary in the axils; fruit black (when dry), glabrous.—High peaks, Trinity and Humboldt Cos.: Yollo Bolly; Buck Mt.

11. *G. californicum* H. & A. Plants usually low, erect, 3 to 6 or 8 in. high, or sometimes diffuse and the stems 1 ft. long; stems slender at the base, arising from a more or less slender rootstock; herbage more or less hispid with

Co. to Shasta Co.; n. to Wash., e. to Col.

7. *G. trifidum* L. CROUP-WEED. Fig. 894. Stems from very slender rootstocks, ascending, slender and weak, 5 to 18 in. high, much branched and intertangled, 4-angled and comparatively smooth; branches commonly in 2s; leaves in 4s or 5s, oblong to linear-spatulate, obtuse, not bristle-pointed, 2 to 9 lines long, very thin, obscurely scabrous on the margins; flowers minute, on capillary pedicels; fruit glabrous, dry, about 1 to  $1\frac{1}{4}$  lines broad.—Marshes or boggy places, 10 to 5400 ft., almost throughout cismontane Cal.; n. to B. C., e. to Lab. and N. Eng.; Eur., Asia.

8. *G. brandegei* Gray. Closely related to *G. trifidum* from which it is distinguished by its peculiar habit of forming dense low mats, the weak stems prostrate or ascending, 2 to 4 in. long, very leafy; leaves obovate-spatulate, in whorls of 4, 2 to 3 lines long, equaling or exceeding the short internodes; fruit glabrous on short stocky pedicels, the pedicels often not exceeding the fruit in length.—Mont-

895. *Galium andrewsii* Gray; a, habit  $\times 1$ ;  
b, fr.  $\times 3$ ; c, fl.  $\times 3$ .

widely spreading hairs; leaves thinnish, ovate or oval, apiculate-acuminate,  $2\frac{1}{2}$  to 5 or sometimes 6 lines long, usually hispidulose, especially on margins and midrib; flowers dioeciously polygamous, the fertile ones solitary on short pedicels at the ends of the branches or in the upper forks, recurved in fruit, the sterile ones terminal and usually in 3s; corolla yellowish with ovate-lanceolate lobes; fruit small, berry-like, purple, glabrous or nearly so.—Common on open hills, 300 to 1500 ft.: Coast Ranges from Humboldt Co. to Monterey Co.; s. to Riverside Co.; Santa Cruz Isl. Var. *MIGUELENSE* Jepson n. comb., a very small shiny-leaved form from San Miguel Isl. (*G. miguelense* Greene.)

12. *G. boländeri* Gray. Stem erect or diffuse from a woody root, 6 to 10 or 14 in. high, forming a thick tuft or sometimes elongated and climbing; angles of the stems scabrous; leaves oblong-lanceolate or oblong, acute, usually narrowed at the base, glabrous or hispid-ciliate,  $2\frac{1}{2}$  to 5 lines long; flowers in small usually terminal cymes, or sometimes cymose-paniculate; pedicels slender,  $2\frac{1}{2}$  to  $3\frac{1}{2}$  lines long, often recurved in fruit; corolla deep red-purple; fruit fleshy, glabrous, purple in age, often 2 lines in diameter.—Mountain valleys or flats, 1800 to 4600 ft.: Solano Co. to Humboldt Co., and n. to Siskiyou Co., thence s. in the Sierra Nevada to Mariposa Co.

13. *G. sparsiflorum* Wight. Erect perennial, 8 to 12 in. high; herbage hispidulose to nearly glabrous; leaves in 4s, unequal, oval or broadly ovate, mostly rather large, 4 to 6 or 8 lines long and 3 to 5 lines broad, cuspidate-pointed, often indistinctly 3-nerved, thin and membranous, sparsely hairy above with short straight hairs; flowers several to numerous, cymose-paniculate; pedicels capillary; fruit glabrous.—Mountain meadows, 6200 to 7000 ft.: Fresno and Tulare Cos.

14. *G. nuttallii* Gray. Suffrutescent from a woody root, with long woody branches, often climbing 2 to 5 ft. high; branches often tinged red or purple; plants glabrous and nearly smooth or angles of the stem and margins of the leaves scabrous or hispidulous; branches very leafy, the internodes of flowering branchlets  $\frac{1}{4}$  to  $\frac{1}{2}$  in. or less long; leaves in whorls of 4, thickish, oval to linear-oblong, mucronulate or obtuse, mostly small, 2 to 4 lines long (1 to 2 lines on the branchlets); flowers mostly solitary, occurring in the axils of the leafy branchlets; peduncles short and thick, 1 to 2 lines long; fruit smooth, fleshy, purple in age, often 2 lines in diameter and usually equaling or exceeding the pedicels.—Common in thickets: Coast Ranges from Humboldt Co. to Monterey Co. and s. to San Diego Co., 200 to 2400 ft.; Sierra Nevada, 2000 to 7000 ft., from Tuolumne Co. to Fresno Co.

15. *G. pubens* Gray. Stems herbaceous, erect or diffuse, 1 to  $1\frac{1}{2}$  ft. high, distinctly 4-angled and rather sparsely leafy, the internodes often  $1\frac{1}{2}$  to 2 in. long; herbage cinereous with a fine partly soft, partly scabrous pubescence; leaves in 4s, broadly oval to oblong-linear on the branchlets, thick,  $\frac{1}{4}$  to  $\frac{1}{2}$  in. long, mostly not pointed; flowers dioecious, axillary or terminal, the sterile in several-flowered cymes, the fertile fewer, often occurring singly or in pairs; young fruit minutely pubescent, becoming fleshy and glabrous, purple in age.—Sierra Nevada, 2000 to 5000 ft., from Mariposa Co. to Tulare Co. Var. *GRANDE* Jepson n. comb. Diffusely branching and densely cinereous-pubescent; leaves narrowly ovate, mostly less than 5 lines long; mature fruit hispid with fine hairs.—Shady places, 2000 to 4000 ft.: San Gabriel and San Bernardino mountains. (*G. grande* McCl.)

16. *G. catalinense* Gray. Stems stoutish, erect, 3 to 4 ft. high, woody below, quadrangular, the nodes with a swollen ring, the mostly few branches bearing numerous short slender compacted branchlets, thus forming very thick tops to the plants; herbage minutely soft-puberulent or almost glabrous, not scabrous; leaves mostly in 4s, the uppermost often in pairs, narrowly oblong, obtuse or mucronate, 1-nerved,  $\frac{1}{2}$  to 1 in. long on the main branches, 2 to 4 lines on the terminal branchlets, either sessile by a contracted base or short-petioled; flowers on short slender pedicels, solitary or in a few-flowered cyme, borne terminally on the very leafy branchlets or in the uppermost axils; corolla white; fruit dry, sometimes glabrous, sometimes sparsely covered with soft straight hairs.—Rocky slopes and cliffs, Santa Barbara Isls.

17. *G. boreale* L. Stems erect, 1 to 2 ft. high, arising from slender woody rootstocks, with conspicuous very leafy sterile branchlets below; herbage glabrous; leaves linear to broadly lanceolate, thick, distinctly 3-nerved, mostly obtuse,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long, those of the sterile branchlets often much smaller; flowers numerous in a more or less condensed terminal panicle of cymes; corolla white; fruit small (less than  $\frac{1}{2}$  line in diameter), hispidulous.—Montane, 3500 to 7000 ft.: e. Humboldt Co.; Shasta Co.; n. to Alas. and Can., e. to N. J.; Eur., Asia.

18. *G. angustifolium* Nutt. Erect shrubby perennial 1 to 4 ft. high, with rigid virgate branches; herbage minutely scabrous-puberulent; leaves in whorls of 4, narrowly linear, mucronulate,  $\frac{1}{2}$  to 1 in. long or shorter on the branches; flowers numerous, polygamo-dioecious, greenish white, in more or less condensed cymes, these forming a narrow panicle; fruit densely covered with long silky white hairs which are longer than the body.—Foothills and mts., 100 to 5500 ft., from Monterey Co. to San Diego Co. Var. *SUBGLABRUM* Jepson n. var. Lower more tufted form with usually broader leaves; mostly glabrous throughout.—Pine belt in mts. of S. Cal.: Whitewater Basin (C. M. Wilder 1113, type); n. to Monterey.

19. *G. siccatum* Wight. "Perennial, 1 to 4 ft. high, erect and branched or bushy when growing in some situations; cinereous-puberulent throughout; leaves in 4s, not rigid, linear, 4 to 8 lines long, mucronulate; inflorescence cymose-paniculate; flowers polygamous, greenish yellow, numerous; fruit a line broad, densely hispid with straight bristles" (ex char.).—Del Mar, San Diego Co.; perhaps also in San Jacinto and San Antonio mountains. Var. *ANOTINUM* Jepson n. var. Dwarf tufted form less than 6 in. high; leaves densely clothing the branches, 2 to 4 lines long.—Mt. San Antonio (Peirson 215, type).

20. *G. stellatum* Kell. Stems diffuse and spreading from the woody base, 5 to 10 in. long, the bark whitish or cream-color as in *G. hallii*, exfoliating in age; herbage minutely puberulent throughout; old leaves whitish, very thin, often  $\frac{1}{2}$  in. long, persisting on the main branches; leaves of the season green, rigid, ovate to narrow-lanceolate, acuminate-cuspidate, 2 to 4 lines long, midrib prominent, lateral veins not developed; flowers paniculate, crowded; corolla white, about 1 line broad; fruit small, the body dark, about  $\frac{1}{2}$  line broad, covered with white silky hairs nearly a line long.—Rocky cañons and dry hills, 4000 to 8000 ft.: Colorado Desert to Inyo Co.; e. to Nev. and Ariz.

21. *G. hallii* Jtn. Stems reclining, from a perennial root-crown, 1 to 2 ft. long, woody below; herbage minutely to densely scabrous-pubescent; bark thin, exfoliating, white-shining in age; leaves spreading in whorls of 4, densely clothing the lateral branchlets, very thin and often turning tawny or creamy white in age, broadly ovate, obscurely mucronulate, 3 to 5 lines long, midrib prominent; flowers creamy white, numerous on the drooping tips of the lateral branchlets; fruit large, the body dark, about 1 line across and densely covered with white or creamy white silky hairs which slightly exceed the body in length.—Montane, 5000 to 7000 ft.: San Gabriel Mts.; Mt. Pinos; mts. of Kern Co.; Providence Mts.

22. *G. multiflorum* Kell. Stems 6 to 12 in. high, from a suffrutescent base, often in tufts; herbage glabrous, pruinose-puberulent or sometimes pubescent; leaves in whorls of 4, broadly ovate, 4 to 7 lines long and 2 to 3 lines broad, midrib and one or two lateral nerves more or less prominent; flowers short-pedicelled, cymose-paniculate or crowded in the upper axils; fruit densely clothed with long tawny hairs, the hairs straight, considerably longer than the body, making the fruit and hairs often  $2\frac{1}{2}$  to 3 lines in diameter.—Arid slopes, 4000 to 4500 ft.: San Jacinto Mts.; Lassen Co.; w. Nev. Var. *HIRSUTUM* Gray. Plants low, tufted, 3 to 8 in. high, cinereous-pubescent throughout.—High montane, 5900 to 10,000 ft.: n. Lake Co. to Yollo Bolly Mts.; Sierra Nevada, mostly east summits or east slopes, from Inyo Co. to Modoc Co.

23. *G. matthewsii* Gray. Stems erect, branching, 8 to 12 in. high, from a woody base; herbage mostly glabrous; leaves rigid, ovate-lanceolate, cuspi-

date-acute, 2 to 3 lines long, with a very prominent midrib and no lateral veins; flowers numerous, cymose-paniculate, short-pedicel; corolla less than 1 line broad; fruit small,  $\frac{3}{4}$  to  $1\frac{1}{2}$  lines in diameter, densely clothed with very short white hairs.—East slope of Sierra Nevada in Inyo Co., 8000 to 9000 ft.; e. to Nev. Var. *SCABRIDUM* Jepson n. var. Plants densely hirsute throughout.—Silver Cañon, White Mts., 7500 ft. (Jepson 7210, type).

24. *G. parvifolium* Jepson n. comb. Dwarf tufted plants 2 to 6 in. high, scabrous-puberulent throughout, with thick woody rootstocks and branchlets densely clothed at base with old leaves; leaves in whorls of 4, minute (1 to 2 lines long), ovate, acute, abruptly mucronate; basal leaves turning tawny with age and closely sheathing the base of the branches, very small, usually less than 1 line; upper whorls more distant (the nodes  $\frac{1}{2}$  in. or more apart), their leaves narrowly to broadly ovate and often 2 lines long, midrib prominent, the lateral veins not developed; flowers small, dioecious, reddish purple, cymose and short-pedicel; fruit less than  $\frac{1}{2}$  line in diameter, covered with short straight silky hairs about equaling the body in length.—Arid montane slopes, 6700 to 10,000 ft.: Santa Rosa, San Jacinto, San Bernardino and San Gabriel mountains; e. to southern Nev. (*G. multiflorum* var. *parvifolium* Parish.)

## 2. *KELLOGGIA* Torr.

Slender perennial herb with opposite leaves and interposed stipules. Flowers in loose forking terminal cymes. Calyx-tube obovoid, somewhat laterally flattened, covered with stiff short bristles. Corolla funnelform. Ovary 2-celled, each cell 1-ovuled. Fruit densely uncinat-hispid, splitting at maturity into 2 closed carpels. (Dr. Albert Kellogg, pioneer botanist, one of the founders of the California Academy of Sciences.)

1. *K. galioides* Torr. Fig. 896. Stems several, often many from the base, 8 to 14 in. high; leaves lanceolate (rarely narrowly ovate),  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long; corolla pinkish, 2 to 3 lines long, its lobes 4 (rarely 5).—Dry ridges and meadow borders, 4000 to 7200 ft.: San Jacinto and San Bernardino mountains; Sierra Nevada from Tulare Co. to Mariposa Co., thence n. to Siskiyou Co.; n. to Wash., e. to Utah and Ariz.

896. *Kelloggia galioides* Torr.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, fl.  $\times 2$ ; c, fr.  $\times 2$ .

## 3. *SHERARDIA* L.

Slender annual with square stems and whorled leaves without stipules. Flowers small, blue or pinkish, in heads surrounded by a deeply divided involucre. Calyx-limb of 4 to 6 teeth, which grow after flowering and crown the fruit. Corolla funnelform, the limb 4 or 5-lobed. Stamens 4 or 5. Style filiform, slightly 2-cleft. Fruit dry, didymous, separating into 2 indehiscent 1-seeded carpels. (Dr. Wm. Sherard, a patron of Dillenius and friend of John Ray.)

1. *S. arvensis* L. FIELD MADDER. Three to 6 in. high, hispidulous-roughened or nearly glabrous; leaves in whorls of 4 to 6, lanceolate to oblong, pungent; flowers subsessile, 2 or 3 in a head; involucre in fruit 3 to 4 lines long, its lobes 6 to 8, ovate or ovate-lanceolate.—Native of Eur., naturalized in pasture lands near the coast from San Mateo Co. to Marin Co., often closely matting the ground.

897. *Cephalanthus occidentalis* L.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, fl.  $\times 1\frac{1}{2}$ ; c, fr.  $\times 1\frac{1}{2}$ .

#### 4. *CEPHALANTHUS* L.

##### BUTTON BUSH

Shrub or small tree with opposite or ternate leaves. Flowers densely aggregated into spherical peduncled heads. Calyx-tube inversely pyramidal, the limb 4-toothed. Corolla narrowly funnelform, slender, the small limb 4-cleft. Style filiform, much exserted; stigma capitate. Fruit dry and hard, obpyramidal, at length splitting from the base upwards into 2 to 4 one-seeded achene-like portions. (Greek *kephale*, a head, and *anthos*, a flower.)

1. *C. occidentalis* L. **BUTTON-WILLOW.** Fig. 897. Shrub or tree, 6 to 20 (or 30) ft. high; bark clay-gray, young branches reddish; leaves elliptic to oblong-ovate, slightly attenuate, truncate or obtuse at base, entire,  $2\frac{1}{4}$  to 5 in. long, on petioles 2 lines long, with short or minute intervening stipules; peduncles 1 to 3 in. long; heads  $\frac{3}{4}$  to 1 in. in diameter; calyx greenish; corolla white, 4 lines long, the segments obtuse, tipped with black; fruit nearly 2 lines long;

seed 1 line long, flattened, acutely margined.—Along living streams, 10 to 1000 ft.: Great Valley, common; Sierra Nevada foothills, less frequent; n. to Can., e. to the Atlantic. Aug.-Sept. The fruiting heads and fruits recall those of the Sycamore.

#### CAPRIFOLIACEAE. HONEYSUCKLE FAMILY

Erect or twining shrubs, or small trees. Leaves opposite, without stipules or with false foliaceous appendages resembling stipules. Flowers complete. Calyx-tube adnate to the ovary, the toothed limb commonly insignificant. Corolla tubular or rotate, regular or irregular, 5-lobed or rarely 4-lobed. Stamens (in ours) as many as the lobes of the corolla and inserted on its tube or base. Ovary inferior, 2 to 5 (rarely 1) -celled; style 1. Fruit a berry or berry-like drupe, or sometimes a dry pod. Endosperm fleshy; embryo small.

Corolla rotate to deeply saucer-shaped, regular; style short; flowers in compound cymes.

Leaves compound; fruit berry-like, 3 to 5-seeded. . . . . 1. *SAMBUCUS*.

Leaves simple; fruit a 1-seeded drupe. . . . . 2. *VIBURNUM*.

Corolla tubular to funnelform; style commonly elongated; leaves simple.

Very low creeping vine; flowers in pairs on a thread-like peduncle. . . . . 3. *LINNAEA*.

Shrubs, erect or twining.

Berry snow-white, 1 or 2-seeded; corolla open-campanulate or tubular-funnelform, regular; stamens 4 or 5. . . . . 4. *SYMPHORICARPOS*.

Berry red or black, few to several-seeded; corolla tubular, commonly irregular and gibbous at base; stamens 5. . . . . 5. *LONICERA*.

##### 1. *SAMBUCUS* L. ELDERBERRY

Deciduous shrubs or small trees. Leaves compound, odd-pinnate, with serrate leaflets. Flowers small, white, in a terminal compound cyme, jointed with their pedicels. Calyx 5-toothed. Corolla regular, rotate, deeply 5-lobed. Ovary 3 to 5-celled; style short; stigmas 3 to 5; ovules solitary, suspended from the summit of each cell. Fruit a small berry-like drupe, containing 3 to 5 cartilaginous nutlets. (Greek *sambuke*, a musical instrument, made of Elder wood.)

Cymes flat-topped; berry blue with a bloom; winter buds small.

Leaves glabrous, the leaflets commonly equal-sided at base. . . . . 1. *S. glauca*.

Leaves finely pubescent beneath, the leaflets unequal-sided at base. . . . . 2. *S. velutina*.

Cymes dome-shaped or thyrsoid; berry red; winter buds large with large scales. . . . . 3. *S. racemosa*.

1. *S. glauca* Nutt. **BLUE ELDERBERRY.** Fig. 898. Roughish thickety bush 6 to 10 ft. high, or eventually developing into a small tree with distinct trunk, up to 25 ft. high; leaves glabrous; leaflets 5 to 7, ovate to oblong-lanceolate, serrate except at the abruptly acuminate apex, 1 to 3½ in. long; cymes flat-topped, 2 to 6 or 9 in. broad; flowers white, 2½ to 3½ lines broad; berries 2 to 3 lines in diameter, blue beneath the white bloom. —Open woods, cañons or moist flats of the lower hill country or middle altitudes, and along stream-banks in the valleys, 10 to 5400 ft.: throughout cismon-tane Cal.; n. to B. C., e. to Utah. May-Aug., fr. Aug.-Sept. (*S. coerulea* Raf.) Var. *ARIZÓNICA* Sarg. Leaves 3 (or 5)-foliolate; leaflets elliptic, acuminate, glabrous or puberulent. —Stream-banks: coastal S. Cal.; Kern Co.; e. to N. Mex. (*S. mexicana* Sarg.)

898. *Sambucus glauca* Nutt.; a, fl. branchlet x ¼; b, fl. x 4½.

2. *S. velutina* D. & H. Shrub or small tree 6 to 15 ft. high; branchlets densely short-pubescent or sometimes glabrous; leaves thick or coriaceous, finely and often densely short-pubescent, especially beneath, or sometimes glabrous; leaflets 5 to 7 or 9, thickish or coriaceous, oblong-ovate, abruptly attenuate at apex, finely serrate, one side continued farther down the petiolule than the other and so very unequal at base, 3 to 6 (or 8) in. long, the lower leaflets not infrequently with a supplementary leaflet; cymes flat-topped, 4 to 8 or 16 in. broad; flowers yellowish; berries black with a bloom, 1 to 1½ lines in diameter. —Dry open slopes, 3000 to 8000 ft.: Sierra Nevada; mts. of S. Cal. Aug. (*S. mexicana* Trees of Cal.)

3. *S. racemosa* L. Thick spreading bush 1 to 3 (or 4) ft. high; leaves thin, glabrous or nearly so; leaflets 5, ovate to elliptic, equal-sided at base, narrowed at apex to a slender entire point, serrate, 1½ to 3 (or 5) in. long; cymes round-ovate, 1¼ to 3 in. high; flowers cream-color; berries red, 2½ lines in diameter. —Moist places and especially margins of surface streams on mountain slopes, 7000 to 10,500 ft.: Sierra Nevada from Tulare Co. to Placer Co.; n. to B. C., e. to Atlantic and Eur. July. Var. *CALLICARPA* Jepson. Fig. 899. Low shrub or small tree 8 to 14 or 20 ft. high; leaves thinnish, pubescent beneath and often above with short appressed hairs; leaflets thinnish, oblong-ovate or obovate, acuminate, sharply serrate to the very apex, 2 to 7 in. long; berries scarlet, without bloom, 2 lines broad; fruiting clusters 2 to 5 in. across, very showy. —Cañon beds or flats along the coast: San Mateo Co. to Humboldt Co.; n. to Wash. (*S. callicarpa* Greene.)

899. *Sambucus racemosa* var. *callicarpa* Jepson; a, fl. branchlet x ½; b, fl. x 1¼.

## 2. *VIBURNUM* L.

Shrubs with simple leaves. Flowers white, in a terminal compound cyme, jointed on the pedicels. Cyme in ours peduncled, with 5 to 7 primary rays.

Calyx-limb 5-parted. Corolla deeply saucer-shaped, 5-lobed. Stamens 5. Ovary 1-celled with 1 ovule. Fruit a drupe with a flattened stone, which (in ours) is broadly sulcate on both faces. (Latin name of the Wayfaring Tree.)

1. *V. ellipticum* Hook. Slender deciduous shrub 4 to 12 ft. tall; herbage minutely pubescent and a little glandular; leaves orbicular or elliptical, dentate except at base, 3 to 5-nerved from the base, 1 to 2½ in. long; petioles 3 to 6 lines long; cymes ¾ to 1 in. high; corolla 3 to 4 lines broad; fruit black, oval, nearly ½ in. long; stone with 2 grooves on one face and 3 on the other (the median groove divided by a longitudinal ridge), 4 to 5 lines long.—Cañons, 1000 to 4200 ft.: Sonoma Co. to Humboldt Co.; Eldorado Co.; n. to Wash. Apr.-June.

### 3. LINNAEA L.

Creeping somewhat woody little evergreen herb with opposite leaves. Flowers nodding, pink or purplish, borne in pairs at the forked summit of thread-like upright peduncles. Calyx-teeth 5, subulate, deciduous. Corolla white, tinged with pink, slender bell-shaped to funnellform, regular, 5-lobed. Stamens 4, two of them shorter, inserted near the base of the corolla-tube. Ovary 3-celled, 2 of the cells with several abortive ovules, the third with a perfect ovule. Fruit a dry 3-celled pod with one seed. (Named by Gronovius for Linnaeus.)

1. *L. borealis* L. var. *americana* Rehder. Stems slender, trailing, ½ to 1 ft. long; peduncles erect, 2½ in. long; leaves oval, serrate above the middle, 6 to 9 lines long, on petioles 1 line long; corolla ½ in. long.—Montane, 2500 to 8400 ft.: Humboldt and Trinity Cos. to Plumas and Modoc Cos.; n. to arctic circle.

### 4. SYMPHORICARPOS L. WAXBERRY

Low branching bushes. Leaves small, simple, short-petioled, deciduous. Flowers 2-bracteolate, white or rosy-tinged, in close short spikes or clusters. Calyx with a globular tube and 4 or 5-toothed limb; limb short, persistent. Corolla regular, open-campanulate or tubular-funnelform, 4 or 5-lobed, the stamens inserted on its throat, in ours included. Ovary 4-celled, each of the 2 lateral cells with a single fertile ovule, the two median cells containing several ovules, none of which develop. Fruit a white berry with bony seeds. (Greek sumphoreo, to bear together, and karpos, fruit, the berries in close clusters.)

900. *Symphoricarpos albus* Blake; a, fl. branchlet x 1; b, long. sect. of fl. x 3½; c, fr. cluster x 1.

Corolla deeply bowl-shaped, 2 to 3 lines long.

Leaves nearly glabrous, mostly 1 in. long, entire or lobed.....

1. *S. albus*.

Leaves densely soft-pubescent, mostly ½ in. long, commonly entire.....

2. *S. mollis*.

Corolla tubular: to oblong-campanulate, 3 to 6 lines long.

Style glabrous.....3. *S. rotundifolius*.

Style bearded.....4. *S. longiflorus*.

1. *S. albus* (L.) Blake. SNOW BERRY. Fig. 900. Erect or spreading shrub with slender branches, 2 to 4 (or 6) ft. high; leaves round-oval to ovate or oblong, entire or on the same branchlet sinuately few-toothed or saliently lobed, glabrous or the lower surface pubescent, commonly 1 (less commonly as much as 2) in. long, short-petioled; calyx-lobes ciliate; corolla pinkish, distended on the lower side, 2 lines long, 5-lobed above the middle.

densely villous-hirsute within; berry globose, 4 to 6 lines in diameter; pulp snowy, nearly tasteless.—Foothills, 10 to 2000 ft.: Coast Ranges; Sierra Nevada foothills; n. to B. C., e. to N. Eng. and Pa. May-June. (*S. racemosus* Michx.) The leaves of sterile shoots are very variable in size, shape, tooth-ing and lobation.

2. *S. mollis* Nutt. Low diffuse shrub about 1 ft. high, of somewhat more delicate habit than the preceding and with thinner leaves; leaves oval or elliptic, on the fertile shoots mostly  $\frac{1}{2}$  in. long and seldom other than entire, pubescent on both surfaces or more so on the lower surface; corolla whitish or rose-red, barely pubescent within, otherwise like the last.—Montane slopes, 5000 to 8400 ft., or near the coast down to 600 ft.: mts. of S. Cal.; Sierra Nevada; Coast Ranges; n. to Wash. Apr.-May.

3. *S. rotundifolius* Gray. Straggling shrub 1 to  $3\frac{1}{4}$  ft. high; herbage finely pubescent to glabrate; leaves orbicular or ovate to oblong-elliptical, obtuse or more commonly acutish at both ends, 5 to 10 lines long; flowers in pairs at the upper nodes, nodding; corolla tubular-campanulate, white, yellowish or pink-tinged, 3 to 5 lines long, the tube pubescent within below the stamens, 3 to 4 times the length of the broad lobes; style glabrous; nutlets of the berry oblong, obtuse at both ends.—High montane, 6000 to 10,000 ft.: inner North Coast Range from Mendocino Co. to Siskiyou Co.; Sierra Nevada from Modoc Co. to Tulare Co., thence sw. to the San Gabriel, San Bernardino and San Jacinto mountains; e. to N. Mex. (*S. parishii* Rydb. *S. parvifolius* Eastw.) Var. *OREOPHILUS* Jones. Diffuse bush 1 to 4 ft. high, minutely pubescent, indistinguishable from the species by any constant character unless it be that of the nutlets which are acutely pointed at base.—Montane, 6300 to 9000 ft.: high easterly flats or east slopes of the Sierra Nevada from Mono and Mariposa Cos. to Lake Tahoe; e. to Col. (*S. oreophilus* Gray.)

4. *S. longiflorus* Gray. Similar to no. 3; leaves very glaucous; corolla 5 to 6 lines long, glabrous within; style long hairy.—Mohave Desert and Inyo Co.; e. to Utah.

##### 5. *LONICERA* L. HONEYSUCKLE

Erect or twining shrubs with simple entire leaves, one or two pairs beneath the inflorescence often connate-perfoliate. Flowers spicate at the ends of the branches or in small axillary clusters. Calyx-limb 5-toothed or truncate, deciduous or persistent, mostly small, sometimes none. Corolla 5-lobed and nearly regular, or strongly 2-lipped with 4 lobes in the upper lip and one lobe in the lower lip, its tube more or less gibbous at base. Stamens 5, inserted on the tube of the corolla. Ovary ovoid or almost globose, 2 or 3-celled, becoming a few- to several-seeded berry. (Adam Lonitzer, a German herbalist of the 16th century.)

Erect deciduous shrubs; flowers borne in pairs on a common peduncle in the leaf axils.

Ovaries and berries of the pair distinct.

Ovaries not enclosed in a sac.

Corolla yellow or reddish, nearly regular, its lobes  $\frac{1}{6}$  to  $\frac{1}{4}$  length of tube...

1. *L. involucrata*.

Corolla white, strongly 2-lipped, its lobes as long as tube. .... 2. *L. utahensis*.

Ovaries of the pair seemingly connate but really enclosed in an urnshaped sac and appearing to form a single berry. .... 3. *L. coerulea*.

Ovaries and berries of the pair connate; corolla nearly black. .... 4. *L. conjugalis*.

Twining or trailing shrubs; flowers sessile, in whorls.

Leaves ciliate, otherwise glabrous, deciduous. .... 5. *L. ciliosa*.

Leaves not ciliate, evergreen; flower-whorls in terminal interrupted spikes.

Leaves all distinct; corolla yellow, pubescent. .... 6. *L. subspicata*.

Leaves next the inflorescence united into a connate-perfoliate disk.

Corolla yellow, glabrous without; leaves without stipule-like appendages. ....

7. *L. interrupta*.

Corolla pink, hispidulous-glandular without; leaves with stipule-like appendages. .... 8. *L. hispidula*.

1. *L. involucrata* Banks. Low upright shrub 2 to 3 ft. high; leaves ovate, more or less abruptly attenuate at apex, hairy-pubescent beneath,  $1\frac{1}{2}$  to 3 or 5 in. long, on short petioles; peduncles 6 to 8 (or 12) lines long, the flowers subtended by large and conspicuous broad bracts which become reddish in age; corolla clear yellow, viscid-pubescent, 6 to 8 lines long, its spreading lobes subequal, about 1 line long, its tube saccate-gibbous at base; tips of

901. *Lonicera involucrata* var. *ledebourii* Jepson; a, fl. branchlet  $\times \frac{2}{3}$ ; b, long. sect. of fl.  $\times 1$ ; c, cross-sect. of ovary  $\times 3\frac{1}{2}$ .

anthers exserted; style puberulent; berries black, 3 to 5 lines in diameter, disagreeable to the taste.—Montane, 6500 to 9500 ft.: Sierra Nevada from Tulare Co. to Tuolumne Co.; n. to B. C. Var. *LEDEBOURII* Jepson n. comb. Fig. 901. Erect, 4 to 7 ft. high; bracts crimson in age; corolla dull yellow or reddish-tinged, its tube saccate at base; anthers included.—Cañon bottoms and river flats, Coast Ranges near the sea from Santa Barbara to Humboldt Co. Mar.-June. (*L. ledebourii* Esch.)

2. *L. utahensis* Wats. Spreading shrub 3 to 5 ft. high; leaves green, the glaucescence scarcely perceptible, oblong-ovate, commonly cordate at base, glabrous or rarely obscurely ciliate towards the base, 1 to  $2\frac{1}{4}$  in. long, shortly petioled; flowers in pairs on axillary peduncles, the peduncles 6 to 9 lines long, longer than the flowers; bracts narrowly linear, as long as the ovaries; bractlets round, minute; corolla pure white, fading in age to a pale salmon-yellow, glabrous; tube 3 to 4 lines long, somewhat saccate on one side at base, the sac marked with pink; corolla-lobes oblong, about as long as the tube, those of the upper lip and that of the lower lip not unlike in shape and scarcely at all in size but strongly 2-lipped as to position of the lobes; middle lobes of upper lip not so deeply parted from each other as from the lateral ones; adnate portion of filaments slightly hairy; ovaries divergent; berries red.—Wooded slopes, 2700 ft.: Siskiyou Co.; n. to B. C., e. to Utah.

3. *L. coerulea* L. Low, 1 to 2 ft. high; leaves thin, ovate to ovate-oblong, 1 to  $1\frac{1}{2}$  in. long; peduncles 1 or 2 lines long, much shorter than the flowers; corolla yellowish, funnelform, rather deeply lobed but little 2-lipped; ovaries distinct but tightly enclosed by the sac-like united bractlets or cupula which becomes juicy in fruit, so that the whole looks like a single globular black berry.—Montane, 7000 to 8000 ft.: Sierra Nevada from Tulare Co. to Mariniposa Co.; n. to Alas.; Eur., Asia.

4. *L. conjugialis* Kell. Fig. 902. Slender shrub 2 to 5 ft. high; herbage with short spreading pubescence; leaves mostly oblong-obovate, 1 to  $2\frac{1}{4}$  in. long, on petioles only 1 or 2 lines long; peduncles 8 to 10 lines long; bracts minute; corolla black-purple, 3 to 4 lines long, strongly 2-lipped, the tube gibbous below the lower lip; upper lip erect, shallowly 4-toothed; lower lip deflexed, oblong, entire; throat of corolla filled with soft white hairs, the lower part of filaments and of style also white-hairy; ovaries about  $\frac{2}{3}$  joined; berries red, the pair transversely oblong, 5 to 6 lines broad and about 3 lines long.—Montane, 6200 to 9500 ft.: n. Humboldt Co.; Sierra Nevada from Tulare Co. to Modoc Co.; n. to Wash., e. to western Nev. July; fr. Sept.

902. *Lonicera conjugialis* Kell.; fl. branchlet  $\times 1$ .

5. *L. ciliosa* Poir. Low, trailing along the ground, the stems 1 to 2 or 10 ft. long; leaves oval or ovate, mostly obtusish, green above, very glaucous beneath, glabrous except the ciliate margin,  $2\frac{1}{2}$  to 4 in. long, on petioles  $\frac{1}{2}$  to 3 lines long; flowers in a single terminal whorl (rarely 2 or 3), the whorl sessile or shortly peduncled; corolla red to yellow, slightly 2-lipped, 8 to 14 lines long, its tube swollen or ventricose below.—Montane, 2500 to 4000 ft.:

Humboldt Co. to Siskiyou Co., thence se. to Butte Co.; n. to B. C., e. to Mont. June-July.

6. *L. subspicata* H. & A. MORONEL. Woody-based but climbing or reclining on shrubs and attaining a height of 3 to 8 ft. or sometimes a distinct erect shrub 4 to 6 ft. high; leaves oblong or oval to ovate, short-petioled, coriaceous, lightly or densely pubescent beneath and often glandular,  $\frac{3}{4}$  to 1 (or  $1\frac{1}{2}$ ) in. long, all distinct, the uppermost pair rarely connate; inflorescence often paniculate, the whorls 2 to 6-flowered; corolla pale yellow, pubescent, 4 to 6 lines long, its lips coiling or recurved, the stamens exserted; berries red or yellow.—Chaparral slopes, 100 to 5500 ft.: cismontane S. Cal.; n. in the South Coast Ranges to Mt. Diablo; Tehachapi Mts.

7. *L. interrupta* Benth. CHAPARRAL HONEYSUCKLE. Plant with a rigid woody trunk 1 ft. or so high, the branches climbing or reclining on bushes; leaves orbicular to elliptic-oblong or ovate, green above, glaucous beneath,  $\frac{3}{4}$  to 1 in. long, on petioles 1 to 3 lines long, mostly without interfoliar appendages; spikes 2 to 5 in. long, peduncled, terminal and solitary or with several additional from the axils of the uppermost leaves, 1 to 3 pairs of which are connate-perfoliate; corolla cream-yellow, 4 to 5 lines long, glabrous exteriorly, nearly glabrous within; filaments hairy towards the base; berries red. — Dry slopes and ridges, 1500 to 4000 ft.: middle and inner Coast Ranges; Sierra Nevada; s. to the San Gabriel and San Bernardino mountains; e. to Ariz.

8. *L. hispida* Dougl. var. *californica* Jepson. Fig. 903. CALIFORNIA HONEYSUCKLE. Stems slender,  $\frac{1}{4}$  to  $\frac{1}{2}$  in. in diameter, climbing bushes or trees 6 to 20 ft. high; leaves oblong, ovate, or elliptic-oblong, truncate or subcordate at base, green above, white-glaucous below,  $1\frac{1}{2}$  to 3 in. long, short-petioled; uppermost leaves connate-perfoliate, the others except the lowest with connate-perfoliate stipule-like (often conspicuous) appendages; spikes very glandular, especially in fruit; corolla pink, 6 to 8 lines long, glandular-hispidulous without, the tube within and the lower portion of the filaments very hairy; berries scarlet.—Cañons and along streams in the foothills, 100 to 2000 ft.: Sierra Nevada foothills; Coast Ranges; rare in S. Cal. July-Aug.

903. *Lonicera hispida* var. *californica* Jepson; a, fl. branchlet  $\times \frac{1}{2}$ ; b, fl.  $\times 1\frac{1}{4}$ ; c, fr.  $\times 1\frac{1}{4}$ .

#### DIPSACEAE. TEASEL FAMILY

Herbs with opposite leaves. Flowers in dense heads or short spikes surrounded by an involucre. Calyx-tube adnate to the ovary, its limb cup-shaped or divided into bristles. Corolla borne on the calyx-limb, with 4 or 5-lobed limb. Stamens 4 (or 2 by abortion), inserted on the throat of the corolla; filaments exserted. Ovary 1-celled; style filiform; ovule 1. Fruit an achene, crowned with the persistent calyx.

Bracts of the spike or head conspicuous, rigid, prickly-pointed, exceeding the flowers. . . .

1. DIPSACUS.

Bracts of the head herbaceous, inconspicuous, concealed among the flowers. . . . 2. SCABIOSA.

#### 1. DIPSACUS L.

Stout coarse and prickly biennial herbs. Cauline leaves united at base. Flowers pinkish white, in a dense oblong head or short spike, surrounded by

an involucre of elongated bracts much surpassing the pointed bracts subtending the flowers. Bracts in fruit very rigid and spine-like. Calyx-limb cup-shaped, 4-toothed. Corolla 4-lobed. Achene surrounded by a 4 to 8-ribbed involucre. (Greek name of the Teasel.)

1. *D. fullonum* L. FULLER'S TEASEL. Erect, 4 to 5 ft. high; basal leaves broadly oblong, arcuate,  $1\frac{1}{4}$  ft. long or less; upper cauline connate-perfoliate; spikes 3 or 4 in. long; bracts of the involucre narrowly linear, tapering to the acute apex, 1 to 4 in. long; bracts of the spike with recurved tips.—Nat. from Eur. in low waste lands, especially near the coast.

## 2. SCABIOSA L.

Large herbs with opposite leaves and the flowers in hemispherical heads on long peduncles. Involucre of many distinct bracts. Involucre cylindrical, not lobed. Calyx-tube adnate to the ovary, produced slightly beyond it and bearing 5 long slender awns. Corolla inserted on the summit of the calyx-tube, slender-funnelform or salverform, with 5 short equal lobes, the marginal corollas much larger with the upper lobes much smaller than the lower. (Latin *scabiosa*, meaning scurfy, the plant used for affections of the skin.)

1. *S. atropurpurea* L. MOURNING BRIDE. Stems branching, 2 to 3 ft. high; lowest leaves lyrate; upper leaves pinnately divided or the uppermost oblong-lanceolate and coarsely serrate or the narrower ones disposed to be entire; peduncles 8 to 12 in. long; heads  $1\frac{1}{2}$  in. broad; flowers black-purple to pinkish white, the regular corollas 5 or 6 lines long; calyx-awns 3 lines long; fruit an achene, enclosed in the persistent involucre and bearing the exserted calyx-awns.—Native of Eur., naturalized by waysides: Sacramento Valley; Napa Valley; Alameda Co.; San Bernardino Co.

## VALERIANACEAE. VALERIAN FAMILY

Herbs with opposite leaves. Flowers mostly perfect, borne in a cymose inflorescence. Corolla epigynous, 2-lipped to regularly 5-lobed, the 1 to 3 stamens borne on its tube. Calyx-tube adnate to the ovary, its limb obsolete or in one species pappus-like. Ovary commonly 3-celled, the two lateral cells reduced to mere nerves, or enlarged and forming wings to the central cell which in fruit is 1-seeded and indehiscent. Style simple, slender; stigmas 1 to 3.

Perennials; limb of calyx-tube pappus-like.....1. VALERIANA.  
 Annuals; limb of calyx-tube obsolete.....2. PLECTRITIS.

### 1. VALERIANA Tourn.

Perennial herbs. Calyx-limb of 5 to 15 bristle-shaped lobes, which are coiled up and inconspicuous until the fruiting stage when they unroll and form a conspicuous plumose and pappus-like crown to the fruit. Corolla campanulate-funnelform to salverform, the tube often gibbous or slightly saccate anteriorly. Stamens 3. Ovary 1-celled, with mere vestiges of 2 lateral cells, ripening into a flattened achene. Roots with a peculiar scent. (Mediaeval Latin name.)

1. *V. sylvatica* Banks. Stems erect, simple, from rootstocks; herbage more or less puberulent; basal leaves mainly undivided, obovate; cauline leaves pinnate or pinnately divided, with 3 to 13 leaflets; corolla white or pinkish, 2 to 3 lines long, the tube short.—Wet places in pine woods, 8000 to 10,000 ft.: Sierra Nevada from Tulare Co. to Nevada Co. and n. to Siskiyou Co. Var. *GLABRA* Jepson n. var. Herbage glabrous.—Hockett Mdw., Tulare Co. (Culbertson, type); Jackson Lake, Siskiyou Co.

### 2. PLECTRITIS DC.

Annuals with glabrous herbage. Stems angled, simple or with slender branches. Leaves entire or sparingly toothed, the cauline commonly sessile. Flowers small (1 to  $2\frac{1}{2}$  lines long), borne in glomerules at the end of the stem or branches, or the glomerules in interrupted or dense spikes. Fruit winged, except in one species, the wings incurved and forming a circular hollow on the ventral side.—Species similar in size, habit, leaves and inflorescence. (From Latin *plecto*, to plait or interweave, on account of the involved inflorescence.)

904. *Plectritis macrocera* T. & G.; a, fl.; b, fr. x 5.

- Fruits wingless.....1. *P. samolifolia*.  
 Fruits winged.  
     Fruits hispid, pubescent or glabrous, not woolly.  
         Spur rather short, not prolonged below the ovary;  
             back of fruit hispid, pubescent or gla-  
             brous.....2. *P. macrocera*.  
         Spur prolonged below the ovary; fruit with a row  
             of short equal bristles bordering the rib-  
             bon-like carina and perpendicular to it.  
                 3. *P. ciliosa*.  
     Fruits very woolly.....4. *P. jepsonii*.

1. *P. samolifolia* (DC.) Hoeck. Corolla ob-  
 scurely 2-lipped; spur short; fruit triangular,  
 wingless, hispid or glabrous, about 1 line long.—  
 Coast Ranges near the coast from Santa Cruz Co.  
 to Humboldt Co., thence e. to Shasta Co.

2. *P. macrocera* T. & G. Fig. 904.  
 Slender, simple or branched, 3 to 15 in.  
 high; leaves linear, ovate or oblong;  
 spur of corolla equaling or somewhat  
 exceeding tube; fruit hispid to nearly  
 glabrous, dorsally carinate; wings  
 broad, more or less lobed at apex,  
 spreading or incurved, the margins  
 often grooved and often ciliate.—Com-  
 mon and widely distributed in the foot-  
 hills and middle altitudes of the moun-  
 tains: Monterey Co. to Siskiyou Co.,  
 thence se. to Butte Co. It is very vari-  
 able, especially in pubescence of fruit.

3. *P. ciliosa* Jepson n. comb. Fig.  
 905. Slender, 3 to 12 in. high; corolla  
 small, distinctly 2-lipped, deep pink,  
 very long; keel broad,  
 ribbon-like, glabrous  
 or hispidulose, dense-  
 ly and regularly cili-  
 ate along both mar-  
 gins.—San Diego Co.;  
 northw. through the  
 Coast Ranges and  
 Sierra Nevada to  
 Tehama Co. (*Valeria-  
 nella ciliosa* Greene.  
*P. davyana* Jepson.)

906. *P. jepsonii*  
 Davy; fr. x 8.

905. *Plectritis ciliosa* Jepson; a, habit x  $\frac{2}{3}$ ;  
 b, fl. x 4; c, dorsal view of fr. x  $6\frac{1}{2}$ ; d, ven-  
 tral view of fr. x  $6\frac{1}{2}$ .

4. *P. jepsonii* Davy. Fig. 906. Stem simple, about 10 in. high; fruit con-  
 spicuously covered with woolly hairs; incurved margin of wing thickish,  
 marked lengthwise on the outside by a groove.—Foothills of the Vaca Mts.

### CAMPANULACEAE. BELL-FLOWER FAMILY

Slender or small herbs with milky juice, alternate simple leaves and regular  
 complete flowers. Calyx-tube adnate to the ovary, the limb commonly 5-  
 parted, usually divided down to the ovary and persistent. Corolla 5-lobed  
 or -parted, inserted with the 5 stamens where the calyx becomes free from  
 the ovary. Ovary 2 to 5-celled; style 1, long, with 2 to 5 stigmas. Fruit a  
 many-seeded capsule.

Capsule dehiscent on the side or close under the calyx; leaves mostly broad (narrow in  
*Campanula uniflora*).

Capsule opening by small valves or circular perforations.

Corolla more or less campanulate; ovary short and broad.....1. CAMPANULA.

Corolla rotate; ovary somewhat elongated.....2. SPECULARIA.

Capsule opening by irregular fissures; ovary short and broad.....3. HETEROCODON.

Capsule dehiscent at the apex within the calyx; ovary club-shaped; leaves mostly narrow.

4. GITHOPSIS.

## 1. CAMPÁNULA L. BELL-FLOWER

Herbs with blue flowers. Calyx with 5 narrow lobes, its tube short and broad. Corolla campanulate or nearly so. Filaments dilated at base. Stigmas and cells of the ovary 3 to 5. Capsule short, opening on the side or close under the calyx by 3 to 5 small valve-like perforations. (Diminutive of Latin *campana*, a bell.)

Style longer than corolla; capsule openings near the middle or base; perennials.

Stem leaves sessile or on very short petioles; corolla lobes narrowly lanceolate. . . . .

1. *C. prenanthoides*.

Stem leaves on petioles at least  $\frac{1}{2}$  as long as blade; corolla lobes ovate-oblong. . . . .

2. *C. scouleri*.

Style not longer than corolla.

Annual, diffusely branched from base; capsule urnshaped, the openings just above the middle; on peaks near the coast. . . . . 3. *C. exigua*.

Perennials.

Stems 2 to 5 in. high from a branched root-crown; capsule oblong-turbinate, the openings near the summit; montane species. . . . . 4. *C. uniflora*.

Stems  $\frac{1}{2}$  to 2 ft. high from a slender rootstock; capsule globular to obconic, the openings near the middle or base.

Stem leaves linear or lanceolate, entire; montane species. . . . 5. *C. rotundifolia*.

Stem leaves oval or ovate-oblong, crenate; coast species. . . . 6. *C. linnaeifolia*.

907. *Campanula prenanthoides* Dur.; a, leaves  $\times \frac{1}{2}$ ; b, fl. stem  $\times \frac{1}{2}$ ; c, long. sect. of fl.  $\times 1\frac{1}{2}$ .

as blade; flowers on filiform peduncles, solitary in the axils or terminal, or the upper leaves reduced to minute bracts and the inflorescence paniculate; corolla exceeding or twice as long as the subulate calyx-lobes, deeply cleft into ovate-oblong lobes.—Montane, 1500 to 5000 ft.: Humboldt Co. to Siskiyou Co., thence se. in the Sierra Nevada to Sierra Co.; far n. to Alas.

3. *C. exigua* Rattan. Stem branching from the base and diffuse, 2 to 4 (or 6) in. high, short-hispid, especially at base; leaves obovate, linear, or the uppermost subulate; flowers erect, lateral or terminal on the branchlets, of two kinds, one with slender and rather short style having 3 revolute stigmas at apex and with the dilated bases of the filaments not ciliate; the other kind with the style longer, conspicuously club-shaped and merely notched at apex, the dilated bases of the filaments ciliate; corolla of both kinds light blue, 2 to 4 lines long; calyx-lobes subulate-linear, nearly twice the length of the turbinate tube; capsule somewhat urnshaped, with 3 valve-like open-

1. *C. prenanthoides* Dur. CALIFORNIA HARE-BELL. Fig. 907. Stem slender, erect,  $1\frac{1}{2}$  to 2 ft. high, often much branched; herbage minutely rough-puberulent or almost glabrous; leaves oblong-ovate or lanceolate, sessile, or short-petioled,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long, sharply serrate; flowers mostly in clusters on short pedicels; clusters axillary, or the upper leaves reduced and the inflorescence racemose; corolla cylindrical in the bud, 4 to 5 lines long, 2 to 3 times the length of the subulate calyx-lobes, parted into linear-lanceolate lobes; capsule hemispherical or short-turbinate. —Wooded slopes, 800 to 6000 ft.: near the coast, from Monterey Co. to Siskiyou Co.; Sierra Nevada from Tulare Co. to Shasta Co.; n. to southern Ore. July-Aug.

2. *C. scouleri* Hook. Stem slender, erect, or decumbent at base, mostly simple, 6 to 12 in. high; herbage glabrous; leaves ovate to lanceolate, sharply serrate,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long, tapering at base into a

marginated petiole at least  $\frac{1}{2}$  as long as blade; flowers on filiform peduncles, solitary in the axils or terminal, or the upper leaves reduced to minute bracts and the inflorescence paniculate; corolla exceeding or twice as long as the subulate calyx-lobes, deeply cleft into ovate-oblong lobes.—Montane, 1500 to 5000 ft.: Humboldt Co. to Siskiyou Co., thence se. in the Sierra Nevada to Sierra Co.; far n. to Alas.

ings just above the middle.—Coast Range peaks and ridges, 2000 to 4000 ft.: Mt. Hamilton; Mt. Diablo; Mt. Tamalpais; Mt. St. Helena.

4. *C. uniflora* L. Stems 1 or more from the branched root-crown,  $1\frac{1}{2}$  to 5 in. high, the larger ones 2 to 4-flowered; herbage puberulent to glabrous; leaves thickish, the basal spatulate, 6 to 8 lines long, the upper cauline linear; corolla 4 to 6 lines long, the ovate-lanceolate lobes as long as the campanulate tube; capsule oblong-turbinate, not narrowed at summit.—Scott Mts., Siskiyou Co.; n. to Alas., e. to Col. and Lab.; Eur., Asia. Aug. (*C. scabrella* Engelm.)

5. *C. rotundifolia* L. Stems diffuse or erect, from slender or filiform root-stocks,  $\frac{1}{2}$  to 2 ft. high, 1 to 9-flowered; lowest leaves orbicular or ovate to cordate, minutely serrate, slender-petioled; cauline leaves linear, entire, sessile,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  in. long; flower-buds erect on slender pedicels; flowers drooping or spreading; calyx-lobes subulate, spreading, longer than the short-turbinate tube; corolla blue, campanulate, 6 to 9 lines long; capsule obconic or ovoid, nodding, opening by short clefts near the base.—Montane, 5000 to 8000 ft.: Trinity and Siskiyou Cos.; n. to Alas., e. to Allegheny Mts.; Eur. July-Sept.

6. *C. linnaeifolia* Gray. Stem slender, simple or sparingly branched at summit, 4 to 12 in. high; leaves ovate-oblong, crenulate except at base, sessile or subsessile, 6 to 11 lines long, the margins retrorsely scabrous, as also the angles of the stem; flowers few, the peduncles as long or much longer; calyx-lobes lanceolate; corolla pale blue, 6 to 7 lines long; capsule globular.—Swampy places along the coast line: Pt. Reyes to Mendocino Co. June-July.

## 2. *SPECULARIA* Heister. VENUS LOOKING-GLASS

Annuals with leafy stems. Flowers solitary or in clusters, sessile in the axils of the leaves, blue or purplish, 1 or 2-bracteolate. Our species with two kinds of flowers: the earlier fertilized in the bud, with undeveloped corolla and 3 or 4 calyx-lobes; the later with a conspicuous blue corolla and 5-lobed calyx. Corolla rotate or nearly so. Stigmas and cells of the ovary 3, sometimes 2 or 4. Capsule dehiscent by 2 or 3 small valve-like openings. (Latin *speculum*, a looking-glass.)

Leaves ovate; sessile; openings of the capsule close under the calyx. . . . . 1. *S. biflora*.  
Leaves round-cordate, clasping; openings of the capsule at or below the middle. . . . .

2. *S. perfoliata*.

1. *S. biflora* (R. & P.) Gray. Stems slender, simple or with many branches from the base, 8 to 15 in. high, retrorsely scabrous-hispidulous on the angles; internodes rather short; leaves ovate, mucronate, sessile, entire or somewhat crenate, 3 to 6 (or the lowermost 8 or 9) lines long; corolla blue, exceeding the linear-lanceolate calyx-lobes; capsule prismatic or cylindric, 3 to 4 lines long, sessile, the valve-like openings close under the calyx.—Low open hills or valley fields, 200 to 4000 ft.: coastal S. Cal.; Coast Ranges; Great Valley; Sierra Nevada; n. to Ore., e. to Va. and Fla., s. to Mex.; n. S. Am.

2. *S. perfoliata* A.DC. Stems commonly stouter than in *S. biflora*, simple or branched from the base, 8 to 20 in. high, very leafy throughout, hirsute or hispid on the angles; leaves round-cordate, crenate, clasping, veiny, 3 to 8 lines long; corolla blue, usually equaled by the calyx-lobes; calyx-lobes of the close-fertilized flowers short, of the later flowers as long as the ovary; capsule oblong or somewhat obconical, 2 to 4 lines long, the 2 or 3 valve-like openings at or below the middle; seeds lenticular.—Open ground and fields, 200 to 3000 ft.: Humboldt Co.; n. to B. C., e. to the Atlantic. June-July.

## 3. *HÉTÉROCÒDON* Nutt.

Delicate annual with solitary axillary flowers of two kinds as in *Specularia*. Calyx-lobes of the earlier flowers 3 or 4, of the later 5 (when 4 or 5 one or two smaller), all foliaceous and much longer than the obpyramidal tube. Corolla open-campanulate. Capsule short and broad, 3-celled, 3-lobed, bursting by mostly irregular lengthwise fissures in the thin spaces between the ribs. (Greek *heteros*, different, and *kodon*, bell, the flowers campanulate and of two different kinds.)

1. *H. rariflorum* Nutt. Stems filiform,  $1\frac{1}{2}$  to 9 (or 16) in. high; leaves roundish,  $1\frac{1}{2}$  to 5 lines long, sessile, truncate or subcordate at base, sharply toothed, the teeth bristle-pointed and the margin between the teeth frequently ciliate-bristly; calyx sparsely hispid, its lobes ovate, sparingly toothed, 1 to 3 lines long; corolla of earlier flowers scarcely evident, of the later flowers well developed, light blue (the short lobes darker), the tube  $1\frac{1}{2}$  to 2 lines long.—Wet places and open fields, 300 to 5500 ft.: San Jacinto and San Bernardino mountains; Tehachapi Mts.; Sierra Nevada from Tulare Co. to Modoc Co.; Coast Ranges from Alameda Co. to Siskiyou Co.; n. to B. C. and Ida., e. to Nev. Apr.-June.

#### 4. GITHÓPSIS Nutt.

Small annuals with blue flowers terminating the stems or branches. Calyx-tube cuneate, strongly 10-ribbed, adnate up to the summit of the ovary, with 5 linear foliaceous lobes. Corolla tubular-campanulate. Filaments short, dilated at the base; anthers long and linear. Ovary 3-celled; stigma 3-lobed. Capsule clavate, coriaceous, crowned with rigid calyx-lobes of its own length, strongly striate-ribbed, many-seeded, dehiscing at apex by a perforation at the place where the style falls away. (Name from Githago, the calyx resembling that of the Corn-Cockle.)

Calyx-lobes equaling or longer than capsule; upper leaves 3 to 5 lines long.....

1. *G. specularioides*.

Calyx-lobes shorter than capsule; none of the leaves over 2 lines long.....2. *G. diffusa*.

908. *Githopsis specularioides* Nutt.; a, b, two kinds of fls. x 1.

1. *G. specularioides* Nutt. Fig. 908. Stem simple or with 1 to several proliferous branches, these in turn sometimes proliferous, 4 to 7 in. high; herbage retrorsely rough-pubescent; upper leaves oblong, or narrower, 3 to 5 lines long, the lowermost obovate, 1 to 2 lines long, all sharply few-toothed; calyx-lobes 3 to 8 lines long, eventually callous-ribbed, shorter than or 3 to 4 times as long as the corolla; corolla-lobes shorter than the tube; capsule rigid, tapering into a short and stout peduncle.—Open ground in hill country, 200 to 4000 ft.: coastal S. Cal.; Coast Ranges from Santa Clara Co. to Humboldt Co.; Sierra Nevada from Mariposa Co. to Plumas Co.; n. to Wash. Var. *GLABRA* Jepson n. var. Glabrous or nearly so; sinuses of the calyx hispidulous.—Amador Co. (Antelope, Hansen 494, type); Humboldt Co.

2. *G. diffusa* Gray. Stems slender, weak, diffusely branched, 2 to 6 in. long; herbage glabrous; leaves small and scale-like, almost lacking on the upper portions of the stem; calyx-lobes lanceolate, shorter than the capsule; corolla blue, 2 lines long.—San Diego.

#### LOBELIACEAE. LOBELIA FAMILY

Herbs, mostly annuals, with alternate simple entire leaves. Flowers in racemes, complete. Calyx-tube adnate to the ovary, its free border with 5 distinct lobes or teeth. Corolla epigynous, 2-lipped, 2 lobes in the upper lip and 3 in the lower. Stamens 5, inserted with the corolla, but generally free from it and alternate with its lobes; anthers and filaments usually united into a tube about the style. Ovary inferior, 2-celled; style 1; stigma capitate and girt with a rim of hairs. Juice mostly milky and acrid. Fruit in ours a many-seeded 1 or 2-celled capsule.—Flowers in capitate clusters in *Parishella* and corolla rotate. Ovary partly or wholly free in *Nemacladus*.

Anthers distinct: flowers minute.

Flowers solitary on filiform pedicels borne on zig-zag stems; stems erect. 1. *NEMACLADUS*.

Flowers subsessile in capitate clusters; stems prostrate.....2. *PARISHELLA*.

Anthers united and forming a tube; flowers larger.

Corolla-tube cleft to the base on one side.....3. *LOBELIA*.

Corolla-tube not cleft at all.

Filaments distinct below; corolla-tube several times longer than the limb.....4. *PALMERELLA*.

**Filaments united.**

- Tube of corolla equaling or nearly as long as the limb; ovary thick (oblong or obconical) ..... 5. LAURENTIA.  
 Tube of corolla very short, shorter than the ample limb; ovary long and slender (stalk-like).  
 Corolla conspicuously 2-lipped ..... 6. DOWNINGIA.  
 Corolla-segments only slightly unequal ..... 7. HOWELLIA.

**1. NEMACLADUS Nutt.**

Low and diffusely branched annuals with very small basal leaves and minute cauline ones. Flowers minute, borne on long capillary pedicels, racemously arranged on the very slender zig-zag branches. Corolla 2-lipped, the lower lip 3-parted, the upper 2-parted, or the segments almost distinct. Filaments united above the base; anthers distinct. Style incurved at tip; stigma capitate, 2-lobed. Capsule 2-celled, 2 or 4-valved from the tip, few to many-seeded. (Greek *nemos*, thread, and *clados*, branch, referring to its capillary habit.)

- Tube of corolla elongated (1 to 1½ times as long as lobes); calyx free from ovary; filaments very deeply divided, without appendages ..... 1. *N. longiflorus*.  
 Tube of corolla very short (¼ to ½ as long as the lobes); calyx-tube more or less adnate to the ovary, the lobes about as long as the tube.  
 Filaments without appendages ..... 2. *N. glanduliferus*.  
 Anterior pair of filaments with appendages or rod-like structures.  
 Rods borne on an extended process of the filament.  
 Corolla-lobes not ciliate; stamens about as long as corolla; pedicels usually ascending; vars. of ..... 3. *N. rigidus*.  
 Upper corolla-lobes generally ciliate; stamens well exerted ..... 4. *N. rubescens*.  
 Rods borne on a knob-like swelling or sessile dilation, the whole somewhat palmate ..... 5. *N. ramosissimus*.

1. *N. longiflorus* Gray. Stems 1 to several from the base, branching, 3 to 6 in. high; calyx free from the ovary, its lobes equal, linear-oblong, acute, nearly distinct; corolla-tube elongated (2 to 2½ lines long), its lobes subequal, much shorter than the tube, the palate short-hairy; capsule long and narrow, 2-valved from top to bottom.—Mostly cismontane S. Cal., 1000 to 5500 ft., from Ventura Co. to San Diego Co.; s. to L. Cal. May.

2. *N. glanduliferus* Jepson n. sp. Plants compact, 3 to 4 in. high, the stems several from the base and very zig-zag; leaves oblong-obovate, entire; calyx-tube partly adnate to the ovary, its lobes lanceolate, acute; corolla white, its lobes ovate-lanceolate, acute; filaments without appendages; ovary surrounded by 5 glands (3 large and 2 small), forming a sort of disk, the stamen filaments arising between the glands.—W. Colorado Desert (Wagon Wash, near Sentenac Cañon, Jepson 8766, type).

3. *N. rigidus* Curran var. *montanus* Munz. Stem diffusely branched, zig-zag, 4 to 8 in. high; herbage glabrous or minutely puberulent; basal leaves oblanceolate, dentate; pedicels ascending; corolla white, 1½ lines long, strongly 2-lipped, its lobes almost twice as long as the sepals; capsule about equaling calyx; seeds with broad flat ridges, each with about 30 cells.—Montane: Butte Co.; Lake Co. to Napa Co. (*N. montanus* Greene.) Var. *INTERIOR* Munz. Similar to var. *montanus*; seeds smaller, ⅓ line long, its low narrow ridges with 10 long regular cells in rows between.—W. slope Sierra Nevada, 2000 to 6000 ft., from Sierra Co. to Tulare Co. Var. *CAPILLARIS* Munz. Stem not zig-zag usually; corolla 1 line long; calyx-tube long-turbinate; capsule swollen above, exceeding the calyx; seeds few (5 to 12).—Napa Co. to Humboldt Co.; Shasta Co. to Tulare Co.; Mohave Desert. (*N. capillaris* Greene.)

4. *N. rubescens* Greene. Plants 3 to 4 in. high, the stems very slender; calyx-lobes linear, acute, the tube adnate to the ovary; corolla white, the upper lobes lanceolate, with brownish-purple tips or a brownish-purple spot near the tips; lower corolla-lobes oblong, acute, the upper portion red-brown and ciliate-fringed; anterior pair of filaments each with a process near the base; process thread-like, bearing 3 usually divergent slender translucent rods nearly as long; seeds with 8 or 9 longitudinal sinuous striae.—Central Mohave Desert to the western Colorado Desert. (*N. adenophorus* Parish.)

5. *N. ramosissimus* Nutt. Stems many from the base, several times forked and ending in racemose flexuous flowering branches with long spreading pedicels; leaves linear, sessile, entire or slightly toothed; calyx-tube adnate to ovary; upper corolla-lobes oblong-ovate, pinkish white; lobes of lower lip narrow-ovate, whitish or pink-tinged with red-brown markings; two anterior filaments bearing a bundle of 6 (or 5) cylindric rods arising from a swollen or knob-like base; ovary bearing laterally 2 large rounded or wart-like protuberances, one on each side, which are visible between the upper and lower sets of filaments; ovary 1-celled, ovules 8; style barely cleft; stigmas 2, roundish.—Coastal mts., 1000 to 5000 ft., Monterey Co. to San Diego Co.; s. to L. Cal. (*N. montanus* Greene.) Var. *PINNATIFIDUS* Gray. Stems slightly zig-zag; basal leaves pinnatifid; corolla very slightly exceeding sepals; capsule acutish; seeds longer than broad.—Cismontane S. Cal.; s. to L. Cal. Var. *GRACILIS* Munz. Similar to var. *pinnatifidus*; stems zigzag; basal leaves dentate to entire; capsule obtuse.—Monterey Co. to San Diego Co. and e. through the Mohave Desert to Inyo Co.; Nev. to Ariz. (*N. gracilis* Eastw.)

## 2. *PARISHÉLLA* Gray

Small annual. Flowers pediceled or subsessile, borne in capitate clusters, 2 or 3 heads successively proliferous from the central sessile head. Calyx-tube campanulate, its lobes spatulate, twice as long. Corolla rotate, shorter than the foliaceous calyx-lobes, almost equally 5-parted. Stamens free from the corolla; filaments united into a slender tube (except at base), strongly incurved at apex. Stigma 2-lobed. Ovary inferior except at apex. Capsule turbinate, its low-conic apex circumscissile just above the calyx-lobes. (S. B. and W. F. Parish, pioneer botanical collectors in Southern California.)

1. *P. californica* Gray. Stems  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; leaves spatulate-obovate, 2 to 3 lines long; corolla white,  $1\frac{1}{2}$  to 2 lines long, its lobes ovate-lanceolate, acute.—Mohave Desert to w. Nev.

## 3. *LOBÉLLA* L.

Perennial herbs (ours) with the flowers in terminal racemes. Calyx-tube short, its limb 5-cleft. Corolla strongly 2-lipped, the tube split to the base on the upper side, the lobe on each side the cleft smaller, erect or recurved, the 3 others pendulous. Stamens 5. Anthers and upper portion of the filaments united around the style. Capsule loculicidally 2-valved. (Mathias de L'Obel, 1538-1616, a botanist of Flanders.)

1. *L. splendens* Willd. Stem simple, erect,  $1\frac{1}{2}$  to  $2\frac{1}{4}$  ft. high; leaves linear-lanceolate to oblanceolate, narrowed below to a petiole or the upper sessile,  $3\frac{1}{2}$  to  $5\frac{1}{2}$  in. long; raceme  $\frac{1}{4}$  to 1 ft. long; calyx-tube hemispherical, its lobes slenderly linear-subulate; corolla intense red,  $1\frac{1}{4}$  in. long; 2 of the anthers strongly bearded at tip; capsule subglobose, 3 lines long.—Montane slopes, 1000 to 5500 ft.: s. slopes of the San Gabriel and San Bernardino mountains to San Diego Co.; e. to Tex., s. to Mex. Aug.-Sept.

## 4. *PALMERÉLLA* Gray

Perennial herbs with the flowers in a terminal raceme. Calyx-tube turbinate, its lobes slender-lanceolate. Corolla with a long straight tube, its limb abruptly spreading; upper lip deeply cleft into 2 lanceolate lobes; lower lip parted into 3 obovatish lobes. Lower  $\frac{2}{3}$  of filaments adnate to the corolla-tube, the upper  $\frac{1}{3}$  free and monadelphous. Two of the anthers tipped with a close tuft of short but unequal bristles. (Dr. Edward Palmer, early botanical collector in Mexico and the Southwest.)

1. *P. débilis* Gray var. *serrata* Gray. Stems simple or branching, 1 to 2 ft. high; herbage glabrous or the inflorescence puberulent; leaves diverse in shape, varying from obovate to oblong and lanceolate or linear,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  in. long, the broader ones serrate, the narrower ones disposed to be entire; calyx-lobes over half the length of the corolla-tube; corolla  $\frac{1}{2}$  to  $\frac{3}{4}$  in. long, limb blue, its tube whitish, pubescent within.—Along streams in the hills, 500 to 3000 ft.: Monterey Co. to San Diego Co.

5. **LAURÉNTIA** Mich.

Small annuals resembling *Downingia* in habit and in the flower. Corolla blue, its tube as long as the limb. Ovary thick, oblong or obconical. Stamens completely united. Capsule 2-valved at apex. (M. A. Laurenti, University of Bologna.)

1. *L. carnòsula* (H. & A.) Gray. Somewhat succulent, glabrous, diffusely branching, 2 to 5 in. high; leaves sessile, lanceolate, about 3 lines long; peduncles filiform; calyx-lobes linear; upper corolla lip erect, with 2 lanceolate diverging lobes; lower lip deeply 3-cleft into roundish-obovate lobes; border bright blue with white or yellow center which is folded at throat, forming 2 prominent ridges; stamen-tube somewhat extruded from corolla-tube and bristle-tipped.—Montane, 5000 to 6000 ft.: Sierra Nevada from Nevada Co. to Lassen Co.; nw. to Wyo. and Mont. (*Porterella carnosula* Torr.)

6. **DOWNINGIA** Torr.

Dwarf annuals. Corolla with a short tube and commonly ample 2-lipped limb; lips spreading, the larger 3-lobed, the smaller 2-cleft with narrow divisions. Ovary very long and stalk-like, 2-celled, becoming a 1-celled capsule with 2 parietal filiform placentae. Capsule long and linear, crowned with the persistent calyx-lobes, dehiscent below the apex by 1 to 3 long fissures.—These plants are found on low plains in the valleys and on flats in the mountains or sometimes in saline marshes, growing in the margins of vernal pools or in "hog wallows" or in their moist beds after the water is gone and flowering from May to July. (A. J. Downing, an American horticulturist.)

909. *Downingia pulchella* Torr.; a, fl. x 2; b, face view of fl. x 2; c, anther-column x 6.

Corolla strongly 2-lipped.

Lower lip of corolla concave, the tube campanulate; stamen-column long-exserted, the anther-tube much incurved, nearly hook-shaped. . . . . 1. *D. elegans*.

Lower lip of corolla plane, forming a platform spreading at right angles to the tube which is more narrow; stamen-column little or not at all exserted, the anther-tube straight or only slightly curved.

Corolla-tube shorter than the calyx-lobes.

Sinuses of corolla not cut below platform; lobes of upper lip of corolla long, lanceolate and divergently spreading. . . . . 2. *D. pulchella*

Sinuses of corolla cut below platform.

Lobes of upper lip of corolla coiled into a ring; main sinuses (between the lips) cut straight down; lower lip with yellow spots; calyx lobes ascending . . . . . 3. *D. ornatissima*

Lobes of upper lip of corolla not coiled; main sinuses (between the lips) cut far forward so that lower lip is hinged; calyx-lobes rotate.

Lobes of upper lip parallel; angle of lower lip at throat with two nipples or folds; lower lip with a central quadrate maroon spot, but no yellow . . . . . 4. *D. concolor*.

Lobes of upper lip divergent, forming a V-shaped sinus; angle of lower lip at throat with 4 nipples or folds; lower lip with 2 yellow spots on a central white field. . . . . 5. *D. bicornuta*.

Corolla-tube longer than the calyx-lobes; no nipples or processes on angle of lower lip . . . . . 6. *D. cuspidata*.

Corolla obscurely 2-lipped, shorter than the calyx, its lobes subequal. . . . . 7. *D. humilis*.

1. *D. elegans* (Lindl.) Torr. Four to 7 (or 12) in. high; leaves oblong to oblong-lanceolate, 6 to 9 lines long; corolla light blue, veiny, the concave palate of lower lip with 2 greenish-yellow spots on a field of white; corolla-tube very short-campanulate; upper lip cut  $\frac{3}{4}$  of the way down, the segments ascending and somewhat divergent; lower lip 3-lobed at apex, the lobes parallel; side of throat next to lower lip frequently with purple spots and yellow lines; stamen-column long-exserted, about equaling the upper segments, the anther-column down-curved and bearing 2 recurved bristles on

910. *Downingia ornatissima* Greene; a, fl. x 3; b, face view of fl. x 3; c, anther-column x 9.

quite equaling the upper lip; anther-tube with 2 short bristles at apex.—South Coast Ranges; Sacramento Valley; Sierra Co.; n. to southern Ore. Var. *ARCANA* Jepson. Like the species but the lobes of upper lip spreading backward; anther-tube not exserted.—W. San Diego Co.; w. Riverside Co.

3. *D. ornatissima* Greene. Fig. 910. Erect, slender, 2 to 6 in. high, simple or branched from the base; leaves linear or subfiliform; calyx-lobes ascending; corolla very light or pale blue; lower lip with squarish white center bearing 2 yellow spots which contract into crests or folds at angle of the throat; lobes of the upper lip coiled backward into a ring, the cleft between them projected backward so as to appear like a short horn; somewhat similar horn-like folds or undulations occur laterally at base of sinuses between upper and lower lips; stamen-column exserted a little from corolla-tube, anthers standing between the coils of the upper lip.—Low spots on the plains of the Sacramento Valley and lower San Joaquin Valley.

4. *D. cóncolor* Greene. Fig. 911. Branched from the base and somewhat tufted or nearly simple, 1 to 2 (or 4) in. high, minutely puberulent; calyx-lobes rotate; flower 4 to 4½ lines broad; corolla blue, the lower lip with a velvety purple quadrate spot on the white central field (or the white mostly absent), its lobes apiculate; nipples 2, arising on the angle of the lower lip from the purple spot and guarding the entrance to the throat; lobes of upper lip lanceolate, parallel, more or less ciliate, curving horizontally backwards; no processes at lateral sinuses; stamen-column included; anther-tube with 2 short bristles at apex.—Abundant locally in low spots,

the lower side.—San Joaquin and Sacramento valleys; Mendocino Co. to Shasta Co.; Sierra Co. to Modoc Co.; n. to Wash.

2. *D. pulchélla* Torr. Fig. 909. Erect or ascending, 2 to 10 in. high; leaves oblong-ovate or narrower, ½ in. long; calyx-lobes rotate; corolla a deep bright blue; center of lower lip white with two obovate yellow spots, contracting into narrow folds at the throat, either side of and in interval between the folds 3 dark violet spots; upper lip deeply 2-cleft, the long oblanceolate lobes very divergent and spreading; corolla-tube 1 line long, lower lip ample (6 lines broad), plane and at right angles to the tube, its lobes quadratish, divergent or trefoil-shaped; stamen-column nearly or

911. *Downingia cóncolor* Greene; a, fl. x 3; b, face view of fl. x 3; c, anther-column x 8

912. *Downingia bicornuta* Gray;  
a, fl. x 2; b, face view of fl. x 2;  
c, anther-column x 6.

Santa Clara Valley to Lake Co. and the plains of the Sacramento Valley.

5. *D. bicornuta* Gray. Fig. 912. Erect, 2 to 3 in. high; calyx-lobes rotate; corolla blue, 5 lines broad, the lower lip with a white central field and two yellow spots; lower lip with 2 ascending horns or nipples at inner angle of the lip, the lateral margins folded back at the throat into 2 less prominent nipples, making 4 in all in a transverse line; lobes of upper lip deep violet purple, very short and broad, acute and curving backwards; sinuses between corolla-lips running far forward, so that the lower lip appears hinged; stamencolumn not exerted from tube, bristle at apex of anther-tube bent forward.—Low plains of the Sacramento Valley. Var. *MONTANA* Jepson. Lobes of upper lip sub-parallel, longer than in the species; sinuses not so deeply cleft.—Montane, 3000 to 5000 ft.: Sierra Nevada from Tulare Co. to Modoc Co.

6. *D. cuspidata* Greene. Stems very slender, 6 to 7 in. high; leaves mostly 1 to 2 lines long; flowers few; corolla violet, the lower lip with a basal yellow spot bordered by white; lower lip broadly trefoil-shaped, broader than long, plane or nearly so, without protuberances or folds or nipples at the angle; lobes broadly ovate, retuse or somewhat obcordate, cuspidately pointed; lobes of the upper lip  $1\frac{1}{2}$  lines long, spatulate-obovate, cuspidately acute, slightly divergent; anther-tube scarcely exerted from the comparatively long ( $1\frac{1}{2}$  lines) and narrow corolla-tube.—Valley fields, Napa and Sonoma Cos. May-June.

7. *D. humilis* Greene. Very dwarf, 1 to 2 in. high; calyx-segments unequal, exceeding the corolla in length; corolla minute, white, 1 line long, obscurely 2-lipped, the ovate-oblong acute segments not very unlike.—S. Sonoma Co.

#### 7. *HOWELLIA* Gray

Annuals. Flowers more or less cleistogamous. Calyx-tube united for its whole length to the ovary, the limb with slender segments. Corolla not surpassing the calyx, its very short tube divided nearly to the base on the (apparently) upper side; lobes oblong, nearly equal, three united higher. Ovary 1-celled, the filiform parietal placentae each with 3 to 5 ovules. Capsule membranous, bursting irregularly on one side. (Thos. Howell of Portland, author of a pioneer flora of Oregon, Washington and Idaho.)

1. *H. limosa* Greene. Weak and procumbent, the branches 1 ft. long, sometimes matted; leaves lanceolate, sessile, entire, 1 in. long; flowers cleistogamous; capsule clavate-oblong,  $\frac{1}{2}$  in. long, crowned by the 5 triangular calyx-teeth.—Beds of former vernal pools, Sacramento Valley.

#### COMPOSITAE. SUNFLOWER FAMILY

Annual or perennial herbs or shrubs with alternate or opposite leaves. Flowers perfect, unisexual or sterile, in heads, borne on the enlarged summit of the peduncle (receptacle) and surrounded by the bracts of the involucre. Receptacle with bracts subtending the flowers, or with bristles among the flowers, or without bracts or bristles (naked). Corollas tubular and 5-toothed or 5-lobed, or the limb strap-shaped (or ligulate) and toothed at apex, those of a head all tubular or all ligulate or of both kinds. When both kinds are present the flowers with the ligulate corollas occupy the margin of the head

and are called ray-flowers, and the ligulate corollas are called rays; the flowers with the tubular corollas occupy the center and are called disk-flowers. Ray-flowers commonly pistillate, sometimes perfect or neutral; disk-flowers commonly perfect, often staminate or pistillate. Heads with both ray- and disk-flowers are called radiate; with disk-flowers only, discoid. Calyx-tube united with the ovary, the limb when present called a pappus and greatly varied in structure, consisting of awns, hairs, bristles, scales or paleae, or in many cases appearing as a mere crown or ring or wholly obsolete. Stamens 5; filaments free; anthers united and forming a tube, or nearly or quite free in the tribe of Ambrosieae. Style divided above into 2 long branches which bear stigmatic lines on the inside. Ovary 1-celled, 1-ovuled, maturing into an achene, crowned by the pappus when that is present. Pappus commonly persistent and assisting in the dispersion of the 1-seeded fruit.

#### SYNOPSIS OF THE TRIBES

Heads composed wholly of perfect flowers with ligulate corollas; ligule 5-toothed at apex; herbs with milky juice; leaves alternate or basal. . . . . 1. CICHORIEAE.

Heads composed of ray- and of disk-flowers or of disk-flowers only.

A. *Receptacle* naked (without bristles or chaffy bracts); leaves alternate or sometimes opposite in Helenieae.

Bracts of involucre in 1 to several series; corolla 2-lipped; anthers with long tails at base. . . . . 2. MUTISIEAE.

Bracts of the involucre equal or imbricated; flowers perfect, regular, white or whitish; rays none. . . . . 3. EUPATORIEAE.

Bracts of involucre well imbricated; disk-flowers commonly yellow, the rays of the same or different color or none; pappus of awns or bristles (or paleaceous in nos. 34 and 35, none in no. 51). . . . . 4. ASTEREEAE.

Bracts of the involucre many and imbricated, often dry or scarious; pappus of capillary bristles; rays none; pistillate corollas mostly filiform; (pappus none and bracts few in no. 67); mostly white-woolly plants. 5. INULEAE.

Bracts of involucre in few series, little imbricated; pappus paleaceous, awn-like, bristly or none; flowers yellow (except no. 133); rays present, or heads discoid in a few genera. . . . . 9. HELENIEAE.

Bracts of involucre imbricated, dry and scarious; pappus none or reduced to a mere crown or ring; flowers white, yellow or greenish; rays present or absent; leaves usually much divided; herbage strong-scented. . . . . 10. ANTHEMIDEAE.

Bracts of involucre in 1 or 2 series; pappus of soft capillary bristles; both disk- and ray-flowers yellow (except no. 149). . . . . 11. SENECTIONEAE.

B. *Receptacle* with chaffy bracts (see also nos. 27, 132, 137 and 138 and one species of nos. 111 and 120).

Rays present, conspicuous or inconspicuous (see exceptions in Heliantheae p. 984); disk-flowers perfect; bracts of the involucre foliaceous or herbaceous, not scarious; pappus of paleae or awns never capillary.

Involucre of 1 to several series of bracts, none enfolding ray-achenes; receptacle very chaffy; leaves mostly opposite or basal. . . . . 6. HELIANTHEAE.

Involucre of 1 series of equal bracts, each embracing or enfolding a ray-achene; bracts of receptacle often in a single series between ray and disk; leaves alternate or opposite; (annuals except 5 species). . . . . 7. MADIEAE.

Rays none; leaves alternate.

Heads unisexual (except no. 100), small, greenish or white; corolla of pistillate flowers none or a rudiment; anthers nearly or quite distinct; pappus none; fruit usually a bur; leaves alternate (the lower opposite in no. 102). . . . . 8. AMBROSIEAE.

Heads composed of both pistillate and staminate (or perfect) flowers; corolla of pistillate flowers filiform; bracts of the involucre few or none; leaves alternate (except no. 65); white-woolly annuals. 5. INULEAE.

C. *Receptacle* covered with bristles; heads large; flowers conspicuous; corollas cleft into long narrow lobes; rays none; very spiny thistles or thistle-like plants; leaves alternate. . . . . 12. CYNAREAE.

#### TRIBE 1. Cichorieae. CHICORY TRIBE

Herbs with milky juice and alternate or basal leaves. Receptacle almost always flat, naked or with chaff-like bracts or bristles. Flowers all perfect and all with ligulate or strap-shaped corollas, the ligule 5-toothed at apex. Anthers sagittate or auricled at base, commonly appendaged at summit. Style-branches stigmatic on their inner side for their whole length.

##### A. Achenes without pappus.

Leaves all basal, the cauline none or reduced to minute bracts; achenes terete or teretish.

Achenes clavate, straight, with 5 corky-thickened ribs; flowers white; leaves broadly obovate. . . . . 1. ATRICHOSERIS.

- Achenes short-oblong, obscurely quadrangular, smooth-sided, slightly curved; flowers yellow; leaves all basal, lanceolate.....2. PHALACROSERIS.  
 Leaves basal and cauline; achenes somewhat flattened, 20 to 30-ribbed; flowers white....  
 3. LAPSANA.

### B. Achenes with pappus.

#### 1. PAPPUS PALEACEOUS.

- Heads sessile or subsessile; paleae awnless.  
 Flowers blue; receptacle naked; leaves and involucre bracts not spinose.....4. CIOHORUM.  
 Flowers yellow; receptacle chaffy; leaves and involucre bracts spinose...5. SCOLYMUS.  
 Heads pedunculate; some or all of the paleae awned; flowers yellow; receptacle naked.  
 Bracts of involucre in 1 series, enfolding the outer achenes; only the inner paleae of the inner achenes awned.....6. RHAGADIOLUS.  
 Bracts of involucre in more than 1 series, not enfolding the outer achenes; all the paleae awned.  
 Annuals; ligules short, the heads in anthesis small; inner bracts of involucre equal, the outer short; pappus-paleae usually 5.  
 Heads nodding in bud; pappus-paleae not cleft at tip, abruptly or gradually passing into the awn.....7. MICROSERIS.  
 Heads erect; pappus-paleae cleft at tip, with a short bristle or awn in the cleft .....8. UROPAPPUS.  
 Perennials; ligules long, the heads in anthesis showy; bracts of involucre imbricated in several series; pappus-paleae usually 10.....9. SCORZONELLA.

#### 2. PAPPUS CONSISTING OF BRISTLES, THESE RARELY SLIGHTLY PALEACEOUS AT BASE.

##### a. Bristles of pappus (or some of them) plumose.

- Achenes (at least the inner) beaked.  
 Receptacle naked; stems somewhat leafy.  
 Flowers yellow; herbage stiff and prickly.....10. PICRIS.  
 Flowers not yellow; herbage not stiff nor prickly.  
 Perennial or biennial with grass-like leaves; flowers purple; involucre bracts in 1 series.....11. TRAGOPOGON.  
 Annual with leaves toothed or pinnatifid; flowers white; involucre bracts in more than 1 series.....12. RAFINESQUIA.  
 Receptacle with chaff-like bracts; leaves basal.....13. HYPOCHOERIS.  
 Achenes beakless.  
 Receptacle naked; stems branched, more or less leafy; heads sessile or on stout peduncles; flowers pink.....14. STEPHANOMERIA.  
 Receptacle with scarious linear bracts; leaves all basal; heads borne on scapes; flowers yellow.....15. ANISOCOMA.

##### b. Bristles of pappus smooth, scabrous or barbellulate, but never plumose; receptacle naked, except no. 23 and sometimes in no. 18.

- Achenes flattened; stems leafy.  
 Heads panicled; achenes beaked.....16. LACTUCA.  
 Heads corymbose or umbellate; achenes not beaked.....17. SONCHUS.  
 Achenes not flattened.  
 Heads commonly nodding in the bud; achenes beakless.  
 Pappus promptly deciduous, or with 1 to 4 bristles persistent; stems leafy, or scapose with the leaves all basal.....18. MALACOTHRIX.  
 Pappus persistent or subsistent, the bristles about 30 to 45; stems scapose, the leaves all basal.....19. APARGIDIUM.  
 Heads erect in bud.  
 Stems scapose, the leaves all basal; achenes beaked (in Agoseris alpestris merely constricted at apex).  
 Achenes spinulose-toothed above.....20. TARAXACUM.  
 Achenes not spinulose-toothed above.....21. AGOSERIS.  
 Stems not scapose, more or less leafy.  
 Achenes beaked; desert annuals.  
 Plants tufted, without tack-shaped glands; receptacle naked; achenes 5-angled, with a row of pits in the intervals; apex of the achene truncately constricted, bearing a short stout beak....  
 22. GLYPTOPLEURA.  
 Plants not tufted, commonly dotted above with tack-shaped glands; receptacle bearing capillary bristles; achene 5-ribbed, narrowed above into a short beak capped by a shallow cup.....  
 23. CALYCOSERIS.  
 Achenes beakless (except in 2 species of Crepis).  
 Flowers yellow (or white); heads mostly in paniculate or corymbose cymes, sometimes solitary.  
 Pappus dull white, reddish-brown or tawny, somewhat rigid; herbage often rough-hairy; bracts not thickened in fruit.....  
 24. HIERACIUM.  
 Pappus white, soft; herbage tomentulose, hairy or glabrous; bracts in fruit often thickened at base or along midrib.....  
 25. CREPIS.  
 Flowers pink or rose-color; pappus persistent; stems often rush-like...  
 26. LYCODESMIA.

TRIBE 2. *Mutisieae*. MUTISIA TRIBE

Herbs or shrubs. Leaves alternate. Heads with the flowers all alike. Corolla in ours 2-lipped with 2 lobes in upper lip and 3 in lower, the lower lip in marginal flowers often elongated. Anthers with long tails at base. Style-branches of perfect flowers not appendaged, in ours comparatively long.

Flowers yellow; bracts of the involucre in a single rank or with supplementary foliaceous bracts at base; inflorescence very leafy; receptacle densely villous... 27. *TRIXIS*.  
Flowers purple to white; bracts of the involucre imbricated in several ranks; inflorescence not leafy; receptacle naked..... 28. *PEREZIA*.

TRIBE 3. *Eupatorieae*. EUPATORY TRIBE

Ours herbs or suffrutescent plants with white or flesh-colored perfect disk-flowers and no rays. Receptacle naked. Anthers not caudate at base. Style-branches stigmatic only below the middle.

Annuals; leaves sessile; pappus consisting of paleae alternating with awns or bristles.  
Leaves opposite; receptacle convex; involucre bracts equal, nerveless..... 29. *TRIOHOCORONIS*.  
Leaves alternate; receptacle flat; involucre bracts unequal, nerved... 30. *MALPERIA*.  
Perennials; leaves petioled; pappus consisting of bristles (in *Hofmeisteria* some of these paleaceous at base).  
Involucre bracts imbricated, striately nerved; stems usually much-branched.  
Achenes with 10 nerves or ribs; leaves alternate..... 31. *BRICKELLIA*.  
Achenes 5-angled by the strong nerves; lower leaves opposite... 32. *HOFMEISTERIA*.  
Involucre bracts in 2 series, nearly equal, nearly nerveless; stems simple or with a few branches..... 33. *EUPATORIUM*.

TRIBE 4. *Astèreae*. ASTER TRIBE

Annual or perennial herbs or shrubs with bland watery juice. Herbage scentless, the foliage sometimes gummy or resinous. Leaves alternate. Receptacle naked. Bracts of the involucre commonly well imbricated. Disk-flowers yellow (except in some *Lessingias*, *Pentachaetas* and *Conyzas*), perfect in all ours except *Baccharis*. Rays present or absent. Anthers not caudate at base. Pappus of awns or bristles (paleaceous in *Gutierrezia* and *Amphiachyris* and sometimes in *Monoptilon*, none in *Bellis*).

## A. Flowers perfect or unisexual, not dioecious.

1. RAYS YELLOW OR NONE (SEE ALSO NOS. 60 AND 52; SOMETIMES WHITE OR PINK IN NO. 50).
  - a. Pappus paleaceous or of bristles united into scales in the ray-flowers; heads small; perennial herbs or bushes.
 

Leaves narrowly linear; disk-flowers usually fertile..... 34. *GUTIERREZIA*.  
Leaves obovate or elliptic; disk-flowers sterile..... 35. *AMPHIACHYRIS*.
  - b. Pappus of bristles or awns, not paleaceous (except in 1 species of *Haplopappus*).
 

Pappus caducous; heads large, usually gummy; rays present, conspicuous; coarse perennial herbs ..... 36. *GRINDELIA*.  
Pappus persistent (or sometimes deciduous in the ray-flowers); heads not gummy.  
Involucre bracts with fimbriate margins; heads spherical; desert shrubs..... 37. *ACAMPTOPAPPUS*.  
Involucre bracts not fringed.  
Heads erect, or at least not nodding in the bud.  
Achenes commonly not flattened.  
Pappus bristles equal or unequal.  
Leaves glandular-punctate, entire; shrubs.  
Heads large, solitary; involucre bracts in about 2 series;  
rays many ..... 38. *STENOTOPHIS*.  
Heads small, paniculate or corymbose; bracts well imbricated  
in several series; rays few or none. 39. *ERICAMERIA*.  
Leaves commonly not glandular-punctate.  
Involucre bracts not in definite vertical ranks.  
Involucre destitute of foliaceous outer bracts.  
Rays present; herbs, the stems from woody root-crowns.  
Leaves mostly toothed or pinnately lobed, not  
evergreen; heads in a panicle or spike,  
or solitary..... 40. *HAPLOPAPPUS*.  
Leaves narrow, entire, more or less evergreen;  
heads solitary; plants low, caespitose.  
41. *STENOTUS*.

- Rays none (sometimes present in no. 43).  
 Flowers permanently yellow; heads in terminal  
 cymes; woody-based plants. .... 42. ISOCOMA.  
 Flowers yellow, changing to brown; heads panic-  
 ulate or racemose; shrubs or perennial  
 herbs. .... 43. HAZARDIA.  
 Involucre with foliaceous outer bracts passing into leaves;  
 rays few or none; stems sometimes densely  
 white-tomentose, the leaves green; montane  
 undershrubs. .... 44. MACRONEMA.  
 Involucral bracts in definite vertical ranks; involucre narrow  
 or turbinate, the bracts rather few, becoming loose  
 in age; heads mostly in panicles or racemes; rays  
 none except 1 species; mostly desert shrubs. .... 45. CHRYSOTHAMNUS.  
 Pappus bristles equal; heads radiate, small, very numerous, in dense  
 clusters; bracts unequal, well imbricated; perennial herbs. .... 46. SOLIDAGO.  
 Achenes, at least those of the disk, flattened.  
 Corolla of the disk-flowers about as long as the style; pappus com-  
 monly double, the outer of short bristles or little scales.  
 Achenes of disk and ray with pappus or ray-flowers none; pappus  
 bristles copious, brownish or rusty; perennial herbs,  
 sometimes woody at base. .... 47. CHRYSOPSIS.  
 Ray-achenes without pappus, or the pappus reduced to a deciduous  
 crown; pappus of disk-achenes brick-red in age; tall  
 hirsute herbs with broad serrate leaves. .... 48. HETEROTHECA.  
 Corolla of outer flowers only  $\frac{1}{2}$  as long as the style; rays none; flowers  
 white or yellowish; herbs. .... 49. CONYZA.  
 Heads nodding in the bud; pappus of 1 to 12 bristles; leaves narrow; annuals  
 with slender or filiform stems. .... 50. PENTACHAETA.
2. RAYS PRESENT, PINK, WHITE, BLUE OR PURPLE (SOMETIMES NONE IN ERIGERON, SOME-  
 TIMES YELLOW IN LESSINGIA, SOMETIMES VERY INCONSPICUOUS); HERBS (EXCEPT 4  
 SHRUBS OR SHRUBBY SPECIES IN ASTER).
- Pappus wanting; rays white; disk yellow; leaves all basal; heads on scape-like peduncles. ... 51. BELLIS.
- Pappus present.  
 Heads with the marginal corollas commonly enlarged and more deeply cleft on the  
 inside, thus a little palmate; annuals. .... 52. LESSINGIA.  
 Heads with rays.  
 Style-branches of disk-flowers usually more or less comose; pappus bristles reddish  
 or rusty brown. .... 53. CORETHROGYNE.  
 Style-branches of disk-flowers not comose; pappus bristles whitish.  
 Pappus in ray-flowers absent or squamellate; rays lavender, disk yellow;  
 leaves sharply toothed or pinnatifid; erect or ascending annuals. ... 54. PSILACTIS.  
 Pappus in both ray- and disk-flowers of awns or bristles (rarely paleae).  
 Pappus scanty (1 to 12 awns); heads leafy-bracteate; rays commonly  
 white, disk yellow; low or prostrate annuals. 55. MONOPTILON.  
 Pappus copious.  
 Disk-flowers white or whitish; rays 5, white; receptacle foveolate;  
 bracts green-tipped. .... 56. SERICOCARPUS.  
 Disk-flowers yellow; rays blue, purple or sometimes white.  
 Pappus conspicuously barbellate, almost short-plumose;  
 achenes flattened, with thick callous margins; tufted  
 montane herb. .... 57. TOWNSENDIA.  
 Pappus not plumose, at most scabrous.  
 Involucral bracts imbricated in 2 or more series.  
 Style-tips lanceolate to subulate, acute; mostly tall  
 plants with leaves 1 to 10 in. long; rays  
 commonly blue or purple. .... 58. ASTER.  
 Style-tips ovate or oblong, obtuse; low tufted desert  
 perennial with leaves less than 5 lines  
 long; rays commonly white. .... 59. LEUCELENE.  
 Involucral bracts in 1 or 2 series, mostly equal; style-  
 tips triangular or oblong, obtuse. .... 60. ERIGERON.
- B. Flowers dioecious, whitish or yellowish; heads discoid; shrubs or perennial  
 herbs. .... 61. BACCHARIS.

#### TRIBE 5. Inuleae. EVERLASTING TRIBE

Annual or perennial herbs. Herbage mostly white-woolly (except *Pluchea*).  
 Leaves alternate (opposite in *Psilocarphus*), entire, or more or less dentate

in *Pluchea* and *Adenocaulon*. Heads small; rays none. Bracts of the involucre frequently white or scarious. Pistillate flowers mostly with filiform corollas. Sterile flowers either perfect or staminate. Anthers caudate at base. Style-branches stigmatic to the unappendaged summit. Pappus capillary or none. (One species of *Pluchea* is a shrub.)

A. Bracts of the involucre sac-like (open in no. 66), bearing pistillate (fertile) flowers; central cluster of flowers sterile, surrounded by chaffy bracts of the receptacle (or the receptacular bracts none in no. 65); annuals.

Fruit-bearing bracts conduplicate or sac-like, completely enclosing the pistillate flower, falling away with the achene.

Involucre below the sac-like bracts consisting of about 5 scarious plane scales; achenes gibbous, the corolla and style borne laterally; receptacle convex; pappus none; leaves alternate.....62. *MICROPUS*.

Involucre below the sac-like bracts none; achenes straight, the corolla and style borne at the apex.

Leaves alternate.

Receptacle convex; pappus present.....63. *FILAGO*.

Receptacle slender or columnar; pappus none or commonly none.....64. *STYLOCLINE*.

Leaves opposite; receptacle globose; pappus none.....65. *PSILOCARPHUS*.

Fruit-bearing bracts open, merely subtending the pistillate flowers, persistent; pappus none.....66. *EVAX*.

B. Bracts of the involucre numerous (5 in no. 67), not sac-like; bracts of the receptacle none; perennials or annuals.

Achenes bearing stipitate glands; pappus none; leaves broad, woolly beneath.....67. *ADENOCaulon*.

Achenes without glands; pappus present.

Bracts of the involucre scarious; herbage woolly.

Flowers all fertile, perfect and pistillate in the same head.....68. *GNAPHALium*.

Flowers dioecious.

Central flowers of pistillate heads sterile; robust herb.....69. *ANAPHALIS*.

Central flowers of pistillate heads fertile; low herbs.....70. *ANTENNARIA*.

Bracts of the involucre dry but not scarious; herbage not woolly.....71. *PLUCHEA*.

#### TRIBE 6. *Heliántheae*. SUNFLOWER TRIBE

Herbs (or shrubs) with mostly opposite or basal leaves and with balsamic-resinous juice. Rays commonly present, almost always showy. Bracts of the involucre herbaceous or foliaceous, or at least not scarious. Receptacle with chaff-like bracts, each subtending a flower. Anthers not caudate. Pappus paleaceous, of rigid awns, or cup-like, never of capillary bristles. Achenes thick or flattened contrary to the subtending chaffy bract, rarely parallel with it.—Rays none in no. 75 and 1 species of nos. 76, 79, 83, 84 and 87.

Inner bracts of the involucre completely enclosing the ray-achenes, i. e. sac-like; herb.....72. *MELAMPODIUM*.

Inner bracts of the involucre plane or nearly so.

Rays white, short; herbs.

Bracts of the receptacle nearly bristle-like; disk-corollas 4-toothed...73. *ECLIPSA*.

Bracts of the receptacle broad, chaffy; disk-corollas 5-toothed...74. *GALINSOGA*.

Rays yellow or none.

Pappus plumose; heads discoid; nearly leafless shrub.....75. *BEBBIA*.

Pappus present or none, never plumose.

Involucre of 2 or more series of similar bracts.

Disk-achenes thickened, angled, not at all compressed or only slightly compressed.

Rays sterile.

Pappus persistent or none.

Pappus a toothed crown or none; receptacle high conic or columnar; leaves basal or alternate; perennial herbs.....76. *RUDBECKIA*.

Pappus of 2 awns and several short intervening scales, or pappus none; receptacle flat or conic; leaves cauline, alternate or opposite; shrubs or herbs.....77. *VIGUIERA*.

Pappus present, caducous; receptacle flat to low conic.....78. *HELIANTHUS*.

Rays fertile; receptacle flat or convex; low herbs, the leaves mostly basal except in 2 or 3 species.

Pappus none; leaves entire to pinnatifid...79. *BALSAMORHIZA*.

Pappus present; leaves mostly entire.....80. *WYETHIA*.

Disk-achenes strongly flattened.

Achenes not winged; rays sterile.

Achenes not ciliate (except 1 species of no. 81), with a pappus crown of minute scales (distinct or united) between the awns; heads solitary; herbs.

- Herbage green, stems leafy; ours cismontane.....  
81. *HELIANTHELLA*.  
Herbage with silvery felt; stems scapose; deserts.....  
82. *ENCELIOPSIS*.  
Achenes ciliate; heads in panicles or cymes or solitary.  
Shrubs; achenes without pappus-crown, usually without  
awns .....83. *ENCELIA*.  
Herbs; achenes with crown and awns.....84. *GERAEA*.  
Achenes winged on each edge; pappus-awns 2; herbs.....  
85. *VERBESINA*.  
Involucre of 2 very unlike series of bracts; herbs or shrubs.  
Pappus various or none, never barbed.....86. *COREOPSIS*.  
Pappus of 2 to 4 barbed awns.....87. *BIDENS*.

#### TRIBE 7. *Madieae*. TARWEED TRIBE

Ours annuals (except one species of no. 98 and 2 species of nos. 91 and 94).  
Herbage glandular, viscid or heavy-scented (except nos. 97, 98 and 99).  
Leaves alternate or opposite. Bracts of the involucre in a single series, each  
partly or completely enclosing an achene. Bracts of the receptacle com-  
monly in a single series between disk- and ray-flowers and often united into  
a cup, or sometimes scattered among the disk-flowers. Rays always present,  
showy or inconspicuous. Anthers not caudate. Ray-achenes always fertile,  
without pappus (except nos. 88, 93 and 98, and one species in no. 94); disk-  
achenes fertile or sterile, their pappus paleaceous, awn-like or none.

Bracts of the involucre plane, merely subtending the ray-achenes; pappus-paleae many,  
fimbriate, present in both disk and ray flowers.....88. *BLEPHARIPAPPUS*.  
Bracts of the involucre not plane.

Ray-achenes half enclosed by the involucre bracts which are rounded on the back;  
achenes often obcompressed.

Achenes of ray without pappus; pappus of disk-achenes often hirsute, not plumose.  
Receptacle conical or convex; bracts of involucre and receptacle persistent.

Leaves (at least the upper) spinose and rigid, little viscid or glandular;  
rays 25 to 40, 2-lobed; bracts of involucre and receptacle  
without processes .....89. *CENTROMADIA*.

Leaves not spinose; rays about 15, 3-lobed; outer bracts of involucre  
beset with clavate processes.....90. *HOLOCARPHA*.

Receptacle flat; bracts of involucre and receptacle at length deciduous.

Rays 5 to many, 3-lobed or -toothed; pappus present or none; areola  
of the ray-achenes intra-apical, most commonly raised on a  
distinct beak; lower leaves usually toothed to pinnatifid.....  
91. *HEMIZONIA*.

Rays 1 to 5 (or 8), broader than long, palmately 3-lobed; achenes with  
paleaceous pappus; areola of the ray-achenes terminal and central  
or nearly so; leaves all narrowly linear and entire.....  
92. *CALYCADENIA*.

Achenes of ray with pappus; disk-achenes with plumose pappus.....  
93. *BLEPHARIZONIA*.

Ray-achenes completely enfolded by the involucre bracts which are usually either  
flattened or strongly carinate on the back.

Achenes of ray laterally compressed; involucre bracts strongly carinate on the  
back; ray-flowers without pappus, disk-flowers without or with pappus..  
94. *MADIA*.

Achenes of ray not laterally compressed, often obcompressed; involucre bracts  
with flattish or sometimes rounded backs.

Achenes in fruit not expanding; pappus present or none.

Vernal annuals; rays 8 to 20, commonly showy, yellow, white, or yellow  
tipped with white; ray-pappus none; disk-pappus commonly  
present .....95. *LAYIA*.

Summer plants; rays 5, comparatively inconspicuous.

Annuals; heads clustered; rays yellow; pappus in disk and ray  
none.

Bracts of the receptacle united.....96. *HEMIZONELLA*.

Bracts of the receptacle distinct.....97. *LAGOPHYLLA*.

Perennial; heads solitary; bracts of receptacle connate; rays white  
or rose-tinged; pappus of disk and ray present.....  
98. *HOLOZONIA*.

Achenes in fruit expanding into an open globose head; pappus silvery-  
scarious, the longer set of paleae longer than the achenes.....  
99. *ACHYRACHAENA*.

#### TRIBE 8. *Ambrosieae*. RAGWEED TRIBE

Coarse homely weeds or shrubs with small greenish or white heads. Leaves  
alternate or the lowest opposite in no. 102. Flowers unisexual, the staminate  
and the pistillate in separate heads (the staminate heads in a raceme or

spike above the pistillate heads, which are few and axillary) or in the same head (heads solitary in the axils). Receptacle of the staminate or of the perfect heads with chaff-like bracts. Rays none. Corolla of pistillate flowers none or a mere rudiment. Anthers distinct or scarcely coherent, not caudate. Pappus none. Fruit commonly a bur.

Heads (or at least some of them) containing both staminate and pistillate flowers, the latter at the margin; involucre of 4 or 5 bracts.

Achenes not flattened, more or less turgid; heads containing both staminate and pistillate flowers (androgynous).

Heads nodding; achenes glabrous or puberulent; leaves entire.....100. IVA.

Heads erect; achenes long-villous; leaf-divisions filiform.....101. OXYTENA.

Achenes strongly flattened, broadly pectinate-winged and subtended by broad scarious bracts; heads androgynous and staminate.....102. DICOMA.

Heads unisexual, both pistillate and staminate on the same plant; involucre of pistillate heads closed and bur-like, only the style-branches exerted; staminate heads in a raceme or spike, their involucre open.

Involucral bracts of staminate heads united.

Fruiting involucre bur-like, armed with spines; leaves variously toothed or pinnatifid.

Bur with a single beak at apex and armed near the beak with a single row of short spines.....103. AMBROSIA.

Bur with 1 to 4 beaks, armed with several rows of short spines.....104. FRANSERIA.

Fruiting involucre winged with broad silvery-scarious wings or scales; leaves or their divisions filiform.....105. HYMENOCLEA.

Involucral bracts of staminate heads distinct; involucre of pistillate heads maturing into a stout extremely spiny bur.....106. XANTHIUM.

#### TRIBE 9. Helenieae. SNEEZEWEED TRIBE

Herbs or some Eriophyllums suffruticose. Leaves alternate or opposite. Flowers commonly yellow. Rays present or none in some species. Anthers not caudate. Receptacle naked (except in no. 132 and in 1 species of nos. 111 and 120). Bracts of the involucre in 1 or 2, sometimes in 3 or 4 series. Pappus of paleae, awns or bristles, or often wanting.

#### A. Bracts of involucre woolly, hairy or glabrous, never dotted with large oil-glands.

##### RAY DECIDUOUS, NOT PAPERY, OR RAYS NONE.

##### a. Involucral bracts in a single series.

Leaves opposite.

Involucral bracts united into a toothed cup; pappus paleaceous or none.

Rays none; leaves long-acuminate; perennials.....107. PERICOME.

Rays present; leaves mostly linear; annuals.....108. LASTHENIA.

Involucral bracts distinct; annuals (except one).....109. BAERIA.

Leaves alternate, sometimes the basal or lower ones opposite.

Rays conspicuous or obvious.

Ray-corollas with a tooth or ligule at base opposite the ray; pappus none; herbage white-woolly, at least when young; annuals.....110. MONOLOPIA.

Ray-corollas without tooth or appendage at base.

Herbage, at least when young, white-woolly; disk-flowers yellow.

Pappus paleaceous; annual or perennial herbs.....111. ERIOPHYLLUM.

Pappus of numerous bristles united at base or none; annuals.....112. SYNTRICHOPAPPUS.

Herbage not white-woolly.

Leaves pinnately parted or divided; rays yellow; achenes not flattened, not ciliate; pappus in ours none.

Herbage puberulent; involucral bracts distinct; perennial herbs... 113. BAHIA.

Herbage glabrous; involucral bracts united for lower half or third; annuals.....114. BLENNOSPERMA.

Leaves palmately lobed, cordate in outline; achenes flattened, ciliate; rays white or yellow; pappus present; herbage viscid-puberulent.....115. PERITYLE.

Rays inconspicuous or none (see also 2 species in no. 111).

Achenes flat.

Pappus present; achenes strongly flattened, bordered with a dense or shaggy mass of long hairs, the sides black, glabrous or glabrate; heads radiate or discoid; herbage woolly; annuals.....116. EATONELLA.

Pappus none; achenes moderately flattened, puberulent or slightly ciliate; heads discoid; herbage green; perennial herb.....117. LAPHAMIA.

Achenes narrow or pyramidal, mostly terete or angled, not flattened.

Heads radiate; pappus-paleae 3 to 5, subulate, curved; annuals.....118. RIGIOPAPPUS.

- Heads discoid.**  
 Herbage gummy; flowers yellow, pappus of 8 to 12 obtuse paleae; annuals .....119. *AMBLYOPAPPUS*.  
 Herbage not gummy; corollas all alike or sometimes the marginal corollas with unequal lobes or palmately enlarged as if radiate; annuals or perennials.  
 Styles whitish or dull color; flowers yellow or white; leaves pinnately parted or dissected, rarely entire.....  
 120. *CHAENACTIS*.  
 Styles pinkish; flowers whitish; leaves linear or linear-lanceolate, entire .....121. *PALAFOLIA*.
- b. Involucral bracts in 2 or more series; perennial herbs or some annual or biennial in nos. 124 and 125.**
- Heads discoid.**  
 Involucral bracts herbaceous; pappus-paleae 5, dissected into slender tawny bristles; annuals .....122. *TRICHOPTILUM*.  
 Involucral bracts with scarious often colored margins; pappus-paleae 10 to 12, thin, obtuse or curved; perennial herbs.....123. *HYMENOPAPPUS*.
- Heads radiate.**  
 Bracts of involucre erect.  
 Pappus paleaceous.  
 Bracts of involucre in 2 unlike rows, the outer united at base; leaves punctate; deserts .....124. *HYMENOXYS*.  
 Bracts of involucre distinct, all much alike; paleae hyaline; leaves not punctate; montane .....125. *HULSEA*.  
 Pappus none.  
 Leaves alternate .....126. *VENEGASIA*.  
 Leaves opposite; succulent perennial herb.....127. *JAUMEA*.  
 Bracts of involucre reflexed; rays short and broad, usually drooping or deflexed. ....  
 128. *HELENIA*.
- 2. RAYS PERSISTENT AND BECOMING PAPERY; HERBAGE MORE OR LESS WHITE-WOOLLY; FLOWERS YELLOW.**
- Leaves all in a basal tuft, the heads scapose; pappus paleaceous, the paleae awned.....  
 129. *ACTINELLA*.
- Leaves borne along the stems.  
 Rays few but conspicuous, very broad; pappus paleaceous.....130. *PSILOSTROPHE*.  
 Rays several to numerous; pappus none.  
 Bracts of involucre numerous, in 2 or 3 series; corolla-teeth bearded; receptacle naked; leaves alternate.....131. *BAILEYA*.  
 Bracts of involucre 9 to 12, in 1 series or nearly; corolla-teeth glabrous; receptacle densely hairy; leaves opposite.....132. *WHITNEYA*.
- B. Bracts of the involucre dotted or striped with oil-glands, equal and disposed in one series; herbage glabrous.**
- Leaves alternate; perennial herbs.  
 Achenes rusty-pubescent.  
 Pappus of copious capillary bristles; heads discoid; flowers dull white or purple. .  
 133. *POROPHYLLUM*.  
 Pappus of both bristles and awned paleae; heads radiate, the rays purple or flesh-color .....134. *NICOLLETIA*.  
 Achenes glabrous; pappus-paleae each divided into slender bristles; heads radiate or rayless .....135. *DYSODIA*.  
 Leaves opposite; heads radiate; involucral bracts strongly keeled; annuals...136. *PECTIS*.

#### TRIBE 10. *Anthemideae*. MAYWEED TRIBE

Strong-scented or aromatic plants. Leaves alternate, all or some of them finely dissected, pinnately parted or pinnatifid, or often merely toothed or entire in no. 142. Bracts of the involucre imbricated, commonly dry and scarious or with scarious margins. Receptacle naked or with chaff-like bracts. Flowers white, yellow or greenish. Rays present or none. Anthers not caudate. Pappus none or a short scarious crown.

##### A. *Receptacle with chaff-like bracts.*

- Heads solitary, terminating leafy branches or peduncles; rays 14 to 20; annual.....  
 137. *ANTHEMIS*.  
 Heads in a terminal corymb; rays 4 or 5; perennial.....138. *ACHILLEA*.

##### B. *Receptacle naked.*

- All the flowers with a corolla.  
 Rays many, conspicuous; heads solitary, terminating leafy branches or peduncles.....  
 139. *CHRYSANTHEMUM*.  
 Rays none.  
 Head solitary or corymbose.  
 Heads corymbose; flowers yellow; perennial herbs.....140. *TANACETUM*.

- Heads solitary, terminating leafy branches or peduncles; flowers greenish; annual herbs .....141. *MATRICARIA*.  
 Heads in racemose panicles or somewhat spike-like; flowers yellow or purplish; shrubs or herbs .....142. *ARTEMISIA*.  
 Marginal flowers without a corolla; heads discoid.  
 Heads peduncled; mature achenes borne on pedicels; style deciduous...143. *COTULA*.  
 Heads sessile; achenes pointed with the spine-like persistent style.....144. *SOLIVA*.

#### TRIBE 11. *Senecioneae*. GROUNDSEL TRIBE

Herbs, or a few species shrubs or woody-based plants. Leaves alternate or basal, sometimes opposite. Bracts of the involucre little or not at all imbricated, mostly in 1 or 2 rows. Receptacle naked. Flowers of both disk and ray yellow, except *Petasites*. Anthers not caudate. Pappus-bristles soft, commonly copious, most often white.

- Receptacle conical; rays present; annuals.....145. *CROCIDIUM*.  
 Receptacle flat.

Corolla throat elongated-cylindric, 4 to 5 times longer than the proper tube; pappus shorter than the corolla; heads discoid; annuals.....146. *PSATHYROTES*.

Corolla throat commonly much shorter than the tube, at least not exceeding it.

Herbs (except 2 species in no. 152).

Pappus-bristles 15 to 25, short, soft, plumose; heads solitary, discoid; leaves basal, entire .....147. *RAILLARDELLA*.

Pappus-bristles not truly plumose.

Leaves large, palmately cleft or parted, mostly basal; heads corymbose; perennials.

Heads few, rayless; flowers all fertile, yellow; styles united about half way .....148. *CAOALIOPSIS*.

Heads many, radiate; flowers of 2 sorts, the perfect ones whitish and the pistillate ones pinkish; styles united nearly to the apex .....149. *PETASITES*.

Leaves entire to toothed, pinnatifid or pinnate.

Leaves alternate or basal.

Flowers white, whitish or pinkish; heads discoid; stems leafy.

Leaves not auricled, entire; herbage cottony-pubescent; perennials .....150. *LUINA*.

Leaves auriculate at base, pinnatifid or denticulate; herbage tomentulose, glabrate; annuals.....

151. *ERECHTITES*.

Flowers commonly yellow or yellowish; heads radiate, sometimes rayless; pappus soft; perennials, or sometimes annuals .....152. *SENECIO*.

Leaves all opposite or only the upper ones alternate; heads radiate or rayless; pappus-bristles denticulate, rather rigid; perennials .....153. *AENIOA*.

Shrubs or shrubby plants; heads discoid.

Bracts of the involucre many to numerous; herbage (at least when mature) glabrous or nearly so.

Branches very leafy, the leaves terete, resinous-dotted.....154. *PEUOEPHYLLUM*.

Branches naked and rush-like, the leaves scale-like.....155. *LEPIDOSPARTUM*.

Bracts of the involucre 4 to 6; heads 4 to 9-flowered; foliage leaves narrow but plane; plants canescently tomentose.....156. *TETRADYMIA*.

#### TRIBE 12. *Cynareae*. THISTLE TRIBE

Thistles or thistle-like herbs with alternate prickly leaves. Heads large. Bracts of the involucre imbricated, usually prolonged into a spine or bristle, or provided with a membranous edge. Receptacle bristly or hairy. Flowers all perfect. Rays none. Corollas tubular, cleft into long narrow lobes. Anthers long-tailed at the base, with elongated appendages at the tip. Pappus bristly or plumose, rarely paleaceous.

Leaves with margin more or less prickly or spinose.

Achenes obliquely or somewhat laterally inserted on the receptacle; heads almost concealed by upper leaves.....157. *CNICUS*.

Achenes inserted on the receptacle by their very bases; heads not concealed by upper leaves.

Leaves conspicuously blotched with white along the veins; pappus of narrow barbellate paleae .....158. *SILYBUM*.

Leaves never blotched with white; pappus of plumose bristles united at base and deciduous in a ring.

Bristles of pappus in several series; achenes somewhat 4-angled.....159. *CYNARA*.

Bristles of pappus in a single series; achenes not angled.....160. *CIRSium*.

Leaves with margin not prickly or spinose.

- Involucral bracts hooked at tip; leaves very broad.....161. *ARCTIUM*.  
 Involucral bracts not hooked at tip; leaves never broad.....162. *CENTAUREA*.

#### TRIBE 1. *Cichorieae*. CHICORY TRIBE

Herbs with milky juice and alternate or basal leaves. Receptacle naked or with chaff-like bracts. Flowers all perfect and all with ligulate corollas, the ligule 5-toothed at apex. Anthers sagittate or auricled at base, commonly appendaged at summit. Style-branches stigmatic on their inner side for their whole length.

##### 1. *ATRICHÓSERIS* Gray

Glabrous annual with broad basal leaves and 1 to several tall scape-like cymosely-branched stems. Involucre of 10 to 15 equal linear acute bracts and several small outer ones. Receptacle scrobiculate. Flowers white. Achenes shortly oblong-clavate, with corky-thickened ribs. Pappus none. (Greek *athrix*, without hair, and *seris*, a cichoriaceous plant.)

1. *A. platyphýlla* Gray. TOBACCO WEED. Stems 1 to several, erect or ascending, slightly glaucous, shining, 1 to 2½ ft. high, ending above in a diffuse cymose panicle; leaves broadly obovate, obtuse, sessile, spinulose-toothed or -erosulate, 1½ to 3½ in. long, the cauline ones few, much reduced and bract-like; heads 1 in. broad; involucre 2½ to 3 lines high; ligules broad, much-exserted; achenes whitish, usually with 5 much-thickened corky ribs and 5 small alternate ones, truncate with a small depressed area at summit, 1½ to 1¾ lines long.—Gravelly valleys or rocky slopes, 150 to 2500 ft.: n. side Colorado Desert; e. Mohave Desert; e. to Utah. Apr.-May.

##### 2. *PHALACRÓSERIS* Gray

Glabrous perennial herbs with naked 1-headed scapes arising from a tuft of basal leaves on the root-crown. Involucre campanulate, of 12 to 16 lanceolate bracts, naked or with 1 or 2 small loose bracts at base. Flowers yellow, opening in sunshine. Receptacle naked. Achenes short-oblong, slightly incurved. Pappus none. (Greek *phalakros*, bald-headed, and *seris*, the Hellenic name of some kind of cichoriaceous plant.)

1. *P. bolánderi* Gray. Scapes 1 to several, slender, erect, ¾ to 2 ft. high; leaves linear-lanceolate or oblong-oblancoate, entire, slightly succulent, narrowed to a short or long petiole, the whole 3 to 13 in. long; heads ¾ to 1 in. broad; involucre 4 to 5 lines high; ligules well exserted; achenes obscurely quadrangular, truncate at both ends, 1½ to 1¾ lines long.—Wet mountain meadows, 7000 to 8000 ft., Sierra Nevada: Westfalls Mdw., above Yosemite Valley; Sage Mdw., near Shuteye Mt., Madera Co.; Grant Park. Var. *CORONATA* Hall. Achenes with a short crown.—Mariposa Co.: Cathedral Peak; Peregoy Mdws.; upper Chinualna Creek; s. to Fresno Co.

##### 3. *LÁPSANA* L.

Annual herbs. Leaves alternate. Flowers yellow, the heads on slender peduncles and disposed in a panicle. Involucre subcylindric, its bracts in one series, nearly equal, with a few minute outer ones at base. Receptacle naked. Achenes obovate-oblong, somewhat flattened, narrowed below, rounded at apex, 20 to 30-nerved. Pappus none. (Greek *lampsana*, the Dioscoridean name of a crucifer.)

1. *L. communis* L. NIPPLEWORT. Stems erect, 1 or few from the base, simple below, paniculately branched above, 2 to 2¼ ft. high; herbage hirsute- or pilose-pubescent below, glabrous above; leaves ovate, dentate, 1 to 1¾ in. long, commonly with 1 or 2 pairs of supplementary leaflets below the main blade, the petioles 3 to 12 lines long; involucre pale green, glabrous and glaucous, 2 to 2½ lines long, its bracts 7 to 9, linear-oblong; achenes 1½ lines long.—Nat. from Eur.: Arcata, Humboldt Co.; also in sw. Ore. (Chetco River). June.

##### 4. *CICHORIUM* L.

Perennial herb, the leaves mostly basal, those of the stiff branching stem reduced and bract-like. Flowers blue, in sessile heads. Receptacle naked.

Bracts of the oblong involucre herbaceous, in 2 series, the outer 4 or 5, somewhat spreading, the inner about 8, erect. Achenes 5-angled, truncate, beakless. Pappus of 2 or 3 series of short blunt paleae. (Altered from the Arabic name.)

1. *C. intybus* L. CHICORY. Stems erect from a deep taproot, 2 to 4 ft. high; herbage more or less hirsute; basal leaves spatulate to obovate or oblong, 3 to 5 (or 10) in. long; cauline leaves lanceolate, more or less auriculate-clasping at base, runcinate-pinnatifid or toothed; heads in sessile clusters along the nearly naked branches; flowers blue, rarely white.—Garden plant from Eur., naturalized in low moist valleys: Eureka; Sacramento Valley; Napa Valley; Berkeley; Santa Clara Valley; San Diego. Also called Blue-weed.

#### 5. *SCOLYMUS* L.

Erect glabrous thistle-like herb. Leaves alternate, rigid, coriaceous, sinuate-dentate or pinnatifid, decurrent, the lobes spinescent. Heads rather large, terminal and lateral, sessile. Flowers yellow. Bracts of the involucre in few rows, scarious-margined and spinescent-tipped, subtended by foliaceous bracts. Receptacle chaffy, the chaff more or less embracing the beakless achenes. Pappus a crown of scarious unequal paleae. (Old Greek name.)

1. *S. hispánicus* L. GOLDEN THISTLE. Plants 1 to 1½ ft. high; leaves 2 to 3 in. long.—Nat. from s. Eur.: Los Gatos. July.

#### 6. *RHAGADIOLUS* Tourn.

Annual herbs with yellow flowers. Bracts of the involucre in a single series, narrow, incurved, enfolding the marginal achenes, stellately spreading in age, sparingly hispid. Receptacle naked. Achenes 5 to 10-ribbed, the ribs barbellate. Pappus of outer achenes a crown of denticulate or simbricate paleae; pappus of inner achenes double, the inner set consisting of bristles paleaceous-dilated towards the base, the outer set consisting of short scales or none. (Etymology unknown to us.)

1. *R. hedýpnois* All. Stem commonly branched from the base, the branches diffuse or divaricately spreading, 5 to 13 in. long; basal leaves petioled and often lobed, the cauline leaves oblanceolate to linear, 1¼ to 5 in. long, shallowly pinnatifid to serrate or entire, sessile or the lower ones drawn down to a short petiole; flowering heads 3 to 4 lines broad, borne on mostly naked elongated peduncles; involucre 4 to 5 lines high; achenes cylindric, 3 to 3½ lines long; pappus-paleae 1 line long, the bristles 2¼ lines long.—Nat. from Asia Minor: Penn Valley, Nevada Co.; Oroville foothills; Atwater; Hornitos; Los Angeles; San Diego.

#### 7. *MICRÓSERIS* Don

Low annuals with basal leaves and naked scape-like one-headed peduncles. Herbage glabrous or only slightly puberulent. Leaves pinnatifid with mostly linear and often falcate lobes, or entire. Heads in anthesis narrowly oblong to ovoid or subglobose, nodding in the bud, mostly erect in fruit. Receptacle naked. Ligules short. Achenes slender-fusiform or cylindric, ribbed, mostly truncate. Pappus-paleae 5, mostly short, abruptly or gradually passing into the scabrous awn. (Greek micros, small, and seris, lettuce.)

Achenes fusiform, attenuate above the middle, the upper part not filled by the seed, 3 to 4½ lines long . . . . . 1. *M. attenuata*.

Achenes attenuate toward base or even almost turbinate, wholly filled by the seed.

Paleae very small or almost none . . . . . 2. *M. aphantocarpha*.  
Paleae conspicuous.

Awns shorter than paleae; heads at maturity turbinate.

Paleae broadly ovate; achenes 1½ to 2 lines long . . . . . 3. *M. platycarpha*.

Paleae narrowly lanceolate; achenes 2½ to 3 lines long . . . . . 4. *M. acuminata*.

Awns longer than paleae; heads at maturity hemispherical.

Achenes contracted under the summit, 2 to 3 lines long . . . . . 5. *M. douglasii*.

Achenes not contracted under the summit, 1½ to 2 lines long . . . . . 6. *M. bigelovii*.

1. *M. attenuata* Greene. Scapes several to many, erect or at base decumbent, 10 to 13 in. high, slightly enlarged at summit; leaves linear in outline, 3 to 7 in. long, mostly pinnately toothed or parted into remote linear segments 2 to 9 lines long, or denticulate; involucre 5 to 7 lines high; inner

bracts rather broadly linear-attenuate to lanceolate, the short outer basal ones calyculate; flowers purplish; achenes fusiform, narrowing above the middle and again enlarged at the truncate apex, 10-ribbed, dull brown, 3 to  $4\frac{1}{2}$  lines long, the upper half not filled by the seed; pappus yellowish white to fuscous,  $4\frac{1}{2}$  to  $5\frac{1}{2}$  lines long; paleae oblong or ovate or lanceolate,  $\frac{1}{2}$  to  $\frac{1}{3}$  the length of the awn, externally either lightly or conspicuously villous; awns barbellate.—Valleys and foothills, 50 to 1500 ft.: Sacramento Valley and foothills west; s. to Alameda Co.; Orange Co. Apr.-May. Var. *PARVULA* Jepson n. comb. Very small, 2 to  $2\frac{1}{2}$  in. high; pappus 3 lines high, the paleae soft villous-pubescent.—Contra Costa Co. (*M. parvula* Greene.)

2. *M. aphantocárpha* Gray. Scapes decumbent at base or wholly erect, 8 to 16 in. high; herbage glabrous or often mealy-puberulent; leaves subentire or pinnatifid, 3 to 7 in. long; expanded fruiting heads 7 to 11 lines broad; involucre 3 to 5 lines high; inner bracts lanceolate to ovate, acuminate, the outer short, ovate; achenes slender,  $1\frac{3}{4}$  to  $2\frac{1}{4}$  lines long; pappus tawny,  $1\frac{3}{4}$  to  $3\frac{1}{2}$  lines long, the paleae much reduced or even obsolete, the bristles slender, fragile or deciduous.—Hillslopes, 500 to 1500 ft.: South Coast Ranges: Apr.-May. Var. *TENÉLLA* Gray. Pappus bristles commonly but 2 or 3, with a manifestly ovate palea at base, or sometimes none.—Napa Valley; lower Sacramento Valley; San Luis Obispo Co. Var. *INDIVISA* Jepson. Scapes strictly erect,  $\frac{1}{2}$  to  $1\frac{1}{2}$  ft. high; leaves oblanceolate, entire or few-toothed or pinnatifid,  $2\frac{1}{2}$  to 10 in. long; outer row of achenes often silvery-silky; pappus 3 to 4 lines long, the paleae triangular.—Beds of former vernal pools, 50 to 500 ft.: Solano Co.; Contra Costa Co.; San Mateo Co. Apr.-May. (*M. indivisa* Greene.) Var. *MARIPOSANA* Jepson n. var. Leaves pinnatifid into slender segments, these somewhat toothed; achenes slender-obconic, a little more than 1 line long; pappus about 2 lines long, the paleae deltoid.—Mariposa Co. (Mariposa, J. W. Congdon, type). Var. *ÉLEGANS* Jepson n. comb. Expanded fruiting heads 5 to 8 lines broad; achenes about 1 line long; paleae ovate-deltoid,  $\frac{1}{4}$  to  $\frac{1}{3}$  line long, the awn  $1\frac{1}{2}$  to 2 lines long, persistent.—Plains and valleys: Sierra Nevada foothills; Great Valley; South Coast Ranges; coastal S. Cal. Apr. (*M. elegans* Greene.)

3. *M. platycárpha* Gray. Scapes several to many, slender, erect or decumbent at base, 3 to 15 in. high; leaves oblong to oblanceolate, entire to pinnatifid, petioled, 2 to 4 in. long; heads in fruit broadly turbinate; involucre 4 to  $5\frac{1}{2}$  lines high; inner bracts elliptical to oblong, acute or obtusish, the outer very small; flowers purplish; achenes slenderly obconic, minutely but rather densely scabrous,  $1\frac{1}{2}$  to 2 lines long; pappus  $2\frac{1}{2}$  to  $3\frac{1}{2}$  lines long, somewhat pubescent, the paleae broadly ovate to oblong-ovate, pale to dark smoky, with incurved crenate margins, terminating in an awn about  $\frac{2}{3}$  as long.—Flats on the mesas or sandy fields, 20 to 500 ft.: Santa Catalina Isl.; w. San Diego Co.; s. to L. Cal. Apr. Var. *PARISHII* Hall. Achenes  $1\frac{1}{2}$  to  $1\frac{3}{4}$  lines long; pappus pale, 3 to 4 lines long; paleae lanceolate.—San Pedro to San Diego. Very variable. (*M. parishii* Greene.)

4. *M. acuminata* Greene. Scapes few, decumbent at base, 4 to 12 in. high; leaves deeply pinnatifid into

913. *Microseris douglasii* Gray; a, habit  $\times \frac{1}{2}$ ; b, achene and pappus  $\times 1\frac{1}{2}$ .

slender lobes, 3 to 4 in. long; heads narrowly oblong, in maturity turbinate, 10 to 11 lines high; achenes slenderly fusiform, 3 lines long, the ribs scabrous; pappus 7 to 8 lines long; shining brown paleae narrowly lanceolate, gradually attenuate into an awn which is shorter than the paleae.—Valleys in the hills, 200 to 1500 ft.: North Coast Ranges from Napa Co. to Humboldt and Tehama Cos.; Sierra Nevada foothills in Eldorado Co. Apr.-May.

5. *M. douglàsii* Gray. Fig. 913. Scapes 6 to 17 in. high; leaves oblanceolate, coarsely pinnately cleft or parted to nearly entire,  $3\frac{1}{2}$  to  $4\frac{1}{2}$  in. long; heads broadly ovoid or in age hemispherical; involucre 5 to 6 lines high, the inner bracts ovate-attenuate to lanceolate, the outer very short, ovate; flowers purplish; achenes linear-turbinate, tapering to the base, somewhat contracted just below the summit, 10-ribbed, 2 to 3 lines long, the outer ones usually white-villous; pappus yellowish to fuscous; paleae ovate to orbicular, entire or erose, commonly imbricated or convolutedly overlapping, silky-villous to glabrous, 1 to 2 lines long, tapering to a bristle 2 to 3 lines long.—Valleys, 50 to 3500 ft.: Great Valley; Coast Ranges; coastal S. Cal. Apr.-May.

6. *M. bigelövii* Gray. Scapes erect or ascending, 6 to 15 in. high; leaves entire or pinnatifid; heads broadly ovate,  $\frac{1}{2}$  in. high; involucre disposed to be somewhat imbricated; achenes oblong-turbinate,  $1\frac{1}{2}$  to 2 lines long, not contracted under the truncate summit, the outermost sometimes villous; pappus brownish or almost rusty, the paleae oblong- to ovate-lanceolate, commonly glabrous, varying in size, as long as or only  $\frac{1}{2}$  to  $\frac{1}{3}$  as long as the awn.—Sandy fields near the coast, 50 to 300 ft.: San Francisco and Alameda Cos. to Humboldt Co. Apr.-May.

#### 8. *UROPAPPUS* Nutt.

Low annuals with basal leaves and naked one-headed scapes. Leaves pinnatifid with mostly subulate or acuminate lobes or entire. Scapes enlarged at summit. Heads oblong, erect; ligules short, the heads in anthesis small. Main bracts of the involucre about equal, but with shorter ones at base, all membranous. Receptacle naked. Achenes 10 to 12-ribbed. Pappus-paleae 5, elongated, tipped with a very short awn or bristle which proceeds from the cleft summit. (Greek *oura*, a tail, and *pappos*, pappus, on account of the bristle-like appendage to the paleae.)

914. *Uropappus linearifolius* Gray; a, habit  $\times \frac{1}{2}$ ; b, achene and pappus  $\times 1$ .

Pappus glistening white to tawny, soft, deciduous from the dark brown to black achenes.

1. *U. linearifolius*.

Pappus dull brown or sordid, of firm texture, persistent on the light colored or brownish achenes.

2. *U. lindleyi*.

1. *U. linearifolius* Nutt. Fig. 914. Scapes often several from the base, erect, 6 to 20 in. high, in robust plants thickened or fistulose under the oblong head; leaves linear (3 to 6 in. long and 1 to 2 lines wide), commonly with 2 or 3 to several pairs of more or less remote salient segments; expanded fruiting heads  $1\frac{1}{2}$  to  $1\frac{3}{4}$  in. broad; bracts lanceolate, the longer ones equaling or exceeding the head in maturity, 2 or 3 of the outer ones much shorter; achenes more or less serrulate-ribbed, attenuate above almost into a beak, dark brown to almost black, 4 to 6 lines long; pappus silvery white to tawny, 5 to 7 lines long, the very delicate awn  $\frac{1}{4}$  to  $\frac{1}{2}$  the

length of the deeply notched linear paleae.—Open ground, hills and mesas, 200 to 4500 ft.: Coast Ranges from Humboldt Co. to Monterey Co. and s. to coastal S. Cal.; Sierra Nevada foothills (infrequent); Mohave and Colorado deserts: s. to L. Cal., e. to Nev. and N. Mex. Apr.-May. (*Microseris linearifolia* Gray.)

2. *U. lindleyi* Nutt. Scapes few to many, stout, 10 to 20 in. high, scarcely thickened under the head; leaves as in *U. linearifolius* but rather broader; longer bracts of involucre shorter than the head in maturity, lanceolate to oblong-attenuate, the outer short ones more numerous than in *U. linearifolius*; achenes brownish,  $4\frac{1}{2}$  to 5 lines long, slightly narrowed toward the summit; pappus dull brown or sordid, 6 to 7 lines long, the awn from a shallow notch and very little shorter than the paleae.—Open hills and valley fields, 200 to 1500 ft.: Napa Co. to Marin Co.; South Coast Ranges; Sierra Nevada foothills (infrequent); coastal S. Cal.; Mohave Desert; w. Colorado Desert; s. to L. Cal. Mar.-Apr. (*Microseris lindleyi* Gray.) Var. *CLEVELANDII* Jepson. Herbage scurfy-puberulent; achenes not at all attenuate; awn less than half as long as the paleae.—Sierra Nevada foothills (infrequent); San Joaquin Valley and s. to San Diego Co. (*U. clevelandii* Greene.) Var. *LEUCOCARPUS* Jepson n. comb. Achenes slender-attenuate toward summit, the seed not filling the narrow part; palea and awn each about  $2\frac{1}{2}$  to 3 lines long.—Santa Cruz Mts. from San Mateo Co. to Santa Clara Co. (*U. leucocarpus* Greene.)

#### 9. *SCORZONÉLLA* Nutt.

Perennial herbs, the leaves basal or sub-basal, the stems branching a little above the base and bearing long naked one-headed peduncles. Root fusiform. Leaves pinnatifid with linear and mostly salient lobes, or entire. Heads ovoid-cylindric to hemispherical, nodding in the bud, showy, the flowers yellow and ligules elongated. Bracts of the involucre mostly thin-herbaceous, imbricate in several series. Receptacle naked. Achenes cylindric or slightly tapering downward, ribbed and often obscurely angled. Paleae 5 to 20, firm, tipped with a rather long often subplumose or barbellate awn. (So named because of the general aspect of *Scorzonera*.)

Pappus-bristles plumose to sub-plumose.

Inner bracts of involucre linear-lanceolate; tips of outer bracts erect; pappus white; paleae 15 to 20.....1. *S. nutans*.

Inner bracts of involucre linear-oblong; acuminate tips of outer bracts tending to coil backward; pappus yellowish or sordid; paleae 5 to 10.....2. *S. sylvatica*.

Pappus-bristles barbellate or naked.

Paleae 5 to 10; leaves not undulate.

Awns about 4 times as long as paleae; pappus sordid or brownish.

Involucre 11 to 14 lines high, the outer bracts broadly ovate, abruptly acuminate.....3. *S. procera*.

Involucre 8 lines high, the outer bracts lanceolate, gradually acuminate.....4. *S. paludosa*.

Awns 7 or 8 times as long as paleae; pappus white.....5. *S. laciniata*.

Paleae about 20; pappus bright white; leaves more or less undulate.....6. *S. troximoides*.

1. *S. nutans* Geyer. Stems 1 to several from the scaly crown of solitary or fascicled fusiform roots, erect, or erect from a somewhat decumbent base, slender, 4 to 18 in. high; leaves narrowly linear-lanceolate to spatulate-obovate or oblanceolate, 4 to 10 in. long, entire, or toothed or cleft into salient lobes, the lobes narrowly lanceolate to filiform,  $\frac{1}{4}$  to  $1\frac{1}{4}$  in. long; upper leaves few, smaller; peduncles long, slender, naked, 3 to 8 in. long; heads  $\frac{3}{4}$  to 1 in. broad; involucre 6 to 7 lines high, in maturity equaling or exceeding the pappus; inner bracts linear-lanceolate, the outer ones lanceolate, short; achenes fusiform,  $2\frac{1}{2}$  to 3 lines long; pappus soft, white, 3 lines long, the 15 to 20 paleae narrowly oblong,  $\frac{1}{2}$  line long, white, tipped by a plumose bristle.—Open pine slopes, 4000 to 8000 ft.: Sierra Nevada from Tulare Co. to Modoc Co.; Humboldt Co. to Siskiyou Co.; n. to B. C., e. to Col. July. Var. *LACINIATA* Jepson n. comb. Leaves linear to almost filiform and entire, or pinnatifid into narrow segments; pappus-paleae  $\frac{3}{4}$  line long.—Montane, 4000 to 8500 ft.: Sierra Nevada from Kings River to Sierra Co.; Humboldt Co. to Siskiyou Co. (*Microseris major* var. *laciniata* Gray.)

2. *S. sylvatica* Benth. Stems 1 or several, simple or sparingly branched near the base, 1 to 2 ft. high, arising from a tuft of leaves and old leaf bases

on the root-crown; herbage densely mealy-puberulent to glabrous; leaves mostly basal, erect, linear-lanceolate to broadly lanceolate or oblong, lacinate-pinnatifid, rarely entire, undulate, narrowed to a margined base or petiole, the whole 2 to 9 in. long; heads  $1\frac{1}{2}$  to 2 in. broad; bracts of the involucre in 2 or 3 series, the inner linear-oblong, acuminate, 8 to 10 lines high, the outer ovate to lanceolate, shorter, the narrowly acuminate tip tending to coil backward; ligules light yellow with a pinkish median line; achenes linear, about 10-ribbed, 3 to 5 lines long; pappus sordid or brownish, 6 to 7 lines long; paleae about 7 (5 to 10), linear-attenuate,  $2\frac{3}{4}$  to  $3\frac{1}{2}$  lines long, truncate or slightly cleft at apex, or sometimes obtuse, the awn sub-plumose, about  $3\frac{1}{2}$  lines long.—Open hillslopes or plains, 100 to 5000 ft.: Sacramento Valley; Sierra Nevada; Tehachapi Mts.; mts. on w. side Mohave Desert. (*Microseris sylvatica* Gray. *M. parryi* Gray. *M. montana* Greene.) Var. *STILLMANII* Jepson n. comb. Bristles not plumose, merely barbellate; achenes obscurely ribbed.—San Francisco; Pt. Reyes. (*Microseris sylvatica* var. *stillmanii* Gray.)

3. *S. prócera* Greene. Stems 1 or few, robust, 2 to  $3\frac{1}{2}$  ft. high, leafy, branched from above the base, the branches long, erect, and naked; herbage glabrous or more or less mealy-puberulent; leaves oblong-lanceolate to oblanceolate, entire, toothed or somewhat lacinate,  $\frac{3}{4}$  to  $1\frac{1}{4}$  ft. long, 1 to 2 in. wide, the upper cauline ones smaller, all acuminate and tipped with a short rigid point; heads  $1\frac{1}{2}$  to  $2\frac{1}{2}$  in. broad; involucre 11 to 14 lines high, as broad or broader; outer bracts roundish-ovate and abruptly short-pointed, the inner ovate to lanceolate, long attenuate; achenes 2 to  $2\frac{1}{2}$  lines long; pappus sordid, 5 to 6 lines long; paleae ovate, 1 to  $1\frac{1}{2}$  lines long; awn minutely barbellulate.—Valley floors or low hills, 300 to 1500 ft.: North Coast Ranges from Napa and Sonoma Cos. to Mendocino Co.; n. to Ore. Apr.-June. (*S. maxima* Bioletti.) Var. *PRATENSIS* Jepson n. comb. Leaves acuminate, entire (sometimes slightly toothed); achenes 2 lines long; pappus white, 4 lines long, the paleae oblong,  $\frac{1}{2}$  line long.—Grassy valley meadows, 3000 to 4000 ft.: Siskiyou Co. to Lassen Co. (*S. pratensis* Greene.)

4. *S. paludosa* Greene. Stems several from the base, slender, 16 in. high or more; leaves  $\frac{1}{2}$  to 1 ft. long, subentire to lacinate-parted into long linear lobes; heads 50 to 75-flowered; involucre 8 lines high, the bracts with a lanceolate base, tapering into a long slender acumination; achene 2 to 3 lines long; pappus brownish, the lanceolate paleae little more than 1, the barbellulate awn 4 to 5 lines long.—Low moist ground: Marin Co. Var. *INTEGRIFOLIA* Jepson n. var. Leaves linear-lanceolate, 3 to 6 in. long.—Monterey Co. (Pacific Grove, Heller 6732, type).

5. *S. laciniata* Nutt. Stems slender, several from base, branching,  $1\frac{1}{2}$  to 2 ft. high; herbage minutely scurfy-puberulent or glabrous; leaves elongate,  $1\frac{1}{2}$  to 10 in. long, pinnately parted into long linear-attenuate segments  $\frac{1}{2}$  to  $1\frac{3}{4}$  in. long; heads 1 to  $1\frac{3}{4}$  in. broad; involucre 7 to 12 lines high, the outer bracts round-ovate to lanceolate, abruptly acuminate, the inner ones linear-lanceolate, attenuate; achenes 2 lines long; pappus white,  $3\frac{1}{2}$  lines long, the paleae ovate-lanceolate, less than  $\frac{1}{2}$  line long.—Wooded hillsides, 800 to 3500 ft.: Humboldt Co. to Siskiyou Co.; n. to Wash. July. Var. *BOLANDERI* Jepson n. comb. Herbage glabrous; leaves lanceolate to oblanceolate, entire or with a few salient linear lobes, 4 to  $6\frac{1}{2}$  in. long, or the upper cauline smaller; achenes 2 lines long; pappus white,  $3\frac{1}{2}$  to 4 lines long, the ovate palea about  $\frac{1}{2}$  line long.—Mendocino Co. to Humboldt Co.; Siskiyou Co.; Lassen Co. (*Calais bolanderi* Gray. *S. arguta* Drew.)

6. *S. troximoides* Jepson n. comb. Stems few from the scaly crown of a thick root, 6 to 8 in. high; herbage glabrous; leaves all basal, linear to lanceolate, attenuate, undulate, 2 to 5 in. long; heads  $1\frac{1}{2}$  in. broad; involucre 8 to 9 lines long, surpassed by the pappus at maturity; bracts linear-lanceolate, the outer more than half as long as the inner, all with a longitudinal black or dark midnerve; achenes fusiform,  $3\frac{3}{4}$  to 4 lines long; pappus shining white,  $5\frac{1}{2}$  lines long; paleae  $2\frac{1}{2}$  to 3 lines long, narrowly linear, tapering into a short awn.—Lassen Co.; n. to Wash. and Mont. (*Microseris troximoides* Gray.)

**SCORZONÈRA L.** Ours perennial herbs with edible carrot-like roots. Heads borne on very long peduncles. Flowers yellow. Bracts imbricated in several series, the outer ovate, the inner lanceolate, all acuminate. Receptacle naked. Achenes many-ribbed, beakless. Pappus-bristles in several series, unequal, serrulate or more or less soft-hairy, some often longer and naked at the apex. **S. HISPÁNICA L.** Viper's Grass. Plants 2 to 3 ft. high; herbage glabrous and glaucous; leaves oblong, serrulate, tapering to a petiole at base,  $1\frac{1}{2}$  ft. long or less; heads in anthesis 2 in. in diameter, nodding in the bud.—Garden plant, native of Eur., adventive in low valleys: upper Napa Valley; Knights Valley; Ukiah Valley.

#### 10. **PÍCRIS L.**

Coarse rough-bristly biennial with leafy stems. Heads short-peduncled, terminal or along the branches. Flowers yellow. Receptacle naked. Outer bracts of involucre loose and spreading, ovate, bristly-margined and spinescent at tip; inner bracts erect, linear-lanceolate. Achene somewhat flattened, transversely rugose, ours with a long and slender beak and bearing a pappus of densely plumose bristles. (Greek pikros, bitter.)

1. **P. echioides L.** BRISTLY OX-TONGUE. Stem branching, 1 to 3 ft. high, hispid with barbed hairs; leaves narrowly oblong or the lower oblanceolate, sessile, rough-hispid, 1 or 2 to 8 in. long; bracts of the outer involucre 5, subcordate at base; inner bracts long-acuminate, bearing just below the tip a spinose-pinnatifid bristle or appendage; achenes oblong, orange-color,  $1\frac{1}{2}$  lines long, rather abruptly passing into a beak as long or longer; pappus copious, white,  $3\frac{1}{2}$  lines long.—Nat. from Eur., a summer weed widely established in open fields and waste grounds: San Bernardino Valley; Los Gatos; Berkeley; Creston, Solano Co.; Cape Mendocino.

#### 11. **TRAGOPÒGON L.**

Stout glabrous biennial or perennial herbs, somewhat succulent. Leaves grass-like, entire, clasping. Heads large, long-peduncled, opening in the early morning, usually closed by midday. Flowers in ours purple. Involucre narrowly campanulate. Involucral bracts in 1 series, nearly equal, lanceolate, acuminate, united at the very base. Receptacle naked. Achenes muricate, 5 to 10-ribbed, long-beaked or the outermost beakless. Pappus ample, its bristles long-plumose. (Greek tragos, a goat, and pogon, a beard.)

1. **T. porrifolius L.** SALSIFY. Stems from a stout taproot, very leafy at base, 2 to 4 ft. high; leaves linear-lanceolate, long-acuminate, 1 ft. long or more; peduncle thickened and hollow below the head; heads in fruit 2 to  $2\frac{1}{2}$  in. high; flowers deep purple; achenes cylindric,  $\frac{1}{2}$  in. long, the beak nearly twice as long; pappus brownish,  $\frac{3}{4}$  in. long.—Nat. from Eur.: Yreka; Ft. Bidwell; Honey Lake Valley; Berkeley; Ross Valley; Ballona, Los Angeles Co.

#### 12. **RAFINÈSQUIA Nutt.**

Stout leafy glabrous branching annuals. Leaves toothed or pinnatifid. Inflorescence more or less corymbosely branching. Heads 15 to 30-flowered. Involucre in anthesis conical-cylindraceous. Flowers white, the ligules unequal. Receptacle naked. Achenes with a few obscure ribs, tapering into a slender beak, excavated at the insertion, but without callous thickening. Pappus-bristles capillary, 10 to 15, long-plumose from the base to near the tip. (C. S. Rafinesque, 1783-1840, American naturalist, celebrated for his genius and eccentricity.)

Body of achene 2 to  $2\frac{1}{2}$  lines long, about as long as the slender beak; plume of pappus not matted; involucre 7 to 9 lines high. . . . . 1. *R. californica*.  
Body of achene 4 to 5 lines long, about twice as long as the thickish beak; plume of pappus matted; involucre 10 to 13 lines high. . . . . 2. *R. neomexicana*.

1. **R. californica Nutt.** Stem erect, robust, sometimes almost fistulous below, branching above,  $1\frac{1}{2}$  to  $5\frac{1}{2}$  ft. high; leaves oblong to round-ovate in outline, 1 to 6 in. long, pinnately cleft or parted into narrow toothed segments to merely denticulate or almost entire, sessile and auriculate-clasping

or the lowermost narrowed to a winged petiole, those of the inflorescence many, reduced to herbaceous bracts; heads in anthesis  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. broad; involucre subcylindric, 6 to 9 lines high, the main bracts 11 to 15, linear or lanceolate-acuminate, and with some loose subulate ones at base; achenes pubescent to glabrate, tuberculate, 2 to  $2\frac{1}{2}$  lines long, tapering into a filiform beak of about equal length; pappus white or brownish tinged, 3 to 4 lines long.—Shady or moist places in the hill country, 500 to 2000 ft.: Coast Ranges from Humboldt Co. s.; s. Sierra Nevada in Kern Co.; coastal S. Cal.; Mohave and Colorado deserts. Apr.

2. *B. neomexicana* Gray. Stem widely branching or sometimes simple and erect,  $\frac{1}{2}$  to 2 ft. high; herbage at first glaucous; lower leaves narrowly to broadly oblong in outline,  $\frac{3}{4}$  to  $4\frac{1}{2}$  in. long, pinnately and often saliently or runcinate lobed to merely toothed, the uppermost reduced to minute usually spinulose bracts, all but the lowest with auriculate-clasping base; heads 1 to  $1\frac{1}{4}$  in. broad; involucre subcylindric, 10 to 13 lines high, the main bracts 8 to 10, linear-lanceolate, with some loose subulate ones at base; ligules pure white, veined on the back with brown-purple; achenes obscurely tuberculate, often mottled, 4 to 5 lines long, tapering into a thickish beak nearly  $\frac{1}{2}$  as long; pappus white, 5 to 6 lines long, the plume somewhat matted.—Desert mesas, common among bushes, 500 to 2000 ft.: Inyo Co.; Mohave and Colorado deserts; e. to Ariz., s. to Mex. Apr.-May.

### 13. HYPOCHOERIS L.

Herbs. Stems naked, bearing a solitary head or a somewhat corymbose cluster of long-peduncled heads. Flowers yellow. Leaves in a basal cluster or rosette, toothed or pinnatifid. Involucre campanulate or cylindrical, its bracts rather few, lanceolate, imbricated, appressed, the outer ones successively shorter. Bracts of the receptacle scarious, thin and narrow. Achenes glabrous, upwardly scabrous, the body 10-ribbed, narrowly oblong or fusiform, all tapering upward into a slender beak, or the outermost truncate. Pappus of plumose bristles, some of the outer often shorter and naked. (Greek name used by Theophrastus for some cichoriaceous plant.)

Annual; heads 2 to 3 lines broad; outermost achenes beakless, truncate at summit. . . . .

1. *H. glabra*.

Perennial; heads 1 to  $1\frac{1}{4}$  in. broad; achenes all beaked. . . . . 2. *H. radicata*.

1. *H. glabra* L. SMOOTH CAT'S-EAR. Glabrous annual; stems few to several, erect, simple or mostly corymbosely branched, 4 to 16 in. high; leaves spatulate-oblong, denticulate or broadly toothed to sinuately pinnatifid,  $\frac{1}{2}$  to 5 in. long; heads campanulate; involucre 6 to 8 lines long, the ligules scarcely exceeding them; achenes dark brown, the outermost truncate at summit,  $1\frac{3}{4}$  lines long, the others prolonged into a slender beak as long as the body of the achene; pappus  $4\frac{1}{2}$  lines long, yellowish or brownish tinged.—Nat. weed from Eur., in cultivated fields and pasture lands, valleys and foothills along the coast, foothills of the interior, almost throughout cis-montane Cal.

2. *H. radicata* L. HAIRY CAT'S-EAR. Stems several, often thickening upward, 1 to 2 ft. high, from a fleshy perennial root; leaves spatulate, hispid with spreading hairs, merely dentate, or pinnatifid below the large terminal lobe into oblong obtuse lobes,  $2\frac{1}{2}$  to  $5\frac{1}{2}$  in. long; rays longer than the involucre, which is disposed to twist slightly after anthesis; achenes brown, the body  $1\frac{3}{4}$  lines long, the beak as long or longer.—Nat. weed from Eur., valleys and hill slopes near the sea, abundant from Humboldt Co. to Monterey Co.

### 14. STÉPHANOMÈRIA Nutt.

Usually tall and rather slender annual or perennial herbs, paniculately branching above. Leaves runcinate or entire, often reduced above to herbaceous bracts. Heads small, 3 to 20-flowered. Flowers pink or flesh-color, open in the early morning, the ligules all equal. Involucre cylindrical or rarely campanulate, its inner bracts linear and equal, with some short usually calyculate outer ones. Receptacle naked. Achenes oblong, short-linear or clavate, strongly angled, glabrous, often rugose, truncate at both ends, the

broad base hollowed at the insertion. Pappus-bristles white or brownish, plumose. (Greek stephane, a wreath, and meros, a division, perhaps referring to the virgate branches.)

Receptacle deeply pitted, fimbriate or scaly; involucre imbricated; root perennial; young herbage woolly; achenes not tuberculate nor rugose. . . . . 1. *S. cichoriacea*.  
Receptacle naked; involucre not imbricated but calyculate at base with small or minute bracts, rarely 1 or 2 intermediate bracts; herbage commonly glabrous.

Perennials; achenes not tuberculate nor rugose.

Stems from slender creeping rootstocks, very leafy; leaves mostly linear, thin, entire or with a few salient teeth, few if any of the leaves bract-like. . . . . 2. *S. lactucina*.

Stems from the crown of a deep-seated taproot; leaves of the branchlets commonly small or minute and bract-like.

Leaves callus-margined; stem leafy, the leaves oblong, thick, runcinate-pinnatifid . . . . . 3. *S. parryi*.

Leaves not callus-margined; stems moderately or sparsely leafy.

Leaves mostly filiform and entire; branches flexuous, ascending. . . . . 4. *S. tenuifolia*.

Leaves linear-subulate, mostly runcinate, those of the branchlets reduced and scale-like; branches mostly rigid and conspicuously divaricate (except in var. *myrioclada*) . . . . . 5. *S. runcinata*.

Annuals or biennials; achenes usually tuberculate or rugose.

Pappus plumose almost throughout, the base scarcely thickened; herbage glabrous or nearly so. . . . . 6. *S. virgata*.

Pappus plumose only above, the naked base thickened or paleaceous, often toothed or giving off short secondary bristles; branchlets more or less glandular-pubescent . . . . . 7. *S. exigua*.

1. *S. cichoriacea* Gray. Stems erect, simple or virgately branched, 1½ to 5 ft. high, few or several from a large woody perennial root; herbage silvery with a close thin tomentum, becoming glabrate; leaves oblong to oblong-lanceolate or lanceolate, acute, remotely and saliently toothed to entire, sessile, 1½ to 8 in. long; heads large for the genus (8 to 10 lines broad), sessile and racemose along the elongated branches, rarely on short peduncles; involucre 6 to 7 lines high, the inner bracts linear, the outer lanceolate, shorter, imbricated; receptacle pitted, the pits bordered with short narrow thin scales; achenes smooth, 5 to 8-nerved, 2½ to 3 lines long; pappus sordid or fuscous, 3½ lines long, the 12 to 22 bristles plumose throughout.—Rocky places in cañons, 1000 to 5000 ft.: Santa Ana, San Gabriel, San Bernardino mountains and n. to Tejon Pass; Santa Barbara Isls. Aug.

2. *S. lactucina* Gray. Stem erect, leafy, 3 to 15 in. high, arising from a slender creeping rootstock, freely branched at or near the base, the branches slender, spreading or divaricate, or sometimes the stem strictly erect with ascending branches at the middle or above; leaves linear, or a few linear-spatulate, entire, or with a few salient teeth, 1 to 4½ in. long; heads about 8-flowered, terminal on the mostly naked corymbose branchlets or peduncles, or sometimes racemosely arranged; involucre 5 to 6 lines high, the main bracts linear-attenuate, the outer short, lanceolate; ligules pink, well exerted; achenes somewhat angled, smooth, 2½ to 3 lines long; pappus white, 4 lines long, of about 20 or 21 bristles plumose nearly to the base, the bases thickened or more or less united.—Montane ridges, flats or plateaus, often in open pine forest, 4000 to 7000 ft.: Mariposa Co. to Siskiyou and Modoc Cos. July-Aug.

3. *S. parryi* Gray. Stems several from a perennial root, erect or spreading, often much branched, 5 to 8 in. (or to 2 ft.) high; herbage glabrous, glaucescent; leaves oblong, thickish, runcinate-pinnatifid, callous-margined, 1 to 2 in. long; leaves of the branchlets minute, ovate to orbicular, entire or somewhat spinulose-lobed; heads terminal on the branchlets; involucre 5 to 6 lines high, the inner bracts linear, the outer ones very short; corollas white; achenes smooth with slender ribs; pappus sordid, 4 to 4½ lines long, often united in 2s or 3s at base, the lower ½ naked.—Mesas or arid slopes of ranges bordering or in the deserts, 3000 to 5000 ft.: n. Colorado Desert; Mohave Desert; Inyo Co.; e. to Utah and Ariz. May-June.

4. *S. tenuifolia* (Torr.) Hall. Stems few or several from a woody root-crown, erect, with numerous ascending slender branches, 8 to 15 in. high; herbage usually light green, glabrous; leaves filiform, ½ to 1½ in. long, entire, or the basal somewhat toothed; heads terminal on the branchlets; in-

volucres 4 to 5 lines high, about 5-flowered, its main bracts about 5; achenes about 10-striate; pappus bristles about 15 to 23, white or sordid, plumose throughout.—Montane slopes, 4000 to 7000 ft.: e. side or easterly parts of the Sierra Nevada from Tulare and Inyo Cos. northward; w. slope Sierra Nevada, infrequent (Huntington Lake; Indian Valley, Plumas Co.); n. to eastern Ore., Ida. and Mont. July-Aug. (*S. minor* Nutt.)

5. *S. runcinata* Nutt. Stems slender, woody below, much branched, the nearly leafless and slender branches divaricate or slightly ascending, forming rounded bushy plants 1 to 2 ft high, with deep-seated perennial roots; herbage pale, glaucescent, glabrous; leaves linear, subulate, entire, or runcinately pinnatifid or toothed,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long, or the upper leaves minute and scale-like; branchlets a little curved at apex, bearing a single terminal head; involucre 3 to 4 lines high, the 5 inner bracts linear, obtuse, the outermost calyculate; achenes 5-angled,  $1\frac{3}{4}$  to 2 lines long; pappus brownish-tinged, plumose to near the somewhat thickened base, or the lower  $\frac{1}{4}$  or  $\frac{1}{2}$  glabrous, 2 to  $2\frac{1}{2}$  lines long.—Desert flats and mesas, 500 to 2500 ft.: Colorado and Mohave deserts; Inyo Co.; e. to N. Mex., s. to L. Cal. May-June. Var. *MYRIOCLADA* Jepson n. comb. Branches very slender, ascending; heads often only 3 or 4-flowered; bracts of the involucre sometimes only 3 or 4.—San Gabriel Mts.; Mohave Desert; e. to Nev. (*S. myrioclada* Eat.) Var. *PARISHII* Jepson n. var. Herbage covered with a grayish hispidulous tomentum; pappus-bristles plumose to the thickened or somewhat united bases.—Sw. Mohave Desert (Victorville, Parish 10,615, type).

6. *S. virgata* Benth. Stem erect, virgate or with virgate branches, 1 to 4 ft. high; herbage glabrous or somewhat puberulent; inflorescence non-glandular, sometimes glandular; leaves oblong or spatulate, often sinuate or pinnatifid,  $1\frac{1}{4}$  to 6 in. long, the upper cauline ones linear, entire; heads 4 to 8 (or to 22)-flowered, subsessile along the naked virgate branches; involucre 3 lines high; flowers pink; achenes subclavate or oblong, 5-angled, irregularly rugose-tuberculate between the angles,  $1\frac{3}{4}$  to 2 lines long; pappus clear white or faintly brownish-tinged, plumose almost throughout, 2 to  $2\frac{1}{2}$  lines long, often deciduous.—Dry hills and valleys, 200 to 6000 ft.: throughout cismontane Cal.; e. to Utah, n. to Ore. Sept.-Oct. (*Ptiloria pleurocarpa* Greene.)

*S. TOMENTOSA* Greene. Herbage white-tomentose when young.—Santa Cruz Isl.

7. *S. exigua* Nutt. Stems stout, much branched at or near base, the branches ascending or spreading,  $\frac{1}{2}$  to 4 ft. high; branchlets with very short scattered gland-tipped hairs, commonly glabrous below; lower leaves narrowly oblong or lanceolate, remotely lobed, auriculate-clasping, 1 to 2 in. long, the upper small and bract-like, rather numerous on the branchlets and peduncles; heads numerous, few-flowered; involucre  $2\frac{1}{2}$  to  $3\frac{1}{2}$  lines high, the ligules much exserted; main bracts about 5, linear-attenuate, the outer ones short, ovate; achenes 5-angled, each of the 5 sides (between the angles) bearing 2 rows of tubercles, each row separated from its companion row by a very narrow channel, about 1 line long; pappus white, the 5 to 18 bristles plumose only on upper  $\frac{1}{2}$  or  $\frac{3}{4}$ ,  $1\frac{1}{2}$  lines long; bases of bristles short-setulose on each side, the setae persistent after the bristles have fallen.—Valley flats and low hills, 1000 to 3000 ft.: coastal S. Cal.; Mohave Desert; n. along e. side Sierra Nevada and far ne. to Wyo.; e. to Tex. Var. *PENTACHAETA* Hall. Herbage glabrous, not glandular; pappus-bristles reduced to 5 (or 7), plumose only on upper half.—More or less with the species. (*S. pentachaeta* Eat.) Var. *CORONARIA* Jepson n. comb. Peduncles usually shorter (as in *S. virgata*); herbage less glandular or sometimes not at all so; pappus-bristles deciduous above the paleaceous base, leaving a crown of setose scales.—Coast Ranges; coastal S. Cal.; s. Sierra Nevada; Inyo Co. (*S. coronaria* Greene.)

# 15. *ANISOCOMA* Gray

Low annual with few to many naked scapes, each bearing a single head and arising from a basal rosette of leaves. Involucre cylindric, the inner

bracts linear, acute, the outer successively oblong, short-oval or orbicular, obtuse, all white-scarious with a broad green midrib. Bracts of the receptacle linear, scarious, persistent. Achenes linear-turbinate, 10 to 15-nerved, truncate, crowned with a narrow entire border, villous. Pappus bright silky white, consisting of 8 to 12 long-plumose bristles; bristles of 2 lengths, disposed in one circle, but the short ones set on one side the flower, the long ones on the other. (Greek anisos, unequal, and kome, tuft of hair, the two sets of pappus bristles unlike.)

1. *A. acaulis* Gray. Scapes stout, 2 to 10 in. high; leaves oblong, pinnately toothed or parted into toothed segments (the margins commonly with tufts of wool), 1 to 2 (or 3) in. long; heads  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. broad; involucre cylindric-campanulate,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. high; bracts often spotted with dark dots; ligules yellow, often pinkish tinged; bracts of receptacle 5 lines long; achenes 2 lines long; pappus 11 lines long, the bristles on inner side of the achene commonly 4 or 5, shorter than the outer ones; outer bristles commonly 5 or 6, geniculate towards the base.—Arid mountain slopes or sandy washes. 4000 to 7800 ft.: San Jacinto Mts.; Mohave Desert; Mt. Pinos; Tehachapi Mts.; Argus Mts. Apr.-June.

#### 16. *LACTUCA* L. LETTUCE

Tall leafy-stemmed annuals or biennials with paniced heads of yellow or purple flowers. Leaves alternate. Involucre cylindrical or in fruit conical, its bracts imbricated in 2 or more series of unequal lengths. Receptacle naked. Achenes obcompressed, that is, flattened parallel to the bracts, ribbed on each side, contracted into a beak, which bears at its dilated summit a copious very soft and white capillary pappus, the hairs of which fall separately. (Ancient Latin, from lac, milk, referring to the milky juice.)

Annual or biennial; achenes margined, abruptly beaked, the beak about as long as the body or a little longer; flowers yellow.

Achenes several-nerved; leaves mostly clasping by a broad sagittate base. . . . .

1. *L. scariola*.

Achenes 1-nerved on each face (sometimes with obscure nerves near the margin).

Leaves narrow at base, sessile or narrowly sagittate-clasping, the midrib not prickly; pappus  $2\frac{1}{2}$  to 3 lines long. . . . . 2. *L. canadensis*.

Leaves with broad sagittate-clasping base, the midrib more or less prickly below; pappus  $3\frac{1}{2}$  to  $4\frac{1}{2}$  lines long. . . . . 3. *L. ludoviciana*.

Perennial; achenes marginless, tapering to a very short beak about as long as the breadth of the body; flowers purple. . . . . 4. *L. pulchella*.

1. *L. scariola* L. PRICKLY LETTUCE. Stem erect, simple, paniculately branched above, glabrous throughout, or hirsute or prickly below, 2 to 5 ft. high; leaves oblong or oblong-lanceolate, spinose-denticulate, pinnatifid, sessile or sagittate-clasping,  $1\frac{1}{2}$  to 7 in. long, with a row of soft prickles on the lower side of the midrib; heads numerous in an open panicle, 9 to 14-flowered; involucre cylindrical, 5 to 6 lines long, the outer bracts about  $\frac{1}{2}$  as long as the inner; ligules cream-yellow; achenes narrowly obovate, several-nerved, dark olive green, pubescent above,  $1\frac{3}{4}$  to 2 lines long, the nerves minutely roughened; beak filiform, about as long or a little longer than the body; pappus white, 2 to  $2\frac{1}{2}$  lines long.—Nat. from Eur., a weed in waste places and fields throughout the valleys of Cal. Var. *INTEGRATA* Gren. & Godr. Leaves oblong-ob lanceolate, merely spinose-denticulate, 2 to 6 in. long; flowers yellow (or purplish).—Nat. from Eur.: Santa Clara, Alameda, Humboldt and Siskiyou Cos.

2. *L. canadensis* L. TRUMPET FIREWEED. Stem simple, erect, leafy, 3 to 4 ft. high; herbage glabrous; leaves 2 to 9 in. long, pinnately parted into salient oblong segments, 1 to  $1\frac{1}{2}$  in. long; panicle ample or elongate; involucre 4 to 5 lines high; flowers pale yellow; achenes oblong-ovate, blackish, transversely striulate, 1-nerved on each face,  $1\frac{1}{4}$  to  $1\frac{3}{4}$  lines long, the beak about  $\frac{1}{2}$  as long; pappus  $2\frac{1}{2}$  to 3 lines long.—Introduced from the e. U. S.: Sisson; Fall River Lake, Shasta Co.; Sierra Valley.

3. *L. ludoviciana* DC. Stem stout, simple, erect, leafy, 3 to  $4\frac{1}{2}$  ft. high; herbage glabrous, the midrib of leaves more or less prickly below on the under side; leaves  $2\frac{1}{2}$  to 4 in. long, mostly broadly oblong, irregularly dentate or sinuately pinnatifid into broad denticulate segments, the terminal segment largest; panicle ample; involucre 6 to 8 lines high; flowers yellow;

achenes oblong-ovate, margined, 1-nerved on each side, transversely striulate, dark brown or somewhat mottled,  $1\frac{1}{2}$  to 2 lines long, narrowing abruptly into a slender beak nearly as long; pappus  $3\frac{1}{2}$  to  $4\frac{1}{2}$  lines long.—Introduced from e. U. S.: Fall River Lake, Shasta Co.

4. *L. pulchella* DC. Stem simple, erect, very leafy,  $1\frac{1}{4}$  to 3 ft. high, ending above in a few to many-flowered panicle; herbage glabrous, glaucescent; leaves linear to linear-lanceolate or oblong-lanceolate, entire to runcinate-dentate or pinnatifid, sessile or with a winged petiole, 2 to 6 in. long; branches of the panicle with small scaly bracts; involucre 5 to 7 lines high; flowers blue or purple, the ligules well exserted; achenes oblong with a very short beak,  $1\frac{1}{2}$  lines long; pappus 4 lines long.—Montane valleys of the Sierra Nevada, 3400 to 6000 ft., mostly on the east side, from Mono Co. to Modoc Co.: Mono Lake; Hetch-Hetchy; Modoc lava beds; Ft. Bidwell; e. to Nev. and Mich., n. to B. C. June-July.

### 17. *SÓNCHUS* L. SOW-THISTLE

Leafy-stemmed coarse annual or perennial weeds, smooth and glaucous, or the peduncles and upper parts of the stem glandular-hispid. Heads corymbd or umbellate, swollen at base or jug-shaped. Involucral bracts thin, the inner linear-attenuate, with many shorter ones at base, these usually becoming callous-thickened. Receptacle naked. Achenes obcompressed, ribbed or striate, not beaked. Pappus copious, of cottony-white exceedingly soft and fine hairs, mainly falling together. (Greek name of the sow-thistle.)

Leaves when sessile usually sagittate-clasping; peduncles glabrous or sometimes with a few gland-tipped hairs; achenes transversely rugose; annual.

Achenes longitudinally ribbed; leaves lyrate or runcinately pinnatifid, the terminal segment large and triangular.....1. *S. oleraceus*.

Achenes longitudinally striate; leaves pinnately parted into linear or lanceolate lobes or merely denticulate.....2. *S. tenerrimus*.

Leaves when sessile usually auriculate-clasping; peduncles hispid with short spreading gland-tipped hairs or entirely glabrous.

Annual; achenes flat, oblong-obovate, with 3 longitudinal ribs on each side, the intervals smooth or nearly so.....3. *S. asper*.

Perennial; achenes oblong with 5 ribs on each side, the middle one forming a keel, both ribs and intervals rugulose.....4. *S. arvensis*.

1. *S. oleraceus* L. COMMON SOW-THISTLE. HARE'S LETTUCE. Stem erect, nearly simple, 1 to 4 ft. high; leaves 3 to 12 in. long, lyrate or runcinately pinnatifid, denticulate or toothed, the terminal segment commonly large and triangular, sagittately clasping at base with acute lobes; lowest leaves petioled, the uppermost ones commonly lanceolate, sessile; achenes obovate, longitudinally ribbed and transversely rugose, 1 to  $1\frac{1}{2}$  lines long; pappus 3 to 4 lines long.—Nat. from Eur.: waste lands in the valleys and hills throughout Cal.

2. *S. tenerrimus* L. Stem much branched,  $\frac{1}{2}$  to  $3\frac{1}{2}$  ft. high, very leafy up to the short-peduncled heads; herbage glabrous; leaves oblong in outline, 3 to 7 in. long, pinnately parted or divided into linear or narrowly lanceolate lobes, the lobes  $\frac{3}{4}$  to  $2\frac{1}{2}$  in. long, commonly cuspidate and either spinulose denticulate or entire, or sometimes the leaves undivided; achenes narrow, longitudinally striate and transversely rugose, 1 line long; pappus 2 to 3 lines long.—Nat. from Eur.: w. San Diego Co.; Santa Barbara Isls.; s. to L. Cal.

3. *S. asper* L. PRICKLY SOW-THISTLE. Very similar to no. 1, the leaves divided or sometimes undivided, commonly clasping by an auricled base, the auricles rounded, the teeth longer and more prickly; upper part of stem and peduncles furnished with spreading gland-tipped hairs, or these parts entirely glabrous; achenes flat, oblong-obovate, margined with a narrow wing and marked on each side with 3 longitudinal ribs; intervals between the ribs smooth, or nearly so, the ribs as well as the marginal wing rugulose or serrulate.—Nat. from Eur.: waste lands in valleys throughout Cal. It is often associated with *S. oleraceus* and there are hybrid-like intermediates.

4. *S. arvensis* L. CORN SOW-THISTLE. Stem slender, branched above, arising from creeping rootstocks, terminating in a corymbose panicle, 2 to  $2\frac{1}{2}$  ft. high; leaves runcinate-pinnatifid or some undivided, spinose-toothed, petioled or auriculate-clasping, 1 to 10 in. long; peduncles more or less gland-

ular-bristly; involucre 5 to 8 lines high; achenes oblong,  $1\frac{1}{2}$  lines long, flattish, bordered by a marginal rib and also 5-ribbed in each side, the middle rib forming a keel, all the ribs transversely rugulose; pappus 4 to 5 lines long.—Nat. from Eur.: Santa Ana.

### 18. MALACÓTHRIX DC.

Herbs or sometimes woody at base. Leaves all basal and the stems scapose, or the stems leafy. Heads peduncled, commonly nodding in the bud. Flowers yellow, white, or pinkish. Receptacle bristly or naked. Achenes short, glabrous, terete, 10 to 15-ribbed, or 4 or 5 of the ribs stronger than the others, truncate at apex and with an entire or denticulate border. Pappus-bristles soft, scabrous, more or less united at base and falling away together, or with 1 to 4 stronger ones which are more persistent and smoother. (Greek malakos, soft, and thrix, hair, in reference to the long wool on *M. californica*, type of the genus.)

Bracts orbicular or ovate to linear, very obtuse, silvery-scarious with a broad dark median line, imbricated in several series; receptacle with slender persistent bristles; persistent pappus-bristles 1 to 4. . . . . 1. *M. coulteri*.

Bracts lanceolate to linear, only sparingly imbricated; receptacle with few deciduous bristles or none.

Annuals (or *M. altissima* sometimes biennial).

Plants less than 2 ft. high.

Persistent pappus-bristles 1 or 2; leaves or their lobes narrowly linear to filiform, elongated.

Stems scapose, the scapes simple or commonly so, one-headed; leaves all basal; persistent pappus-bristles 2; heads large, the outer ligules 7 to 10 lines long. . . . . 2. *M. californica*.

Stems freely branched, bearing many or numerous heads; leaves mainly basal, some cauline; persistent pappus-bristle 1; heads small, the outer ligules  $2\frac{1}{2}$  to 3 lines long. . . . . 3. *M. clevelandii*.

Persistent pappus-bristles none.

Margins of leaves with tufts of white wool. . . . . 4. *M. obtusa*.

Margins of leaves without tufts of wool.

Stems sparsely leafy; desert species. . . . . 5. *M. sonchoides*.

Stems densely leafy throughout; insular or coast species.

Involucre 5 to 6 lines high; leaves and their lobes acute. . . . . 6. *M. foliosa*.

Involucre  $2\frac{1}{2}$  to 3 lines high; leaves with their lobes mostly obtuse. . . . . 7. *M. indecora*.

Plants more than 2 (usually 3 to 6) ft. high. . . . . 8. *M. altissima*.

Perennials, wholly herbaceous or woody at base; persistent pappus-bristles none; south coast.

Herbage essentially glabrous; involucre bracts linear-lanceolate, attenuate. . . . . 9. *M. saxatilis*.

Herbage densely white-tomentose when young; involucre bracts obtuse, often purplish or pinkish. . . . . 10. *M. incana*.

1. *M. coulteri* Gray. SNAKE'S HEAD. Stem branching at or above the base, 5 to 14 in. high, the branches bearing mostly single heads; herbage glabrous and glaucescent; basal and lower cauline leaves narrowly oblong, sinuately pinnatifid or toothed, or dentate, 2 to 4 in. long; upper cauline leaves ovate to lanceolate or oblong, irregularly toothed or shallowly pinnatifid, sessile with an auricled or broad base,  $\frac{1}{2}$  to 3 in. long; heads subglobose,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. broad; involucre 4 to 7 lines high; bracts silvery-scarious, the linear central portion green (changing to brown), regularly imbricated in several ranks, the short outer ones orbicular, the inner oval to lanceolate or linear; achenes 4 or 5-angled, 15-ribbed, 1 line long, the summit obscurely denticulate by projection of the ribs; pappus white or faintly tawny, with 1 to 4 stouter pappus-bristles persistent.—Sandy valleys, 500 to 7400 ft.: coastal S. Cal.; upper San Joaquin Valley; Mohave Desert; Inyo Co. Mar.-May. Var. *COGNATA* Jepson n. var. Leaves pinnately parted into remote linear-lanceolate divisions.—Santa Cruz Isl. (T. Brandegee, type).

2. *M. californica* DC. Stems scapose, few to many, diffuse or erect, one-headed,  $3\frac{1}{2}$  to 12 in. high, the leaves all basal; herbage remarkably woolly when young, glabrate in age or the wool somewhat persistent on the involucre and often in conspicuous tufts among the leaf bases; leaves laciniately pinnatifid into narrowly linear or almost filiform lobes, 2 to 6 in. long; heads 1 to  $1\frac{1}{4}$  in. broad; involucre 4 to  $6\frac{1}{2}$  lines high, their bracts narrowly linear or subulate, in about 3 ranks; bristles of the receptacle delicate, usually

present; flowers canary yellow; achenes narrow, lightly striate,  $1\frac{1}{4}$  lines long; pappus white or faintly tawny, the outer of 2 persistent bristles and some intervening minute teeth.—Sandy soil, valleys and mesas, 20 to 4500 ft.: Contra Costa Co. to San Luis Obispo Co.; s. Sierra Nevada in Tulare and Kern Cos.; coastal S. Cal.; Inyo Co. Apr.-June. Var. *GLABRATA* Eat. Stems usually branched above and bearing several heads; herbage glabrous, except the outer calyculate bracts of the involucre, these sometimes canescently pubescent.—San Bernardino Valley; Riverside; Lakeside; Colorado and Mohave deserts; upper San Joaquin Valley; n. along e. side Sierra Nevada to Lassen Co.; e. to Nev., n. to Ore. (*M. glabrata* Gray.)

3. *M. clevelandii* Gray. Stems several to many from the base, erect or ascending, slender, often much branched, 5 to 16 in. high, the leaves mainly in a basal tuft, the cauline few and often reduced; herbage glabrous throughout; basal leaves linear, remotely pinnatifid, 1 to 3 in. long; cauline leaves scattered, pinnately toothed, denticulate or entire; heads  $2\frac{1}{2}$  to 3 lines broad, few-flowered; involucre 2½ to 3 lines high; bracts linear, the main ones in one rank, the shorter ones somewhat calyculate, in 1 or 2 ranks; corollas yellow; achenes linear, minutely striate-costate, ½ to 1 line long; pappus

white, mostly deciduous except one persistent bristle and a circle of white setulose teeth.—Open hill or chaparral slopes, 500 to 5000 ft.: common in coastal S. Cal.; infrequent in Sierra Nevada foothills; Lake Co. May-June.

915. *Malacothrix obtusa* Benth.; a, habit x ½; b, achene and pappus x 4.

4. *M. obtusa* Benth. Fig. 915. Stems 1 to several from base, paniculately branching, 4 to 16 in. high, almost naked, the leaves nearly all basal; basal leaves oblong, dentate or dentate-pinnatifid, ½ to 3 (or 5) in. long, the margin commonly bearing scattered tufts of wool; heads 4 to 7 lines broad, numerous; involucre 2 to 3 lines high, their main bracts linear, acuminate, nearly equal, with a few short ones at base, the tips often purplish; corollas pale yellow or white, often pinkish-tinged,  $3\frac{1}{2}$  to 5 lines long; achenes obovate-oblong, the summit entire, ¾ line long; persistent pappus-bristles none.—Gravelly slopes or loose soil of hillslopes, 500 to 6000 ft.: Santa Barbara Co.; Mt. Pinos; Coast Ranges from San Benito Co. to Siskiyou Co.; Sierra Nevada from Mariposa Co. to Lassen Co. June-July.

5. *M. sonchoides* T. & G. Stems several from base, ascending, 4 to 11 in. high, freely branching, the leaves chiefly basal, the cauline few and scattered and often reduced; herbage glabrous or early glabrate; basal leaves oblong, sinuately pinnatifid with callus-toothed lobes,  $1\frac{1}{2}$  to 6 in. long; cauline leaves ½ to 2 in. long; heads 7 to 12 lines broad; involucre about 3 to 4 lines high; bracts linear-acuminate, in about 4 series; flowers fragrant; corollas very bright yellow; achenes 15-striate with 5 of the ribs stronger, ¾ line long, the summit 15-denticulate; persistent pappus-bristles none.—Sandy valleys, 2000 to 5000 ft.: Mohave Desert; Inyo Co.; e. to Ariz., n. to Nev. June.

6. *M. foliosa* Gray. Stem erect, much branched above, very leafy nearly to the yellow-flowered heads, ½ to 2 ft. high, arising from an annual root; herbage glabrous; leaves mostly lanceolate, laciniate-pinnatifid, 2 to 4 in. long, the uppermost reduced; heads numerous, short-peduncled; involucre

5 to 6 lines high; achenes obscurely 5-angled and 2 or 3-striate between the angles; pappus all deciduous, leaving neither bristles nor crown.—San Clemente and Santa Cruz Isls.

7. *M. indécora* Greene. Stems several, sometimes diffuse and forming mats 6 in. or less thick, sometimes erect, slender, 4 to 15 in. high; leaves very thick and succulent, oblong to oblanceolate, pinnately lobed, the lobes mostly obtuse; involucre 2½ to 3 lines high, imbricate; inner bracts linear-lanceolate, green, the outer ones said to be purplish; corollas greenish-yellow, not exceeding the bracts; achenes 5-angled and 2 or 3-striate between the angles, about ¾ line long; pappus all deciduous.—Santa Cruz, San Miguel and San Nicolas Isls.

8. *M. altissima* Greene. Stem stout, erect, herbaceous, simple below, strict and cymosely branched above, 2½ to 6 ft. high, arising from an annual or biennial very long and stout taproot; herbage tomentulose or glabrate; leaves oblong to lanceolate or linear-attenuate, entire or the lower somewhat toothed to parted, 1 to 4 in. long; heads ¾ to 1 (or 2) in. broad; involucre 3½ to 4½ lines high; bracts in about 4 series, the inner linear-attenuate, the outer short, subulate, passing into the bracts of the peduncle; flowers white or purplish; achenes linear, 1 line long, pubescent with minute short spreading hairs, the sides with 5 strong ribs and 5 to 10 faint intermediate ribs; pappus-bristles deciduous, leaving a narrow white denticulate border.—Tehachapi Range; n. San Luis Obispo Co. June-Aug.

9. *M. saxatilis* (Nutt.) T. & G. Stems 1 or several from the root-crown, stout, erect, diffuse or decumbent, wholly herbaceous, branched above, densely leafy, ½ to 2 (or 4) ft. high; herbage somewhat succulent, tomentulose to glabrate; leaves linear-lanceolate, entire or some of the lower coarsely toothed or pinnatifid, 1 to 5½ in. long; heads ¾ to 1¾ in. broad; involucre 5 to 7 lines high; bracts in 3 or 4 series, linear-lanceolate, attenuate; corollas white or pinkish; achenes 10 to 15-ribbed, 5 of the ribs stronger than the others, the summit obscurely denticulate; persistent pappus-bristles none.—Along the seacoast: Santa Barbara Co.; Santa Catalina Isl. Var. *TENUIFOLIA* Gray. Herbage not succulent; leaves narrowly linear to filiform, entire.—Santa Barbara Co. to Orange Co. Var. *IMPLICATA* Hall. Stems becoming woody, branching, 5 to 8 in. high, densely leafy above, more or less roughened below by the persistent bases of old leaves; leaves bipinnately parted into filiform or narrowly linear segments, ¾ to 2 in. long; flowers purplish-tinged.—Santa Barbara Isls. (*M. implicata* Eastw.)

10. *M. incana* T. & G. Stems several from the woody crown of a stout taproot, ascending, branching, densely leafy, 4 to 13 in. high; herbage when young clothed with a dense felt-like white tomentum, the tomentum more or less completely deciduous in age; leaves oblanceolate, tapering to a long narrow base, 1 to 4 in. long, entire to irregularly and shallowly lobed, or the cauline cleft or sometimes parted into remote linear or acute segments; heads ½ to 1¼ in. broad; involucre 5½ to 7 lines high; bracts in about 4 series, often pinkish or purplish, the inner equal, linear-oblong, obtuse, the outer short, ovate, imbricated, passing into the scale-like bracts of the peduncle; corollas lemon-yellow; achenes oblong, 15-striate, ¾ line long; pappus-bristles all deciduous.—Along the seacoast: San Luis Obispo Co.; Santa Barbara Co.; Santa Rosa Isl. May-Nov. (*M. succulenta* Elmer.)

#### 19. *APARGIDIUM* T. & G.

Slender glabrous perennial herbs with naked 1-headed scapes and linear-lanceolate leaves in a basal tuft from branching rootstocks. Heads nodding in bud, medium-sized. Involucre narrowly campanulate, the bracts lanceolate, acuminate, in several series. Flowers yellow. Receptacle naked. Achenes linear, truncate, 10-nerved. Pappus brownish, of minutely barbellulate bristles, the bristles about 30 to 45, persistent. (Resembling *Apargia*, a sort of dandelion.)

1. *A. boreale* T. & G. Scapes slender, 1 or 2 from a tuft of basal leaves, 7 to 14 in. high; leaves entire or remotely denticulate, tapering to a broadish petiole, the whole 5 to 8 in. long; heads 5 to 11 lines broad; involucre 7

lines high; ligules exserted; achenes 2 to 2½ lines long; pappus 2½ to 3 lines long.—Wet meadows or "prairies," 3500 to 4000 ft., Bald Mt., Humboldt Co.; n. to Alas.

## 20. *TARAXACUM* Haller. DANDELION

Perennial or biennial herbs, the leaves in a basal tuft and the heads solitary and terminal on naked hollow scapes. Leaves pinnatifid or toothed. Flowers yellow. Involucre double, the outer bracts much shorter and in several series, often reflexed or spreading, the inner bracts in a single row, erect. Receptacle naked. Achenes 4 or 5-ribbed, the ribs roughened or spinulose-muricate at apex, the body prolonged above into a very slender beak bearing at apex the copious soft white capillary pappus. (From Greek tarassein, to disturb or alter, in allusion to its supposed effects on the blood in medicine.)

Outer involucre bracts linear or lanceolate, reflexed or spreading.

Achenes greenish or light brown, the beak 2 to 3 times as long.....1. *T. vulgare*.

Achenes red, the beak 1½ to 2 times as long.....2. *T. laevigatum*.

Outer involucre bracts ovate, erect; achenes light brown, the beak about 2½ times as long.....3. *T. ceratophorum*.

1. *T. vulgare* (Lam.) Schrank. COMMON DANDELION. Scapes several, erect or diffuse, 3 to 10 in. high; herbage glabrous or puberulent, a little succulent; leaves oblong or spatulate, sinuate-pinnatifid (and often with a large terminal lobe) to irregularly dentate, 2 to 11 in. long; inner bracts of the involucre linear or linear-lanceolate, acute, 5 to 7 lines long; outer ones similar, short, reflexed; flowers yellow; achenes 1½ lines long; beak 3½ to 4½ lines long; pappus brownish or white, 2½ to 3 lines long.—Low wet lands, nat. from Eur.: Eureka; Scott Valley, Siskiyou Co.; Meadow Valley, Plumas Co.; Cisco; Berkeley; Long Beach. (*T. officinale* Weber. *T. dens-leonis* Desf.)

2. *T. laevigatum* (Willd.) DC. RED-SEEDED DANDELION. Similar to no. 1; scapes diffuse, 3 to 6 in. high; leaves deeply lacinate-pinnatifid or pinnately divided.—Old gardens and low places, introduced from Eur.: San Francisco Bay region. (*T. erythrospermum* Andr.)

3. *T. ceratophorum* (Ledeb.) DC. var. *bernardinum* Jepson n. var. Scapes few, ascending or erect, often somewhat sinuous, 4 to 7 in. high; leaves spatulate to oblong-ob lanceolate, subentire to saliently or irregularly dentate, narrowed below to a short petiole, 1¼ to 5 in. long; inner bracts of involucre lanceolate, the outer short ones ovate, erect or barely spreading; achenes 1 to 1½ lines long; beak 2½ to 3½ lines long; pappus 2 lines long.—Montane meadows, 7500 to 8200 ft., San Bernardino Mts. (South Fork Mdws., Santa Ana Cañon, Hall 7512, type).

## 21. *AGOSERIS* Raf.

Perennial herbs with strong and often deep taproots, or annuals. Stems naked and scape-like, bearing single large heads. Leaves in a basal tuft, elongated. Flowers yellow. Bracts of the campanulate involucre imbricated, the outer often ovate, passing into the linear or lanceolate inner ones. Receptacle naked. Achenes terete, oblong or fusiform, 10-ribbed, prolonged into a slender or filiform beak. Pappus-bristles fine, copious, white or nearly white, inserted on the dilated apex of the beak. Achenes in fruit expanding and forming a globose head, the bracts of the involucre reflexed.—The achene of *A. alpestris* is not beaked. (Greek agos, chief, and seris, lettuce.)

Perennials (or biennials).

Achenes narrowed at apex but not beaked; montane.....1. *A. alpestris*.

Achenes beaked.

Leaf-segments retrorse; achenes truncate or slightly cupped, very abruptly beaked; bracts of the involucre in 2 rather unlike sets....2. *A. retrorsa*.

Leaves entire or toothed or parted, when lobed the segments not retrorse; achenes tapering above into the beak.

Beak with nerves of body prolonged to apex.....3. *A. glauca*.

Beak nerveless.

Body of achene equaling or longer than beak.

Leaves mostly deeply lobed; coastal.....4. *A. apargioides*.

Leaves mostly entire; inner montane.....5. *A. elata*.

Body of achene usually much shorter than beak.

Involucre usually equaling or exceeding the pappus; heads many-flowered.

Ligules commonly much exceeding the involucre.

Involucral bracts not very unlike, mostly oblong, glandular villous; fruiting heads 7 to 9 lines high....

6. *A. hirsuta*.

Involucral bracts rather markedly differentiated, the inner long-linear or lanceolate-attenuate, the outer very short, ovate or oblong-lanceolate; fruiting heads 1½ to 1½ in. high....

7. *A. grandiflora*.

Ligules shorter than the involucre or little exceeding it....

8. *A. plebeia*.

Involucre little exceeding the beaks of the achenes; heads narrow, relatively few-flowered....

9. *A. gracilens*.

Annuals ..... 10. *A. heterophylla*.

1. *A. alpéstris* Greene. Scapes 1 to 3 from the crown of a stout taproot, 2 to 4 in. high; herbage pale, glaucous, glabrous, the stems sometimes a little tomentose; leaves lanceolate or oblanceolate, entire or remotely toothed or pinnatifid, ¾ to 3 in. long; involucre 5 to 9 lines high, their bracts linear or lanceolate; ligules well-exserted; achenes linear-fusiform, somewhat narrowed at summit but not beaked, 2½ to 4 lines long; pappus 3½ to 4 lines long.—Montane summits, 7500 to 10,100 ft.: White Mts.; Sierra Nevada from Mt. Whitney to Modoc and Siskiyou Cos.; n. to Wash. July-Aug. (*A. monticola* Greene.)

2. *A. retrórsa* Greene. Scapes 1 to several from a stout simple or branched root-crown, 6 to 18 in. high; herbage woolly-pubescent when young, the wool more or less deciduous in age; leaves lanceolate to oblong-lanceolate, pinnately parted into narrowly linear or lanceolate retrorse and more or less remote segments, 3 to 10 in. long; involucre 1 to 1¾ in. high, in maturity about equaling the pappus; bracts of the involucre in 2 rather unlike sets, the inner ones few, linear to linear-attenuate, very widely separated, subglabrous, the outer ones oblong to lanceolate, very much shorter, overlapping or slightly imbricated, persistently soft-ciliate, bearing a broad brown median band; ligules somewhat exceeding the involucre; achenes 2½ to 3 lines long, truncate or slightly cupped at the apex, the cup or truncation bearing abruptly a slender beak 7 to 10 lines long; pappus 5 to 8 lines long.—Montane often rocky slopes and flats, 2800 to 8000 ft.: mts. of coastal S. Cal.; San Emigdio Mts.; Tehachapi Range; Sierra Nevada from Kern Co. to Placer Co.; Coast Ranges from San Carlos Range and Mt. Sanhedrin to Siskiyou Co. June-July.

3. *A. glánca* (Pursh) Greene var. *laciniáta* (Eat.) Smiley. Scapes slender, erect or at base decumbent, 1 to several from the short branches of the root-crown, 4 to 15 (or 18) in. high; herbage puberulent to glabrate; leaves exceedingly variable in outline, lanceolate or oblanceolate, entire or sparsely toothed, 5 to 12 in. long; involucre 6 to 7 lines high, their bracts oblong to lanceolate; achenes 2 to 3 lines long, tapering into a stout nervose beak 1 to 2½ lines long; pappus white, more or less barbellulate, 4 to 6 lines long.—Montane meadows, 4000 to 7500 ft.: Tulare Co. to Lassen Co., thence w. to Trinity and Siskiyou Cos.; n. to Ore., e. to Rocky Mts. June-Sept. (*Troximon glaucum* var. *laciniatum* Gray.) Var. *DASYCÉPHALA* Jepson n. comb. Scapes stout, 7 to 12 in. high; herbage glabrate or somewhat pubescent; leaves lanceolate, entire or toothed, 3½ to 5½ in. long; involucre 9 to 11 lines high, their inner bracts lanceolate, the outer ovate-lanceolate, shorter; achenes fusiform-linear, 3 to 3½ lines long, tapering into a thick nervose beak 1 line long; pappus yellowish white, 5 to 7 lines long.—Montane, 5000 to 10,000 ft.: White Mts.; Sierra Co. to Siskiyou Co.; e. to Col., n. to Wash. July. (*Troximon glaucum* var. *dasycephalum* T. & G.)

4. *A. apargioides* Greene. Scapes few to many from the root-crown, erect or ascending, 3 to 7 (or 12) in. high; herbage puberulent to glabrate; leaves oblanceolate, remotely toothed, pinnatifid into slender lobes, or sometimes entire, 2 to 5½ in. long; involucre 5 to 7 lines high, villous-pubescent, their bracts linear-attenuate; ligules well-exserted; achenes fusiform, 1½ to 2 lines long, strongly ribbed, tapering into a nerveless beak, the beak shorter than or equaling the body of the achene; pappus white or yellowish white, 2 to 3

916. *Agoseris hirsuta* Greene; a, habit  $\times \frac{1}{4}$ ; b, leaf  $\times \frac{1}{4}$ ; c, achene with pappus  $\times 1\frac{1}{2}$ ; d, e, bracts  $\times 1$ .

acutely ribbed,  $1\frac{1}{4}$  to  $1\frac{1}{2}$  lines long, the outer achenes sometimes with turgid or rounded ribs; beak  $2\frac{1}{2}$  lines long; pappus 2 to  $2\frac{1}{2}$  lines long.—Open fields and hillslopes, sandy or adobe ground, near the coast, 20 to 1000 ft.: Monterey Co. to Alameda Co. and w. Contra Costa Co.; n. to Wash. May-June. (*Troximon humile* Benth.)

7. *A. grandiflora* (Nutt.) Greene. Scapes several from the branched crown of the taproot, stout,  $1\frac{1}{4}$  to  $2\frac{1}{4}$  ft. high; herbage hirsute-pubescent to glabrate, or the involucre and basal portions somewhat tomentose; leaves lanceolate or oblong-spatulate, entire or sinuate-dentate to lacinate or with salient subfalcate lobes, 4 to 12 in. long; fruiting heads mostly  $1\frac{1}{8}$  to  $1\frac{1}{2}$  in. high, the expanded fruiting heads 2 to  $2\frac{3}{4}$  in. broad; involucre  $\frac{7}{8}$  to  $1\frac{1}{2}$  in. high, the inner bracts linear-lanceolate, the outer ones short, oblong to ovate or lanceolate, more or less reddish; achenes linear or somewhat turbinate, strongly ribbed,  $2\frac{1}{2}$  to 3 lines long, narrowing rather abruptly into a filiform beak 7 to 10 lines long; pappus 5 to 6 lines long.—Dry slopes or flats, 200 to 4800 ft.: throughout cismontane Cal.; n. to Wash. Var. *LACINIATA* Jepson n. comb. Scapes often slender, 6 to

lines long. — Sandy hills and valleys along the coast, 5 to 500 ft.: Marin Co. to San Luis Obispo. Apr.-Aug.

5. *A. elata* (Nutt.) Greene. Scapes stout, 1 to 2 ft. high; herbage glabrous to puberulent, the peduncles tomentulose beneath the heads; leaves erect, oblanceolate, entire or rarely remotely denticulate, narrowed below to a petiole, the whole 5 to 12 in. long; involucre  $\frac{3}{4}$  to 1 in. high; bracts lanceolate or oblong-lanceolate, little unequal; achenes 4 to  $4\frac{1}{2}$  lines long, the beak about  $\frac{1}{2}$  to  $\frac{3}{8}$  as long; pappus 4 lines long.—High montane meadows, 6500 to 7000 ft.: Lake Tenaya; Fallen Leaf Lake; n. to Wash. (*Troximon nuttallii* Gray.)

6. *A. hirsuta* (Hook.) Greene. Fig. 916. Scapes several to many, erect, 5 to 17 in. high; herbage thinly hirsute or hirsutulose; leaves oblong-oblanceolate, entire to pinnatifid, narrowed below to a petiole, the whole 3 to 11 in. long; heads in fruit 7 to 9 lines high; involucre 6 to 7 lines high, their bracts in about 2 series but not very unequal, oblong to linear, obtuse or acute, villous-pubescent and often a little glandular; ligules much exserted, yellow, brownish on back; achenes strongly and

917. *Agoseris plebeia* Greene; a, habit  $\times \frac{1}{4}$ ; b, leaf  $\times \frac{1}{4}$ ; c, achene with pappus  $\times 1\frac{1}{2}$ ; d, e, bracts  $\times 1$ .

16 in. high; involucre 7 to 10 lines high, not over  $1\frac{1}{4}$  in. broad at maturity; achenes  $1\frac{1}{2}$  to  $2\frac{1}{2}$  lines long, tapering into a filiform beak 3 to 5 lines long; pappus 3 to  $4\frac{1}{2}$  lines long.—North Coast Ranges; n. to B. C. (*Stylopappus laciniatus* Nutt.)

8. *A. plebeia* Greene. Fig. 917. Stems robust, few or several from the root-crown, erect, 1 to 2 ft. high; leaves 3 to 14 in. long, narrowly to broadly lanceolate, entire to pinnatifid with slender curving lobes, the apex commonly slenderly acuminate and entire; heads in anthesis only 5 to 7 lines broad, the ligules short, deep yellow, scarcely or not at all surpassing the bracts of the involucre; involucre commonly woolly at base; body of achene 2 to  $2\frac{1}{2}$  lines long, the beak 5 to 6 lines long; pappus white.—Open fields, foothill slopes, and montane valleys, 10 to 3500 or 6200 ft.: Humboldt Co. to coastal S. Cal.; Sierra Nevada.

9. *A. gracilens* (Gray) Ktze. Scapes few or several from the root-crown, rather stout, 8 to 17 in. high; herbage glabrate or the involucre and upper end of the peduncles glandular-puberulent; leaves oblong-lanceolate, subentire to remotely toothed or pinnatifid, 5 to 6 in. long; involucre 9 to 12 lines high; inner bracts lanceolate, the outer oblong, acute, half or less as long; achenes linear-fusiform, ribbed,  $1\frac{1}{4}$  to 3 lines long, tapering into a slender beak 4 to 6 lines long; pappus white, 5 to 7 lines long.—Grassy flats or low ground along streams, 100 to 4100 ft.: Placer Co. to Plumas Co.; Humboldt Co. to Siskiyou Co.; n. to Wash. July-Aug. (*Troximon gracilens* Gray.) Var. *GREENEI* Jepson n. comb. Scapes more slender; herbage somewhat puberulent; involucre  $7\frac{1}{2}$  lines high, the bracts all lanceolate; achenes ribbed, 2 lines long, tapering into a beak 1 to  $1\frac{1}{2}$  lines long; pappus 3 to  $3\frac{1}{2}$  lines long.—Montane, 6000 to 7000 ft.: Nevada Co. to Siskiyou Co. (*Troximon gracilens* var. *greenei* Gray.)

10. *A. heterophylla* (Nutt.) Greene. Scapes few to many, usually arising from a short basal leafy stem, 3 to 12 in. high; herbage villous-pubescent, the involucre and upper part of the peduncle often glandular or viscid; leaves linear to spatulate or oblong, entire, denticulate or sinuate-pinnatifid, 2 to 6 (or 8) in. long; ligules little or not at all exerted; involucre  $4\frac{1}{2}$  to 7 lines high; bracts lanceolate-acuminate; achenes 1 to 2 lines long, straight-ribbed, or the inner merely nervose, slightly pubescent to glabrous; beak filiform, 2 to 4 lines long, commonly longer than the whitish pappus.—Hillslopes and valley flats, 500 to 4000 ft.: throughout cismontane Cal.; n. to B. C. Var. *KYAMPLEURA* Greene. Outer or sometimes all the achenes with the ribs corky and sinuate or undulate.—Alameda Co.; North Coast Ranges; Shasta Co.; Modoc Co. Var. *CRYPTOPLEURA* Greene. Outer achenes enlarged or conspicuously inflated, somewhat striate, not ribbed.—Grassy hills, Humboldt Co. Var. *CALIFORNICA* Jepson n. comb. Heads in anthesis  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. broad, the ligules conspicuous, much exceeding the involucre; outer achenes with straight ribs.—Grassy hills and flats, widely distributed. (*Cryptopleura californica* Nutt.) Var. *CRENULATA* Jepson n. comb. Like var. *californica* but the ribs of the outer achenes corky, conspicuously undulate.—Widely distributed. (*Troximon heterophyllum* var. *californicum* f. *crenulatum* Hall.) Var. *TURGIDA* Jepson n. comb. Like var. *californica* but the achenes, or at least the outer ones, much inflated, not ribbed or at most inconspicuously striate.—Coastal S. Cal.; San Luis Obispo Co. (*Troximon heterophyllum* var. *californicum* f. *turgidum* Hall.)

## 22. GLYPTOPLEURA Eat.

Low annuals, the short stems and leaves in a compact tuft on the crown of the taproot. Leaves scarious-margined, surrounding the short-peduncled heads. Involucral bracts 7 to 12, equal, linear-lanceolate, somewhat connate below, some loose foliaceous ones at base. Receptacle naked. Achenes narrowly oblong, often incurved, obtusely 5-angled, each interval with a row of conspicuous pits, the pits separated by low transverse ridges, apex of the achene truncate constricted, becoming a very short and stout cupulate 5-nerved beak. Pappus-bristles bright white, the outer falling separately, the inner remaining united in a ring at base. (Greek *glyptos*, carved, and *pleura*, side, from the sculptured achenes.)

1. *G. margináta* Eat. Plant much-branched and very leafy, forming a thick tuft 1 to 2 in. high and  $1\frac{1}{2}$  to  $2\frac{1}{2}$  in. broad; leaves obovate to spatulate, sinuately pinnatifid into rounded or oblong lobes with scarious toothed margin, 4 to 6 lines long, tapering into a broad petiole of often greater length; involucre 4 to 5 lines high, with thickish rounded base; inner bracts linear-attenuate, the outer with dilated green tip and white pectinate margins; ligules white, turning pink, scarcely exserted; achenes (including the short thick beak) 2 lines long; pappus 4 lines long.—Desert plains and washes, 2000 to 4000 ft.: central and eastern Mohave Desert; Inyo Co.; e. to Utah, n. to Ore. May. Var. *SETULOSA* Jepson n. comb. Leaves oblong, sinuately pinnatifid into rounded or oblong lobes with the scarious margin acicular-toothed; outer bracts commonly bearing teeth only at their dilated tips; ligules broad, conspicuously exserted, white or yellow, often changing to pink,  $4\frac{1}{2}$  to 8 lines long.—Mohave Desert. (*G. setulosa* Gray.)

### 23. CALYCÔSERIS Gray

Branched annuals, the leaves mostly basal. Herbage glabrous, but the peduncles and involucre sprinkled with short tack-shaped glands. Heads rather large, long-peduncled, the ligules much exserted. Involucre many-flowered, the inner bracts numerous, narrow, scarious-margined, equal, the outer much shorter, loose, calyculate. Receptacle bearing capillary bristles. Achenes 5-ribbed, narrowed above to a short beak, the beak terminated by a shallow denticulate crown. Pappus copious, white, the bristles united at base and falling away in a ring. (Greek kalux, cup, alluding to the shallow cup at summit of achene, and seris, a cichoriaceous plant.)

Flowers yellow; achenes smooth or very minutely muriculate under a lens. . . . 1. *C. parryi*.  
Flowers white, turning purplish; achenes rugulose on the ribs. . . . 2. *C. wrightii*.

1. *C. párryi* Gray. Stems 1 to several from base, branching, erect or ascending, leafy,  $\frac{1}{2}$  to 2 ft. high; tack-shaped glands dark-colored; leaves 1 to 5 in. long, pinnately divided into remote linear or filiform segments, the upper cauline ones smaller and bract-like; heads  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. broad; involucre campanulate, 6 to 9 lines high, the inner bracts linear, attenuate at apex; achenes acutely 5-ribbed, the body 2 lines long, tapering into a shorter slender beak capped with a small white cup; pappus 3 lines long.—Arid mesas or valleys, 2000 to 5000 ft.: Inyo Co.; central and eastern Mohave Desert; Colorado Desert, thence w. to coastal San Diego Co.; e. to Ariz. and southern Nev. Apr.-May.

2. *C. wrightii* Gray. Similar to *C. parryi*; tack-shaped glands pale; ligules rose-color or white with pink-brown spots on back; achenes with rugulose ribs.—Sandy mesas or washes, 500 to 1500 ft.: Inyo Co.; e. Mohave Desert; Colorado Desert; e. to Utah and N. Mex. Apr.

### 24. HIERACIUM L. HAWKWEED

Ours mostly rough-hairy erect perennial herbs. Leaves entire or nearly entire, never deeply lobed. Heads in a panicle or cymose cluster. Involucre cylindric or campanulate, its main bracts in 1 to 3 series, with shorter ones at base. Receptacle naked or sometimes more or less fimbrillate-toothed. Flowers yellow or white. Achenes linear, mostly 10-ribbed, not beaked. Pappus 1 or 2 rows of bristles, the bristles capillary, fragile, tawny, brownish or dull white. (Greek hierax, a hawk.)

Flowers white; stems  $\frac{3}{4}$  to 3 ft. high; leaves mostly basal. . . . 1. *H. albiflorum*.  
Flowers yellow.

Stems very leafy (at least below).

Herbage tomentose with dense stellate pubescence. . . . 2. *H. greenet*.

Herbage (at least below) covered with long brown (or whitish) shaggy hairs.

Leaves toothed; pappus sordid. . . . 3. *H. argutum*.

Leaves entire; pappus brownish. . . . 4. *H. horridum*.

Stems sparsely or not at all leafy.

Basal leaves glabrous; involucre hirsute with black hairs. . . . 5. *H. gracile*.

Basal leaves more or less hairy.

Leaves entire; involucre glandular. . . . 6. *H. cynoglossoides*.

Leaves more or less toothed; involucre not glandular. . . . 7. *H. bolanderi*.

1. *H. albiflorum* Hook. Fig. 918. Stems 1 to several from a thickish root-stock, slender, erect, nearly naked above,  $\frac{3}{4}$  to 3 ft. high, ending in a loose

panicle of white-flowered heads; leaves and lower portion of stem thickly beset with tawny or whitish bristly hairs; leaves mostly basal, oblong to oblanceolate, 2 to 6 (or 12) in. long, narrowed at base to a winged petiole, or the upper cauline sessile and often lanceolate or linear, much smaller; involucre often glandular and with black hairs, 3 to 4 lines high, their bracts linear-subulate, the outer very short; achenes reddish brown, 1 to  $1\frac{1}{2}$  lines long; pappus dull white or tawny, fragile. —Dry openly wooded slopes in the hills and mts., 300 to 8500 ft.: throughout cismontane Cal.; e. to Col., n. to B. C. July-Aug.

2. *H. grœnei* Gray. Stems 1 or few from a tuft of basal or sub-basal leaves, simple or paniculately somewhat branched,  $\frac{2}{3}$  to 2 ft. high; herbage clothed with a dense grayish or rusty stellate tomentum, the lower leaves shaggy with long yellowish or grayish hairs; leaves chiefly basal and sub-basal, oblong-oblanceolate, entire or somewhat obscurely or remotely toothed, 1 to  $3\frac{1}{2}$  in. long; upper cauline leaves linear-oblong, much smaller; heads narrow, 5 to 8-

flowered; flowers yellow; involucre of few linear obtuse bracts in several series,  $4\frac{1}{2}$  to 5 lines high; achenes linear, dark brown, 10-ribbed,  $2\frac{1}{4}$  lines long; pappus reddish-brown. —Montane, dry pine slopes, 4100 to 5500 ft.: Mt. Hull (n. Lake Co.) to Mt. Shasta; n. to southern Ore. July.

3. *H. argutum* Nutt. Stem simple, 1 to  $2\frac{1}{2}$  ft. high, terminating in a racemose panicle, the leaves in a basal tuft or nearly so; herbage bristly- or shaggy-pilose below, puberulent above, sometimes more or less glabrate, the involucre and peduncles glandular-puberulent; leaves oblanceolate to narrowly oblong, remotely and saliently toothed, 2 to 10 in. long, tapering to a narrow base or petiole, or the upper linear-lanceolate or linear and mostly entire, or the uppermost passing into bracts; involucre 4 to 5 lines high, with black stipitate glands, the inner bracts linear-attenuate, the outer shorter, passing into the bracts of the peduncle; flowers probably yellow; pappus sordid. —Santa Rosa and Santa Cruz Isls. Var. *PARISHII* Jepson n. comb. Stems leafy to middle, somewhat scattered. —Dry openly wooded cañon sides, about 2700 to 3000 ft.: San Gabriel and San Bernardino mountains. July. (*H. parishii* Gray.)

4. *H. horridum* Fries. Stems few to many from stout horizontal roots, paniculately branched above, 4 to 13 in. high; herbage densely shaggy with rather soft long brown (or whitish) hairs, and also more or less puberulent; leaves spatulate to oblong, tapering to a narrow base, entire, 1 to 4 in. long; heads rather small; involucre 2 to 4 lines high; bracts lanceolate with the medial portion densely glandular, in about 2 series, the outer ones shorter; flowers bright yellow; achenes terete, 10-ribbed,  $1\frac{1}{2}$  lines long; pappus brownish, persistent. —Montane, often in rocky places, 5200 to 11,000 ft.: San Jacinto, San Bernardino and San Gabriel mountains; Sierra Nevada from Tulare Co. to Lassen and Modoc Cos.; Mt. Shasta. (*H. breweri* Gray.)

5. *H. gracie* Hook. var. *detonsum* Gray. Fig. 919. Stems 1 to several from a tuft of basal leaves, slender, puberulent, more or less branched above, sparsely leafy, 4 to 14 in. high; leaves spatulate to oblong-oblanceolate, entire

918. *Hieracium albiflorum* Hook.; a, b, habit x  $\frac{1}{4}$ ; c, head x 1; d, achene and pappus x  $1\frac{1}{2}$ .

919. *Hieracium gracile* var. *detonsum* Gray; a, b, habit  $\times \frac{1}{2}$ ; c, fr. head  $\times 1$ ; d, achene and pappus  $\times 2$ .

or nearly so, essentially glabrous, 1 to 3 in. long, tapering to a slender petiole  $\frac{1}{4}$  to  $\frac{2}{3}$  as long; cauline leaves none or few and narrowly lanceolate to linear, 1 to  $2\frac{1}{4}$  in. long; heads few or slender bracteate peduncles  $\frac{1}{2}$  to 2 in. long; involucre 3 to 4 lines high; peduncles and involucre glandular-pubescent, the involucre and often the peduncles sparsely hirsute with black hairs; achenes dark or reddish brown, 1 line long, rather prominently 10-ribbed; pappus dull white.—Montane flats or ridges, 8200 to 10,000 ft.: Sierra Nevada from Tulare Co. to Eldorado Co.; n. to B. C., e. to Col. July.

6. *H. cynoglossoides* Arv. Stems 1 or few, simple, 1 to 2 ft. high, terminating in a broad cymose panicle; leaves chiefly basal and on lower part of stem, lanceolate to oblanceolate or oblong-oblanceolate, entire, tapering to a narrow base, hirsute with coarse shaggy brownish or yellowish hairs, 3 to 5 in. long; upper cauline leaves few, lanceolate, sessile,  $\frac{1}{2}$  to 2 in. long, passing into bracts above; peduncles densely stipitate-glandular, or sometimes obscurely so or only on upper part; involucre 5 to 6 lines high; inner bracts linear-attenuate, with scarious margin and densely glandular median portion; outer bracts shorter, passing into the bracts of the peduncle; flowers bright yellow, much exceeding the involucre; achenes dark brown, striate,  $2\frac{1}{2}$  lines long; pappus coarse, sordid.—Open woods of cañon sides, 3000 to 6000 ft.: Sierra Nevada from Tulare Co. to Modoc Co.; Yollo Bolly Mts.; e. Humboldt Co. to Siskiyou Co.; n. to B. C., e. to Rocky Mts. July-Aug. Var. *NUDICAULE* Gray. Leaves basal, the stems naked or reduced to few remote bracts.—Humboldt Co. to Siskiyou and Shasta Cos.

7. *H. boländeri* Gray. Stems 1 or few from base, loosely branched, glabrous or puberulent, 7 to 9 in. high, ending in a narrow few-flowered panicle; leaves basal, oblong, subentire or obscurely toothed, tapering below to a short winged petiole, more or less long-hirsute,  $1\frac{1}{2}$  to  $2\frac{3}{4}$  in. long; receptacle somewhat fimbriate-toothed; involucre narrow, 4 to  $4\frac{1}{2}$  lines high, glabrous or below minutely puberulent; main bracts 7 to 14, linear, mostly obtuse, in one series, the outer ones 2 or 3, calyculate; flowers yellow; achenes linear, dark brown, striate, 2 lines long; pappus dark-fuscous.—Mendocino Co. to Shasta Co.

## 25. CRËPIS L.

Annuals, biennials or perennials, similar to *Hieracium*. Herbage tomentulous, hairy or glabrous. Leaves chiefly though not wholly basal, entire, toothed or deeply lobed. Heads in panicles or cymes. Involucre a single row of equal bracts, or often with smaller ones at base. Receptacle naked. Flowers yellow. Achenes columnar or fusiform 10 to 20-ribbed. Pappus copious, white or yellowish, soft. (Greek krepis, a sandal, the ancient name of some plant.)

### A. Perennials; native species.

Low (1 to  $2\frac{1}{4}$  in.). forming dense tufts; herbage glabrous; leaves entire. . . . 1. *C. nana*. Much taller, not tufted; herbage somewhat tomentose or hairy; leaves more or less toothed or pinnatifid.

Achenes with a short thick beak; herbage glabrous to shortly glandular-hispid. . . . . 2. *C. andersonii*.

**Achenes not beaked.**

**Herbage tomentose or glabrate, or sometimes with short glandular hairs.**

One to 2 ft. high; stems greatly exceeding the basal leaves; leaves with a tail-like prolongation at apex (except in var. *pleurocarpa*); principal bracts of involucre usually 5 to 8, glabrous or sub-glabrous except in vars. .... 3. *C. acuminata*.

**Lower, the stems often not much exceeding the basal leaves; leaves seldom much prolonged, at apex; principal bracts of involucre usually 8 to 12, gray-pubescent** ..... 4. *C. occidentalis*.

**Herbage bristly with long hairs, also more or less tomentose.**

Bristly hairs not glandular ..... 5. *C. subacaulis*.

Bristly hairs glandular ..... 6. *C. monticola*.

*B. Annuals or biennials; introduced species.*

**Herbage glabrous to glandular-pubescent; achenes 1 line long, narrowed equally at each end** ..... 7. *C. capillaris*.

**Herbage glabrous to hispidulose; achenes attenuate upward into a beak, 3½ to 4 lines long** ..... 8. *C. vesicaria*.

1. *C. nana* Rich. Densely tufted, 1 to 2¾ in. high; stems many from the short branches of the root-crown, bearing a small cyme of 2 to 6 heads or a solitary head; herbage glabrous; leaves mostly basal, obovate-spatulate, thickish, entire or essentially so, 1 to 2 in. long, tapering to a margined petiole ½ to as long; heads narrowly cylindric, little surpassing the leaves; involucre 3½ to 5 lines high, the inner bracts linear, obtuse, scarious-margined, the outer ones oblong, very short; ligules yellowish, exserted; achenes linear, constricted below the disk at the apex, 10 to 13-nerved, 2 to 3 lines long; pappus 2 lines long, readily deciduous.—High montane slopes, 8000 to 10,600 ft., rare: Mt. San Antonio; Farewell Gap; Sonora Pass; e. to Nev. and Col., n. to Can. July.

2. *C. andersónii* Gray. Stems 1 to several from the very heavy root-crown, erect or ascending, 16 to 18 in. high, cymosely forked and bearing only 2 to 4 heads, the leaves basal or the cauline few and bract-like; herbage nearly glabrous to sparsely hispid with short often glandular hairs; leaves oblong-obovate, laciniately pinnatifid or dentate, drawn down to a winged base, 1¾ to 6 in. long; involucre 5 to 8 lines high, glandular-pubescent; bracts somewhat imbricated, the inner rather broadly lanceolate, the outermost oblong-to ovate-lanceolate, ½ to ¾ as long as the inner; achenes fusiform, unequally 8 to 10-ribbed, tapering to a short thick beak; pappus 3 to 4 lines long.—Alkaline or wet meadows, 4500 to 5500 ft.: e. Sierra Co.; w. Nev. to e. Ore. June-July.

3. *C. acuminata* Nutt. Stems slender, 1 to several from a cluster of basal leaves, cymosely branched above, 1 to 2 ft. high; herbage cinereous-puberulent, the inflorescence glabrous or nearly so; basal and lower cauline leaves lanceolate to ovate-lanceolate, pinnatifid with narrow spreading or retrorse, often somewhat toothed lobes, attenuate below into a petiole and above into a tail-like prolongation, the whole 4 to 12 in. long; upper cauline leaves linear, entire, sessile; involucre narrow, 4 to 5 lines high, glabrous, the inner bracts linear, usually with a thickened median callus below, the outer ones small; ligules light yellow, well exserted; achenes linear-fusiform or tapering upward, 10-nerved, 3 lines long; pappus persistent, yellowish-white, the bristles somewhat united in a ring at base, 3 lines long.—Dry ground, 4200 to 9600 ft.: San Bernardino and San Gabriel mountains; Frazier Mt.; Sierra Nevada from Kern Co. to Lassen Co.; Yollo Bolly Mts.; e. to Col., n. to Ore. and Mont. June-July. Var. *INTERMEDIA* Jepson n. comb. Herbage, including the involucre, tomentose or tomentulose; involucre 5 to 7½ lines high; achenes attenuate upward, 3 to 4 lines long, equaling or longer than the pappus.—Montane, 1500 to 10,300 ft.: n. Lake Co. to Humboldt Co.; Sierra Nevada; desert ranges in Inyo Co.; e. to Col. (*C. intermedia* Gray.) Var. *PLEUROCÁRPA* Jepson n. comb. Leaves commonly not prolonged at apex; achenes less obviously narrowed upward, shorter than the pappus, saliently 10-ribbed.—Montane, 1500 to 7500 ft.: n. Lake Co. to Siskiyou Co., thence e. to Modoc and Lassen Cos. (*C. intermedia* var. *pleurocarpa* Gray.)

4. *C. occidentalis* Nutt. GRAY HAWKSEAR. Stems stout, one or several from the very scaly summit of the root-crown, branching above, 4 to 12 in. high; herbage pubescent, thinly tomentulose or glabrate, and often with

short gland-tipped hairs, especially on the peduncles; leaves oblong or ovate to lanceolate, runcinately toothed or deeply pinnatifid into linear or lanceolate lobes, entire at the acuminate apex, 3 to 7 in. long, on petioles about  $\frac{1}{2}$  as long; involucre 6 to 8 lines high, the inner bracts linear-attenuate, the outer ovate to lanceolate, small; achenes brown, oblong, narrowed towards the apex, 10 to 18-costate, 3 to  $3\frac{1}{2}$  (or 4) lines long; pappus 4 to 5 lines long.—Stony or sandy mountain ridges, 4000 to 8800 ft.: San Bernardino Mts.; mts. of n. Ventura Co.; Tehachapi Mts.; desert ranges of Inyo Co.; Sierra Nevada from Tulare Co. to Nevada and Modoc Cos.; Mt. Hamilton; Siskiyou Co.; n. to eastern Ore. and Wash., e. to western Nev.

5. *C. subacaulis* Cov. Stems leafy, 1 to several from the base, 3 to 10 in. high, bearing several stout-pedunculate heads; herbage more or less tomentose, hirsute with long glandless spreading hairs, those of the involucre few, black; leaves oblong to ovate in outline, 2 to 5 in. long, pinnately parted into oblong lobes, the lobes again pinnately parted, toothed or cleft; involucre 6 to 8 lines high, the inner bracts linear-attenuate, the few short outer ones lanceolate; achenes dark or black, linear, attenuate upward, about 10-nerved,  $4\frac{1}{2}$  lines long.—Montane valleys, 3500 to 6000 ft., Sierra Co. to Siskiyou Co.

6. *C. monticola* Cov. Stems 1 to several from the base, leafy, cymosely branched above, 5 to 14 in. high; herbage darkish, glandular-hirsute, sometimes scantily tomentose as well; basal leaves oblong to ovate-lanceolate, dentate to pinnatifid with toothed lobes, 2 to 6 in. long, the petioles margined, 1 to 2 in. long; cauline leaves similar, sessile,  $1\frac{1}{2}$  to  $3\frac{1}{2}$  in. long; involucre 8 to 10 (or 11) lines high, the bracts lanceolate, with or without shorter ones at base; achenes oblong, slightly narrowed near apex, with 10 prominent ribs and often smaller intermediate ones, 3 lines long; pappus  $3\frac{1}{2}$  to 4 lines long, tardily deciduous, leaving a white crown.—Montane at middle altitudes (4000 to 6000 ft.): Lake Co. to Siskiyou Co., thence e. to Lassen Co.; n. to Ore. May-June.

7. *C. capillaris* (L.) Wallr. SMOOTH HAWKSBEARD. Annual or biennial; stems 1 to several from base, slender, simple below, paniculate above, 1 to  $2\frac{1}{2}$  ft. high; herbage green and glabrous to glandular-pubescent; leaves mostly basal, broadly oblanceolate, thinnish, toothed (the teeth inclined to be salient), or pinnatifid or pinnately parted, 2 to 4 in. long, narrowed into a winged petiole; upper cauline lanceolate, with broad sessile base, 1 to 2 in. long; heads many, small; involucre 2 to  $3\frac{1}{2}$  lines high, the bracts linear, acuminate; achenes linear-oblong or narrowed equally at each end, 10-ribbed, 1 line long; pappus  $1\frac{1}{2}$  to 2 lines long. — Introduced European weed, spontaneous in fields and pastures: Eureka; Berkeley; Hetch-Hetchy. (*C. virens* L.)

8. *C. vesicaria* L. var. *taraxacifolia* Thuill. ROUGH HAWKSBEARD. Biennial; stems 1 or few from the root-crown, paniculately branched above,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  ft. high; herbage subglabrous, but provided with short scattered bristles, these gland-tipped on the peduncles and involucre; basal and lower leaves oblong or spatulate in outline, pinnately parted, runcinate-pinnatifid or sometimes merely dentate,  $1\frac{1}{2}$  to 4 in. long, on petioles about  $\frac{1}{2}$  as long; upper cauline leaves small and scattered, sessile by a sagittate-dentate base; involucre 4 to 6 lines high; achenes oblong, 10 to 13-ribbed, the body 2 to  $2\frac{1}{2}$  lines long, narrowed above to a rather slender beak  $1\frac{1}{2}$  lines long, the narrowed portion not filled by the seed; pappus  $2\frac{1}{2}$  lines long.—Introduced from Eur.: spontaneous on the Mendocino coast and near Los Angeles. June-Aug. (*C. biennis* auct. Cal.)

## 26. *LYGODESMIA* Don

Much-branched herbs with slender tough branches. Leaves narrow or those of the branchlets scale-like. Heads terminal on the branchlets, 3 to 12-flowered. Receptacle naked. Flowers pink or rose-color. Achenes slender, terete but tapering slightly to base, angled or obscurely striate, truncate at each end, glabrous. Pappus persistent, of numerous bristles, the bristles capillary, unequal, white or whitish, not plumose. (Greek *lygos*, a pliant twig, and *desme*, bundle, the original species with fasciculate stems.)

Very spinescent perennial; pappus yellowish white. . . . . 1. *L. spinosa*.  
 Annual; not spinescent; pappus bright white. . . . . 2. *L. exigua*.

1. *L. spinosa* Nutt. Stems few or several from the root-crown, many times parted into slender rigid branches with spinose-tipped branchlets, forming an almost leafless and very thorny plant  $\frac{1}{2}$  to 2 ft. high; root-crown indurated, matted with large tufts of wool; herbage bright green, puberulent to glabrate; lower leaves linear, entire, 3 lines to 2 in. long, the upper reduced to scales; heads about 3-flowered, mostly erect, subsessile or on very short branchlets; involucre 4½ lines high, their bracts loose, the inner lanceolate, the outer broad, calyculate; ligules well exerted, rose-pink; achenes slightly tapering from apex to base, somewhat 5-angled, 2 lines long; pappus 3 lines long.—Gravelly slopes or alkaline plains, 4000 to 6000 ft.: e. of Sierra Nevada from Modoc Co. to Inyo Co.; Blue Ridge, San Gabriel Mts. (F. W. Peirson); e. to Nev. and Utah.

2. *L. exigua* Gray. Diffusely much-branched annual 4 to 12 in. high; herbage glabrous or puberulent; leaves mostly basal, spatulate, entire or runcinately toothed or pinnatifid,  $\frac{3}{4}$  to 1¼ in. long, the upper few and smaller, those of the branchlets reduced to scales; heads small, about 3 or 4-flowered, terminating slender branchlets about  $\frac{1}{2}$  to 1 in. long; involucre 2 to 2½ lines high, the inner bracts lanceolate, the outer few, minute, calyculate; achenes clay-white, 5-angled, minutely roughened, 1¼ to 2 lines long, the sides with a median groove; pappus 1¼ lines long.—Desert cañons or valleys, 200 to 4000 ft.: Colorado Desert; n. to Inyo Co.; e. to Utah and N. Mex. May.

#### TRIBE 2. *Mutisieae*. MUTISIA TRIBE

Herbs or shrubs. Leaves alternate. Heads with the flowers all alike. Corolla in ours 2-lipped with 2 lobes in upper lip and 3 in lower, the lower lip in marginal flowers often elongated. Anthers with long tails at base. Style-branches of perfect flowers not appendaged, in ours comparatively long.

#### 27. *TRIXIS* P. Br.

Ours a low desert shrub. Leaves alternate, entire or merely denticulate. Heads (in ours) terminal on the leafy corymbose branchlets. Flowers yellow, all perfect and fertile. Corolla 2-lipped; upper lip deeply 2-lobed; lower lip ligulate, 3-toothed at apex, larger in marginal flowers. Involucre subtended by several leafy bracts, its proper bracts chartaceous or coriaceous, 8 to 12 in one rank (in ours). Achenes slender, sometimes tapering to or somewhat beaked at the summit. Pappus soft. (Greek trixos, three-fold, referring to the 3-cleft corolla lip.)

1. *T. californica* Kell. Stems many from the base, erect, 1¼ to 2 or 4 ft. high, leafy up to the heads; herbage glabrous or scaberulous; leaves ovate-lanceolate, sessile, 1½ to 2 in. long; involucre bracts dull straw-color, linear, acute, 5 to 6 lines long; achenes densely squamellate.—Desert washes: w. and n. borders of the Colorado Desert; e. to Ariz., s. to L. Cal. (*T. suffruticosa* Wats.)

#### 28. *PEREZIA* Lag.

Branching perennial herbs. Leaves alternate, coriaceous, reticulated. Heads (in ours) cymosely paniculate. Involucre narrowly campanulate, its

920. *Perezia microcephala* Gray; a, lower leaf x  $\frac{1}{4}$ ; b, infl. x  $\frac{1}{2}$ ; c, fl. x 3.

bracts narrow, imbricated. Corolla 2-lipped, whitish or purplish. Achenes 5-angled, the angles nerved. Pappus (in ours) of many capillary scabrous bristles. (Lorenzo Perez, Spanish medical botanist, 16th century.)

1. *P. microcéphala* (DC.) Gray. SACAPELLOTE. Fig. 920. Stem stout, leafy,  $2\frac{1}{2}$  to  $3\frac{1}{2}$  ft. high; herbage glandular-puberulent; leaves oblong-ovate, denticulate, cordate-clasping, 2 to  $7\frac{1}{2}$  in. long; panicle 5 to 11 in. broad; heads 4 to  $5\frac{1}{2}$  lines high; bracts of the involucre linear, acute, mucronate; corolla rose-color to white, the lower (or outer) lip broad, 3-toothed, the upper lip deeply parted into 2 linear lobes; pappus white, soft.—Chaparral belt, rather common: San Luis Obispo Co. to w. San Diego Co.; Santa Rosa Isl.

### TRIBE 3. Eupatorieae. EUPATORY TRIBE

Ours herbs or suffrutescent plants with white or flesh-colored perfect disk-flowers and no rays. Receptacle naked. Anthers not caudate at base. Style-branches stigmatic only below the middle.

#### 29. TRICHOCORONIS Gray

Slender herb, the stems branching, weak or at base creeping. Leaves opposite, sessile. Flowers flesh-color, in slender peduncled heads terminating the branches. Receptacle convex, naked. Bracts of the involucre 12 to 18, herbaceous or somewhat membranous, equal, nerveless. Corolla abruptly much dilated above the narrow tube. Pappus of many small or minute paleae and awns, forming a sort of crown. (Greek trichos, hair, and koronis, top.)

1. *T. wrightii* Gray. Annual; stems assurgent, 6 to 9 in. high, rooting at the lower nodes; leaves oblong or linear-lanceolate, remotely serrate or entire, auricled at base, 4 to 13 lines long; heads 2 to  $2\frac{1}{2}$  lines broad; achenes 5-angled, the angles hispidulous toward the summit; pappus of 4 barbellate bristles with an equal number of intervening but very small fimbriate paleae.—Muddy shores or moist bottoms: Sutter Co.; lower San Joaquin River; Beaumont; San Jacinto Lake; thence e. to southern Tex., s. to Mex. Sept. (*T. riparia* Greene. *Biolettia riparia* Greene.)

921. *Malperia tenuis* Wats.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, outer bract  $\times 4$ ; c, inner bract  $\times 4$ ; d, fl.  $\times 4$ ; e, pappus-bristle  $\times 8$ .

#### 30. MALPÈRIA Wats.

Annual plants with the aspect of Rigiopappus. Leaves alternate, narrow, sessile. Heads loosely cymose. Involucre turbinate, its bracts very unequal, thin, scarious-margined, 2 or 3-nerved. Receptacle flat, naked. Style-branches thickened, included, exserted in age. Achenes slender, 5-angled. Pappus-paleae 3 or 4, minute, truncate and erose, with 3 intervening barbellulate bristles as long as the corolla and dilated at base. (Etymology obscure.)

1. *M. tenuis* Wats. Fig. 921. Stems erect, branching, 8 to 12 in. high, glabrous; leaves narrowly linear, entire, obscurely puberulent, 1 to 2 in. long; heads 4 to 5 lines high, its bracts narrowly lanceolate, pubescent on the back; flowers brownish.—Sw. Colorado Desert: Split Mt.; Signal Mt.; s. to L. Cal.

#### 31. BRICKÉLLIA Ell.

Perennial herbs or low shrubs. Leaves alternate, sometimes opposite, resinous-dotted. Flowers white or whitish, in narrow heads. Heads in termi-

nal clusters or paniculate or solitary. Involucre imbricated, its bracts usually striately nerved. Receptacle naked. Corolla slender, 5-toothed. Achene with 10 nerves or ribs. Pappus of numerous scabrous or barbellate capillary bristles mostly in a single series. (Dr. John Brickell, early Georgia botanist.) *COLEOSANTHUS*.

*A. Heads solitary or terminating the more or less corymbosely arranged branchlets.*

Stems leafy up to the heads.....1. *B. greenei*.  
Stems not leafy up to the heads (except outer bracts of the involucre leaf-like in var. of no. 3).

Herbage whitened with a dense rather close tomentum; involucre bracts in 5 or 6 series, well imbricated.....2. *B. incana*.

Herbage green; involucre bracts in 3 or 4 series, not so closely imbricated.

Outer bracts of involucre foliaceous; leaves ovate, mostly saliently toothed.....3. *B. atractylodes*.

Outer bracts of involucre not foliaceous; leaves mostly narrower, entire or nearly so.

Branches divaricate; pappus  $2\frac{1}{2}$  to  $3\frac{1}{2}$  lines long, usually surpassing the involucre bracts; leaves of the branchlets not over 4 lines long...4. *B. frutescens*.

Branches ascending; pappus 4 lines long, usually equaled or surpassed by the involucre bracts; leaves of the branchlets 6 to 11 lines long...5. *B. oblongifolia*.

*B. Heads clustered, usually somewhat racemose-paniculate, or if terminating the branchlets these not corymbosely arranged.*

Leaves lanceolate, entire, trough-shaped; heads in racemously arranged clusters; involucre 2 to  $2\frac{1}{2}$  lines high.....6. *B. multiflora*.

Leaves ovate to ovate-lanceolate, toothed, plane or nearly so.

Leaves of the branchlets with blades mostly 3 to 5 lines long.

Outer involucre bracts herbaceous-tipped.

Leaves and young stems tomentose.....7. *B. nevadensis*.

Leaves and stems glandular-villous and viscid.....8. *B. microphylla*.

Outer involucre bracts not herbaceous-tipped.

Leaves and young stems viscid and puberulent.....9. *B. watsonii*.

Leaves and young stems white-puberulent, not viscid...10. *B. desertorum*.

Leaves of the branchlets with blades mostly 4 to 12 (or 24) lines long.

Heads in clusters racemously arranged along the main stem or branches.....11. *B. californica*.

Heads not in racemously arranged clusters.

Outer involucre bracts abruptly tipped with a long spreading tail.....12. *B. grandiflora*.

Outer involucre bracts not long-tailed.....13. *B. knappiana*.

1. *B. greenei* Gray. Stems many from a woody base, erect or ascending, simple or somewhat branched above, very leafy, 9 to 16 in. high; herbage very viscid and glandular-pilose up to the heads; leaves alternate, ovate, mostly serrate, sometimes entire, 7 to 11 lines long, the petioles about  $\frac{1}{2}$  line long; heads terminal and solitary or terminating the corymbosely arranged branchlets, closely subtended and the lower portion enveloped by a tuft of leaves; involucre 6 to 7 lines high, their bracts linear, acuminate, 2 or 4-nerved, nearly or quite equaling the pappus.—Montane, 6000 to 8000 ft.: Placer Co. to Lassen Peak; Yollo Bolly Mts.; Scott Mts.; Mt. Shasta; n. to Ore. June-Aug.

2. *B. incana* Gray. Stems suffrutescent below, branching, forming a globose bush 2 to 4 ft. high; herbage white with close tomentum, the tomentum deciduous from the stems and revealing the chalky-white bark beneath; leaves alternate, broadly ovate, entire or serrulate, 5 to 12 lines long, sessile or on petioles  $\frac{1}{2}$  line long; heads solitary, terminating the branchlets, large for the genus (9 to 12 lines high in fruit); involucre turbinate-campanulate, 7 to 9 lines high, their bracts well imbricated in 5 or 6 series; pappus at maturity much exceeding the bracts; achenes ashy-pubescent, the base with a conspicuous callus.—Sandy washes and mesas in the deserts, 1500 to 3000 ft.: n. Colorado Desert; Mohave Desert; e. to southern Nev. May-June.

3. *B. atractylodes* Gray var. *arguta* Jepson n. comb. Low much-branched shrub (8 to 14 in. high); herbage with scattered gland-tipped hairs, the old stems dark, the young stems whitish, the leaves vivid green; leaves alternate, ovate, saliently toothed or serrate to entire, the acute or commonly acuminate apex mostly entire, prominently veined, 6 to 11 lines long, the petioles very short ( $\frac{1}{2}$  line long); heads solitary at the ends of the branchlets on slender peduncles  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; involucre 5 to 6 lines high, the outer

bracts lanceolate or ovate, rarely foliaceous, the inner linear-attenuate; pappus sordid, at maturity surpassing the involucre bracts.—Desert valleys and mesas, 2000 to 4000 ft.: Inyo Co.; Mohave Desert; Colorado Desert; s. to L. Cal. Apr.-June. (*B. arguta* Rob.) It passes in e. Inyo Co. into *B. atractyloides* of s. Nev. which is granular-puberulent, not glandular, and with broader involucre bracts. Var. *ODONTÓLEPIS* Jepson n. comb. Involucre subtended by foliaceous dentate bracts.—W. Colorado Desert. (*B. arguta* var. *odontolepis* Rob.)

4. *B. frutescens* Gray. Rigid shrub 8 to 14 in. high, the branches divaricate and often spinose; herbage glandular-pubescent; leaves alternate, linear-spatulate, obtuse, entire, 2 to 5 lines long; heads terminal on the corymbose branchlets, 26 to 35-flowered; involucre campanulate, 4 to 5 lines high; bracts distinctly 2 to 4-nerved, acute or obtuse, the short and oblong outer ones somewhat greenish-tipped; achenes hispidulous-scabrous; pappus-bristles minutely serrulate.—W. borders of the Colorado Desert; s. to L. Cal. Apr.-May.

5. *B. oblongifolia* Nutt. var. *linifolia* Rob. Stems numerous from a woody base, ascending or erect, leafy, forming round-topped clumps 7 to 12 in. high; herbage cinereous-pubescent and also glandular, at least above; leaves broadly oblong or oblong-ovate to linear, acute, entire or with 1 or 2 short teeth, 7 to 10 (16) lines long, sessile or with petioles 1 line long; heads 6 to 8 lines high, 30 to 50-flowered, terminal on partly naked peduncles; involucre campanulate,  $5\frac{1}{2}$  to  $6\frac{1}{2}$  lines high; bracts 2 to 4-nerved, linear, acute to attenuate, the inner with very slender tips; achenes hispidulous on the ribs.—Desert areas, 4000 to 6000 ft.: Colorado and Mohave deserts; Inyo Co.; e. to Utah and Ariz. (*B. mohavensis* Gray.)

6. *B. multiflora* Kell. Erect shrub 3 to 8 ft. high, the stem and branches white; herbage glabrous, sometimes slightly scabrid; leaves alternate, ovate-lanceolate to lanceolate, entire or denticulate, 3-nerved, commonly sickle-shaped, markedly trough-shaped (that is, the sides a little conduplicate), very gummy, 1 to 3 in. long, the petioles  $\frac{1}{2}$  to 2 lines long; leaves of the crowded panicle lanceolate to linear, small, with obscure lateral nerves; heads racemose-paniculate or the panicle compound and as much as  $\frac{1}{2}$  to  $1\frac{1}{4}$  ft. long; bracts of the involucre 13 to 31; receptacle glabrous; achenes sparsely hairy,  $\frac{3}{4}$  line long.—Sandy washes, east side Sierra Nevada, 4000 to 6000 ft.: Hanaupah Cañon, Panamint Range; Silver Cañon, Inyo Range; e. to Soda Sprs. Cañon, Esmeralda Co., Nev., n. to Kings Cañon, Ormsby Co., Nev.

922. *Brickellia nevinsii* Gray; a, infl.  $\times \frac{1}{2}$ ; b, fl.  $\times 2$ .

7. *B. nevinsii* Gray. Fig. 922. Dense shrub, the stems several from the base, 1 to  $1\frac{1}{2}$  ft. high, slender, crowded with short branches above, the heads solitary or in 2 or 3-flowered glomerules on the ends of the branches and thus paniculate; herbage white-tomentose, the tomentum soon becoming loose, especially on the stems; leaves alternate, ovate, subcordate and closely sessile or on very short ( $\frac{1}{2}$  line) petioles or rarely cuneate at base, acutish, few-toothed or entire, 3 to 8 lines long; heads oblong-cylindric, 21 to 25-flowered; involucre narrowly turbinate, white-tomentose (or in age glabrate and green),  $4\frac{1}{2}$  to  $5\frac{1}{2}$  lines high, their bracts linear, acute, the outer regularly shorter, the outermost

commonly with spreading tips, the inner with erect acuminate tips; achenes minutely pubescent.—Foothills: Santa Monica Mts.; San Gabriel Mts.

8. *B. microphylla* Gray. Stems erect from a somewhat woody base, 1 to 2 ft. high, paniculately much branched, the short leafy branchlets terminated by 1 to 3 heads; herbage glandular, short-villous or -puberulent, rarely a little tomentulose; leaves roundish ovate to oblong, subcordate or truncatish at base, obtuse or apiculate, vivid green, when old somewhat scabrous, denticulate or subentire, 4 to 9 lines long, sessile or on petioles to 2 lines long, those of flowering branchlets 1 to 2 lines long; heads 5 to 5½ lines long, about 22-flowered; bracts of the involucre about 21 to 45, herbaceous at the apex; flowers yellowish or a little purplish; achenes grayish brown, 2 lines long, hispidulous on the ribs; pappus-bristles obscurely barbellate.—Sandy cañons, 5000 to 6000 ft.: San Gabriel Mts.; e. side Sierra Nevada from Inyo and Mono Cos., Cal., to Storey Co., Nev.; e. to Col., n. to Ore. and Ida. Sept.-Oct.

9. *B. watsonii* Rob. Habit and foliage as in no. 8; stems and peduncles tomentulose-puberulent, the leaves puberulent and a little glandular; leaves ovate, sparingly dentate or denticulate, 4 to 8 lines long, the petioles about 1 line long; leaves of the flowering branchlets 1 to 3 lines long, subsessile; heads 1 to 3 on the ends of the branchlets, 3 to 4 lines high, 13 to 18-flowered; bracts of the involucre linear, acute, the shorter outer ones with recurved green tips; achenes 1½ lines long.—Providence Mts., e. Mohave Desert; e. to Nev. and Utah. Aug.

10. *B. desertorum* Cov. Shrubby, branching, 3 ft. high, the branches slender; herbage white-tomentulose, the branches becoming glabrate and white-barked; leaves opposite or alternate, ovate, crenate-serrate, obtuse, 2 to 4 lines long, white-tomentulose; petioles about ½ line long; heads in glomerules terminating the short lateral branchlets, 8 to 12-flowered; involucre 3 to 4 lines high, the bracts linear, acute, striate, not herbaceous-tipped; flowers white; achenes finely setulose on the ribs.—Desert cañons, rare: Inyo Co.; Colorado Desert; e. to Ariz. and Nev. Oct.-Nov.

11. *B. californica* T. & G. Stems many from the shrubby base, virgate or paniculately branching, 2 to 3 ft. high; herbage roughish puberulent; leaves roundish or triangular-ovate, 3-ribbed and roughish, somewhat irregularly serrate, ½ to 2¼ in. long; glomerules of heads spicate or racemose along the more or less leafy stems; heads 5 to 6 lines high, 10 to 15-flowered, often more or less nodding; bracts of the involucre, especially the inner, with thin obtuse straight tips; achenes 1¼ lines long, the pappus-bristles white or more or less sordid, slightly scabrid.—Gravelly stream beds, 200 to 2700 ft.: Coast Ranges from Siskiyou Co. to San Luis Obispo Co.; Sierra Nevada foothills from Shasta Co. to Amador Co.; coastal S. Cal.; e. to Col. and New Mex., s. to Mex. The plants fill arid valleys at night with their perfume. Var. *JEPSONII* Rob. Leaves and pubescence as in the species; heads on pedicels ½ to 2 in. long; outer involucral bracts acutish, the inner acute.—Solano Co. to Lake Co. July-Sept.

12. *B. grandiflora* Nutt. Stems herbaceous, erect, several from a fusiform root, usually simple up to the inflorescence, 1 to 2¼ ft. high; herbage finely puberulent or somewhat cinereous; leaves usually opposite or sometimes alternate, deltoid-ovate or lanceolate, truncatish or cordate at base, 1¼ to 2¾ in. long, dentate, the acuminate apex entire; cyme one and compact, terminating the stem, or several and terminal on the branchlets and thus more or less paniculate; heads more or less drooping, 20 to 38-flowered; involucre 6 to 7 lines high, the bracts about 30 to 37, green, 5 to 7-nerved, loosely imbricated, the inner linear, acute, the outer oblong to ovate, caudate or subulate-attenuate at apex, the subulate part of the bracts loose, commonly longer than the body; flowers greenish or yellowish white, the golden yellow style-branches conspicuously exserted; achenes 2 lines long, brown, slightly hirtellous; pappus-bristles white, barbellate, caducous.—Montane, 4000 to 6500 ft.: Sierra Nevada from Mariposa Co. to Shasta Co.; Siskiyou Co.; n. to Wash., e. to Ariz. and Col. Var. *PETIOLARIS* Gray. Slender, the axils often with leafy shoots; leaves subcordate at base, caudate-acuminate, mi-

nutely scabrid-puberulent, the petiole about as long as the blade.—Sonora Pass; e. to Col. and N. Mex., s. to Ariz. and Mex.

13. **B. knappiana** Drew. Slender willow-like shrub 2 to 8 ft. high, the branches white-barked or the bark in age shreddy; stems evidently, the leaves very slightly scaberulose and somewhat glutinous; leaves alternate, ovate to lanceolate, acute, serrate or sometimes saliently toothed, 1 to  $1\frac{1}{4}$  in. long, the petioles 2 lines long; heads in glomerules terminating lateral branchlets of the leafy panicle, 5-flowered; involucre turbinate, 2 to 3 lines high; bracts linear to oblong, obtuse, regularly imbricated, the outer successively shorter, 4-nerved; achenes rather densely but minutely appressed-setulose, indistinctly nerved.—Rare, Panamint Mts., Inyo Co., 3000 ft. Aug.-Sept.

### 32. HOFMEISTERIA Walp.

Bushy plants. Lower leaves opposite, the upper alternate. Heads medium-sized, long-peduncled or nearly sessile, many-flowered. Flowers whitish.

Involucre campanulate, its bracts narrow, striate, imbricated. Receptacle naked. Achenes 5-angled by the strong nerves, callous-thickened at base. Pappus of 2 to 19 scabrous bristles, some of them paleaceous at base. (W. Hofmeister, the great plant embryologist.)

923. *Hofmeisteria pluriseta* Gray; a, fl. branchlet  $\times \frac{1}{2}$ ; b, involucral bract  $\times 2\frac{1}{2}$ ; c, fl.  $\times 2\frac{1}{2}$ .

1. **H. pluriseta** Gray. Fig. 923. Intricately branched bush, 1 to  $2\frac{3}{4}$  ft. high; herbage glandular-puberulent; leaves deltoid, acuminate, entire or with a few acute or subulate teeth, 2 to 4 lines long, on petioles  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long; involucre 4 lines high, about 23 to 26-flowered; bracts conspicuously 3-striate, with acuminate often recurved tip; pappus-bristles 10 to 19, unequal, the longer about equaling the corolla, some of them scarious-margined at base, or the scarious margins becoming free.—Rocky beds and walls of cañons in the deserts: Inyo Co. to the Mohave and Colorado deserts; e. to Ariz.

### 33. EUPATORIUM L. THOROUGHWORT

Ours erect perennial herbs with the leaves mostly opposite. Heads discoid, in terminal corymbs. Flowers purplish or white, perfect. Receptacle naked. Styles with long thickened or clavate branches, much exserted. Achenes angular or striated. Pappus consisting of a single row of capillary bristles. (Eupator Mithridates, King of Pontus; Pliny says the king used a species as a poison antidote.)

1. **E. occidentale** Hook. Stems several from the base, strict, simple or with few ascending branches, 1 to  $1\frac{1}{2}$  ft. high; herbage minutely puberulent, glabrate; leaves ovate, truncate or subcordate at base, or sometimes roundish, coarsely serrate to subentire, 1 to  $1\frac{1}{2}$  in. long, the petioles 1 to 7 lines long; cymes small, compact, somewhat paniculate; heads 4 to 5 lines high, 8 to 16-flowered; involucre very slightly longer than the mature achenes, the bracts 9 to 15 in 2 series, nearly equal, lanceolate, rather firm, nearly nerveless; corolla pinkish, sometimes whitish.—Montane: Sierra Nevada, 4000 to 9500 ft., from Tulare Co. to Nevada Co.; Mt. Shasta; Humboldt Co., 2000 to 4000 ft.; n. to Wash., e. to Nev. Var. **ARIZONICUM** Gray. Stems taller (2 to  $2\frac{3}{4}$  ft. high), more branching, the panicle much larger; leaves  $1\frac{1}{2}$  to  $2\frac{1}{2}$  in. long.—Humboldt Co.; Mariposa Co.; se. to Ariz.

TRIBE 4. *Astèreae*. ASTER TRIBE

Annual or perennial herbs or shrubs with bland watery juice. Herbage scentless, the foliage sometimes gummy or resinous. Leaves alternate. Receptacle naked. Bracts of the involucre commonly well imbricated. Disk-flowers yellow (except in some *Lessingias*, *Pentachaetas* and *Conyzas*), perfect in all ours except *Baccharis*. Rays present or absent. Anthers not caudate at base. Pappus of awns or bristles (paleaceous in *Gutierrezia* and *Amphiachyris*, none in *Bellis*).

34. *GUTIERREZIA* Lag.

Herbs or suffrutescent plants. Herbage resin-bearing, nearly glabrous. Leaves alternate, narrowly linear, entire. Heads very small, turbinate-campanulate to linear, numerous, in terminal cymes. Bracts of the involucre coriaceous, the outer shorter. Receptacle in ours flat. Flowers yellow; rays short, 1 to 11. Achenes angled or striate, mostly silky. Pappus paleaceous, its scales unequal in ours. (Name of a noble Spanish family.)

Flowers of disk and ray more than 1 or 2 each.

Ray-flowers 8 to 11; involucre turbinate.....1. *G. californica*.

Ray-flowers 3 to 7; involucre clavate-oblong.....2. *G. sarothrae*.

Flowers of disk and ray 1 or 2 each; involucre linear.....3. *G. lucida*.

1. *G. californica* T. & G. Stems several from a much-branched woody base, loosely branched above,  $\frac{3}{4}$  to  $1\frac{1}{2}$  ft. high; herbage scabrous; heads corymbose; involucre turbinate, 2 to  $2\frac{1}{2}$  lines high, their bracts with roughish green tips; rays 8 to 11; disk-flowers 6 to 14; achenes densely silky; pappus of about 12 paleae.—Dry hills and plains: South Coast Ranges; upper San Joaquin Valley; coastal S. Cal.; e. to Ariz. Var. *BRACTEATA* Hall. Branchlets strongly divaricate or even geniculate, with numerous bract-like leaves, or these deciduous; heads few and large, solitary.—Between Banning and Seven Palms. (*G. bracteata* Abrams.)

2. *G. sarothrae* Britt. & Rusby. MATCHWEED. Bushy plant with numerous erect stems from a woody base, 1 to 2 ft. high; inflorescence cymose-paniculate, the heads solitary on short peduncles or 3 to 5 in terminal glomerules; involucre clavate-oblong,  $1\frac{1}{2}$  to 2 lines high, the bracts with minute green tips; disk- and ray-flowers each 3 to 7; pappus of 9 to 12 scales; achenes silky-pubescent.—Coastal S. Cal.; w. Mohave Desert; e. to Tex., thence n. to Man.

3. *G. lucida* Greene. Straggling bush 1 to  $1\frac{1}{2}$  ft. high; herbage clear yellowish-green, very resinous; foliage sparse and lax; inflorescence cymose-paniculate, the numerous heads glomerate at the ends of the slender twigs; involucre linear,  $1\frac{1}{2}$  lines high; bracts closely appressed, almost destitute of greenish tips; disk-flowers reduced to 1 or 2, the ray-flowers 1, rarely 2; pappus of disk and ray of 8 to 10 scales; achenes silky.—Dry hills, 2000 to 4000 ft.: Mohave Desert; Inyo Co.

35. *AMPHIACHYRIS* Nutt.

Ours a low bush with entire leaves. Herbage glabrous. Flowers yellow, the heads nearly sessile and glomerate in small cymes. Heads radiate; ray-flowers pistillate, fertile; disk-flowers perfect, sterile. Bracts of the involucre thin, closely imbricated or slightly cohering, the outer more or less boat-shaped. Ray-achenes pubescent; disk-achenes glabrous. Pappus of ray-flowers, in our species, of few and short bristles, the bristles (chiefly on the outer side) united into 2 or 3 lacinate scales; pappus of disk-flowers of 5 to 20 weak flattened bristles, united at base, nearly or quite equaling the corolla, denticulate. (Greek *amphi*, on both sides, and *achuron*, chaff.)

1. *A. fremontii* Gray. Bush 1 to 2 ft. high, with rigid divaricate branches; bark white after the first season; leaves obovate or elliptic, acute, narrowed to the sessile base or short petiole, 4 to 7 lines long; cymes terminal, compound, leafy-bracted; involucre ovoid, 2 lines high, the outer bracts broadly oblong, very obtuse, thin, the inner bracts narrow; rays 1 or 2, about 1 line long; disk-flowers 3 to 6.—Rocky mountain slopes or gravelly washes: Death Valley region from the Argus Range to the Funeral Range; e. into southern Nev.

36. *GRINDELIA* Willd. GUM PLANT

Coarse perennial herbs, sometimes suffrutescent at base. Leaves obovate or spatulate to oblong-lanceolate, sometimes narrower, commonly serrate. Heads usually gummy, medium-sized or large, solitary on the branches, ours with rays. Involucre campanulate or hemispherical, the bracts many-ranked, foliaceous or firm-herbaceous, often with attenuate squarrose points. Achenes short, truncate, compressed or turgid, glabrous. Pappus of 2 to 8 very readily deciduous awns or small scales. Involucral cups of the budding heads completely filled with the white or cream-like gummy exudation. (Hieronymus Grindel, Russian botanist, professor at Riga and Dorpat.)

Involucre with conspicuous foliaceous bracts (except in var. *davyi*) ..... 1. *G. robusta*.  
Involucre without foliaceous bracts or with only a few small ones.

Stem and branches (at least above) and sometimes the leaves pubescent; plants 1 to 3 ft. high ..... 2. *G. rubricaulis*.

Herbage wholly glabrous.

Stems woody at base, 2 to 3 ½ ft. high; often with densely leafy sterile shoots. . . .

3. *G. cuneifolia*.

Stems herbaceous nearly or quite to the base, ½ to 2 ft. high; without sterile shoots; bracts of involucre with spreading or recurved tips.

Heads 2 to 2 ½ in. broad; leaf veins brownish. . . . . 4. *G. venulosa*.

Heads less than 1 in. broad; leaf veins not brownish.

Leaves clasping; heads 6 to 10 lines wide. . . . . 5. *G. camporum*.

Leaves not clasping; heads 3 to 4 lines wide. . . . . 6. *G. nana*.

1. *G. robusta* Nutt. GUM PLANT. Stems few to several, mostly erect, 1 to 2 ft. high; herbage glabrous or very slightly pubescent; leaves oblong to ovate or lanceolate, acute or sometimes wider above and obtuse, sharply serrate or denticulate or the uppermost entire, sessile or auriculate-clasping, 1 to 2 in. long; heads with foliaceous sometimes broad bracts, 2 to 5 in a terminal cyme, each rather long leafy branch one-headed; involucre ¾ to 1 in. broad; bracts with attenuate squarrose or recurved tips; mature achenes crowned with a mostly 1 or 2-dentate often oblique border; pappus-awns 2 to 8.—Along the seacoast: San Diego to Santa Barbara; n. to San Francisco; not plentiful. May-Aug. Var. *LATIFOLIA* (Kell.) Gray. Stems robust; leaves large and broad, 1½ to 2½ in. long, 1 to 2 in. wide, subcordately clasping.—Santa Barbara Isls. (*G. latifolia* Kell.) Var. *MARITIMA* Jepson. Stems ascending or erect, 1 to 2 ft. high; leaves narrowly or broadly oblong to lanceolate, in a few cases wider above, obtuse, or mostly acute, more or less serrate; involucre ¾ in. broad; bracts linear-lanceolate, closely compacted, with erect or spreading tips; accessory foliaceous bracts few or several, unequal, ovate to lanceolate or linear, often deflexed.—Along the seaboard: Marin Co.; San Francisco; San Mateo Co. June-July. The foliaceous bracts are very variable in shape and size, even on the same plant, always more numerous on the head terminating the main axis, few or sometimes none on the heads terminating branches. (*G. rubricaulis* var. *maritima* Greene.) Var. *PATENS* Jepson. Stems 1 to 2 ft. high, mostly simple or with few strict 1-headed branches; herbage glabrous or finely puberulent; leaves narrowly oblong to oblanceolate, the lower narrowed to a petiole, 2 to 3½ in. long, the upper sessile, narrowed toward the base, serrate or often entire below the middle; involucre wholly or largely foliaceous, its bracts erect, nearly equal, linear or lanceolate, 1 to 2 lines broad, not glutinous-compacted, sometimes with an inner involucre of subulate or filiform bracts which are glutinous-compacted. — Hilltops in the Coast Ranges, not common. (*G. patens* Greene.) Var. *PLATYPHYLLA* Greene. Stems erect, leafy, ½ to 1 ft. high; leaves broadly spatulate, obtuse, auriculate-clasping; involucre 7 lines wide, the foliaceous bracts ovate, few.—Monterey. July. Var. *DAVYI* Jepson. Stems commonly clustered, erect, 2 ft. high, rarely simple, mostly with long 1-headed sparingly leafy peduncles; herbage glabrous, rarely puberulent, darker green than in the next species; basal leaves oblong or obovate, narrowed to a rather long, often winged petiole, serrate or coarsely and saliently toothed, 2 to 8 in. long, the cauline similar or sessile; heads naked; involucre ¾ to 1 in. broad, very gummy, the lanceolate bracts with subulate or filiform squarrose tips.—Valley lands about San Francisco Bay.

2. *G. rubricaulis* DC. RED-STEM GRINDELIA. Stems commonly 2 ft. high, tufted, reddish or brownish, ending in a small corymb of about 3 or 4 heads

or one-headed; herbage scantily soft-pubescent when young, in age often glabrous; leaves 2 to 5½ in. long, oblong, serrate or disposed to be entire, the basal attenuate into a petiole as long as the blade, the cauline similar or sessile; heads small, ½ in. in diameter (not including the rays); involucrel bracts lanceolate, not squarrose, very slightly or not at all glutinous, sometimes tomentose.—Ridges and hillsides of the Coast Ranges, in openly wooded country: Mt. Tamalpais; Sonoma; Napa Range. Var. *INTERIORIS* Jepson n. var. Basal leaves oblanceolate, the cauline oblong; involucre ¾ to 1 in. wide, the bracts spreading or reflexed.—Calaveras Co. foothills (Copperopolis, Davy 1383, type); Glenn Co.

3. *G. cuneifolia* Nutt. MARSH GRINDELIA. Stems 2 to 3½ ft. high (commonly woody at base), ending in a corymbose panicle of several heads or the simple sterile shoots densely leafy at summit; leaves thick, oblong or cuneate-oblong, 2 to 5 in. long, with broadly sessile or clasping base, those of the flowering branches much reduced, oblong-ovate, entire or serrate; involucre 7 to 11 lines wide, the bracts lanceolate with tips erect or spreading.—Salt marshes: Humboldt Bay southward along the coast to San Mateo Co. Aug.-Sept. Stems sometimes flexuous. Var. *PALUDOSA* Jepson. Stems 4 to 5 ft. high, with suffrutescent base 1 to 2 ft. high lasting through the winter; cauline leaves sometimes triangular-oblong, with subauriculate clasping base.—Marshes in San Francisco Bay region. Aug.

4. *G. venulosa* Jepson n. sp. Stems herbaceous nearly or quite to the base, 1 to 2 ft. high; leaves obovate or spatulate, obtuse, clasping, serrulate, 1 to 2 in. long, the brownish veins terminating in brownish dots; heads large, 2 to 2½ in. broad; involucre 1 in. wide, the bracts acute or acuminate; rays 10 lines long; achenes obscurely bordered at summit; pappus-awns 5 to 8, stout, flattened, sparingly ciliate-scabrous or nearly smooth.—Humboldt Co. coast (Big Flat, Bolander 6493, type).

5. *G. camporum* Greene. Fig. 924. Stems usually several from base, simple or sparingly branched above, white or yellowish, not leafy at base, ¾ to 2½ ft. high; herbage glabrous, often glutinous; leaves oblong to oblanceolate, clasping, saliently serrate, 1 to 2½ in. long, becoming small and bract-like above; heads solitary or loosely corymbose; involucre 6 to 10 lines wide, the bracts with slender recurved tips; disk-achenes compressed, with 2 pappus-bristles.—Dry hills and interior plains, 10 to 2500 ft.: throughout cismontane Cal., but mostly not along the coast line. June-Sept.

6. *G. nana* Nutt. Stems many from a somewhat woody branched root-crown, slender, somewhat branched above, ¾ to 1¾ ft. high; herbage glabrous, more or less glutinous; leaves oblanceolate, or the upper linear-lanceolate, ¾ to 1¼ (or the lower 2½) in. long; heads small, corymbosely clustered; involucre globose, 2½ to 4 lines wide, the bracts with recurved tips; achenes narrow, truncate or bidentate at summit; pappus-awns mostly 2.—Dry hills and valleys, 2000 to 3000 ft.: Siskiyou Co. to Modoc Co.; n. to Wash., e. to Wyo. Sept.

924. *Grindelia camporum* Greene; a, summit of flowering stem x 1; b, leaf x ½; c, disk-fl. x 2½.

37. **ACAMPTOPÁPPUS** Gray

Low round-topped shrubs with slender rigid stems and nearly glabrous herbage. Leaves small, entire, sessile. Heads spherical, yellow-flowered, discoid or radiate. Flowers all fertile. Involucral bracts closely imbricated in about 3 series, very broad and obtuse, a little convex and coriaceous, pale, the margins thin-scarious and erose-fimbriate. Disk-corollas with funnelliform tube and acute translucent lobes. Achenes short-turbinate, very heavily and densely long-villous. Pappus of about 20 to 30 silvery awns, some lanceolate-flattened at tip and equaling the corolla, others bristle-like and a little shorter, all persistent. (Greek akamptos, unbending, and pappos, pappus.)

Heads depressed-globose; rays none. . . . . 1. *A. sphaerocephalus*  
Heads spherical, larger; rays present. . . . . 2. *A. shockleyi*

1. *A. sphaerocephalus* Gray. Depressed-globose bushes 1 to 1½ ft. high with striate stems; herbage pale, glabrous or nearly so, leaves linear or linear-spatulate, acute, 4 to 9 lines long, sometimes fascicled; heads solitary or in loose clusters on the ends of the branches; involucre 3 to 4 lines high, the bracts coriaceous, commonly with a subapical greenish spot; rays none.—Desert mesas and flats, 2000 to 3500 ft.: e. slope Cuyamaca and San Jacinto mountains; widely distributed in the Larrea belt of the Mohave Desert; Inyo Co.; e. to Ariz. and Utah.

2. *A. shockleyi* Gray. Shrub; peduncles leafy only below, bearing solitary heads; leaves narrowly obovate to oblanceolate, 3 to 9 lines long; heads ½ or mostly ¾ to 1 in. high; rays 10 to 12, bright yellow, 4 to 6 lines long; outer bracts of involucre with a large green spot at tip.—Death Valley region; e. into southern Nev.

38. **STENOTÓPSIS** Rydb.

Shrubs or suffrutescent plants with glabrous herbage and evergreen foliage. Leaves alternate, narrow and entire, resinous-dotted in ours. Heads large and broad, solitary on the peduncles. Involucre hemispherical, its bracts little imbricated (in 2 or 3 series), membranous with scarious margins, closely appressed. Flowers yellow; rays several to many. Achenes oblong, somewhat compressed. Pappus of slender bristles, permanently white. (The genus *Stenotus*, and Greek opsís, resemblance.)

925. *Stenotopsis linearifolius* Rydb.; a, fl. branch x ½; b, fl. x 2.

1. *S. linearifolius* (DC.) Rydb. Fig. 925. Shrub 1 to 2 or 4 ft. high, with balsamic sticky herbage; flowering branchlets more or less fastigiate, leafy below, nearly naked above and bearing solitary heads; leaves much crowded or fascicled, linear and narrowed toward the base, or subfiliform, ½ or ¾ to 2 in. long, ½ to 1½ lines wide; heads hemispherical, 1 to 2 in. broad; bracts of the involucre in 2 or 3 rows, all nearly equaling the disk, linear or oblong, acute or commonly acuminate, greenish, the inner with broad scarious fimbriolate margins; rays 11 to 18, oblong-lanceolate, 4 to 8 lines long; disk-flowers numerous; achenes white-silky; pappus white, soft and deciduous.—Mountain slopes and desert mesas, 2000 to 5000 ft.: San Diego Co. to Mt. Diablo, s. Sierra Nevada and Inyo Co.; e. to

southern Utah and Ariz., s. to L. Cal. Mar.-May. (*Aplopappus linearifolius* DC. *Stenotus linearifolius* T. & G.) Passes by numerous intergrades into: Var. *INTERIOR* Mcbr. Fig. 926. Leaves shorter (mostly  $\frac{1}{2}$  to  $\frac{3}{4}$  in. long); heads smaller; rays only 4 to 5 lines long.—Mohave Desert.

926. *Stenotopsis linearifolius* Rydb. var. *interior* Mcbr.; fl. branch  $\times \frac{2}{3}$ .

### 39. *ERICAMERIA* Nutt.

Low evergreen shrubs or suffrutescent plants. Herbage glabrous, rarely obscurely puberulent. Leaves resinous and punctate, narrowly linear or terete and often heath-like, rarely obovate or oblanceolate, always entire. Flowers yellow, the heads in terminal panicles, cymes or racemes. Rays present or none. Involucre turbinate, its bracts chartaceous or coriaceous, regularly imbricated. Achenes more or less prismatic. Pappus-bristles slender, scabrous, dull white or yellowish, in age reddish. (Greek *erike*, the European heath, and *meris*, part, the minute evergreen leaves of the first-known species heath-like.)

Leaves filiform to linear (or sometimes oblanceolate in no. 9).

Involucral bracts commonly about 15 to 25, rather firmly imbricated even in age.

Rays present; leaves filiform.

Leaves mostly 5 to 10 lines long (or to  $1\frac{1}{2}$  in.); heads in panicles; plains and foothills of coastal S. Cal.

Outer involucral bracts obtuse; panicles commonly much elongated or racemose ..... 1. *E. palmeri*.

Outer involucral bracts acuminate; panicles congested-racemose, rarely loose ..... 2. *E. pinifolia*.

Leaves 1 to 2 lines long; heads corymbose-paniculate; sand dunes along the coast ..... 3. *E. ericoides*.

Rays none.

Heads in loose oblong panicles or racemes.

Leaves terete.

Involucral bracts tipped with a glandular spot. .... 4. *E. teretifolia*.

Involucral bracts without apical spot. .... 5. *E. paniculata*.

Leaves filiform but flat.

Involucral bracts without a resin line. .... 6. *E. cooperi*.

Involucral bracts with resin-thickened midnerve. .... 7. *E. brachylepis*.

Heads in close rounded cymes.

Leaves filiform or becoming so. .... 8. *E. arborescens*.

Leaves broadly linear to oblanceolate. .... 9. *E. parishii*.

Involucral bracts 8 to 10, very loose in age; rays 1 or 2 or none; herbage minutely pubescent ..... 10. *E. monactis*.

Leaves obovate or oblanceolate; rays present or none. .... 11. *E. cuneata*.

1. *E. palmeri* (Gray) Hall. Low much-branched bush (1 to 2 ft. high), the branchlets very slender; herbage minutely puberulent or almost glabrous; leaves narrowly linear, resinous and punctate, 3 to 10 lines or to  $1\frac{1}{2}$  in. long, mostly with shorter ones fascicled in the axils; heads 3 to 4 lines high, borne in an elongated commonly narrow panicle; involucre narrow, about 3 lines high; bracts obtuse, the tips greenish, the narrow white margins shortly ciliate; rays 3 or 4, short; achenes silky-hirsute with ascending hairs.—Plains and foothills, common: coastal S. Cal.; e. to the Colorado River; s. to L. Cal. (*Aplopappus palmeri* Gray.)

2. *E. pinifolia* (Gray) Hall. Stout spreading shrub 2 to 5 ft. high; herbage nearly glabrous, resinous, the leaves minutely but sparingly punctate, or not at all punctate or only on the involute margins; leaves filiform to narrowly

927. *Eriocameria ericoides* Jepson; a, fl. branchlet x 1; b, disk-fl. x 4.

linear, 4 to 9 or 15 lines long, the fascicled ones mostly shorter (3 to 5 lines long); vernal heads few and solitary, their involucre hemispheric, 4 to 5 lines broad, closely subtended by long leaves; rays 15 to 25; heads of the regular (or autumnal) flowering numerous, densely racemose, or sometimes loosely paniculate; involucre turbinate, 2 to 3 lines broad; rays 6 to 10, short; bracts acuminate or the innermost only acute, with narrow membranous margins woolly-ciliolate at the green tips, the outermost subulate and passing into the bract-like leaves of the flowering branchlets; achenes lightly pubescent, glabrate; pappus reddish or sordid.—Foot-hills in the chaparral: San Gabriel, San Bernardino and San Jacinto mountains; s. to San Diego Co. (*Aplopappus pini-folius* Gray.)

3. *E. ericoides* (Less.) Jepson. Fig. 927. **MOCK HEATHER.** Heather-like shrub 1 to 2¾ ft. high, the main stems decumbent or ascending, bearing numerous erect branchlets; herbage slightly pubescent; leaves linear-terete, 1 to 2 lines long, crowded or fascicled; heads numerous, 3 to 4 lines high, corymbose-paniculate; bracts of involucre tomentose-ciliolate, the inner narrowly oblong, acute, the outermost lanceolate, acuminate; rays about 5, 2 lines long; achenes cylindric, striate, glabrous; pappus dull white, aging slightly brown.—Sand dunes along the coast: Marin Co. to Los Angeles Co. Aug.-Sept. (*Aplopappus ericoides* H. & A.)

4. *E. teretifolia* Jepson n. comb. Glabrous shrub 1 to 3 ft. high; herbage dark green, balsamic-resinous; leaves terete, conspicuously punctate, 3 to 7 lines long; heads narrowly oblong, 4 to 5 lines long, in dense spikes, or somewhat capitately congested at the ends of the branches; involucre narrow, 2 to mostly 3 lines high; bracts linear, obtuse, all except the innermost tipped with a greenish glandular spot; achenes linear, silky-villous.—Cañon walls and rocky ledges: Funeral and Panamint ranges; w. to e. slope Sierra Nevada in Inyo Co. and to the Tehachapi Range; e. to southern Nev. (*Bigelovia teretifolia* Gray. *Linosyris teretifolia* D. & H.)

5. *E. paniculata* (Gray) Rydb. Erect shrub 4 to 6 ft. high, the stems many from the base, much-branched above and slender; herbage paler than in *E. teretifolia*; leaves filiform, punctate, ¾ to 1 or 1½ in. long; panicle profusely branched; heads 4 to 5 lines high; involucre bracts straw-color, thin, obtuse, but subacutely pointed, without glandular spot at apex, the inner ones 2½ to 3 lines long.—Sandy or gravelly washes or in cañon bottoms in the deserts: Colorado Desert; Mohave Desert; Inyo Co.; e. to Ariz. and southern Nev. (*Bigelovia paniculata* Gray.)

6. *E. cooperi* (Gray) Hall. Low shrub, branched from the base, the stems slender; herbage minutely tomentose, resinous-punctate; leaves filiform, thickish, 5 to 10 lines long; heads few in a terminal cluster, 6 to 8-flowered; rays none; involucre bracts rather few, narrowly oblong, the outer ones ovate, chartaceous, without green tips; achenes turbinate, silky-villous.—Providence Mts. in the Mohave Desert, the only known locality. (*Bigelovia cooperi* Gray.)

7. *E. brachylepis* (Gray) Hall. Shrub 3 to 6 ft. high, branched from the base, the branchlets crowded with leaves; leaves viscid and resinous-punctate, glabrous, filiform, 5 to 12 lines long; heads racemose or narrowly paniculate

at the ends of the leafy branchlets, 8 to 12-flowered; involucre 2 to  $2\frac{1}{2}$  lines high; bracts oblong, obtuse or only acutish, with a brown resinous-thickened midnerve and ciliolate margins, the outermost passing into minute bracts of the peduncle; rays none; achenes linear, canescent.—S. San Diego Co.: Campo; Potrero; s. to L. Cal. (*Bigelovia brachylepis* Gray.)

9. *E. arborescens* (Gray) Greene. GOLDEN FLEECE. Erect shrub with fastigate very leafy branches, 3 to 10 (or 15) ft. high; leaves narrowly linear, or closely revolute and becoming filiform, resinous-punctate, 1 to 2 in. long; heads  $2\frac{1}{2}$  to  $3\frac{1}{2}$  lines high; bracts of the involucre lanceolate, acute, 2 lines long or less; rays none, rarely present; achenes canescent, somewhat quadrangular; pappus permanently dull white, its bristles unequal.—Open dry chaparral or chamise slopes in the foothills, mostly 1000 to 2000 ft.: Coast Ranges from Napa Co. to Monterey Co. and s. to Santa Barbara Co.; Sierra Nevada from Amador Co. to Tulare Co. Sept.-Nov. (*Bigelovia arborescens* Gray.)

9. *E. parishii* (Greene) Hall. Erect shrub 3 to 8 ft. high, the branchlets very leafy up to the inflorescence; leaves oblanceolate or linear, resinous-punctate, entire, narrowed at base, acute,  $1\frac{1}{2}$  to 2 in. long,  $1\frac{1}{2}$  to mostly 3 lines wide; heads discoid, 10 to 12-flowered, borne in terminal rounded cymes 1 to 2 in. high; bracts of the cymes linear-subulate; involucre  $2\frac{1}{2}$  to 3 lines high, their bracts lanceolate, very acute, with a distinct midrib, but no green tip; achenes turbinate, minutely silky.—Lower portions of the chaparral belt: cismontane Cal.; s. to L. Cal. (*Bigelovia parishii* Greene.)

10. *E. monactis* (Gray) McCl. Fig. 928. Shrub 1 to  $3\frac{1}{2}$  ft. high, with numerous leafy branchlets and deep-green foliage; herbage obscurely and minutely pubescent, the axillary leaves always and the primary leaves sometimes resinous-punctate; leaves linear or linear-spatulate, flat, acute, 3 to 8 lines long, commonly with minute fascicled ones in the axils, especially the lower; heads in round-topped terminal cymes; involucre narrowly campanulate, 2 to  $2\frac{1}{2}$  lines high; bracts loosely imbricated, chartaceous, obtuse or acute; rays 1 or 2, or none in some heads, occasional plants with all the heads discoid; disk-flowers 5 to 8; achenes white-pubescent.—Arid mesas, 1000 to 4000 ft.: Riverside; Tejon Pass, s. entrance; Mohave Desert and neighboring ranges; Inyo Co.; e. to southern Nev. (*Aploppapus monactis* Gray. *Chrysanthamnus corymbosus* Elmer. *Acamptopappus microcephalus* Jones.)

928. *Ericameria monactis* McCl.; a, fl. branchlet x 1; b, head x  $2\frac{1}{4}$ ; c, disk-fl. x 3.

11. *E. cuneata* (Gray) McCl. Dark green shrub  $\frac{1}{2}$  to 4 ft. high, freely branching; herbage glabrous but balsamic-glutinous and resinous-punctate; leaves thick, oblanceolate to obovate, a little undulate, obtuse but commonly mucronate at apex, cuneately narrowed below to a short petiole-like base, 2 to 4 lines long; heads 4 to 6 lines high, in small compact cymes or sometimes solitary; involucre turbinate, 3 to 4 lines high; bracts lanceolate to linear, chartaceous, with firm brown or greenish midrib and silvery-scarious margins, somewhat obtuse but usually cuspidate-tipped, the outermost passing into minute bracts of the peduncle; rays 1 to 5 or none; achenes silky-strigose; pappus-bristles copious, about equal to and as long as the corolla, brown.—Rocky ledges and cliffs, 5000 to 8000 ft.: Sierra Nevada from Placer

Co. to Tulare Co.; San Jacinto Mts. (*Aplopappus cuneatus* Gray.) Var. *SPATHULATA* Hall. Leaves 4 to 8 lines long, 3 to 5 lines wide, very obtuse or even retuse, less commonly mucronate, spatulately narrowed to a petiole-like base; rays none or rarely present.—Inyo Co.; Mohave and Colorado deserts; cismontane S. Cal.; s. to L. Cal. (*Bigelovia spathulata* Gray. *Chrysoma merriami* Eastw.)

#### 40. HAPLOPAPPUS Cass.

Leafy-stemmed perennial herbs commonly with a thickened or fusiform taproot (one species shrubby and one annual). Leaves serrate, pinnately toothed or cleft, or sometimes entire. Heads radiate, usually many-flowered, the flowers yellow. Involucral bracts more or less imbricated. Achenes turbinate to linear, somewhat flattened, silky-villous to glabrous. Pappus of numerous bristles, sordid or yellowish. (Greek, haploos, simple, and pappos, down, in allusion to the absence of an outer pappus.)

*A. Involucral bracts and the lobes or teeth of the leaves bristle-tipped; bracts well imbricated.*  
Annual; stems leafy, only a few in. high; pappus-bristles somewhat paleaceous.....

1. *H. gracilis*.

Perennial; stems reedy, 1 to 1½ ft. high, the leaves much reduced; pappus-bristles not at all paleaceous.....2. *H. junceus*.

*B. Involucral bracts and lobes or teeth of leaves not bristle-tipped.*

Plants shrubby at base, 3 to 4 in. high; herbage glandular.....3. *H. eximius*.  
Plants from a thick root-crown or fusiform root, mostly much taller, herbage not glandular (except in *H. hirtus*).

Outer involucral bracts foliaceous, usually much exceeding the inner and the flowers.

Basal leaves 4 to 6 in. long; herbage more or less puberulent; montane species...

4. *H. carthamoides*.

Basal leaves ¾ to 1 ft. long; herbage glabrous; species of the San Francisco Bay region.....

5. *H. longifolius*.

Outer involucral bracts not foliaceous and not exceeding the inner and the flowers.

Heads racemously arranged (scattered in var. *stenocephala*); involucral bracts well imbricated, in about 4 series.....

6. *H. racemosus*.

Heads not racemously arranged; involucral bracts loosely if at all imbricated, in fewer series.

Herbage glandular throughout; stems very leafy; achenes villous.....

7. *H. hirtus*.

Herbage not glandular; stems moderately leafy.

Heads corymbose-paniculate on long peduncles; herbage glabrous;

achenes silky-villous.....8. *H. lanceolatus*.

Heads terminating the stems or short branchlets.

Achenes glabrous; herbage hirsute-pubescent to glabrate; basal leaves laciniately toothed.....

9. *H. apargioides*.

Achenes silky-villous; herbage woolly, becoming glabrate above; basal leaves entire or coarsely toothed (not laciniate)...

10. *H. gossypinus*.

1. *H. gracilis* (Nutt.) Gray. Stem erect, leafy, branched at or above the base, 1 to 8 in. high, arising from an annual root; herbage hirsute with white hairs; leaves elliptic or oblong in outline, 2 to 6 lines long, pinnately divided into somewhat crowded linear lobes, or only toothed, each lobe or tooth tipped with a long white bristle; heads 6 to 8 lines broad, the branches one-headed; involucre campanulate, 2½ lines high; bracts linear-lanceolate, well imbricated in several ranks, bristle-tipped; rays yellow, well exerted, 3 lines long; achenes silky-canescens; pappus-awns unequal, somewhat paleaceous toward the base.—Desert ranges, e. Mohave Desert, 4000 ft.: Providence Mts.; New York Mts.; e. to Col., s. to Mex. June. (*Sideranthus gracilis* Rydb. *Eriocarpum gracile* Greene.)

2. *H. junceus* Greene. Stems rigid, erect, several from a branched woody base, rush-like on account of the small or few leaves, 1 to 1½ in. high, ending above in a corymbose panicle; herbage glabrous or sometimes tomentose; leaves oblong to linear, 3 to 9 lines long, serrate or pinnatifid (the lobes or teeth bristle-tipped), or sometimes entire, the uppermost linear, entire, 1 to 3 lines long; heads turbinate to hemispherical, rather long-peduncled in the panicle; involucres 3 to 3½ lines high; bracts linear, cuspidate, well imbricated in several series, a narrow greenish spot below the cusp or bristle; rays pale yellow, well exerted, 2 lines long; achenes pubescent; pappus sordid.—Dry or sandy soil, San Diego Co.: Valley Center; San Diego Falls; Mt. Tecate; Descanso; Cottonwood grade; s. to L. Cal.

3. *H. eximius* Hall. Stems several to many, densely tufted on the branched crown of a taproot, ascending or erect, simple, leafy, one-headed, 3 to 6 in. high; herbage glandular, fragrant; leaves obovate or broadly oblanceolate to oblong, coarsely toothed, attenuate to a narrow base or petiole, the whole  $\frac{3}{4}$  to  $2\frac{1}{4}$  in. long; heads radiate; involucre campanulate, 3 lines high, the outer bracts oblong, foliaceous, the inner lanceolate, pinkish tinged; rays 3 to 4 lines long; achenes narrowly cylindric, silky, 2 lines long; pappus bristles scabrous.—Montane, in rocky places, 8800 to 10,000 ft.: e. summits of the Sierra Nevada from Eldorado Co. to Inyo Co. July-Aug.

4. *H. cārthamoides* (Hook.) Gray. Stems several, tufted on the branched root-crown of a thick fusiform root, ascending or decumbent, leafy, simple and one-headed, 3 to 5 in. high; herbage finely canescent or puberulent; leaves obovate to oblanceolate, entire or minutely spinulose-toothed, 1 to 3 in. long, narrowed to a petiole  $\frac{1}{2}$  to 2 times as long; heads large, 6 to 9 lines broad, 1 in. high; involucre campanulate, 6 to 9 lines high, oblong or sometimes lanceolate, obtuse or sometimes acute and spinescent-tipped, the outermost foliaceous, often much exceeding the flowers; achenes glabrous.—Dry flats or ridges, 4000 to 6000 ft.: Mt. Eddy, Siskiyou Co.; Modoc Co.; n. to Wash. and Ida. June-Aug. Var. *CUSICKII* Gray. Stems 3 to 4 in. high; heads narrower; achenes puberulent.—Eagle Lake, Lassen Co.; n. to Ore. (*Pyrrocoma cusickii* Greene.)

5. *H. longifolius* Jepson n. comb. Stems leafy, erect, 1 ft. high, several from a thick taproot; herbage glabrous; leaves mostly entire, the basal oblanceolate,  $\frac{3}{4}$  to 1 ft. long, the cauline oblong or oblong-lanceolate, clasping, 1 to 2 in. long; heads mostly solitary, terminal, leafy-bracteate; involucre broadly turbinate,  $\frac{3}{4}$  in. high; involucral bracts spatulate or oblanceolate, green-tipped, subequal; rays numerous.—Mt. Eden, w. Alameda Co. May. (*Pyrrocoma longifolia* Greene.)

6. *H. racemōsus* (Nutt.) Torr. Stems several from the thick root-crown, erect or ascending, leafy, 9 to 18 in. high, simple, ending above in a spike-like inflorescence; root-crown chaffy with old leaf-bases; herbage glabrous or the leaves and bracts scabrous-ciliate; basal leaves oblanceolate to oblong-oblanceolate, minutely spinulose-ciliate, petioled, the whole 2 to 6 in. long; cauline leaves linear to narrowly lanceolate, sessile,  $\frac{3}{4}$  to 2 in. long; heads radiate, solitary in the axils of the upper leaves and thus racemose; involucre turbinate,  $2\frac{1}{2}$  to  $3\frac{1}{2}$  lines high; bracts oblong to broadly ovate, well imbricated, the green tips somewhat spreading; rays yellow, well exerted, 2 to 3 lines long; achenes almost glabrous; pappus sordid or yellowish.—Saline flats, 10 to 4000 ft.: San Mateo Co.; upper Napa Valley; Del Norte Co.; Shasta Valley, Siskiyou Co.; n. to Ore.; e. to Nev. (*Pyrrocoma racemosa* T. & G.) Var. *GLOMERELLUS* Gray. Leaves entire or denticulate; heads narrower and smaller, disposed to be fascicled in 2s or 3s in the axils of the small upper leaves; involucre often turbinate; achenes nearly glabrous.—Arid areas, 3000 to 4000 ft.: Inyo Co.; e. to Nev., n. to Ore. Var. *VIRGATUS* Gray. Leaves narrower; heads smaller.—E. side Sierra Nevada from Sierra Co. to Mono Co.; upper San Joaquin Valley. Var. *STENOCÉPHALUS* Gray. Low, only 2 to 3 in. high; heads scattered, narrow, few-flowered.—Sierra Co.

7. *H. hirtus* Gray. Stems several from the thick root-crown, ascending or decumbent at base, leafy, 6 to 13 in. high, ending above in a few-headed panicle; herbage glandular-viscid, hirsute-pubescent throughout; basal leaves oblong-ovate to linear-lanceolate, serrate or the teeth coarsely laciniate, 1 to  $3\frac{1}{2}$  in. long, the petioles  $\frac{1}{4}$  to  $1\frac{1}{2}$  times as long; cauline leaves linear or narrowly oblong to lanceolate, 1 to  $2\frac{1}{2}$  in. long, sessile by a broad base; panicle commonly racemose; heads radiate; involucre turbinate to hemispherical,  $4\frac{1}{2}$  lines high; bracts lanceolate, unequal, 3-ranked, somewhat spreading at tip; achenes villous; pappus yellowish.—Montane: Lassen and Modoc Cos.; n. to Wash. July. (*Pyrrocoma hirta* Greene.)

8. *H. lanceolātus* (Hook.) T. & G. Stems few or several from a thick root-crown chaffy with old leaf-bases, erect or ascending, somewhat leafy but the leaves mainly basal, simple but 2 or 3-forked at summit, 8 to 16 in. high;

herbage glabrous; basal leaves oblanceolate to narrowly oblong, serrate or somewhat saliently toothed, attenuate to a petiole, the whole 2 to 8 in. long; cauline leaves narrowly oblong to lanceolate, with broad clasping base, 1 to 2 in. long; heads campanulate, long-peduncled, 2 or 3 in the corymb; involucre broadly campanulate, 3 to 4 lines high; bracts lanceolate or oblong, green-tipped, imbricated; rays yellow, well exserted, 2 to 3 lines long; achenes silky-villous; pappus yellowish.—Modoc Co.; n. to B. C., e. to Col. (*Pyrrocoma lanceolata* Greene.)

9. *H. apargioides* Gray. Stems several from the simple or branched root-crown of a very thick root, decumbent, 3 to 5 (or 11) in. high; root-crown densely sheathed with the bases of old leaves; herbage glabrate to slightly villous-pubescent; leaves mostly basal in a basal tuft, lanceolate to narrowly oblanceolate, acuminate, serrate or laciniately toothed,  $1\frac{1}{2}$  to 4 in. long; heads radiate, hemispherical, terminating the stems, rarely 1 or 2 below the main head on short lateral branchlets; involucre 3 to 5 lines high; bracts lanceolate to oblong, the inner purplish-tipped; rays 3 lines long; achenes glabrous.—Grassy meadows, 8000 to 10,000 ft.: San Bernardino Mts.; Sierra Nevada from Tulare Co. to Sierra Co.; e. to Nev. July-Aug. (*Pyrrocoma apargioides* Greene.)

10. *H. gossypinus* (Greene) Hall. Stems decumbent at base, ascending, 6 to 10 in. high, several from a thick fusiform root; herbage white-tomentose becoming more or less glabrate above; leaves oblanceolate or oblong-oblan-ceolate, entire or spinose-serrate, the cauline sessile, the basal long-petioled, 1 to 5 in. long; heads radiate, hemispherical, solitary at the ends of the stems or branchlets; involucre  $4\frac{1}{2}$  lines high, the bracts lanceolate or linear, spinescent-tipped, somewhat unequal; rays yellow, well exserted; achenes silky-villous; pappus yellowish-white.—San Bernardino Mts. Aug. (*Pyrrocoma gossypina* Greene.)

#### 41. *STENOTUS* Nutt.

Depressed caespitose plants with narrow entire leaves. Heads large, solitary on the peduncles. Involucre hemispherical to campanulate, its bracts little imbricated, closely appressed, in 2 or 3 series. Flowers yellow; rays several to many. Achenes oblong, narrowing toward base, somewhat compressed. Pappus of slender bristles permanently white. (Greek *stenotes*, narrowness, in reference to the leaves.)

Leaves very narrow, linear-spatulate to almost filiform, not nerved. . . . . 1. *S. stenophyllus*.  
Leaves broader, spatulate to oblanceolate, mostly 3-nerved. . . . . 2. *S. acaulis*.

1. *S. stenophyllus* (Gray) Greene. Caespitose plants  $2\frac{1}{2}$  to 4 in. high; flowering stems many from the much-branched and depressed woody base, simple, densely leafy, bearing a nearly naked one-headed peduncle about twice as long as the leafy portion; herbage glandular, scabrous; leaves linear-spatulate to almost filiform, 4 to 8 lines long; involucre broadly turbinate to hemispherical, 3 to 4 lines high, the linear equal bracts in 2 rows; rays rather broad, 3 to 4 lines long, well exserted; achenes densely villous, narrowed towards base,  $1\frac{1}{2}$  to 2 lines long.—Gravelly slopes, 4000 to 5000 ft.: Modoc Co.; n. to Wash. May-June. (*Haplopappus stenophyllus* Gray.)

2. *S. acaulis* Nutt. Plants 2 to 6 in. high, with the habit of no. 1; leaves mostly basal, the erect flowering stems sparsely leafy or naked; herbage (especially the lower surface of the leaves) scabrous and viscid; leaves oblanceolate to spatulate, conspicuously 3 (or 5)-nerved,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; involucre 3 to 4 lines high, their bracts ovate to ovate-lanceolate, somewhat unequal, in 2 ranks; rays broad, 3 to 4 lines long, well exserted; achenes densely villous, narrowed towards base,  $1\frac{1}{2}$  lines long.—Rocky slopes, 8200 to 9600 ft.: Pyramid Peak; Mt. Tallac; Castle Peak; Warner Mts.; n. to Wash., e. to Utah. July-Aug. (*Aplopappus acaulis* Gray.) Var. *KENNEDYI* Jepson n. var. Plants 4 to 5 in. high; herbage viscid, the leaves somewhat glandular with markedly scabrous margins, otherwise nearly glabrous; leaves oblanceolate, conspicuously veined,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long; involucre 4 lines high, their bracts ovate to lanceolate, unequal, in about 3

ranks: achenes glabrous.—Plumas Co. (hills above Red Clover Valley, Heller & Kennedy 8696, type).

#### 42. *ISÓCOMA* Nutt.

Rigid plants, somewhat woody at base, with thickish leaves. Heads rayless, borne in glomerules which are terminal on short lateral branches or disposed in terminal cymes or panicles. Involucral bracts coriaceous, closely imbricated, the tips herbaceous, but appressed. Flowers permanently yellow. Corolla-tube slender, the throat ventricose or obliquely dilated, its segments erect or more or less connivent about the style. Achenes longitudinally striate or ribbed, the intervals silky-pubescent or -hirsute. Pappus of numerous sordid bristles, the inner longest and often distinctly flattened. (Greek isos, equal, and koma, a tuft, the florets equal, not unequal as in Lessingia.)

1. *I. veneta* (H.B.K.) Greene var. *véronioides* Jepson. Stems freely branching, erect, somewhat woody below, 1 to 2 ft. high, very leafy, commonly with fascicled leaves in the axils; herbage with a rather close and somewhat glandular indument, the stems villous below; leaves linear to oblong or obovate, serrate or entire, sessile,  $\frac{1}{4}$  to  $1\frac{1}{2}$  (or 2) in. long; heads disposed in a dense terminal corymb; involucre 3 to  $4\frac{1}{2}$  lines high; bracts more or less rounded or obtuse at apex, but also shortly or minutely acute; achenes  $1\frac{1}{2}$  lines long; pappus of rather rigid and unequal bristles.—Subsaline plains, 20 to 1500 (or 4000) ft.: coastal S. Cal., n. to San Luis Obispo Co., upper San Joaquin Valley and Inyo Co. (*I. vernonioides* Nutt.) Var. *acēta* Jepson. Low bush 7 to 15 in. high; leaves pinnately cleft into acute lobes or only deeply toothed.—Lower Sacramento Valley; Santa Clara Valley. (*Isocoma arguta* Greene.) Var. *sedoides* Jepson n. comb. Stems decumbent or ascending; herbage subglabrous; leaves obovate, succulent,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long; heads a terminal capitate cluster.—Santa Cruz Isl. (*I. sedoides* Greene.) Var. *acradēnia* Hall. Bark of the main branches white and shining; leaves pale, entire or toothed, commonly glabrous, the fascicled ones few; heads few in close clusters, the clusters in somewhat loose panicles.—Saline flats: Colorado Desert; Mohave Desert; upper San Joaquin Valley. (*Bigelevia acradenia* Greene.) Var. *decumbens* Jepson n. comb. Stems very slender, decumbent; inflorescence corymbose, the heads solitary on the branches, rarely 2.—Depressions on the mesas, San Diego Co. (*Bigelevia veneta* var. *decumbens* Bdg.)

#### 43. *HAZÁRDIA* Greene

Shrubs or bushes with brittle ascending stems, or one species an herb. Herbage tomentose, or quite glabrous, or glandular, never resinous-punctate. Leaves coriaceous, entire or spinulose-serrate. Heads 20 to 40-flowered, borne in spikes, racemes, or panicles. Involucre turbinate or campanulate, its bracts numerous, closely imbricated. Rays yellow, changing to purple, or wanting. Disk-corollas yellow, changing to brownish-purple. Achenes linear, 4 to 6-nerved. Pappus reddish. (Barclay Hazard, who assisted E. L. Greene in reaching the Santa Barbara Islands.)

Shrubs; coastal S. Cal.

Herbage white-tomentose; tips of involucral bracts erect.....1. *H. cana*.

Herbage bright green; involucral bracts with spreading or recurved tips.....2. *H. squarrosa*.

Herb; involucral bracts with erect tips; Sierra Nevada mainly.....3. *H. whitneyi*.

1. *H. cana* Greene. Large shrub; herbage densely white-lanate, the tomentum sometimes deciduous from the foliage; leaves obovate to oblanceolate, entire to sharply serrate,  $1\frac{1}{2}$  to 8 in. long; heads borne in a loose panicle; involucre campanulate, densely woolly, 5 to 6 lines high; bracts erect with thickened tips; rays inconspicuous, yellow, turning purple (sometimes wanting); achenes canescent, prominently nerved.—Rocky slopes, Santa Barbara Isls.: San Clemente, Santa Cruz, and Santa Rosa Isls. July.

2. *H. squarrosa* Greene. Bush 1 to 3 ft. high, the erect stems minutely roughish, pubescent or scaberulous; leaves oblanceolate to obovate, rounded at apex, sessile and somewhat clasping at base, sharply serrate, glutinous or glandular-spotted,  $\frac{1}{2}$  to 1 (or 2) in. long; heads spicate or more commonly racemosely thyrsoïd or paniculate; involucre turbinate, 5 to 7 lines high;

bracts imbricated in many series, the acutish green tips glandular-granuliferous and recurved or squarrose-spreading; rays none; achenes glabrous or sparsely hairy.—Rocky points, mostly in the chaparral belt, 200 to 4000 ft.: along the coast from the Santa Lucia Mts. to San Diego; e. to San Bernardino; Santa Cruz Isl. Sept.-Oct. Var. *obtusa* Jepson n. comb. Involucres 6 to 7 lines high, their bracts very obtuse or truncate but with a short cusp; achenes quite glabrous.—San Emigdio Mts. (*Hazardia obtusa* Greene.)

3. *H. whitneyi* (Gray) Greene. Stems simple below, several from a woody root-crown, 12 to 17 in. high; herbage glandular-puberulent, the leaves bright green; leaves broadly oblong and usually a little narrowed below, rarely obovate, serrate, sessile,  $\frac{1}{2}$  to  $1\frac{3}{8}$  in. long; heads 7 to 11 lines broad, solitary on the ends of the branchlets in a loose panicle, sometimes subsessile or shortly peduncled along the upper part of the main stem and the inflorescence thus spicate; involucres 5 lines high, the bracts linear, chartaceous-margined, with erect tips; rays few, 3 lines long; pappus reddish.—Montane, 7000 to 9500 ft.: Scott Mts.; Sierra Nevada from Mariposa Co. to Tulare Co. (*Aplopappus whitneyi* Gray.)

#### 44. *MACRONEMA* Nutt.

Low bushy undershrubs with short branches, leafy up to the heads. Involucre turbinate to campanulate, with foliaceous outer bracts passing into the leaves. Receptacle naked. Flowers all perfect, yellow, the rays few or wanting, the disk 5-lobed. Style-branches stigmatic throughout, with long filiform appendages. Achenes slender, compressed, 5-nerved, soft-pubescent. Pappus of numerous soft white bristles. (Greek makros, long, and nema, a thread.)

Heads discoid; branches white-tomentose. . . . . 1. *M. discoidea*.  
Heads radiate; branches not white-tomentose.

Branches and herbage glandular; involucre not at all tomentose. . . . . 2. *M. suffruticosa*.  
Branches and herbage not glandular, the herbage glabrous to puberulent or tomentose . . . . . 3. *M. greenii*.

1. *M. discoidea* Nutt. Low branched undershrub 4 to 8 in. high, the stems and branches densely white-tomentose; leaves oblong to oblanceolate, sessile, green, glandular-puberulent, 4 to 10 lines long; heads solitary or somewhat clustered at the ends of the branchlets; involucres turbinate to campanulate, 4 to 5 lines high, the inner bracts few, lanceolate; rays none.—Rocky slopes, 8000 to 11,000 ft.: Sierra Nevada from Tulare Co. to Eldorado Co.; n. to Ore., e. to Col. July-Sept. (*Aplopappus macronema* Gray.)

2. *M. suffruticosa* Nutt. Bushy undershrubs 4 to 12 in. high; stems reddish brown; herbage puberulent with gland-tipped hairs; leaves oblanceolate to linear, entire, green,  $\frac{1}{2}$  to 1 in. long; heads solitary at the ends of the branchlets or sometimes a little clustered; involucres broadly turbinate, 4 to 6 lines high, the bracts lanceolate or linear, the outer foliaceous, the inner scarious-margined, often purplish; rays few, 3 to 5 lines long.—High montane peaks, 8000 to 12,000 ft.: Sierra Nevada from Mt. Guyot and Mt. Goddard to Pyramid Peak and Castle Peak; e. to Ariz., n. to Mont. July-Sept. (*Aplopappus suffruticosus* Gray.)

3. *M. greenii* (Gray) Greene. Stems from a shrubby base, 8 to 12 in. high; herbage glabrous or above viscid-puberulent; leaves spatulate-oblong or oblanceolate,  $\frac{1}{2}$  to  $1\frac{1}{8}$  in. long; heads in crowded clusters on the ends of the branchlets, rarely solitary; involucres turbinate,  $4\frac{1}{2}$  to  $5\frac{1}{2}$  lines high; bracts in about 3 series, lanceolate to linear, all but the innermost with foliaceous tips; rays broad, 3 to 4 lines long.—Montane, 5000 to 6200 ft.: Yollo Bolly Mts. to Scott Mts.; Modoc Co.; n. to Wash. Sept. Var. *mollis* Jepson n. comb. Herbage puberulent to white-tomentose, especially above.—Warner Mts., Modoc Co.; n. to Ore. (*Aplopappus mollis* Gray.)

#### 45. *CHRYSOETHAMNUS* Nutt.

Shrubs or suffrutescent plants. Leaves narrow, entire. Herbage tomentose to glabrous, sometimes viscidulous or resinous. Inflorescence paniculate or cymose, rarely racemose or with solitary heads. Heads narrowly turbinate, discoid, rarely radiate, 5 to 30-flowered. Involucral bracts well imbricated,

commonly in more or less distinct vertical ranks, chartaceous or coriaceous, with or without herbaceous tips. Style-branches subulate or filiform, usually well-exserted. Achenes narrow, terete or slightly angled, pubescent. Pappus-bristles copious, soft, dull white to yellowish or brownish. (Greek chrysos, gold, and thamnos, bush or shrub.)

Heads discoid.

Branches glabrous or puberulent, pubescence not felt-like. . . . . 1. *O. viscidiflorus*.  
Branches with felt-like tomentum, thin and close, or thicker and looser.

Outer involucre bracts obtuse to moderately acuminate; inflorescence cymose. . .  
2. *O. nauseosus*.

Outer involucre bracts with long attenuate tips; inflorescence racemose, spicate  
or paniculate . . . . . 3. *O. parryi*.

Heads radiate, the rays 2 to 4; herbage glabrous. . . . . 4. *O. bloomeri*.

1. *C. viscidiflorus* Nutt. Shrub 1 to 8 ft. high; younger stems glabrous or sometimes puberulent, commonly white; leaves linear, acute, apiculate, mostly 3-nerved, glabrous or puberulent, evidently or obscurely scabrous-ciliate, 1 to 2 in. long; heads in a dense cymose cluster; involucre 3 to 3½ lines high, the bracts mostly obtuse, in about 3 series, only the small basal ones foliaceous or foliaceous-tipped.—Dry slopes and benches, 3400 to 8600 ft.: n. and e. sides of the Sierra Nevada from Siskiyou Co. to Inyo Co.; s. to L. Cal., n. to Mont., e. to Ariz. The species and varieties are distinguished as follows:

Plants mostly 1½ to 8 ft. high.

Leaves 1 to 2 lines wide, 1 to 3-nerved. . . . . *C. viscidiflorus*.

Leaves 2 to 4 lines wide, 3 to 5-nerved. . . . . var. *latifolius*.

Plants mostly 5 in. to 1½ ft. high.

Herbage glabrous; leaves linear.

Leaves deep green . . . . . var. *pumilus*.

Leaves pale . . . . . var. *stenophyllus*.

Herbage densely puberulent.

Leaves narrowly linear. . . . . var. *puberulus*.

Leaves linear to linear-oblongate. . . . . var. *humilis*.

Var. *LATIFOLIUS* Greene. One to 3½ ft. high; leaves 2 to 4 lines wide, oblongate, obtuse, mucronate, 3 to 5-nerved.—Modoc Co. Var. *PUMILUS* Jepson n. comb. Five to 15 in. high; leaves linear, bright green, glabrous except the scabrous to hispidulose margins.—Eastern Sierra Nevada and S. Cal., 6000 to 8000 ft. (*C. pumilus* Nutt.) Var. *STENOPHYLLUS* Hall. Leaves paler, somewhat rigid, margins hispidulose.—Bear Valley, San Bernardino Mts.; e. to N. Mex. Var. *PUBERULUS* Jepson n. comb. Erect, ½ to 1 ft. high, the branches short, fastigiate, leafy; foliage and twigs scabrous-puberulent to hispidulose; leaves spatulate-linear to linear, 1-nerved, ¼ to 1 in long; heads in small clusters at the ends of the branchlets; involucre barely 3 lines high, their bracts obtusish, mucronulate.—Dry sandy situations, 5000 to 6000 ft.: Mono Co.; n. to B. C., e. to Col. (*C. puberulus* Greene.) Var. *HUMILIS* Jepson n. comb. Plants depressed, much-branched from base, forming broad compact tufts 6 to 8 in. high; herbage finely puberulent; leaves linear or narrowly oblongate, apiculate, 5 to 10 lines long; heads 6-flowered, disposed in compact cymose clusters at the ends of the stems; involucre 4 lines high, viscid, the bracts in about 3 series, the lower lanceolate, foliaceous, the others oblong, obtuse, scarious-margined.—Arid valleys: e. Nevada Co.; e. to Nev., thence n. to Ore. (*C. humilis* Greene.)

2. *C. nauseosus* (Pall.) Britt. Shrub 1 to 5 ft. high, of the Great Basin region, represented in Cal. by the following varieties:

Plants green, the felted tomentum close, inconspicuous.

Involucre bracts with slender recurved tips. . . . . var. *ceruminosus*.

Involucre bracts obtuse to acute.

Bracts strongly keeled in very distinct vertical rows. . . . . var. *mohavensis*.

Bracts moderately keeled. . . . . var. *consimilis*.

Plants gray or white, the felted tomentum apparent.

Tomentum thick, loose.

Corolla commonly less than 3 lines long; style appendages ½ to ¾ line long. . . .

var. *hololeucus*.

Corolla 4 to 5 lines long; style appendages 1 line long. . . . . var. *albicaulis*.

Tomentum thin, compact.

Involucre 5½ to 6 lines high.

Bracts abruptly acute. . . . . var. *occidentalis*.

Bracts acuminate. . . . . var. *bernardinus*.

Involucre 3 to 4½ lines high.

Style appendages about 1 line long. . . . . var. *speciosus*.

Style appendages about ½ line long. . . . . var. *gnaphalodes*.

Var. *CERUMINOSUS* Hall. Rounded shrub  $1\frac{3}{4}$  to 5 ft. high, fastigiately branched, the branches sparsely leafy; herbage covered with a compact yellowish green tomentum, scarcely odorous; leaves narrowly linear, 4 to 9 lines long; involucre puberulent, the bracts with slender recurved tips.—W. Mohave Desert and mts. bordering it on the west. Oct. (*Linosyris ceruminosa* D. & H.) Var. *MOHAVENSIS* Hall. Stems covered with a compact yellowish green tomentum, the leaves for the most part soon deciduous; leaves narrowly linear to filiform, puberulent to glabrate,  $\frac{1}{2}$  to 1 in. long; involucre glabrous, 4 to  $4\frac{1}{2}$  lines high, sharply 5-angled, the bracts strongly keeled, abruptly acute, in 4 or 5 series.—Colorado and Mohave deserts and bordering mts.; n. in the inner South Coast Ranges to Mt. Hamilton. July-Oct. (*Bige-  
lovia mohavensis* Greene. *B. leiospermus* Gray in part.) Var. *CONSIMILIS* Hall. Stems covered with a compact yellowish green tomentum; herbage fragrant; leaves very narrowly linear to filiform, nearly glabrous,  $\frac{3}{4}$  to 2 in. long; inflorescence thyrsoid; involucre puberulent, 3 to  $3\frac{1}{2}$  lines high, the bracts obtuse or acute, in 3 series.—Alkaline flats, n. and e. sides of the Sierra Nevada: Siskiyou Co. to Modoc Co., thence s. to Mono Co.; n. to Ore. and Ida., e. to Col. and N. Mex. Sept.-Oct. (*C. consimilis* Greene.) Var. *HOLELEUCUS* Hall. Two to 6 ft. high, the entire plant white with a thick densely felted tomentum; leaves of the flowering stems commonly spreading or recurved, 4 to 10 lines long, 1 line or less wide; involucre bracts very obtuse; corolla commonly less than 3 lines long; style-appendages  $\frac{1}{2}$  to  $\frac{3}{4}$  line long.—Gravelly slopes, desert region, e. side the Sierra Nevada, 4800 to 5700 ft.: Mono Co. to w. Mohave Desert; n. to Pyramid Lake, Nev. Oct.-Nov. (*Bige-  
lovia graveolens* var. *hololeuca* Gray.) Var. *ALBICAULIS* Rydb. Similar in appearance to var. *hololeucus*; corolla longer (4 to 5 lines); style-appendages 1 line long.—Dry slopes, e. side the Sierra Nevada: Modoc Co. to Mono Co. (*Bige-  
lovia graveolens* var. *albicaulis* Gray.) Var. *OCCIDENTALIS* Hall. Stems rather thinly grayish-tomentose; herbage fragrant; leaves narrowly linear, erect, tomentose to glabrate,  $\frac{3}{4}$  to 2 in. long; involucre bracts ovate to ovate-lanceolate, acute or cuspidate, puberulent, in 3 or 4 series.—More or less rocky situations, 500 to 9000 ft.: inner North Coast Ranges; Sierra Nevada; San Bernardino Mts. Aug.-Oct. (*C. occidentalis* Greene.) Var. *BERNARDINUS* Hall. Stems thinly tomentose; leaves narrowly linear, erect, strict, tomentulose,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long; involucre glabrous, 4 to 5 lines high, the bracts acuminate, in 3 to 4 series.—Mts. of S. Cal., 8000 ft.: San Gabriel, San Bernardino and San Jacinto mountains. Aug. Var. *SPECIOSUS* Hall. Stems thickly leafy; herbage grayish-tomentose; leaves linear, mostly  $1\frac{1}{4}$  to  $2\frac{1}{2}$  in. long; involucre 4 to  $4\frac{1}{2}$  lines high, puberulent, the bracts in 3 or 4 series.—Moderately alkaline slopes and benches, 3000 to 7900 ft.: n. and e. side of the Sierra Nevada from Siskiyou Co. to Mono Co. (*C. speciosus* Nutt.) Var. *GNAPHALODES* (Greene) Hall. Rounded shrub  $1\frac{1}{2}$  to 5 ft. high; heads in a rounded cyme; involucre bracts in 5 distinct vertical rows, tomentose; achenes densely pubescent.—Gravelly or sandy places in the deserts: Mohave Desert; Inyo and Mono Cos.; e. to Nev. (*C. speciosus* var. *gnaphalodes* Greene.)

3. *C. párryi* (Gray) Greene. Shrub 1 to 2 ft. high, of the Great Basin region, represented in Cal. by the following varieties:

Leaves less than 2 lines wide.

Racemes with heads several to many.

Plants more than 6 in. high.

Involucre bracts 12 to 20 in rather obvious vertical rows... var. *nevadensis*.

Involucre bracts 8 to 12, vertical rows obscure... var. *vulcanicus*.

Plants mostly less than 6 in. high... var. *imulus*.

Racemes reduced to 1 or 2 heads each; involucre bracts 8 to 12, vertical rows obscure... var. *monocephalus*.

Leaves 2 to 5 lines wide.

Leaves linear-oblancoate, mostly 2 lines wide; flowers 8 to 11 in head... var. *bolanderi*.

Leaves oblanceolate to elliptic,  $2\frac{1}{2}$  to 5 lines wide; flowers 5 to 7 in head... var. *latior*.

Var. *NEVADENSIS* Hall. Much branched, the branches strict, covered with grayish tomentum; leaves linear, mucronate, tomentose,  $\frac{1}{2}$  to 1 in. long; inflorescence paniculate, the heads 5-flowered, mostly clustered toward the ends of the branchlets; involucre tomentose, 7 lines high; bracts 12 to 20, lanceolate, in about 4 series, in rather obvious vertical rows, all except the

inner herbaceous-tipped.—Montane, 4500 to 9000 ft.: e. Sierra Nevada from Plumas Co. to Alpine Co.; e. to Nev. and Ariz. Aug.-Sept. (*C. nevadensis* Greene.) Var. *VULCANICUS* Jepson n. comb. Leaves commonly greener and more glandular; involueral bracts 8 to 12, not obviously in vertical rows.—Eastern and southern Sierra Nevada: Mono, Inyo and Tulare Cos.; thence w. to Alamo Mt., Ventura Co. (*C. vulcanicus* Greene. *C. asper* Greene.) Var. *IMULUS* Jepson n. comb. Stems spreading at base, less than 6 in. high, the branches erect, leafy, white-tomentose; leaves rigid, spatulate to linear-spatulate, minutely pungent, thinly tomentose, 4 to 8 lines long; involucre tomentose; corollas 4 lines long.—Bear Valley, San Bernardino Mts. (*C. parryi* subsp. *imulus* Hall.) Var. *MONOCÉPHALUS* Jepson n. comb. Much branched, 3 to 10 in. high, tomentose; leaves linear to spatulate-linear; heads usually solitary (or 2), sessile at the ends of the branchlets.—Sierra Nevada, 8000 to 9000 ft., Mono Co. Aug. (*C. monocephalus* Nels. & Ken.) Var. *BOLÁNDERI* Jepson n. comb. About 1 ft. high; leaves thinner, minutely glandular-puberulent, linear-oblongate, acute, mucronulate, 10 to 18 lines long; flowers 8 to 11 in a head.—East slopes or e. summits of the Sierra Nevada, 8000 to 10,000 ft.: Tuolumne and Mono Cos. to Tulare Co. (*Bigelovia bolanderi* Gray.) Var. *LÁTIOR* Hall. Leaves firm, minutely glandular, oblongate to elliptic, mucronulate,  $2\frac{1}{2}$  to 5 lines wide; flowers 5 to 7 in a head.—Siskiyou and Modoc Cos.

4. *C. bloómeri* (Gray) Greene. Low shrub 1 to  $1\frac{1}{2}$  ft. high, the main woody stems with numerous fastigate branches; herbage glabrous; leaves linear, 1 to 2 in. long, carinately 1-nerved beneath, the upper side sometimes a little trough-shaped; heads in a rather dense raceme or narrow panicle; involucre oblong,  $4\frac{1}{2}$  lines high; bracts linear, acute, chartaceous, scarious-margined, villous-ciliate; rays 2 to 4, 3 to  $5\frac{1}{2}$  lines long; achenes sparsely pubescent.—Openly wooded slopes, 7000 to 9000 ft.: Sierra Nevada from Kern Co. to Modoc Co.; Mt. Shasta; n. to Wash., e. to Nev. Aug.-Sept. (*Aplopappus bloomeri* Gray.)

#### 46. *SOLIDAGO* L. GOLDEN ROD

Perennial herbs with alternate leaves. Heads small, the raceme-like clusters aggregated in a rounded pyramidal or spike-like panicle or thyrsus, or in one of our species the heads corymbose. Bracts of the involucre narrow, thin or chartaceous, imbricated in 2 or more series. Both ray- and disk-flowers yellow. Pappus a single series of scabrous and mostly equal capillary bristles, usually dull white. Achenes terete or angular, 5 to 10-nerved. (Latin *solidus* and *ago*, to unite firmly, certain species reputed to have wound-healing properties.)

Stem freely branching; rays commonly more numerous than the disk-flowers.....

1. *S. occidentalis*.

Stems simple; rays commonly fewer or not more numerous than the disk-flowers.

Leaves grayish with a minute rough pubescence, oblong to oblong-obovate.....

2. *S. californica*.

Leaves glabrous or sometimes puberulent (*S. corymbosa* sometimes pubescent).

Heads 3 to 4 lines high.

Leaves commonly serrate above the middle; heads in clusters in a single (more or less interrupted) spike-like thyrsus; coast species.....

3. *S. spathulata*.

Leaves commonly entire; montane species.

Heads usually glomerate in a compact roundish or oblong cluster; herbage not resinous.....

4. *S. corymbosa*.

Heads in a flat-topped cymose cluster; herbage somewhat resinous.....

5. *S. pumila*.

Heads  $1\frac{1}{2}$  to 2 lines high.

Leaves mostly entire; South Coast Ranges; coastal S. Cal.

Heads many in a dense panicle.....

6. *S. confinis*.

Heads few in a narrow thyrsus.....

7. *S. guiradonis*.

Leaves mostly serrate; Sierra Nevada and North Coast Ranges.....

8. *S. elongata*.

1. *S. occidentalis* Nutt. WESTERN GOLDEN ROD. Fig. 929. Stem simple, erect, 3 to 5 ft. high, very leafy, freely and paniculately branching above, the branches terminated by more or less distinctly corymbose clusters of small heads; herbage glabrous; leaves linear or nearly so, entire, sprinkled

929. *Solidago occidentalis* Nutt.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, leaf  $\times \frac{1}{2}$ ; c, head  $\times 2$ ; d, ray-fl.  $\times 4$ ; e, achene and pappus  $\times 4$ .

Spanish-Californians. Var. *NEVADENSIS* Gray. Thyrsus and its clusters more secund; heads rather smaller; involucre mostly glabrous.—Dry situations, 2000 to 5300 ft.: Sierra Nevada from Plumas Co. to Fresno and Inyo Cos.; e. to Nev.

3. *S. spatulata* DC. COAST GOLDEN ROD. Stems simple, 15 to 18 in. high, one or several from the decumbent base which is thickly clothed with broad leaf-bases; herbage glabrous, slightly glutinous; leaves mostly basal, the basal spatulate or obovate, more or less serrate above the middle, narrowed below to a margined petiole, the whole 1 to 2 in. long; cauline leaves scattered, rather smaller; heads 3 to 4 lines high, in clusters of 4 to 12, the clusters borne in a single spike-like thyrsus terminating the stem; bracts of the involucre linear-oblong to oblong; rays 5 to 10, inconspicuous, commonly shorter than the disk; disk-flowers 8 to 20.—Sandy hills along the coast: Pt. Reyes to Monterey.

4. *S. corymbosa* Nutt. Stems simple, leafy,  $\frac{1}{4}$  to  $1\frac{1}{2}$  ft. high, few or several from a branching rootstock, the leaves chiefly basal, the cauline few and smaller; herbage glabrous or puberulent; leaves oblong-spatulate to oblanceolate, entire or sometimes serrate, 1 to  $3\frac{1}{2}$  in. long, narrowed to a petiole  $\frac{1}{2}$  to as long; heads 3 lines high, relatively few in a single roundish terminal cluster or sometimes 1 or 2

with minute clear or dark dots, 1 to 4 in. long; heads 2 to  $2\frac{1}{2}$  lines high; bracts of involucre chartaceous, linear-lanceolate; rays 16 to 20; disk-flowers 8 to 14; achenes turbinate.—Marshes, stream beds and river banks, 10 to 2000 ft.: throughout cismontane Cal.; n. to B. C., e. to Rocky Mts. Aug.-Oct.

2. *S. californica* Nutt. COMMON GOLDEN ROD. Fig. 930. Stem erect, simple, rather densely leafy, 2 to 4 ft. high, ending above in a terminal panicle; herbage grayish with a minute rough pubescence; leaves oblong to oblong-obovate, serrate or entire, acute, attenuate below, 1 to  $4\frac{1}{2}$  in. long, the upper smaller, narrow and entire; panicle usually compact, dense, not leafy, 4 to 13 in. long, made up of raceme-like clusters (or when elongated, secund), seldom recurved at tip, sometimes spreading in age; heads 2 to  $3\frac{1}{2}$  lines high; bracts of the involucre oblong-linear or lanceolate, somewhat pubescent; rays 7 to 12, pale yellow, about as many as the disk-flowers; achenes pubescent.—Dry plains or hillslopes, 100 to 4000 (or 6000) ft.: throughout cismontane Cal. Sept.-Nov. Orojo de Liebre of the

930. *Solidago californica* Nutt.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, leaf  $\times \frac{1}{2}$ ; c, ray-fl.  $\times 6$ .

loose axillary clusters; ray-flowers 9 to 16; disk-flowers 13 to 45.—High montane, 8500 to 12,000 ft.: Sierra Nevada; e. to the Rocky Mts. July-Aug. (*S. multiradiata* var. *scopulorum* Gray.)

5. *S. pumila* T. & G. Stems erect, usually many from a branched woody root-crown, simple, 5 to 8 in. high, leafy but the leaves chiefly basal; herbage glabrous, somewhat resinous; basal leaves oblanceolate to linear-oblanceolate, acute, rigid, 3-nerved, attenuate below to a petiole, the whole 1 to 4 in. long; cauline leaves narrow, sessile,  $\frac{3}{4}$  to 2 in. long; heads 3 to 4 lines high, borne in a flattish-topped cymose cluster; involucre bracts rigid, somewhat carinate, imbricated in several series; achenes 5-nerved, broad and flattish, rather longer than the rigid pappus.—Rocky ridges, 3500 to 9000 ft.: Providence Mts.; e. to Tex., n. to Ida. July.

6. *S. confinis* Gray. Stem  $1\frac{1}{2}$  to 4 ft. high, simple and leafy up to the terminal panicle; herbage pale green, glabrous or rarely minutely pubescent above; leaves narrowly lanceolate, acuminate, entire or sometimes serrate, narrowed to the sessile base, 2 to 6 in. long, the basal petioled; panicle dense, oblong, or sometimes more compound and pyramidal, the heads 2 lines high; rays scarcely surpassing the disk; achenes minutely to canescently pubescent.—Moist places, 1000 to 6000 ft.: South Coast Ranges; coastal S. Cal.; s. to L. Cal. July-Nov. Var. *LUXURIANS* Jepson n. comb. More robust and the herbage succulent; leaves thickish, broadly lanceolate or oblong; inflorescence oblong or pyramidal; heads larger.—Swampy ground, often in alkaline soil in the vicinity of hot springs: San Bernardino Mts.; Ventura Co. (f. *luxurians* Hall.)

7. *S. guiradonis* Gray. Stem slender, simple,  $2\frac{1}{2}$  ft. high, bearing rather few heads in a simple virgate thyrsus; leaves linear-lanceolate, acuminate, entire, attenuate toward base, thickish, 3 to 7 in. long; heads 1 to  $1\frac{1}{2}$  lines high; involucre bracts lanceolate or linear, acutish; rays 8 to 15, small; achenes pubescent.—Stream banks, San Carlos Range. Aug.

8. *S. elongata* Nutt. Stem simple, erect, leafy, puberulent, 3 ft. high, ending above in a thyrs-like panicle; leaves oblong to broadly oblanceolate or linear-oblanceolate, acute, attenuate below to a narrow winged base, sharply serrate, except at base, or entire, 2 to  $3\frac{3}{4}$  in. long, almost or quite glabrous, scabrous-margined, often bright green; panicle dense, thyrs-like, the heads little if at all secund in the raceme-like clusters; heads small,  $1\frac{1}{2}$  to  $2\frac{1}{4}$  lines high or less; bracts of the involucre thin, linear; rays 10 to 16, narrow, usually more numerous than the disk-flowers.—Along the coast, 100 to 3000 ft., from San Mateo Co. to Humboldt and Siskiyou Cos.; Sierra Nevada, 3000 to 6600 ft., from Tulare Co. to e. Siskiyou Co.; n. to B. C. and Mont. July-Aug.

#### 47. CHRYSOPSIS Ell.

Perennial herbs, sometimes suffrutescent, with entire leaves. Heads medium-sized, solitary or paniculate. Rays present or none. Involucre campanulate to hemispherical, its bracts narrow and regularly imbricated. Flowers yellow. Style-appendages linear-filiform to subulate. Achenes compressed or turgid. Pappus brownish or ferruginous, of numerous capillary bristles, with or without a short outer row of little scales. (Greek *chrusos*, golden, and *opsis*, aspect, from the color of the blossom.)

Heads with rays; outer pappus linear-squamellate. . . . . 1. *C. villosa*.  
Heads rayless; corolla sparingly hirsute; outer pappus none or indistinct.

Herbage hirsute with spreading white hairs; involucre bracts linear-lanceolate, in 3 or 4 series, the longer often equaling the (3 to  $3\frac{1}{2}$  lines long) pappus. . . . . 2. *C. oregana*.

Herbage somewhat puberulent; involucre bracts broader, in 2 series (except in var. *multibracteata*), the longer little exceeding the achenes, the pappus exceeding the bracts by  $2\frac{1}{2}$  to 3 lines.

Leaves distinctly apiculate or mucronate; achenes villous, not glandular. . . . . 3. *C. breweri*.

Leaves merely acute; achenes with rather long gland-tipped hairs. 4. *C. shastensis*.

1. *C. villosa* Nutt. Stems leafy, branched, several to many from a woody perennial base, 5 to 11 in. high; herbage grayish with strigose or hirsute pubescence; leaves oblong-spatulate, entire,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; heads rather

931. *Chrysopsis villosa* var. *bolanderi* Gray;  
a, fl. stem  $\times \frac{1}{2}$ ; b, head  $\times 1$ ; c, disk-fl.  $\times 2$ ;  
d, ray-fl.  $\times 2$ .

few, solitary or clustered at the ends of leafy branchlets, naked or with a few small foliaceous bracts; involucre campanulate,  $3\frac{1}{2}$  to 4 lines high, their bracts oblong to lanceolate; rays yellow; achenes villous, the outer pappus of narrow scales.—Montane, 3600 to 5800 ft.: Placer Co. to Modoc Co.; n. to B. C., e. to Minn. and Tex. June. Var. *BOLANDERI* Gray. Fig. 931. Stems low, 3 to 12 in. high, rather stout, several from the woody base; herbage villous-pubescent and often scabrous, greenish or sometimes silky; leaves oblong-spatulate, mucronate, narrowed below to a distinct petiole or the upper sessile and less spatulate, or widest at the middle and tapering to both ends, mostly 1 in. long; heads 5 to 7 lines high, leafy-bracted, solitary or few in a corymbose cluster; involucre campanulate or cylindric-campanulate, their bracts lanceolate or subulate, villous-pubescent, in a few ranks; rays 4 to 6 lines long; pappus-bristles minutely scabrous, in a single row; outer pappus of little scales; achene silky,  $\frac{3}{4}$  line long.—Dry hillsides or rocky hilltops near the coast: San Bruno Hills; San

Francisco; Berkeley Hills and northward to the ocean bluffs of Mendocino Co., where it occurs in typical form. June-Sept. Var. *ECHIOIDES* Gray. Stems rigid, erect, 10 to 16 in. or even  $2\frac{1}{2}$  ft. high, usually suffrutescent at base; herbage densely hirsute-canescens; leaves rigidulous,  $\frac{1}{2}$  in. long, the lowermost longer; involucre bracts hispid-pubescent, the foliose bracts often hispid-ciliolate; pappus-bristles in a single row; outer pappus consisting of very short little scales, not concealed by the pubescence of the achene.—Dry ground: Vaca Mts. and s. through the San Joaquin Valley and South Coast Ranges to San Diego Co. Var. *SÉSSILIFLORA* Gray. Stems few or several from a woody root-crown,  $1\frac{1}{2}$  to 2 ft. high, freely branching above, the heads 4 to 5 lines high and solitary, or 2 or 3 together at the ends of long branchlets; herbage hispid or villous-canescens or greenish, somewhat viscid; bracts sparsely hirsute, granulose-glandular; rays 3 to 4 lines long; corolla-tube 4-angled toward the base; slender little scales of the outer pappus often concealed by the densely villous hairs clothing the achene.—Santa Cruz Mts. and s. to coastal S. Cal. Var. *FASTIGIATA* Hall. Stems densely leafy above the base; leaves elliptic to oblong-ovate, obtuse or acute, mucronate, silky-tomentose, especially beneath, sessile, 5 to 11 lines long; outer pappus sometimes present as short bristles.—Rocky washes or dry slopes, San Gabriel Mts.; also in the Sierra Nevada in Fresno Co. (*C. fastigiata* Greene.) Var. *CAMPHORATA* Jepson n. comb. Stems many from a woody root-crown, 1 to 3 ft. high; herbage densely glandular, somewhat hirsute; leaves oblong-lanceolate; heads rather few, cymose-paniculate; foliaceous bracts usually several, small; involucre turbinate to campanulate; achenes villous, the outer pappus of narrow scales.—Santa Cruz Mts. July. (*C. camphorata* Eastw.)

2. *C. oregana* Gray. Stems several from the base, very freely and often densely branched, the branchlets often long, forming a low bush  $1\frac{1}{2}$  to 2 ft. high; herbage hirsute with spreading white hairs but the aspect green; leaves oblong to lanceolate, ascending,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long, those of the branchlets 3 to 6 lines long; heads few or numerous, naked, the peduncles with 1 or 2 subulate bracts; bracts linear-lanceolate, in several series; corolla very

slender, sparingly hirsute about the middle or on the lobes only; outer pappus none; achenes oblong.—Gravelly beds of streams in the Coast Ranges, 100 to 1200 ft.: Santa Clara Co. to Lake Co.; n. to Ore. Aug.-Sept. Var. *RÜDIS* Jepson. Stems 8 to 24 in. high, arising from a stolon-like rootstock, simple below and bearing above a subcorymbose or paniculate cluster of heads; herbage hispid-pubescent, but not hoary, glandular; leaves narrowly oblong, varying to lanceolate, acute or acuminate, cuspidate, the lower more often widest above the middle,  $\frac{3}{4}$  in. long; involucre nearly or quite equaling the flowers, its bracts scarious-margined, 1-nerved.—Sandstone stream beds: Napa Valley. Sept.-Oct. Var. *SCABÉRRIMA* Gray. Leaves small, these and the branches very hispid-scabrous.—Monterey Co.; Tulare Co. June.

3. *C. brèweri* Gray. Stems erect from a hard root-crown, slender, very leafy, corymbosely branched above with erect or suberect branches,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  ft. high; herbage puberulent, commonly a little glandular; leaves oblong to ovate-lanceolate, apiculate, sessile,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; heads broadly turbinate, on naked or leafy-bracteate peduncles at the ends of the branchlets; involucre 3 to 4 lines long; involucre bracts few, rather broadly lanceolate, in 2 series, little exceeding the achenes; rays none; flowers yellow; achenes strigose-pubescent; pappus much exceeding the involucre, the outer pappus setulose.—Montane, 5000 to 9500 ft.: Sierra Nevada from Tulare Co. to Nevada Co. July-Aug. Var. *MULTIBRÁCTEATA* Jepson n. var. Bracts narrowly ovate to oblong-lanceolate, sometimes contracted above the middle, about 3-ranked.—Siskiyou Co. (Sisson, J. W. Congdon, type). Aug.

4. *C. shasténsis* Jepson n. sp. Stems freely branched, leafy, about 1 ft. high; stems, branches and peduncles pilose with spreading gland-tipped hairs; leaves ovate, sessile, 7 to 13 lines long, subacute; heads terminating the branchlets and thus corymbosely arranged, the peduncles  $\frac{3}{4}$  to 2 in. long, mostly naked; involucre 4 lines high, their bracts oblong-ob lanceolate, acute, somewhat chartaceous, pubescent with gland-tipped hairs; rays none; flowers apparently reddish brown; achenes striately angled, pubescent with ascending gland-tipped hairs; pappus much exceeding the involucre in mature heads.—Mt. Shasta (Horse Camp, 8000 ft., Jepson 51i, type).

*C. WRIGHTII* Gray. Herbage pubescent with fine soft hairs; involucre bracts all partly herbaceous, the inner ones nearly equaling the flowers; rays lacking; corolla-limb slightly hairy outside; outer pappus obscure; inner pappus extremely copious (ex char.).—San Bernardino Mts. (acc. Gray), but not recollected.

#### 48. *HÉTÉROTHÈCA* Cass.

Tall hairy herbs with heads of yellow flowers in a terminal corymbose panicle. Involucre broadly oblong (or ovate in fruit), its narrow bracts closely imbricated in many series, without spreading tips. Both ray- and disk-flowers numerous and fertile. Ray-achenes triangular, with broad sides and narrow back; pappus none or caducous. Disk-achenes compressed, silky-hirsute; pappus double, the copious inner bristles long, capillary and scabrous, the outer of short and stout bristles or scales or inconspicuous. (Greek heteros, different, and theke, a case or ovary, the achenes of disk and ray dissimilar.)

932. *Heterotheca grandiflora* Nutt.; a, leaves  $\times \frac{1}{2}$ ; b, fl. branchlet  $\times \frac{1}{2}$ ; c, disk-achene and pappus  $\times 2\frac{1}{2}$ ; d, ray-achene  $\times 2\frac{1}{2}$ .

1. *H. grandiflora* Nutt. Fig. 932. Stem mostly simple below, 2 to 5 ft. high, ending above in a panicle; peduncles with gland-tipped hairs; leaves ovate, varying to elliptic or oblong, serrate, 1 to 3 in. long, the lower and basal long-petioled, the upper sessile by a rather broad base; heads rather large (4 or 5 lines high); rays about 30; pappus of disk-flowers as long as or longer than the achene, in age brick-red; outer pappus inconspicuous.—Sandy valleys, 20 to 1200 ft.: coastal S. Cal.; n. to the San Joaquin and Santa Clara valleys. May-Oct.

#### 49. *CONYZA* Less.

Ours herbs with rather small heads borne in cymes, racemes or panicles. Heads composed of numerous pistillate flowers and a few central perfect flowers. Bracts of the involucre in 2 or 3 series, linear, membranous-margined in ours. Flowers dull white or yellowish. Pistillate flowers fertile, in 2 or 3 outer circles; corollas filiform and merely 2 to 4-notched at apex or truncate, much shorter than the style. Perfect flowers few, central, mostly fertile; corolla tubular-funnelform, 5-lobed, little shorter than the style. Rays none. Achenes small, compressed. Pappus commonly a single series of a few capillary bristles. (Greek name for fleabane, supposedly from *konops*, a flea.)

1. *C. coulteri* Gray. Annual; stem erect, simple below, paniculately branched above, 1 to 3 ft. high; herbage hirsute and glandular-puberulent; leaves narrowly obovate to oblong or oblong-oblancheolate, unequal and often coarsely serrate or pinnatifid, sessile or somewhat clasping,  $\frac{1}{2}$  to  $2\frac{1}{4}$  in. long; panicle ample, 8 to 24 in. long; heads 2 lines high, the involucre shorter than the soft pappus; corolla of pistillate flowers with entire apex, about  $\frac{1}{2}$  as long as the style; perfect flowers 5 to 7.—Moist valley flats, commonly in alkaline soil, 190 to 1200 ft.: coastal S. Cal.; Colorado Desert; Kern Lake, upper San Joaquin Valley; Santa Clara Valley; Santa Rosa; lower San Joaquin River; Ione; Nev. to Col. and Mex. Sept.

#### 50. *PENTACHAETA* Nutt.

Low and very slender annuals with narrowly linear entire leaves. Heads small, solitary, or somewhat clustered at the ends of more or less naked branches, nodding in the bud. Receptacle convex. Involucre turbinate-campanulate, its bracts in 2 series, narrowly oblong, thin, scarious-margined, mucronulate, appressed. Disk-corollas yellow or rose-red, very slender; rays white, pink or yellow, or none. Achenes oblong, flattened, hirsute-pubescent. Pappus of 5 slender bristles, often with 2 reduced or wanting, or all obsolete. (Greek *pente*, five, and *chaite*, a bristle, in allusion to the pappus.)

Flowers of the ray white or purple-tinged or wanting; disk-corollas yellow or reddish, or changing to purple in age.

Disk-corollas yellow; herbage glabrous; stem simple or with 1 or 2 branches near the base ..... 1. *P. bellidiflora*.

Disk-corollas rose-red or reddish; herbage more or less pubescent.

Disk-corollas urnshaped-campanulate; stem simple or with simple branches from the base, erect; peduncles white-villous beneath the head. .... 2. *P. exilis*.

Corollas all filiform, truncate or merely toothed at apex; stem dichotomous, and disposed to be diffuse; peduncles with somewhat scattered hairs. .... 3. *P. alsinoides*.

Flowers of both ray and disk golden yellow (rays occasionally yellow only at base in *P. aurea*); heads 4 to 12 lines broad.

Involucre glabrous.

Bracts of involucre very unequal; leaves narrowly linear to filiform. .... 4. *P. aurea*.

Bracts of involucre equal; leaves oblong to spatulate. .... 5. *P. fragilis*.

Involucre pubescent ..... 6. *P. lyoni*.

1. *P. bellidiflora* Greene. Stems simple or sparsely branched near the base, reddish, 3 to 4 in. high; herbage glabrous; heads 4 to 7 lines broad, solitary, terminating the stems or branches; involucre broadly campanulate, 2 to  $2\frac{1}{2}$  lines high; bracts oblong, acute or mucronate, purplish, equal; rays 2 to 14, white, 1 to 2 lines long; pappus bristles 5.—Marin Co. Apr.

2. *P. exilis* Gray. Fig. 933. Stem simple or branched from the base with erect branches,  $2\frac{1}{2}$  to 4 in. high, the heads solitary on the end of the stem or branches; herbage purplish; leaves filiform or nearly so, 3 to 12 lines long;

involucres narrowly campanulate, 2 lines high; disk-corollas rose-red, widening upward, the throat evidently contracted beneath the minute teeth, the 3 to 5 outer or ray-flowers with the corolla reduced to a filiform tube, the tube truncate or merely toothed at apex; achenes oblong-turbinate, villous; pappus reduced to 3 or 5 short cusps or sometimes abortive.—Hillslopes or valley flats, 100 to 1500 ft.: Salinas Valley to Eldorado Co. Apr.-May. (*Aphantochaeta exilis* Gray.) Var. *GRAYI* Jepson n. comb. Heads broadly campanulate; rays 8 to 14, 2 lines long; pappus-bristles 3 to 5.—Dry hills, Santa Clara Co. to Sonoma Co. (*P. exilis* Gray, Syn. Fl.)

3. *P. alsinoides* Greene. Stems diffusely and somewhat dichotomously branching, 2 to 5 in. high; leaves narrowly linear, 4 to 11 lines long; involucres narrowly turbinate, 1 to  $1\frac{1}{4}$  lines high, containing 3 to 7 flowers; involueral bracts 5 to 7 or 9; disk-corollas filiform, with minute teeth; rays none; achenes obovate-clavate; pappus-bristles 3, very slender.—Foothills, 50 to 1000 ft.: San Luis Obispo Co. to Humboldt Co.; Eldorado Co. Apr.-May.

4. *P. aurea* Nutt. Stem very diffusely branched or nearly simple, 3 to 12 in. high; herbage glabrous or minutely and sparsely pubescent; leaves filiform to narrowly linear,  $\frac{1}{8}$  to  $1\frac{1}{4}$  in. long; heads 7 to 11 lines broad; involucres nearly hemispheric,  $2\frac{1}{4}$  to 3 lines high; involueral bracts imbricated, broadly linear or lanceolate, acute or acuminate, with scarious margins; rays golden yellow, conspicuous, 2 to 3 lines long; disk-corollas slightly irregular; pappus-bristles 5 to 8.—Hills and valley flats, 200 to 5000 ft.: San Luis Obispo Co. to San Diego Co.; e. to west side Colorado Desert. Apr.-July.

5. *P. fragilis* Bdg. Stems wiry, diffusely branched from the base, 2 to 4 in. high; leaves oblong to spatulate, ciliate, 1 to 3 lines long; heads 4 to 5 lines broad, solitary at the ends of the branches; involucres broadly campanulate, 2 lines high; involueral bracts oblong, equal, scarious-margined, ciliate and somewhat fringed at tip; ray-flowers yellow; pappus-bristles 7 to 12, scabrous, very fragile.—Montane, 2500 to 4000 ft., Sierra Nevada in Kern Co. June.

6. *P. lyonii* Gray. Stem erect, simple below or branched throughout,  $\frac{1}{2}$  to  $1\frac{1}{2}$  ft. high; herbage lightly pubescent to glabrate; leaves narrowly linear,  $\frac{1}{2}$  to 2 in. long; heads solitary on the ends of the corymbose branches, 6 to 8 lines broad; involucre  $1\frac{3}{4}$  to  $2\frac{1}{4}$  lines high, hirsute; involueral bracts linear, acute to subulate-acuminate, with scarious margins; flowers golden-yellow; pappus-bristles 8 to 12, somewhat dilated at base.—S. Cal. coast line: San Diego; Wilmington; Santa Catalina Isl.

#### 51. *BÉLLIS* L. DAISY

Low herbs with (in ours) basal leaves and solitary heads on scape-like peduncles. Disk yellow. Rays white, or tinged with pink. Involucre hemispherical, its bracts wholly herbaceous and green, equal, in 2 rows. Receptacle conical. Achenes flattened, without pappus. (Latin *bellus*, pretty.)

1. *B. perennis* L. GARDEN DAISY. Tufted perennial; scapes 3 to 6 in. high; leaves obovate, sparingly toothed, narrowed at base to a margined petiole, 1 to  $1\frac{1}{4}$  in. long; peduncle about 4 in. high; rays about 50.—Native of Eur., an occasional escape from gardens: Berkeley; Mill Valley; established about Humboldt Bay and Trinidad.

933. *Pentachaeta exilis* Gray;  
a, habit x  $\frac{2}{3}$ ; b, bract of involucre x 4; c, fl. x 4.

52. *LESSINGIA* Cham.

Annuals with branching stems and commonly panicle heads. Heads rather small, campanulate to turbinate, usually narrow, 5 to 35-flowered. Bracts of the involucre imbricated in several appressed ranks. Receptacle flat. Flowers yellow, purplish, pink or white, perfect. Corollas with linear lobes, or those of the marginal rows enlarged, more deeply cleft on the inside, and simulating a palmately lobed ligule. Achenes all fertile, turbinate or cuneate, more or less flattened, silky-villous. Pappus commonly of numerous unequal scabrous bristles, usually turning reddish brown. (Named for the Lessings, German family of scientists and authors.)

Style-branches long-subulate, the hairs distributed all along the appendages.

Flowers yellow; plants spreading, much branched; upper leaves and involucre bracts margined with large yellowish glands.....1. *L. lemmoni*.

Flowers pale blue or purplish; plants less branched, rather fastigiate; upper leaves and involucre bracts scarcely glandular-puberulent.....2. *L. fastigiata*.

Style-branches blunt, the hairs crowded in penicillate tufts at the ends with a slender setiform appendage sometimes protruding.

Distinct tack-like glands none.

Plants with stems erect or none; apparently not glandular.

Stems slender,  $\frac{1}{2}$  to 2 ft. high; branches rigid, rather fastigiate.

Inflorescence paniculate.....3. *L. leptoclada*.

Inflorescence virgate.....4. *L. virgata*.

Stout depressed dwarfs,  $\frac{1}{2}$  to 2 in. high.....5. *L. nana*.

Plants with stems spreading or ascending; bracts and branchlets somewhat glandular-puberulent beneath tomentum.

Tomentum becoming for most part deciduous.....6. *L. germanorum*.

Tomentum persistent or partially deciduous on involucre bracts.....

7. *L. tenuis*.

Distinct tack-like glands on leaf and bract margins.

Outer corollas exceeding inner, irregularly cleft.....8. *L. glandulifera*.

Corollas equal, all nearly regular.....9. *L. ramulosa*.

1. *L. lemmoni* Gray. Stem diffusely branched from base, 3 to 8 in. high; herbage persistently tomentose, the bracts and upper leaves bearing yellowish glands on the margins; leaves oblong to linear, entire,  $\frac{1}{4}$  to  $\frac{3}{4}$  in. long; heads terminating the branchlets; involucre turbinate, the bracts oblong, obtuse; flowers yellow, the outer larger than the inner; style-branches long-subulate; achenes white-villous, the pappus brownish.—Desert flats, 2000 to 4000 ft.: Mt. Pinos; Mohave Desert (Bissel sta., Kramer sta., Indian Wells); Inyo Co. (Little Owens Lake, Bishop); e. to Ariz. June.

2. *L. fastigiata* Greene. Stems 1 to several, rather slender, strict, mainly erect, somewhat fastigiately branched at or above the middle, 3 to 10 in. high; herbage tomentose below, becoming more or less deciduous above and scarcely glandular-puberulent; leaves oblanceolate to oblong, pungently acute, entire or somewhat serrate, 4 to 14 lines long; heads solitary, or 2 or 3, at the ends of the rigidly filiform branchlets.—Grassy flats, 2000 to 4000 ft.: Humboldt Co. to Siskiyou Co., thence se. to Butte Co.

3. *L. leptoclada* Gray. Stem simple below, branching above,  $\frac{1}{2}$  to 2 ft. high; herbage tomentose or becoming partially glabrate; lower leaves denticulate, those of the branchlets ovate or lanceolate, acute, sometimes mucronate, with somewhat sagittately adnate base; branchlets virgate and almost filiform, bearing few (sometimes glomerate) or solitary heads; involucre turbinate; bracts in many ranks, persistently tomentose, greenish at tip and cuspidate; corollas conspicuously exserted; style-branches bluntly penicillate, only the tips barely exserted at anthesis; pappus-awns paleaceous or more or less united into groups at base.—Open slopes and grassy flats, 1100 to 5000 ft.: Sierra Nevada from Eldorado Co. to Tulare Co.; Coast Ranges from Marin Co. to Santa Clara Co. Var. *HOLOLEUCA* Jepson n. comb. Inner involucre bracts not cuspidate or less evidently so; cauline leaves mainly ovate, more uniformly mucronate than in species.—Pastures, San Mateo Co. to Sonoma and Yolo Cos. (*L. hololeuca* Greene.)

4. *L. virgata* Gray. Plant 1 ft. high, with stem and virgate branches rigid; herbage woolly, becoming somewhat glabrate; leaves ovate or oblong, sessile, entire,  $\frac{1}{4}$  to  $\frac{1}{2}$  in. long, the upper appressed, concave, carinately nerved; heads solitary and sessile in the axil of a leaf of nearly the same length, thus forming a somewhat spicate inflorescence; involucre cylin-

drical, woolly, 5 to 7-flowered.—Plains and bordering foothills of the Great Valley. June-Sept.

5. *L. nana* Gray. Depressed dwarf  $\frac{1}{2}$  to  $2\frac{1}{4}$  in. high, the whole plant densely tomentose with thick wool; stems 1 or several from the base, the heads borne at the ground or in small terminal clusters; heads 10 to 12-flowered, 5 to 6 lines long, leafy-bracted; leaves oblanceolate to linear,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; outer bracts of involucre linear-lanceolate, somewhat herbaceous; inner bracts white, tapering into a long pearly white awn which conspicuously equals or exceeds the flowers and the pappus; pappus showy, dark red or brownish; achenes very short and turgid.—Sandy plains and foothills on the eastern side of the Sacramento and San Joaquin valleys, 200 to 1000 ft., from Amador Co. to Kern Co. July-Aug. (*L. parryi* Greene.)

6. *L. germanorum* Cham. Stem diffusely branched or erect,  $\frac{1}{3}$  to  $1\frac{1}{2}$  ft. high; herbage with appressed white tomentum, mainly deciduous in age, at least on the branches, the exposed surface puberulent, only slightly glandular; leaves pinnatifid, those of the branchlets oblanceolate or linear, mostly entire, 1 to 4 lines long; heads 21 to 25-flowered; involucre hemispherical; involucre bracts with greenish tips or the outer ones wholly greenish; pappus-bristles about 35, 1 to  $1\frac{1}{2}$  times as long as the achene.—Sandy hills along the coast: San Francisco to San Luis Obispo Co. Aug.-Oct.

7. *L. tenuis* Cov. Stems somewhat flexuous and diffuse, flowering when simple or little branched and 1 to 3 in. high, or increasing to 8 in. high and becoming much branched and spreading; herbage mainly tomentose, the partially exposed branchlets and involucre glandular-puberulent; leaves oblong or spatulate, entire or the lower sometimes pinnately lobed or parted; corollas variable, purple or yellow, or the inner yellow and outer pink, subregular; pappus-bristles about 20.—Montane, 2500 to 5300 ft.: San Benito Co. to n. Ventura Co. June. (*L. ramulosa* var. *tenuis* Gray.) Var. *JAREDII* Jepson n. var. Stems a little stouter; leaves more uniformly pinnately toothed to parted; corollas yellow, the marginal ones the larger; pappus of 5 to 8 paleaceous awns.—San Luis Obispo Co. (Estrella, *L. Jared*, type). June. (*L. parvula* Greene in part.)

8. *L. glandulifera* Gray. Stem erect, stoutish, paniculately very much branched, 1 to  $2\frac{3}{4}$  ft. high; herbage glabrate or the leaves with persistent wool; leaves of the main stem or main branches ovate to oblanceolate, toothed or cleft,  $\frac{1}{2}$  to 1 in. long, those of the branchlets numerous, sometimes crowded, ovate to linear, white-woolly or green,  $\frac{1}{2}$  to 2 lines long, with the margin bearing yellowish tack-shaped glands; involucre broadly turbinate to campanulate, their bracts gland-bearing; heads 20 to 35-flowered; pappus-bristles of inner flowers as long, of outer flowers shorter than corolla.—Plains and montane flats, 10 to 5000 ft.: inner South Coast Ranges; San Joaquin Valley; Inyo Co.; Mohave Desert; Colorado Desert; coastal S. Cal. July-Sept. Var. *PECTINATA* Jepson n. comb. Leaves pinnatifid with toothed segments; herbage very glabrate.—Monterey. (*L. pectinata* Greene.) Var. *ALBIFLORA* Jepson n. comb. Divaricately spreading, about  $\frac{1}{2}$  ft. high and  $1\frac{1}{2}$  ft. across; flowers white, about 8 in each head.—Rose sta., Kern Co. (*L. albiflora* Eastw.)

9. *L. ramulosa* Gray. Stems slender,  $\frac{1}{3}$  to  $1\frac{1}{2}$  ft. high, loosely branching, granulose-glandular above or with minute tack-shaped glands; herbage tomentose to glabrate; lowest leaves spatulate or oblong, denticulate or entire, the upper lanceolate, mostly entire, those of the branchlets with partly clasping base; heads 10 to 25-flowered, 3 to 4 lines long, terminating diffuse slender branchlets; involucre turbinate or campanulate; corollas short, purple; pappus-bristles longer than the achene, 20 or more, paleaceous or more or less coalescent at base into sets.—Dry hills, 50 to 1500 ft.: Coast Ranges from Santa Clara and Marin Cos. to Mendocino Co. July-Sept. Var. *ADENOPHORA* Gray. Upper herbage with tack-shaped glands more conspicuous; pappus-bristles in 5 paleaceous-aristiform sets or reduced to 5 awns.—North Coast Ranges in northern Napa Co., Lake and Colusa Cos. July-Aug. Var. *MICROCEPHALA* Jepson n. comb. Stems and branchlets exceedingly slender, strict; upper leaves scale-like; heads very small, 3 to 5-flowered.—Foothills: Antioch; Eldorado Co. Aug. (*L. leptoclada* var. *microcephala* Gray. *L. nemoclada* Greene.)

53. *CÓRETHRÓGYNE* DC.

Perennial herbs, some resembling *Lessingia*, others *Aster*, but flowering in late spring or summer. Herbage whitened when young with a cotton-like tomentum, which is often deciduous in age. Heads radiate, solitary or corymbose or paniculate. Involucre hemispherical to turbinate, imbricated. Receptacle pitted. Rays purple, lavender or violet. Disk-flowers yellow. Ray-flowers sterile. Style-appendages comose or with a bearded tuft. Achenes silky or pubescent. Pappus reddish brown, of rigid capillary bristles, present in the disk, reduced or none in the ray. (Greek *korethron*, besom, and *gune*, style, on account of the brush-like tuft of hairs on the style tips.)

Stems decumbent or prostrate, flexuous.

Heads 9 to 19 lines broad, including rays; style-branches completely exserted at height of anthesis ..... 1. *C. californica*.

Heads 6 to 9 lines broad, including rays; style-branches only partially exserted at height of anthesis ..... 2. *C. leucophylla*.

Stems ascending to strictly erect; style-branches only partially exserted during anthesis.... 3. *C. flaginifolia*.

1. *C. californica* DC. Stems mostly prostrate or decumbent at base, densely leafy below, simple or somewhat branched,  $\frac{1}{3}$  to  $1\frac{1}{2}$  ft. high; herbage white with dense cottony tomentum, this deciduous from the upper parts of the plant and exposing the glandular-puberulent surface; leaves spatulate to obovate, narrowed to a distinct petiole, entire or serrate toward the apex,  $\frac{3}{4}$  to 2 in. long, or the uppermost becoming reduced and bract-like; heads solitary on somewhat flexuous scape-like peduncles at the ends of the stems and branches; involucre campanulate, 4 to  $4\frac{1}{2}$  lines high, the outer bracts largely herbaceous; rays deep purple to lilac, 6 to 7 lines long, their minute sterile achenes bearing a pappus one or more of whose divisions are often developed in various paleaceous forms simulating inner bracts; style-branches densely comose, completely exserted at height of anthesis; pappus reddish brown.—Along the coast from San Mateo Co. to Humboldt Co. May-Aug. (*C. obovata* Benth. *C. californica* var. *obovata* Jepson.)

2. *C. leucophylla* Menzies. Depressed somewhat scraggly plant, the decumbent stems  $\frac{1}{2}$  to 1 ft. long, bearing numerous ovate-spatulate leaves  $\frac{1}{2}$  in. long or less; herbage persistently white-woolly, the involucre less densely so; heads 6 to 9 lines broad; rays purple; style-branches densely comose, partially exserted during anthesis.—Sand dunes by the sea at Monterey: Pacific Grove; Pt. Pinos; Asilomar.

3. *C. flaginifolia* (H. & A.) Nutt. Stems several from the root-crown, slender, flexuous, decumbent at base, commonly ascending,  $\frac{1}{2}$  to  $1\frac{1}{2}$  ft. high; tomentum often floccose-deciduous, the exposed surface scarcely or not at all glandular; leaves broadly oblanceolate, sharply serrate at apex or above the middle, gradually narrowed to a petiole, the whole 1 to 3 in. long; heads  $\frac{3}{4}$  to 1 in. broad, solitary on the ends of the paniculate branchlets; involucre campanulate to turbinate, 3 to 5 lines long, the tomentum deciduous or mainly so; rays purple or violet.—Hillsides near the sea and ocean bluffs, Monterey Co. to San Diego. May-Sept. The species and its varieties are differentiated in the following key:

- Inflorescence scarcely or not at all glandular; involucre campanulate to turbinate.
  - Involucres with tomentum deciduous..... *C. flaginifolia*.
  - Involucres with tomentum persistent.
    - Inflorescence open-paniculate ..... var. *linifolia*.
    - Inflorescence contracted-paniculate ..... var. *latifolia*.
- Inflorescence markedly glandular-puberulent.
  - Involucres campanulate to turbinate.
    - Inflorescence paniculate ..... var. *rigida*.
    - Inflorescence contracted-paniculate to virgate; heads 1 to several in axils of upper leaves ..... var. *glomerata*.
  - Involucres hemispheric; inflorescence paniculate; typical..... var. *pacifica*.

Var. *LINIFOLIA* Hall. Herbage paler where tomentum is shed, scarcely if at all glandular; involucral bracts, or at least the tips, persistently woolly.—Foothills, 1000 to 3000 ft.: both sides of the San Joaquin Valley; coastal S. Cal. Var. *LATIFOLIA* Hall. Herbage densely and persistently tomentose including the involucre; inflorescence contracted-paniculate; involucre turbinate, the bracts in about 5 series.—Montane, about 5000 ft.: San Bernardino

Mts.; s. to Mex. Var. *RÍGIDA* Gray. Stems several, erect or ascending, 10 to 20 in. high; herbage similar to the species; heads uniformly smaller, 6 to 8 lines broad; involucre campanulate, the tips of the bracts sometimes becoming recurved.—Sandy hills and dry cañon sides, 300 to 6000 ft.: South Coast Ranges; mts. of coastal S. Cal.; s. Sierra Nevada in Tulare Co. (*C. flaginiifolia* var. *virgata* Gray. *C. viscidula* Greene. *C. viscidula* var. *greenei* Jepson.) Var. *GLOMERATA* Hall. Herbage densely tomentose except the glandular green-tipped involucral bracts; inflorescence virgate, the heads solitary on short peduncles along the axis or 2 to several in the axils of the scarcely reduced upper leaves.—Montane: San Bernardino Mts.; Tehachapi Mts. Var. *PACÍFICA* Hall. Stems several to many, stout, erect, 1 to 3 ft. high, simple or fastigiately branching with the branchlets of the inflorescence more spreading; herbage with floccose tomentum, deciduous from inflorescence at time of flowering, the exposed surface viscid, glandular-puberulent; involucre hemispheric; heads 8 to 12 lines broad; rays bluish purple.—Near the seashore, San Diego Co. (*C. incana* Nutt.)

#### 54. *PSILÁCTIS* Gray

Branching annual. Heads rather small, hemispheric, radiate, solitary or loosely cymose. Involucral bracts unequal, closely imbricated in 2 or 3 series. Ray-flowers pistillate, fertile or often infertile. Disk-flowers perfect, fertile. Achenes compressed, pubescent. Pappus of ray-flowers none or an obscure ring; pappus of disk-flowers a row of slender bristles. (Greek *psilos*, naked, and *actis*, ray, the ray flowers without pappus.)

1. *P. coulteri* Gray. Stem freely branched at or just above the base, 4 to 12 in. high; herbage glandular-pubescent; leaves oblong to linear in outline, sharply toothed to pinnatifid, 5 to 14 lines long, sessile by a broad base or the lowermost petioled, those of the branchlets reduced to 2 to 4 lines; involucre 1½ lines high; bracts narrowly oblong to oblong-lanceolate, the inner ones whitish below; rays numerous, lavender; disk-flowers yellow; achenes linear, those of the disk with many unequal pappus-bristles.—Sandy alkaline flats, 1800 to 2200 ft.: Mohave Desert; e. to Nev. and Ariz., thence s. to Mex. May.

#### 55. *MONÓPTILON* T. & G.

Low or depressed annuals with hirsute herbage. Leaves linear-oblongate or spatulate, entire, borne in a basal rosette and along the branches. Heads radiate, daisy-like in appearance, solitary on the ends of the branchlets or somewhat clustered. Involucre campanulate, its bracts linear, equal, hirsute. Receptacle flat. Ray-corollas white, sometimes violet or rose-tinged; disk-corollas yellow, the throat cylindric, 4 times as long as the short proper tube. Achenes narrowly obovate, compressed, marginally nerved, pubescent. Pappus present, alike in ray and disk, consisting of 1 to 12 awns, the paleae laciniate or none. (Greek *monos*, one, and *ptilon*, feather, in allusion to the solitary plumose bristle of the first species.)

Pappus a circle of very minute scales and 1 bristle which is conspicuously plumose above; corolla throat hairy on lower part.....1. *M. bellidifforme*.

Pappus awns 1 to 12, not plumose, alternating with shorter deeply laciniate or lacerate paleae; corolla throat glabrous or nearly so.....2. *M. bellioides*.

1. *M. bellidifforme* T. & G. Stem with several ascending or spreading branches from the base, the branches ½ to 2½ in. long; leaves 1 to 6 lines long; heads 3 to 8 lines broad; pappus-bristle nearly as long as corolla.—Desert flats and mesas, 2000 to 4000 ft.: Mohave Desert; Inyo Co.; e. to Utah. Apr.-May.

934. *Monoptilon bellioides* Hall; a, habit x ½; b, basal leaf x 1; c, invol. bract x 1½; d, ray-fl. x 1½; e, achene and pappus x 3.

2. *M. belliioides* (Gray) Hall. Fig. 934. DESERT STAR. Stems branching at or near the base, the branches ascending or widely spreading,  $\frac{1}{2}$  to 4 in. long; leaves 1 to 7 lines long; heads 4 to 8 lines broad; pappus-bristles about  $\frac{1}{2}$  as long as corolla.—Desert flats and mesas, 100 to 3000 ft.: Colorado Desert; e. Mohave Desert; Inyo Co.; e. to Utah and Ariz. Mar.-May. (*Eremiastrum belliioides* Gray.)

#### 56. *SÈRICOCÁRPUS* Nees

Perennial herbs with erect leafy stems. Heads small, few-flowered, radiate, usually fascicled in terminal compact cymes. Flowers white, or the disk-flowers becoming purplish. Bracts of the involucre closely imbricated, whitish or coriaceous, green-tipped. Receptacle foveolate. Ray-flowers 5 (or 6); disk-flowers 8 to 16. Achenes narrow, a little compressed, 2-nerved, silky-pubescent. Pappus of numerous unequal scabrous bristles. (Greek *serikos*, silky, and *karpós*, fruit.)

1. *S. rigidus* Lindl. Stems erect, simple below the cymose inflorescence, 1 to  $3\frac{1}{2}$  ft. high, arising from a stoutish rootstock; herbage scabrous-puberulent; leaves commonly oblong, sometimes oblong-lanceolate, acute, entire or nearly so, sessile or the lower narrowed to a margined petiole, 1 to 4 in. long; heads somewhat turbinate, 3 to  $5\frac{1}{2}$  lines high, crowded, glomerate, about 15-flowered; involucre bracts linear, 1-nerved, the tips slightly spreading; rays  $1\frac{3}{4}$  to 2 (or 3) lines long; achenes clavate; pappus white.—Open montane or openly wooded slopes, (500 or) 3500 to 7000 ft.: Sierra Nevada from Tulare Co. to Eldorado and Plumas Cos.; Humboldt Co. to Siskiyou Co.; n. to Wash. July-Oct.

#### 57. *TOWNSENDIA* Hook.

Low tufted herbs with entire leaves. Heads large, broadly hemispheric, in ours solitary on scape-like peduncles. Rays purplish the disk-flowers yellow. Involucre bracts lanceolate, with scarious-ciliate margins. Receptacle areolate. Achenes obovate or oblong, strongly compressed, pubescent, with thickened or callous margins. Pappus a single series of bristles or in the ray reduced to small scales or paleae. (David Townsend, botanical associate of Dr. Wm. Darlington, famous early botanist of Pennsylvania.)

1. *T. scapigera* Eat. Annual or biennial; plants  $\frac{3}{4}$  to 2 in. high; herbage hirsute; basal leaves spatulate, drawn down to a long narrowed base or petiole, the whole 6 to 13 lines long, the spatulate portion mostly about 2 to 4 lines long; involucre bracts linear to broadly lanceolate, 3 to 4 lines long; rays  $3\frac{3}{4}$  lines long; both disk- and ray-achenes with pappus-bristles, the bristles conspicuously barbellate.—Rocky ridges, 5000 to 8000 ft., rare: Nelson Range, Inyo Co.; Warner Mts., Modoc Co.; e. to Nev. May.

#### 58. *ÁSTER* L. ASTER

Mostly late summer or autumnal herbs, rarely shrubs. Stems leafy, the leaves merely toothed or entire. Heads radiate, usually numerous, paniculate, corymbose or racemose, sometimes solitary. Involucre turbinate or campanulate to hemispherical, the bracts in several ranks, often imbricated, herbaceous or often coriaceous and green-tipped. Receptacle flat, pitted. Ray-flowers pistillate, the rays blue, purple or violet. Disk-flowers perfect, yellow, sometimes changing to purple or brown. Style-branches flattened, their tips subulate or lanceolate, acute. Achenes more or less flattened. Pappus copious, of simple capillary bristles. (Greek *astere*, a star, from the star-like heads of flowers.)

##### A. HEADS SOLITARY ON ERECT STEMS OR AT THE SUMMIT OF MAIN BRANCHES.

More or less shrubby species peculiar to the Mohave and Colorado deserts and adjacent mts.; leaves narrowly oblong to obovate, spinose-toothed.

Herbage glabrous; involucre bracts linear-lanceolate, none especially elongated. . . . . 1. *A. orcuttii*.

Herbage more or less pubescent.

Leaves obovate; inner involucre bracts and occasionally others greatly elongated. . . . . 2. *A. cognatus*.

Leaves linear to lanceolate; inner involucre bracts not greatly elongated. . . . . 3. *A. tortifolius*.

Herb of the Sierra Nevada above 4000 ft.; leaves grass-like. . . . . 4. *A. andersonii*.

B. HEADS MANY TO NUMEROUS, RARELY ONLY ONE, BORNE IN CYMES, PANICLES  
OR RACEMES.

1. Heads more than  $3\frac{1}{2}$  lines high; herbs.

Pappus not exceedingly copious nor obscuring rays in fruit.

Involucral bracts linear and attenuate to spatulate.

Herbage somewhat gray; leaves rather rigid, seldom more than 5 lines wide; plants of arid foothill valleys, or interior ridges or plateaus.

Tips of involucral bracts recurved in mature heads.

Leaves mostly toothed; bracts of the involucre conspicuously green-tipped; rays numerous; achenes compressed; pappus-bristles rigid ..... 5. *A. canescens*.

Leaves entire or mostly so; bracts of the involucre pinkish, commonly not green-tipped; rays comparatively few; achenes hardly compressed; pappus-bristles soft ..... 6. *A. shastensis*.

Involucral bracts not recurved; leaves entire ..... 7. *A. menziesii*.

Herbage green, bright or paler.

Leaves lanceolate to linear.

Branches of inflorescence not conspicuously bracteate.

Outer involucral bracts less than  $\frac{1}{2}$  line wide; leaves entire or nearly so; plants of montane regions ..... 8. *A. adscendens*.

Outer involucral bracts about 1 line wide; plants of semi-arid to humid regions.

Leaves entire or subserrate ..... 9. *A. foliaceus*.

Leaves serrate ..... 10. *A. douglasii*.

Branches of inflorescence conspicuously leafy-bracteate; plants often of wet soil ..... 11. *A. chilensis*.

Leaves obovate or oblong to oblanceolate or the upper lanceolate.

Leaf-margins serrate.

Herbage not markedly scabrous nor rigid; leaf-margins bluntly serrate ..... 12. *A. greatai*.

Herbage markedly scabrous and rigid; leaf-margins sharply serrate.

13. *A. radulinus*.

Leaf-margins entire; involucral bracts often becoming reddish-margined.

14. *A. integrifolius*.

Involucral bracts ovate-lanceolate, becoming reddish-margined; leaves not rigid, somewhat glaucous; rays 6 to 7 lines long ..... 15. *A. engelmanni*.

Pappus exceedingly copious, exceeding rays in fruit; plants of alkaline situations ..... 16. *A. frondosus*.

2. Heads less than  $3\frac{1}{2}$  lines high; plants of alkaline or saline situation.

Stems spineless.

Stems mostly simple, not rigid; upper leaves linear, thin; annual ..... 17. *A. exilis*.

Stems much branched, rigid; upper leaves reduced to subulate scales; shrub ..... 18. *A. carnosus*.

Stems with spines in axils of cauline scales or leaves; herbage light green, glabrous; perennial herb ..... 19. *A. spinosus*.

1. *A. orcúttii* Vasey & Rose. Stems erect, branched, very leafy, woody below, forming a bush  $1\frac{1}{4}$  to  $2\frac{1}{2}$  ft. high; branches erect, naked or nearly so for 1 or 2 in. below the solitary heads; bark white; herbage glabrous; leaves obovate to oblong, spinulose-toothed, acute, cuspidate,  $\frac{1}{4}$  to 2 in. long, the lower cuneate at base, the upper sessile by a broad base; heads large, 2 to  $2\frac{1}{2}$  in. broad; involucre hemispheric, 8 to 9 lines high; bracts closely imbricated, broadly lanceolate to linear-lanceolate, ciliate below the attenuate apex; rays purple or lavender, 2 to 3 lines broad,  $\frac{3}{4}$  to 1 in. long; achenes white-villous.—S. Colorado Desert: Borrego Sprs.; Split Mt. Apr.

2. *A. cognatus* Hall. Stems branched, erect, leafy up to the heads, woody below, forming a bush 10 to 20 in. high; bark white; herbage subglabrous or furnished with minute mostly scattered stipitate glands; leaves elliptic or oblong to narrowly obovate, spinose-dentate, sessile,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long; heads  $1\frac{1}{2}$  to 2 in. broad, mostly solitary on the ends of the branchlets; involucre hemispherical; bracts ovate or lanceolate, attenuate, 6 to 7 lines long, or with a series of outer linear ones twice as long, at least the inner ones ciliate; rays blue or violet, 1 to  $1\frac{1}{2}$  lines wide, 8 to 10 lines long; achenes long-villous.—Colorado Desert: Shavers Well; Red Cañon near Mecca. June.

3. *A. tortifolius* Gray. Stems leafy, more or less branched from a woody base, 1 to 2 ft. high; bark white; herbage tomentose-pubescent, the peduncles somewhat glandular; leaves linear or narrowly oblong to lanceolate, acute to acuminate, spinosely serrate,  $1\frac{1}{2}$  to 3 in. long; heads large ( $1\frac{1}{2}$  to  $2\frac{3}{4}$  in. broad), solitary on long usually bracteate peduncles; involucre shallowly hemispherical,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. wide, the numerous bracts lanceolate-subulate,

the longest about equaling the disk; rays numerous, pale purple or violet,  $\frac{1}{2}$  to 1 in. long; achenes silky-villous; pappus of coarse rigid tawny bristles, deciduous in a ring.—Desert mesas and mountain slopes, 2000 to 4000 ft.: Mohave Desert; Inyo Co.; e. to Utah.

4. *A. andersönii* Gray. Stems scape-like, few or several, erect or assurgent from the crown of a thick root, 5 to 15 in. high, the leaves mostly basal erect; herbage glabrous or the peduncles a little woolly at the summit; basal leaves narrowly linear or linear-lanceolate, grass-like, acute, entire, nervose when dry, 2 to 8 in. long; leaves of the scape-like stems few, reduced to short bracts; heads  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. broad; involucre 3½ to 4½ lines high, their nearly equal bracts narrowly oblong, acute, scarious or reddish-margined; rays purple to light blue, 4 to 5½ lines long; style-appendages filiform.—Wet montane meadows, 4000 to 8200 ft.: Humboldt Co. to Trinity Co.; Sierra Nevada from Butte and Plumas Cos. to Tulare Co.; San Jacinto Mts.; e. to Nev. June-Aug.

5. *A. canescens* Pursh. Stems leafy, erect or ascending, one or several from a biennial or perennial root, simple to much-branched,  $\frac{1}{2}$  to  $1\frac{3}{4}$  ft. high; herbage puberulent, the inflorescence glandular; leaves oblong or linear to oblanceolate, spinose-toothed or the upper entire,  $\frac{1}{2}$  to  $1\frac{3}{4}$  in. long, those of the branchlets small and bract-like; heads in a cymose panicle; involucre broadly turbinate, 3½ to 4 lines high; bracts imbricated, green-tipped, the tips spreading or recurved; rays many to numerous, bluish-purple; achenes narrowed below, pubescent.—Dry situations, 5500 to 10,500 ft.: San Gabriel and San Bernardino mountains; Mt. Pinos; e. slope and e. side of the Sierra Nevada from Inyo Co. to Modoc Co.; Siskiyou Co.; e. to Ariz., n. to B. C. May-Sept. Var. *TEPHRODES* Gray. Involucre broad, canescent not glandular, the long green tips of the bracts attenuate.—Arid valleys: San Jacinto Valley; Colorado Desert; e. to N. Mex. Apr.-Aug.

6. *A. shastensis* Gray. Stems several to many from the base, ascending or erect, arising from a short branched woody crown, 3 to 13 in. high; herbage finely canescent; leaves spatulate, attenuate below to a petiole, the whole  $\frac{1}{4}$  to  $1\frac{1}{2}$  in. long, the upper leaves mostly linear and sessile, all the leaves entire or rarely few-toothed; heads 7 to 11 lines broad, borne in terminal panicles, rarely solitary; involucre campanulate; bracts commonly pinkish, the tips a little recurved or spreading, rarely herbaceous; ray-flowers few, sterile, the rays 2 to 3 lines long; achenes 5-nerved and with intermediate striae.—Montane, 6000 to 8000 ft., peaks of n. Cal.: Scott Mts.; Mt. Shasta; Medicine Lake; Lassen Peak. Aug.-Sept.

7. *A. menziësi* Lindl. PURPLE ASTER. Stems simple, commonly several from the woody root,  $1\frac{1}{2}$  to 2 ft. high; herbage roughish-puberulent or sometimes almost glabrous; leaves linear to lanceolate, purple-veined beneath, remotely serrate or entire, sessile, subcordate at base, 1 to  $2\frac{1}{2}$  in. long, those of the raceme or thyrsoid panicle much reduced, so that the inflorescence seems almost naked; heads 3 to 5 lines high on rigid erect branchlets; involucre hemispherical or broadly turbinate, the bracts linear-spatulate in several closely imbricated ranks, the green tips obtuse; rays violet or purple.—Low dry ground, 100 to 4500 ft.: almost throughout cismontane Cal. from San Diego Co. to Shasta Co.; also w. Mohave Desert and Siskiyou Co.; s. Ore., w. Nev. Aug.-Dec. Var. *BERNARDINUS* Jepson n. comb. Herbage soft-pubescent; inflorescence leafy-bracteate. — Valleys, 500 to 1200 ft., coastal S. Cal. (*A. bernardinus* Hall.)

8. *A. adscendens* Lindl. Stems slender, rigid, paniculately branched above,  $1\frac{1}{2}$  to 2 ft. high, arising from creeping rootstocks; leaves linear to oblanceolate, entire, strigose-hispidulous or glabrous with only the margins hispidulous,  $1\frac{1}{2}$  to  $3\frac{1}{2}$  in. long; cauline leaves sessile, somewhat clasping, the basal ones narrowed to long ciliate petioles with clasping more or less fringed bases and deciduous as the heads flower; heads rather numerous, loosely corymbose-paniculate; involucre broadly turbinate to campanulate,  $2\frac{1}{2}$  to 3 lines high, the bracts linear to spatulate, green-tipped; rays violet.—Montane, 3000 to 8000 ft.: Tulare Co. to Butte Co., thence nw. to Siskiyou Co.; e. to Col., n. to Mont. Aug.-Sept. Var. *YOSEMITANUS* Gray. Less rigid, the

leaves usually larger and hispidulous only on the margin, entire or sometimes subserrate; panicles leafy; heads few, larger, with looser involucre.—Wet meadows, 4000 to 6800 ft.: Sierra Nevada. Aug.-Sept. (*A. yosemitanus* Greene.) Var. *FREMONTII* Gray. Similar to var. *yosemitanus* but the stems stouter; panicles with reduced leaves; involucre bracts not long-pointed.—Grassy flats, 5700 to 8700 ft.: Sierra Nevada. (*A. fremontii* Gray.) Var. *DELECTABILIS* Jepson n. comb. Commonly more foliaceous than var. *yosemitanus*, the cauline leaves with expanded margins on each side of the clasping base; rays 5 to 7 lines long.—Montane meadows, 7000 to 9000 ft.: San Jacinto and San Bernardino mountains; s. Sierra Nevada. (*A. delectabilis* Hall.)

9. *A. foliaceus* Lindl. Stem erect or ascending, mostly simple, leafy, 10 to 20 in. high, from a creeping rootstock, pubescent above; leaves lanceolate, 2 to 6 in. long, glabrous, with margins subserrate to entire, ciliolate, the cauline sessile, the basal narrowed to slender winged petioles  $\frac{2}{3}$  the length of the blades; heads several in reduced panicles; involucre hemispherical, 3 to 4 lines high, the outer bracts linear or oblanceolate, foliaceous, the inner shorter, hyaline-margined, scarious below the middle; rays violet, 3 to 5 lines long.—Warner Mts., Modoc Co.; n. to Alas. Var. *FRONDEUS* Gray. Leaves broader, puberulent or nearly glabrous.—Mt. Bidwell, Modoc Co.; Plumas Co.; Tulare Co.; n. to B. C., e. to Col. Var. *APRICUS* Gray. Stems ascending from tufted rootstocks, 3 to 10 in. high; leaves usually shorter, somewhat thickened, more rigid, apparently glabrous; heads 1 to 3, 9 to 15 lines broad.—Mt. Bidwell, Modoc Co.; e. to Col., n. to Wash. Var. *EATONI* Gray. Stems erect, 2 to 3 ft. high; leaves more or less pubescent and scabrous; heads numerous.—Monterey Co. to Siskiyou Co. Var. *HESPERIUS* Jepson n. comb. Stem erect, 2 to 4 ft. high, the flowering branches many; leaves numerous, narrowly lanceolate, scabrous, puberulent or nearly glabrous.—Meadows and stream banks, 500 to 5000 ft.: coastal S. Cal.; Sierra Nevada from Tulare Co. to Butte Co.; Siskiyou Co.; n. to B. C. (*A. hesperius* Gray.)

10. *A. douglasii* Lindl. Stems leafy, slender, erect or ascending, simple or somewhat branched above, 2 to 3 ft. high; herbage glabrous or nearly so; leaves lanceolate, narrowed at both ends, commonly serrate along the middle, 3 to 5 in. long,  $1\frac{1}{2}$  to 6 lines wide; heads rather few in a narrow leafy panicle; involucre bracts linear, loosely imbricated, the inner green-tipped, the outer green throughout; rays purple.—Montane, along streams: Siskiyou Co.; n. to B. C.

11. *A. chilensis* Nees. COMMON ASTER. Stems 1 to several from the base, erect, simple below, ending above in a narrow or sometimes broad panicle, 2 to  $3\frac{1}{2}$  ft. high; herbage villous-pubescent or more or less glabrous; leaves lanceolate, sessile, 5 in. long or less, entire, above passing gradually into the bract-like ones of the inflorescence, the basal oblong-spatulate, remotely serrate and attenuate into a petiole, all commonly with scabrous-ciliolate margins; panicle of loose leafy racemes  $\frac{1}{2}$  to  $1\frac{1}{4}$  ft. long or more; heads 4 to 5 lines high; involucre bracts in several series, somewhat carinate, with green tips; rays white, lavender or bluish, 4 to 6 lines long.—Wooded hillsides, dry banks of gulches or streams, or in moist situations in fields, from the valleys to the foothills, 10 to 500 ft.: Coast Ranges from Humboldt Co. to Alameda Co. and s. to Santa Barbara Co.; e. to the Sacramento Valley and lower San Joaquin Valley. Sept.-Nov. Var. *LÉNTUS* Jepson. Slender, 4 to 6 ft. high, slightly succulent, mostly glabrous; heads few and large; rays 7 to 9 lines long.—Very common and conspicuous in the Suisun Marshes. Var. *MÉDIUS* Jepson. Branchlets of the inflorescence rather divaricate, with many spatulate-oblong or oblong-lanceolate spreading leaves 2 to 3 lines long; heads few, those on the same branchlets maturing at very unequal periods.—Lower Sacramento River; Saratoga. Var. *INVENUSTUS* Jepson. Herbage cinereous-pubescent; upper leaves and those of the inflorescence small; involucre bracts spatulate-linear, thickish, obtuse, in rather few ranks, almost wholly herbaceous; rays dull purplish.—Calistoga. Var. *SONOMÉNSIS* Jepson. Slender, 1 ft. high, more glabrous; leaves mainly basal, oblong-spatulate, attenuate into a petiole  $\frac{1}{2}$  to as long as the blade, remotely serrate; cauline leaves reduced, sometimes petioled, linear to lanceolate, those of the cymose panicle subulate-lanceolate and closely ascending; heads soli-

935. *Aster radulinus* Gray; a, fl. branchlet  $\times \frac{1}{2}$ ;  
b, leaf  $\times \frac{1}{2}$ .

bage scabrous-pubescent; leaves oval-obovate to the entire (often attenuate) base, 1 to 4 in. long,  $\frac{1}{2}$  to  $2\frac{1}{4}$  in. wide; heads 7 to 13 lines broad, mostly numerous (sometimes very few), 5 to 6 lines high; involucre turbinate, 3 to 4 lines high; bracts imbricated, green-tipped, sometimes red-margined, the outer shorter, villous-puberulent; rays violet to whitish, 3 to 5 lines long; disk-corollas sometimes conspicuously reddish. — Foothills and mts., mostly wooded slopes, 200 to 5000 ft.: Coast Ranges from San Luis Obispo Co. to Siskiyou Co., thence se. in the Sierra Nevada to Nevada Co.; n. to Wash. July-Sept. (*A. torreyi* Porter.)

14. *A. integrifolius* Nutt. Fig. 936. Stems leafy, 1 to several from a stout rootstock usually somewhat branched,  $\frac{1}{2}$  to 1 ft. high; herbage tomentose becoming glabrate, the inflorescence viscid-glandular; leaves oblong to spatulate or the upper lanceolate, entire or repand-serrulate, the upper  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long, somewhat auriculate-clasping, the lower 3 to 6 in. long,  $\frac{1}{2}$  to 2 in. wide, tapering to a winged petiole; heads 10 to 12 lines broad, somewhat racemose; involucre broadly turbinate to campanulate, 5 lines high; bracts linear, few-ranked, ascending, the inner somewhat purplish- or red-

tary or few at the ends of the strict branchlets; rays light pink to bright purple. — Subsaline lands: Petaluma; Napa.

12. *A. grèatai* Parish. Stems leafy, slender, erect,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  ft. high, from branched creeping rootstocks; herbage scabrous-pubescent; lower leaves obovate to oblanceolate, tapering to a narrow base, toothed above the middle,  $\frac{1}{2}$  to  $1\frac{3}{8}$  in. wide, the basal ones with long slender winged petioles, the whole 3 to 8 in. long; upper leaves with broad auriculate-clasping base, mostly entire, becoming much reduced in the open panicle; involucre bracts lanceolate or linear, loosely imbricated, the outermost wholly green or whitish at base; rays light purple; achenes pubescent. — Cañons, San Gabriel Mts., 1000 to 3000 ft.: Eaton Cañon; Evey Cañon.

13. *A. radulinus* Gray. BROAD-LEAF ASTER. Fig. 935. Stems  $\frac{1}{2}$  to  $1\frac{1}{2}$ , seldom 2 ft. high, arising from branching rootstocks; her-

936. *Aster integrifolius* Nutt.; a, habit  $\times \frac{1}{2}$ ;  
b, head  $\times 1$ ; c, d, disk-fls.  $\times 1\frac{1}{2}$ .

dish-margined; rays 15 to 25, deep bluish-purple, 7 lines long; pappus tawny, rigid.—Montane, 7000 to 9000 ft.: Sierra Nevada from Tulare Co. to Lassen Co.; n. to Ore., e. to Col. July-Sept.

15. *A. engelmanni* Gray. Stem erect, leafy, simple or branched, arising from a perennial base, about 2 ft. high; leaves oblong to broadly lanceolate, apiculate, revolute, nearly glabrous, sometimes a little glaucous, sessile, 6 to 13 lines wide, 2 to 3 in. long, or the uppermost reduced; heads paniculate on bracteate peduncles; involueral bracts ovate-lanceolate, fimbriate, the margins somewhat reddish or purplish; rays 5 to 10, purple, 6 to 7 lines long; pappus tawny.—Montane, Siskiyou Co.; n. to Wash., e. to Rocky Mts. Var. *LEDOPHYLLUS* Gray. Leaves glaucous above, cottony-tomentose below; rays 2 to 5, light violet.—Del Norte Co.; n. to Wash.

16. *A. frondosus* T. & G. Stems 3 to 12 in. high, several from the base and diffuse, or erect and simple, in either case ending in a narrow or racemose panicle or small cluster of heads; herbage nearly glabrous; leaves linear, entire, hispid-ciliate,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long; heads  $3\frac{1}{2}$  to 4 lines high; involucre hemispherical, the bracts linear or somewhat spatulate, obtuse, the outer foliaceous and loose; rays pinkish-purple, slightly exserted; achenes strigose-pubescent, the copious pappus sordid.—Alkaline soil, 2600 to 5000 ft.: e. side the Sierra Nevada from Inyo Co. to Modoc Co., thence w. to Siskiyou Co.; n. to Ida., e. to N. Mex. Aug.-Sept.

17. *A. exilis* Ell. SLENDER ASTER. Fig. 937. Stem erect, slender, 1 to 5 ft. high, ending above in a mostly rather narrow panicle; herbage glabrous; leaves linear, 2 to 4 in. long and 1 to 2 lines wide, or rarely some of the lower oblanceolate or oblong and 2 to 4 lines wide, entire, rarely serrate, those of the inflorescence lanceolate-subulate; heads 2 to 3 lines high; bracts linear, acute, herbaceous, scarious-margined; rays light pinkish-purple, 2 lines long; pappus fine and soft.—Saline soil or in marshes or ricefields, 10 to 1000 ft.: Sacramento Valley; s. to coastal S. Cal., thence e. to the Atlantic. Sept.-Oct.

18. *A. carnosus* Gray. Stems slender, rigid, divaricately much-branched, woody below, forming a tangled almost leafless bush 2 to 3 ft. high; herbage pale green, glaucescent; lower leaves linear, fleshy,  $\frac{3}{4}$  to 1 in. long, those of the branches reduced to small subulate scales; heads turbinate, terminating the branches; involucre 3 to  $3\frac{1}{2}$  lines high, the bracts linear, acute; rays none; pappus sordid; achenes pubescent.—Alkaline flats, 2000 to 3000 ft.: Mohave Desert; e. to Ariz. May-Sept.

19. *A. spinosus* Benth. MEXICAN DEVIL-WEED. Stem slender, with reed-like almost leafless branches, 3 to  $9\frac{1}{2}$  ft. high; herbage light green, glabrous; lower leaves linear,  $\frac{1}{4}$  to 2 in. long; upper leaves subulate or scale-like, often with spines (2 to 6 lines long) in or above their axils; heads 3 lines high, solitary on the ends of the branchlets or racemose on the branchlets; involueral bracts lanceolate, scarious-margined; rays white, drying brown,  $1\frac{1}{2}$  lines long; style-branches triangular-subulate; achenes glabrous.—Colorado Desert. Sept.-Jan.

937. *Aster exilis* Ell.; a, lower leaf  $\times \frac{3}{8}$ ; b, infl.  $\times \frac{1}{2}$ ; c, head  $\times 1\frac{1}{2}$ ; d, disk-fl.  $\times 3$ ; e, achene and pappus  $\times 3$ .

59. **LEUCELÈNE** Greene

Low perennial herbs with many leafy stems from a woody root-crown. Leaves linear, entire. Heads small, radiate, solitary and terminal on the stems or branches. Involucre campanulate, its bracts imbricated in about 3 unequal series, green with scarious margins. Rays white, pink or reddish; disk-flowers yellow or reddish. Style-tips ovate or oblong, obtuse. Achenes slender, compressed, pubescent. Pappus a single series of scabrous bristles. (Etymology unknown.)

1. **L. éricoides** (Torr.) Greene. Stems densely tufted, wiry, erect or diffuse, 3 to 4 in. high, terminated by short-pedunculate heads, the branching woody base from a stout rootstock; herbage strigose-canescens, more or less glandular, the leaves hispid-ciliate; leaves linear-oblongate, or the lower spatulate, mucronate, 3 to 5 lines long; heads 5 to 7 lines broad; involucre 3 to 3½ lines high, their bracts lanceolate, acute; achenes pubescent. —Desert ranges, 2000 to 4000 ft., e. Mohave Desert: Cima; Providence Mts.; New York Mts.; e. to Col. (*Aster ericaefolius* Rothr.)

60. **ERIGERON** L. FLEABANE

Herbs, the stems leafy, or more or less naked and scape-like. Leaves entire, toothed or dissected, generally sessile. Heads corymbose, paniculate or solitary, commonly radiate, sometimes discoid. Involucre campanulate to hemispherical, its bracts narrow, mostly equal, little imbricated, seldom coriaceous or green-tipped. Receptacle flat or convex. Ray-flowers usually numerous, often in more than one series, pistillate, the rays white, purple or rarely yellow, linear to filiform, conspicuous, inconspicuous or none. Disk-flowers perfect, yellow, the marginal nerve of the corolla-lobes often forming a sort of hood at apex. Styles minute, their branches short, spatulate, obtuse, those of the disk-flowers shorter and broader. Achenes flattened, usually pubescent and nerved. Pappus of capillary bristles, more scanty and fragile than in *Aster*, sometimes with a distinct short outer series. (Greek *eri*, early, and *geron*, old man, "old man in spring.")

**A. Stems more or less scape-like, the leaves mostly in a dense basal tuft from a branched or thickened root-crown; dwarfed high montane or alpine species.**

Leaves, at least the basal, dissected. . . . . 1. *E. compositus*.  
Leaves not dissected.

Basal leaves linear to linear-lanceolate.

Herbage hispidulose.

Rays (or ligules) reduced to minute scales. . . . . 2. *E. austinae*.

Rays (or ligules) exceeding disk. . . . . 3. *E. radicans*.

Herbage minutely pilose.

Rays none; involucre woolly. . . . . 4. *E. bloomeri*.

Rays present; involucre pubescent with spreading or appressed hairs.

Root-crown compactly or obscurely branched. . . . . 5. *E. peucephyllus*.

Root-crown freely branched. . . . . 6. *E. ursinus*.

Basal leaves oblanceolate to spatulate; involucre bracts hairy, mostly purple-tipped. . . . . 7. *E. albidus*.

**B. Stems leafy.**1. **RAYS LACKING.**

Heads solitary, the involucre bracts equal; stems decumbent or ascending, the leaves unilateral on the decumbent portion. . . . . 8. *E. suplex*.

Heads usually several or numerous, sometimes solitary, the bracts unequal; leaves occasionally unilateral.

Stems erect, 1 to 2 ft. high; herbage glabrous or sparsely hispid-pubescent. . . . . 9. *E. inornatus*.

Stems usually decumbent or ascending, clustered on a thickish root-crown or rootstock, ¼ to ¾ ft. high; herbage canescently hirsute. . . . . 10. *E. miser*.

2. **RAYS PRESENT.**

*a. Rays inconspicuous, filiform, at most slightly surpassing the disk.*

Stems from a short perennial (or biennial) rootstock; leaves linear to oblanceolate or spatulate, entire. . . . . 11. *E. lonchophyllus*.

Stems from a biennial or annual taproot.

Lower leaves usually somewhat toothed.

Involucre nearly glabrous, the bracts scarious-margined; heads very numerous in a many-branched panicle. . . . . 12. *E. canadensis*.

Involucre densely pubescent, at least the outer bracts herbaceous; heads rather few in a usually narrow panicle. . . . . 13. *E. linifolius*.  
 Leaves all entire; involucre somewhat hirsute; heads few in the inflorescence. . . . . 14. *E. acris*.

*b. Rays conspicuous, much surpassing the disk.*

- Plants with an annual or biennial root; rays filiform or very narrowly linear, usually very numerous.  
 Stems diffusely branched from base; cauline leaves mostly entire, sessile, the basal 1 to 2½ in. long. . . . . 15. *E. divergens*.  
 Stems simple or branched above; basal leaves mostly much longer.  
 Cauline leaves auriculate-clasping, commonly toothed or serrate. . . . . 16. *E. philadelphicus*.  
 Cauline leaves sessile by a narrow base, or the lower petioled; inflorescence leafy.  
 Stem leaves all or nearly all serrate. . . . . 17. *E. annuus*.  
 Stem leaves entire or only the lower serrate. . . . . 18. *E. ramosus*.  
 Plants with a rootstock or thickened root-crown, perennial or sometimes biennial; rays broader, usually less numerous; basal leaves entire or merely toothed.  
 Stems from slender rootstocks; mostly montane species.  
 Bracts equal.  
 Leaves obovate or oblanceolate to ovate or oblong, often serrate; heads usually solitary. . . . . 19. *E. coulteri*.  
 Leaves linear to narrowly oblanceolate, or spatulate, entire.  
 Heads usually corymbose; stems 1 to 1½ ft. high. . . . . 20. *E. corymbosus*.  
 Heads solitary; stems 4 to 8 in. high. . . . . 21. *E. sanctarum*.  
 Bracts unequal.  
 Leaves filiform; herbage grayish with strigose pubescence. . . . . 22. *E. linearis*.  
 Leaves linear to oblong or lanceolate or narrow-spatulate; herbage green.  
 Leaves thickened, densely hispidulose, 2 to 3 lines long; internodes 1 line long. . . . . 23. *E. jacinteus*.  
 Leaves not thickened, moderately to sparingly hispidulose; internodes 2 to 6 lines long. . . . . 24. *E. breweri*.  
 Stems from a thickened or branched root-crown (or from a thick rootstock in no. 28); heads solitary or commonly in a loose or open corymb or panicle.  
 Stems bearing an open corymb with mostly divaricate or spreading peduncles; herbage with a somewhat appressed-scabrous pubescence. 25. *E. foliosus*.  
 Stems bearing solitary terminal heads or a few-headed inflorescence with erect peduncles.  
 Herbage silvery with soft appressed pubescence; Mohave Desert. . . . . 26. *E. parishii*.  
 Herbage green.  
 Basal leaves linear or oblanceolate to spatulate; heads ½ to 1½ in. broad; montane or inland species.  
 Stems mostly one or few, 1 to 2 ft. high.  
 Leaves linear; rays 3 to 4½ lines long; herbage retrorse-pubescent; Inyo Co. . . . . 27. *E. porphyreticus*.  
 Leaves lanceolate to obovate or oblong; rays 6 to 7 lines long; Sierra Nevada . . . . . 28. *E. subuginosus*.  
 Stems usually numerous, 5 to 12 in. high.  
 Leaves oblong-lanceolate, chiefly basal; rays 1 to 1½ lines long. . . . . 29. *E. tener*.  
 Leaves linear to linear-spatulate or linear-lanceolate.  
 Herbage appressed-pubescent; leaves mostly 3 to 6 in. long; rays rather broadly linear, 4 to 5 lines long. . . . . 30. *E. nevadensis*.  
 Herbage conspicuously hirsute with spreading hairs; leaves mostly 1 to 3 in. long; rays narrower, 3 to 4 lines long. . . . . 31. *E. concinnus*.  
 Basal leaves broadly spatulate to obovate; heads 1½ to 1½ in. broad; maritime species . . . . . 32. *E. glaucus*.

1. *E. compósitus* Pursh. Fig. 938. Tufted plant, the stems 1 to several, scape-like, one-headed, 1½ to 3 in. high, arising from the shortly branched and densely leafy root-crown; herbage hirsute; basal leaves 1 to 3-ternately parted into narrow lobes, 2 to 6 lines long, borne on hirsute-ciliate petioles 2 to 12 lines long, those of the flowering stems few (much-reduced, 3-lobed or entire, or none; heads 8 to 11 lines broad; involucre somewhat glandular, 2½ to 3½ lines high, equaling the disk, the bracts linear, acuminate, equal; rays 30 to 60, white to purple or violet, 2 to 3 lines long.—Alpine and sub-alpine, 7100 to 11,750 ft.: Sierra Nevada from Mt. Whitney to Castle Peak; n. to B. C., e. to Rocky Mts. June-July. Var. *DISCOIDEUS* Gray. Rays shorter than the pappus, very variable in the same heads, often with fimbriated margins, or with 1 to 3 filiform divisions.—Sierra Nevada, 9000 to 13,000 ft.

2. *E. áustinae* Greene. Tufted plant, the many stems scape-like, 1 to 3½ in. high, arising from a shortly branched and densely leafy root-crown; herbage hispid with spreading hairs; leaves narrowly spatulate to linear, ½ to

938. *Erigeron compositus* Pursh; a, habit  $\times \frac{2}{3}$ ; b, leaf  $\times 1\frac{1}{2}$ ; c, another leaf type, lowest on shoots  $\times 2\frac{1}{2}$ .

$2\frac{1}{4}$  in. long; heads hemispherical, 6 to 7 lines broad; ray-flowers with the rays reduced to minute scales; disk-flowers very numerous; achenes pubescent with spreading hairs.—Open fields, about 5500 ft.: Modoc Co.; n. to Ore. May-July.

3. *E. radicans* Hook. Densely tufted plant, the scape-like stems 1 to 4 in. high, arising from a stout very shortly branched or condensed root-crown; branches of the root-crown roughened and gray or black with the persistent bases of old leaves; herbage densely gray-hispidulous; basal leaves linear-spatulate,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long, the cauline few and much reduced, narrowly oblanceolate to linear; heads solitary (or rarely 1 or 2 younger heads in axils of lower cauline leaves), 6 to 9 lines broad; involucre bracts lanceolate-linear, subequal, about equaling disk, hairy, somewhat glandular, the inner scarious-margined below; rays white or purple, 3 to 5 lines long; pappus tawny, single, equaling the disk.—Alpine summits,

9500 to 12,500 ft.: Sierra Nevada from Tulare Co. to Tuolumne Co.; White Mts.; n. to Can., e. to Rocky Mts. (*E. nevadensis* var. *pygmaeus* Gray.)

4. *E. bloomeri* Gray. Tufted plant, the stems several, scape-like,  $2\frac{1}{2}$  to 7 in. high, arising from the densely leafy and branched root-crown; herbage somewhat appressed-pubescent to glabrate; basal leaves narrowly linear, sometimes a little dilated upward, 1 to  $2\frac{1}{2}$  in. long; cauline leaves few, nearly filiform; heads turbinate,  $3\frac{1}{2}$  to  $4\frac{1}{2}$  lines high; involucre bracts equal, linear-lanceolate, villous or canescent; rays none; achenes glabrate or sericeous, oblong-linear, flat; pappus soft, whitish, simple, shorter than corolla.—Montane, 2700 to 7000 ft.: Yollo Bolly Mts. to Siskiyou Co.; Sierra Nevada from Nevada Co. to Modoc Co.; n. to Ore. and Ida. May-July.

5. *E. peucephyllus* Gray. Tufted plant, the stems several or many, scape-like, erect, simple or sometimes forked, about 3 to 5 in. high, arising from the rather freely branched root-crown; herbage somewhat canescent; leaves narrowly linear, 1 to 2 in. long, mostly basal; involucre bracts lanceolate, equal, surpassed by the disk; rays 20 to 30, cream-color or yellow, oblong-ovate, 3 to 4 lines long.—Modoc Co.; n. to B. C., e. to Nev. and Ida. June-July.

6. *E. ursinus* Eat. Densely tufted plants, the root-crown much branched and matted with persistent brown leaves of former years; stems ascending or erect, flexuous, 2 to 6 in. high; herbage finely pilose; leaves linear-lanceolate to narrowly oblanceolate with midnerve evident, especially toward base, 1 to  $1\frac{3}{4}$  in. long; heads 1 to  $1\frac{1}{8}$  in. broad, solitary on the scape-like stems, somewhat nodding; involucre bracts linear-lanceolate, somewhat glandular, pubescent, subequal, about 3 lines long, mainly equaling disk; pappus copious, equaling disk or with some of the bristles reduced suggesting an outer pappus; rays about 50, white to lavender or purple, 3 to 5 lines long.—Mountain flats, 6000 to 9000 ft.: Sierra Nevada from Tulare and Tuolumne Cos. to Lassen Co. (*E. nevadensis* var. *sonnei* Smiley. *E. elegantulus* Greene.)

7. *E. algidus* Jepson n. sp. Stems simple, scape-like, usually several from a thickened or branched root-crown of a rootstock,  $1\frac{1}{2}$  to  $7\frac{1}{2}$  in. high; herbage green with rather fine sometimes sparse pubescence; leaves mostly in basal tufts, spatulate to oblanceolate, entire, narrowed to slender ciliate

petioles. the whole  $\frac{1}{2}$  to 3 in. long, the cauline 2 or occasionally more, linear, bract-like, 2 to 12 lines long; involueral bracts narrowly lanceolate, slightly glandular, often dark-purplish, hirsute, 3 lines long, about equaling the disk; rays about 50, lavender to purple, 3 to 4 lines long; pappus copious.—Alpine, 9000 to 13,000 ft.: Sierra Nevada from Tulare Co. to Mariposa and Nevada Cos. (Mt. Lyell, Jepson 3349, type); e. to Col. and Wyo. (*E. ursinus* of Gray etc., not of Eat.)

8. *E. súpplex* Gray. Stems decumbent or ascending 4 to 8 in. high, terminated by a single broad short-peduncled head 6 to 9 lines broad; herbage sparingly hirsute-pubescent or almost glabrous, the involucre canescently hirsute; leaves linear-spatulate to linear-lanceolate, 1 to 2 in. long; bracts of involucre equal, linear-lanceolate; rays none.—Along the coast from Sonoma Co. to Humboldt Co. June.

9. *E. inornátus* Gray. PINE ERIGERON. Stems few to several from the root-crown, erect, simple or sparsely branched, 1 to  $2\frac{1}{2}$  ft. high, the stem on the branches ending above in a low broad corymb with divaricate or ascending branches; herbage nearly glabrous above, more or less hispidly pubescent toward base; leaves linear, 1 to  $2\frac{1}{4}$  in. long, 1 to 2 (or 3) lines wide; heads 4 to 6 lines broad, about 5 to 20 in the corymb; involucre broadly campanulate; bracts unequal, somewhat imbricated, glandular, sometimes puberulent or pubescent; rays none.—Pine forests or along river bluffs: North Coast Ranges, 100 to 3500 ft., from Sonoma and n. Lake Co. to Siskiyou Co.; Sierra Nevada, 3500 to 7000 ft., from Tulare Co. to Modoc Co.; n. to Wash. July-Aug. Var. *viscidulus* Gray is the viscid state.

10. *E. miser* Gray. Stems several, somewhat tufted on the short woody branched root-crown, erect or ascending, densely leafy, 3 to 10 in. high; herbage canescently hirsute; leaves linear-oblong, or cuneately narrowed towards the base,  $\frac{1}{2}$  to 1 in. long, sometimes borne chiefly on one side of the stem; heads  $3\frac{1}{2}$  to 4 lines high, few in a rather close corymb; involucre campanulate, the bracts imbricated; rays none.—Rocky ridges, 2000 to 8000 ft.: Coast Ranges from Mt. Hamilton to Siskiyou Co.; Sierra Nevada from Eldorado Co. to Modoc Co. July-Aug.

11. *E. lonchophýllus* Hook. Stems erect, leafy, strict, 1 to several from a biennial (or perennial) root, 4 to 15 in. high; herbage (especially the stems) hirsute with spreading hairs to glabrate; leaves spatulate to linear or oblanceolate, mostly narrowed below, the basal tapering into a long petiole, the whole 1 to 4 in. long; heads few, 5 to 9 lines broad, often somewhat racemose-paniculate; involucre hemispherical, the bracts lanceolate; rays filiform, inconspicuous, slightly surpassing the disk; pappus copious, fragile.—Dry or moist meadows, 7000 to 9500 ft.: Sierra Nevada from Tulare Co. to Mono and Tuolumne Cos.; n. to Can., e. to Col. July. (*E. armeriaefolius* of Bot. Cal.)

12. *E. canadensis* L. HORSEWEED. Fig. 939. Stem erect, simple below, paniculately branching above, 2 to 5 ft. high; herbage hispid with scattered hairs or nearly glabrous, especially above; leaves linear to lanceolate, entire or the lower ones toothed, 2 to 3 in. long, the lowest spatulate or narrowed to a petiole; heads small ( $1\frac{1}{2}$  to 2 lines high), very numerous in a dense panicle; rays very short and inconspicuous, white, 2-

939. *Erigeron canadensis* L.; a, leaf  $\times \frac{1}{2}$ ; b, inf.  $\times \frac{1}{2}$ ; c, head  $\times 2$ ; d, achene and pappus  $\times 6$ .

toothed.—Common weed in waste or half-cultivated lands, nat. from the e. U. S. Aug.-Oct.

13. *E. linifolius* Willd. Stem erect, simple or with long simple branches, densely leafy,  $\frac{3}{4}$  to 2 ft. high, ending above in a raceme of heads or a racemose panicle; root annual or biennial; herbage conspicuously hispid-pubescent; leaves linear to narrowly spatulate,  $\frac{3}{4}$  to  $2\frac{1}{4}$  in. high, the lower few-toothed; heads rather few; involucre densely pubescent; bracts linear-subulate, at least the outer herbaceous; rays white, very narrow and short, not exceeding the disk; pappus sordid or somewhat tawny.—Waste places about towns, nat. from the Am. tropics: Oakland; Pasadena; Redlands; San Diego.

14. *E. acris* L. Stems one or few from a usually biennial root, 4 to 12 in. high; herbage hirsute to glabrate; leaves narrow, entire, the basal ones narrowly spatulate, drawn down to a narrow base or petiole, 1 to  $3\frac{1}{4}$  in. long, the cauline ones narrowly spatulate to linear, 1 to  $1\frac{1}{2}$  in. long; heads 5 to 9 lines broad, rather few, short-peduncled and racemose along the summit of the stem, or the peduncles longer and somewhat corymbose; pappus copious, fragile; rays purple, numerous, very slender, equaling the disk, or surpassing it by 1 to  $1\frac{1}{2}$  lines; disk with a row of pistillate flowers with tubular corollas inside the rays.—Grassy flats, e. side the Sierra Nevada, 7000 to 9000 ft., rare: Inyo Co.; betw. Bridgeport and Mono; e. to Col., n. to Can. and Alas. Aug.-Sept.

15. *E. divergens* T. & G. Stems several to many, ascending, from an annual or biennial taproot, sometimes decumbent at base, 4 to 12 or 16 in. high; herbage shortly hispid-pubescent; basal leaves oblanceolate to obovate, entire or rarely somewhat incisely toothed, rarely deeply pinnatifid, 1 to  $2\frac{1}{2}$  in. long, including the petiole; upper leaves linear to linear-spatulate, entire,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; heads 7 to 9 lines broad, solitary or somewhat corymbose, on long slender peduncles; involucre 2 lines high; bracts linear, acuminate, more or less membranous-margined, hirsute with white spreading hairs; rays numerous, filiform, violet to white, 2 to 3 lines long; pappus sordid, scanty, fragile, equaling the disk, also a variable short outer pappus of squamellae or simple strigae.—Arid flats, foothills or mountain slopes, 500 to 6700 ft.: Colorado and Mohave deserts and their bordering mts.; Sierra Nevada; Siskiyou Co.; n. to Wash., e. to Neb. Apr.-Aug. (*E. californicus* Jepson.)

940. *Erigeron philadelphicus* L.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, leaves  $\times \frac{1}{2}$ .

16. *E. philadelphicus* L. SKEVISH. Fig. 940. Stem simple, 2 to 3 ft. high, commonly branched only at or near the summit; herbage hispidly pubescent; leaves spatulate or obovate, serrate or coarsely few-toothed, the basal (including the long margined petioles) 4 to 11 in. long, the cauline with auriculate-clasping base, 1 to 4 in. long; heads corymbose, commonly on rather long peduncles,  $\frac{1}{2}$  to 1 in. broad; rays white or pink, numerous, narrow.—Along streamlets and by springy places in the hills and valleys, 100 to 4000 ft.: coastal S. Cal.; Coast Ranges; Sierra Nevada; n. to B. C., e. to the Atlantic.

17. *E. annuus* Pers. Stems stout, leafy, erect, corymbosely branched above, 2 to 4 ft. high, from a stout branched root; pubescence sparse, that of the leaves and branchlets appressed; leaves broadly ovate to obo-

vate or oblong-lanceolate, 2 to  $5\frac{1}{2}$  in. long, coarsely serrate, sessile by a narrow base or the lower tapering to a winged petiole  $1\frac{1}{2}$  times as long; upper leaves narrowly ovate or lanceolate, serrate or entire, smaller; heads numerous, in a leafy panicle; involucre with a few bristly hairs; disk 3 to  $3\frac{1}{2}$  lines broad, slightly surpassed by the subequal lanceolate bracts; rays numerous, narrowly linear, 3 to 4 lines long.—Nat. from e. U. S. in Humboldt Co.; Hydesville; Eureka. July.

18. *E. ramosus* (Walt.) B. S. P. Stems several from a biennial root, erect, simple below, branching above and forming a corymbose panicle,  $1\frac{1}{2}$  to 4 ft. high; herbage roughish-pubescent; leaves oblong-obovate, coarsely serrate or entire, drawn down to a winged base or petiole, the whole  $1\frac{1}{2}$  to 6 in. long; upper leaves lanceolate or linear, entire,  $\frac{3}{4}$  to 2 in. long; panicle somewhat leafy, the heads few to several; heads 5 to 10 lines broad; involucre  $1\frac{1}{2}$  to 2 lines high; rays numerous, white,  $2\frac{1}{2}$  to  $3\frac{1}{2}$  lines long; pappus-bristles comparatively few (6 to 12), with many short bristles  $\frac{1}{8}$  as long.—Nat. from e. U. S.: Nature's Rest, lower Klamath River; Hydesville, Humboldt Co.; Plumas Co.; Yosemite Valley. July. (*E. strigosus* Muhl.)

19. *E. coulteri* Porter. Stems erect, leafy, arising from a slender rootstock, 1 to 2 ft. high, simple and one-headed, or about 3 to 5-branched with the branches rather strict and one-headed; herbage more or less hirsute-pubescent; lower leaves oblanceolate or narrowly obovate, somewhat serrulate, narrowed to a winged base or petiole, the whole 2 to 6 in. long, the upper oblong or lanceolate with clasping base, 1 to 4 in. long; heads  $\frac{7}{8}$  to  $1\frac{1}{2}$  in. broad; involucre bracts equal, lanceolate, surpassing the disk; rays 50 to 80, narrowly linear, white to purplish, 5 to 6 lines long.—Montane, 6000 to 10,000 ft.: Sierra Nevada from Tulare Co. to Nevada Co.; e. to Rocky Mts. June-Aug. (*E. frondeus* Greene.)

20. *E. corymbosus* Nutt. Stems few or several, branching, leafy, erect or at base decumbent, 1 ft. high, arising from creeping rootstocks; herbage thinly pubescent with rather long spreading hairs; leaves linear to narrowly spatulate, entire, 1 to  $1\frac{3}{4}$  in. long; heads  $1\frac{1}{4}$  to  $1\frac{3}{4}$  in. broad, several in a corymbose cluster, or sometimes solitary; involucre  $2\frac{1}{2}$  to 3 lines high, the equal bracts narrowly lanceolate; rays 30 to 50, mostly narrow, 3 to 6 lines long, blue, lilac or white.—Mountain slopes, 2500 to 4500 ft.: Buck Mt., Humboldt Co.; Lassen Co.; n. to Wash. July.

21. *E. sanctarum* Wats. Stems slender, leafy except above, 1 to several from a slender rootstock, 3 to 8 in. high, terminated by a single pedunculate head; herbage rough-pubescent, the involucre densely so; leaves spatulate-obovate to oblanceolate or linear, entire,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long; heads large, the disk 6 to 7 lines broad, about equaled by the bracts; rays many, purple to white.—San Luis Obispo and Santa Barbara Cos.; Santa Barbara Isls. May-June.

22. *E. linearis* Piper. Stems many, slender, erect,  $\frac{1}{2}$  to 1 ft. high, arising from a depressed branched or short woody root-crown, simple and one-headed, or with about 2 or 3 one-headed branches at summit; herbage appressed-pubescent; leaves crowded below, linear-filiform or the lower slightly dilated upward,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long; heads 9 to 11 lines broad; involucre  $1\frac{3}{4}$  to  $2\frac{1}{4}$  lines high; rays 30 to 50, purple, violet or white, 3 to 5 lines long; achenes slightly pubescent or glabrate; pappus simple, the bristles fragile.—Arid slopes, 2800 to 8000 ft.: Providence Mts.; Lassen, Modoc and Siskiyou Cos.; n. to B. C. June-July.

23. *E. jacintus* Hall. Stems few to several, erect or ascending, 2 to 3 in. high, leafy, arising from slender branched rootstocks, ending above in a solitary head on a peduncle  $\frac{1}{2}$  in. long; herbage evenly and densely hispidulous; leaves spatulate to obovate, 1 to  $4\frac{1}{2}$  lines long, exceeding the internodes, all sessile; heads hemispherical, 7 to 9 lines broad; involucre 2 lines high, their bracts narrow, acute, with green midrib and scarious margin; rays about 20, narrow, purple, 2 lines long; achenes flattened, more or less appressed-pubescent, sometimes only so at summit; pappus simple, the scabrous bristles equaling the disk-corollas.—Rocky ridges, about 9000 ft.: San Antonio and San Jacinto mountains.

24. *E. brèweri* Gray. Stems several to many, leafy, slender, erect or ascending, simple or corymbosely branched above, 7 to 15 in. high, arising from the branched crown of a long slender rootstock; herbage hispidulose, a little grayish; leaves linear to oblanceolate, narrow-spatulate, entire,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long; heads solitary or few in a corymb, the peduncles bracteate; involucre 2 lines high, their bracts unequal, oblong to lanceolate or linear, glandular-puberulent to glabrous; rays mostly 10 to 20, violet, 2 to  $3\frac{1}{2}$  lines long.—Rather dry often sandy situations, 4000 to 9000 ft.: San Bernardino Mts. (Big Mds.); Sierra Nevada from Kern Co. to Lassen Peak; Mt. Shasta. Var. *ELMERI* Jepson n. comb. Stems weaker than in the species, decumbent, 5 to 8 in. long; leaves smaller, more sparingly pubescent.—Among rocks, 7200 to 9000 ft.: Sierra Nevada from Mariposa Co. to Tulare Co. (*E. elmeri* Greene.)

25. *E. foliosus* Nutt. Stems many from the base, erect, simple, branching above, 1 to 2 ft. high, arising from the branched root-crown of a short taproot; herbage strigose-hispidulous or somewhat scabrous; leaves more or less crowded on the stems, reduced on the branches of the inflorescence, narrowly linear or lanceolate,  $\frac{3}{4}$  to 2 in. long, 1 to 2 lines wide; heads hemispherical, 10 to 13 lines broad, rather few in an open terminal corymb, the branches often spreading or ascending-divaricate, broad; bracts lanceolate, unequal, glandular and mostly puberulent or pubescent; rays about 30 to 40, 2 to 6 lines long; achenes nerved, the nerves hirsutulose; pappus coarse and tawny.—Along the coast and on river banks or moist hill-sides of the interior, 200 to 5000 ft.: Humboldt Co. to coastal S. Cal.; Sierra Nevada foothills (Amador Co. to Mariposa Co.). May-Aug. Var. *STENOPHYLLUS* Gray. Leaves 1 line or less wide, often filiform; heads 6 to 10 lines broad; rays fewer than in species and narrower; some plants with several rayless heads, these similar to *E. inornatus*.—Drier situations, 100 to 6000 ft.: San Joaquin Valley; w. Mohave Desert; coastal S. Cal. May-June. (*E. fragilis* Greene. *E. setchellii* Jepson.) Var. *BLOCHMANAE* Hall. Achenes glabrous or nearly so.—Near the coast: San Luis Obispo Co.; n. Santa Barbara Co. (*E. blochmanae* Greene.) Var. *HARTWEGII* Jepson n. comb. Herbage sparsely strigose; leaves narrowly linear, 1 to 2 in. long.—Foothills, 800 to 1600 ft.: n. Sierra Nevada foothills from Amador Co. to Butte Co.; inner North Coast Ranges. May-June. (*E. hartwegii* Greene.) Var. *CONFINIS* Jepson n. comb. Flowering stems decumbent, arising from a long much-branched woody root-crown, 3 to 8 in. high, ending above in 1 or several heads; herbage sparsely to cinereous-pubescent.—Rocky ridges, 5000 to 7000 ft.: ne. Humboldt Co. to w. Siskiyou Co.; n. to southern Ore. (*E. confinis* Howell.)

26. *E. parishii* Gray. Stems many, slender, erect or ascending, somewhat tufted on the branched woody root-crown, 7 to 12 in. high, mostly simple and one-headed or with 2 to 5 one-headed branches above; herbage silvery with soft appressed hairs; leaves narrowly oblanceolate to linear, drawn down to a narrow base,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; involucre greenish, puberulent,  $3\frac{1}{2}$  lines high; bracts linear-lanceolate, shorter than the disk; rays violet or purple, 4 to 5 lines long.—Cushenberry Sprs., Mohave Desert. May-June.

27. *E. porphyreticus* Jones. Stems few to several, slender, leafy, branched, erect or somewhat flexuous, 1 to 2 ft. high, arising from a thick woody root-crown; herbage retrorse-pubescent with stiffish hairs; leaves linear to spatulate-linear,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long; heads solitary on the ends of the branches, rather long-peduncled; involucre 2 to 3 lines high, their bracts unequal; rays many, narrow, purple, 3 lines long.—Arid areas, 4000 to 5000 ft., Inyo Co.: Lone Pine; Deep Spring Valley; e. to Nev.

28. *E. salsuginosus* Gray. Fig. 941. Stem simple, erect or ascending, leafy, commonly  $\frac{1}{2}$  to  $1\frac{1}{2}$  ft. high, arising from a short thickish rootstock, commonly with a single terminal head, rarely 2 or 3; herbage glabrous or glabrate below, pubescent above; leaves erect; basal and lower cauline leaves oblanceolate to oblong-spatulate, scabrous-ciliolate, attenuate below into a margined petiole, the whole 2 to 5 in. long; upper cauline leaves ovate-oblong to lanceolate, sessile, conspicuously mucronate or apiculate-acuminate, the uppermost small and bract-like; heads  $1\frac{1}{4}$  to  $1\frac{3}{4}$  in. broad; involucral bracts

loose or even spreading, linear-subulate or attenuate, viscidulous; rays 50 to 70, purple or violet, 6 to 7 lines long.—Montane, 5500 to 10,000 ft.: Sierra Nevada from Tulare Co. to Nevada Co.; e. to N. Mex., n. to Alas. and w. Can. June-Aug. Var. *ANGUSTIFOLIUS* Gray. Stems  $\frac{1}{2}$  to 1 ft. high; basal and lower cauline leaves narrowly spatulate to lanceolate, the upper cauline linear-lanceolate, small; rays about 40.—Montane, 6200 to 10,000 ft.: Sierra Nevada from Tulare Co. to Nevada Co.; n. to Wash. July-Aug.

29. *E. tener* Gray. Stems filiform, erect, several from the root-crown,  $3\frac{1}{2}$  to 7 in. high, ending in a single head or a corymb of 2 or 3 long-peduncled heads; leaves oblong-ob lanceolate, acute,  $\frac{1}{2}$  to 1 in. long, narrowed to a long petiole 1 to  $1\frac{1}{2}$  times as long; herbage finely villous; heads 5 to 8 lines broad; rays blue, 1 to  $1\frac{1}{2}$  lines long.—Montane peaks, 7000 to 9000 ft.: Scott Mts.; Silver Mt., Alpine Co.; e. to Nev. Aug.

30. *E. nevadensis* Gray. Stems several to many, erect or at base decumbent, 5 to 10 in. high, arising from a branched root-crown, simple and one-headed or with 2 or 3 one-headed branches at summit; herbage appressed-pubescent; leaves long and narrowly lanceolate to linear, 1 or 3-nerved, the basal in one erect tuft, attenuate below to a narrow base or slender petiole, the whole 3 to  $6\frac{1}{2}$  in. long, the uppermost small and linear or subulate; heads about  $\frac{3}{4}$  in. broad, solitary, peduncled, often somewhat nodding; involucre 3 lines high, villous-pubescent, sometimes glabrate, their bracts equal; rays broadly linear, white or pale blue, 4 to 5 lines long; achenes comparatively large; pappus rather coarse, of 20 to 30 bristles.—Montane dry meadows, 4200 to 8500 ft.: Plumas Co. to Shasta and Modoc Cos. June-July. (*E. plantagineus* Greene.)

31. *E. concinnus* T. & G. Stems many, erect or at base decumbent, leafy, simple and one-headed or corymbosely few-branched above, 5 to 14 in. high, arising from the thickened or shortly branched root-crown; herbage pale, hirsute with harsh spreading hairs, sometimes white-shaggy at base; leaves linear to linear-spatulate,  $\frac{3}{4}$  to  $3\frac{1}{2}$  in. long; heads somewhat long-peduncled; involucre bracts linear-lanceolate, equal, 2 to 3 lines long, about equaling the disk; rays many, blue or white, 3 to 4 lines long; pappus scanty, about equaling disk, with an evident striate-membranous outer circle  $\frac{1}{5}$  to  $\frac{1}{4}$  as long, this outer circle readily separating into broad paleaceous divisions or hair-like scales; rays blue or rarely white, 2 to 3 lines longer than disk.—Arid slopes, 3000 to 5000 ft.: Sierra Co. to Modoc Co., thence w. to Siskiyou Co.; n. to Can., se. to Ariz. July. Var. *APHANACTIS* Gray. Ray with the corolla reduced to a toothed or fimbriated tube; style exserted.—Rocky slopes, 3000 to 6000 ft.: e. of the Sierra Nevada from Inyo Co. to Lassen Co.; e. to Nev. Var. *CONDENSATUS* Eat. Dwarf, 1 to  $2\frac{1}{2}$  in. high, densely tufted on a stout branched woody root-crown; herbage gray with hirsute spreading hairs; stems scapose, sparsely leafy at base; rays very short or none.—Summits, San Bernardino Mts.: Mt. San Geronio; Sugarloaf Mt.; e. to Nev. where it is said to intergrade with var. *aphanactis*. Var. *EREMICUS* Jepson n. var. More compact, the basal tufts more numerous with stems of mostly even height, making a broad flat-topped plant 3 to  $5\frac{1}{2}$  in. high; herbage more rigid; heads more showy, the rays 5 to 7 lines long.—Rocky ridges, 3000 to 4000

941. *Erigeron salsuginosus* Gray; a, b, habit x  $\frac{1}{2}$ ; c, bract x 4; d, disk-fl. x  $2\frac{1}{2}$ .

942. *Erigeron glaucus* Ker.; a, habit x  $\frac{3}{4}$ ; b, fl. head x  $\frac{1}{2}$ ; c, head of unopened fls. x  $\frac{3}{8}$ .

ft., e. Mohave Desert: Cima; Providence Mts.; New York Mts. (Jepson 5464, type).

32. *E. glaucus* Ker. SEASIDE DAISY. Fig. 942. Stems erect, 4 to 8 (or 10) in. high, commonly one-headed, arising from a basal tuft of leaves on the fleshy root-crown, and often, also, from rosulate offsets terminating prostrate woody branches; stems pilose-pubescent, leaves finely puberulent, heads somewhat tomentose; leaves spatulate, obovate, entire, rarely with a small tooth on either side below the apex, 1 to 4 in. long; upper cauline leaves small and scattered; heads large,  $1\frac{1}{4}$  to  $1\frac{1}{2}$  in. broad; rays numerous, lilac or violet.—Common on cliffs or sandy shores, near the sea only, 10 to 100 ft.: San Miguel Isl.; Monterey Co. to Humboldt Co.; n. to Ore. May-Aug.

#### 61. *BACCHARIS* L.

Perennial herbs or shrubs, commonly resinous or glutinous. Branches commonly striate or angled. Heads discoid, many-flowered, small (mostly 3 or 4 lines high), borne singly or in clusters on the ends of branchlets and aggregated in panicles or corymbs. Involucre imbricated. Flowers whitish or yellowish, dioecious. Staminate (or sterile) flowers with tubular corolla slightly dilated at the throat, the limb cleft into 5 linear lobes; ovary abortive; style present. Pistillate flowers with the corolla very slender and thread-like, truncate at apex or with 5 obscure closely erect teeth, much shorter than the style; stamens none. Pappus of capillary minutely scabrous bristles, in the sterile plant scanty and tortuous, in the pistillate very long and copious. (The god Bacchus.)

A. *Achenes 10-nerved; leaves not willow-like.*

Pappus of flowers copious, soft and fine, conspicuously elongating in fruit; receptacle naked. Leaves all obovate; heads in sessile glomerules in a leafy panicle. . . . . 1. *B. pilularis*.  
Leaves, at least the uppermost, linear; panicle naked or less leafy.

Pappus bright white; branchlets of the panicle bearing glomerules of heads. . . . . 2. *B. emoryi*.

Pappus brownish; branchlets of the panicle bearing mostly 1 head. . . . . 3. *B. sarothroides*.

Pappus of pistillate flowers rigid, scanty, not elongating in fruit; receptacle with some bracts . . . . . 4. *B. sergiloides*.

B. *Achenes 5-nerved, sometimes obscurely so.*

Herbage glabrous or nearly so.

Herbs; leaves resinous . . . . . 5. *B. douglasii*.

Shrubs; leaves willow-like.

Leaves dull green, not glutinous; involucre tawny. . . . . 6. *B. viminea*.

Leaves lustrous green, glutinous; involucre stramineous. . . . . 7. *B. glutinosa*.

Herbage slightly pubescent; leaves linear; stems woody at base.

Leaves acutely serrate, 1 to 4 in. long. . . . . 8. *B. plummerae*.

Leaves entire, 3 to 6 lines long. . . . . 9. *B. brachyphylla*.

1. *B. pilularis* DC. COYOTE BRUSH. CHAPARRAL BROOM. Fig. 943. Shrub 2 to 5 ft. high; branchlets angular; leaves broadly obovate or cuneate, coarsely or sinuately few-toothed, or occasionally entire, very obtuse, sessile, ( $\frac{1}{4}$  or)  $\frac{1}{2}$  to 1 in. long; heads short-cylindrical or ovoid, 2 or 3 lines long, solitary or commonly several in axillary and terminal clusters on the numerous leafy branchlets, the whole forming a leafy panicle; outer bracts of

involucre broadly, the inner narrowly oblong, sometimes denticulate at apex; pappus minutely scabrous, that of the pistillate flowers becoming  $2\frac{1}{2}$  to 5 lines long, that of the staminate flowers about  $\frac{1}{2}$  as long, in both (but more especially in the staminate) dilated at apex into a bent lanceolate appendage.—Common and usually gregarious on low hills, mountain slopes or on the coast sand dunes (especially in a prostrate form), 10 to 1500 ft.: throughout cismontane Cal.; n. to Ore. Aug.-Oct.

2. *B. emoryi* Gray. Loosely branched shrub 4 to 8 (or 12) ft. high, with long stems and with striate branchlets; lower leaves oblong, 3-nerved, often with 1 or several short broad teeth, 1 to 2 in. long, the upper linear, 1-nerved, entire; panicle large, the pistillate very showy in fruit, sparingly leafy, the heads few in glomerules terminating short branchlets; involucre campanulate or oblong, 3 lines long; bracts closely imbricated, bordered by a narrow scarious minutely ciliate margin, the outer oval, firm, the inner oblong or linear, thin; pappus of staminate flowers bearded at tip, of the pistillate flowers copious, in fruit 6 lines long.—Los Angeles and San Diego to the Colorado River; e. to Utah.

3. *B. sarothroides* Gray. Much-branched nearly leafless shrub 3 to 8 ft. high; panicle broom-like, composed of numerous slender branchlets and bearing only a few small leaves; branchlets 4-sided and strongly striate, bearing mostly 1, or at least few, heads; leaves few, linear or tapering to base, entire, 3 to 5 (or 10) lines long; sterile heads turbinate or hemispherical, 2 lines high; fruiting heads 4 to 5 lines high; involucre bracts chartaceous, oval, obtuse, rather closely imbricated, the few inner oblong or linear ones loosening at maturity; receptacle without bracts; achenes glabrous; pappus of pistillate flowers brownish, 3 to 4 lines long, not lanceolate-dilated at tip or very slightly.—Colorado Desert and mts. on its northern borders; w. to San Diego; e. to Ariz.; adjacent Mex. The dark green branches of the inflorescence often contrast vividly with the light tan color of the main stems. Var. *PLURICÉPHALA* Jepson n. var. Branchlets several-headed or even spicate; involucre bracts acute; achenes  $1\frac{1}{2}$  lines long.—Conchilla Mts. (Piñon Well, Jepson 6008, type).

4. *B. sérgiloides* Gray. SQUAW WATERWEED. Glabrous shrub 3 to 7 ft. high, the herbage very glutinous; branchlets slender, striate, mostly 4-sided; leaves obovate, entire, apiculate, drawn down to a narrow base,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; panicle usually nearly leafless, of numerous heads; heads oblong or widening a little upwards,  $1\frac{1}{2}$  to 2 lines high; involucre bracts oblong-ovate, acute, herbaceous in center and minutely puberulous, with scarious margins; receptacle with a few linear bracts amongst the flowers; pappus of pistillate flowers 2 lines long, not elongating in fruit, not dilated at tip; achenes glabrous.—Moist places in desert cañons: mts. on w. side Colorado Desert; e. Mohave Desert; Panamint Range; e. to Nev., Ariz. and Utah.

5. *B. douglasii* DC. Fig. 944. Stems suffrutescent at base, 4 to 5 ft. high, simple up to the terminal corymb; herbage very glutinous; leaves lanceolate and very acute, or the lower ovate-lanceolate, 3 to 4 in. long, serrulate, almost

943. *Baccharis pilularis* DC.; a, pistillate branchlet x 1; b, staminate branchlet x 1; c, staminate fl. x 3; d, pistillate fl. x 3.

944. *Baccharis douglasii* DC.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, long. sect. of head with fls. removed  $\times 3$ ; c, staminate fl.  $\times 6$ ; d, pistillate fl.  $\times 6$ ; e, achene and pappus  $\times 6$ .

ers nearly smooth, a little crinkle-bent at tip, those of the fertile flowers more slender, a little scabrous or nearly smooth, shorter than the sterile at flowering time, in fruit longer.—Flood beds of streams and rivers, Sierra Nevada foothills, Sacramento and Napa valleys southward to coastal S. Cal. July-Aug. The leaves of sterile shoots are often large ( $5\frac{1}{2}$  in. long and 1 in. wide).

7. *B. glutinosa* Pers. WATER-WALLY. Stems slender, erect or straggling, several in a cluster, 3 to 10 ft. high,  $\frac{1}{2}$  to 1 in. in diameter at base, woody at least below; branches striate; leaves bright lustrous green, lanceolate, remotely denticulate, acute at both ends, 3-nerved from the base,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  (or "to 6") in. long; staminate heads  $1\frac{1}{2}$  lines high; fruiting heads 3 or 4 lines high, in a terminal compound corymb; bracts of the involucre oblong-lanceolate or the short outer ones ovate, stramineous, with narrow scarious margins, fimbriate at tip; pappus-bristles minutely scabrous.—Along streams and in moist ground: Colorado Desert, w. to Riverside, n. through the Mohave Desert to Owens Valley; e. to Tex., s. to Mex.; Chile.

8. *B. plummerae* Gray. Stems slender, woody at base, forming rounded bushes 2 to 3 ft. high; herbage loosely puberulent, slightly viscid; leaves linear-oblong, obtuse, sharply serrate, sessile, 1 to  $1\frac{1}{2}$  in. long; panicles small or medium sized; staminate heads 2 to  $2\frac{1}{2}$  lines high; fertile heads 5 lines high; bracts linear-lanceolate, acute, scarious-margined; achenes puberulent.—Mountain cañons: Santa Inez Mts. to the Santa Monica Mts.; Santa Barbara Isls.

9. *B. brachyphylla* Gray. Stems slender, much branched, woody at base, 2 to  $3\frac{1}{4}$  ft. high, sparsely leaved; herbage puberulent; leaves linear, acute, entire, 3 to 6 lines long, the upper reduced and scale-like; heads  $1\frac{1}{2}$  to 2 (fruiting heads 4) lines high, loosely paniculate; involucre bracts oblong-lanceolate, the green midrib pubescent and with broad scarious margins; fruiting pappus sordid, 3 lines long; achenes sparingly puberulent.—S. San Diego Co.; e. to Ariz.

entire, 3 to 4 in. long; heads numerous in a terminal compound almost naked corymb; bracts of the involucre linear or lanceolate-linear with greenish center, the scarious margins erose-ciliate; receptacle broadly conical; pappus of pistillate flower short and soft, of the staminate clavellate at summit.—Moist lowlands: abundant in the salt marshes about San Francisco Bay, thence s. to coastal S. Cal.

6. *B. viminea* DC. MULE FAT. Leafy shrub with many slender loosely branching stems, 4 to 8 ft. high; branches striate-angled; leaves rather dull green, lanceolate or oblong, acute at both ends, entire or sparingly denticulate, 1 to 3 in. long; main stem or branches of the inflorescence very leafy, the heads borne in rather close corymbose clusters disposed in a mostly loose and often interrupted panicle or compound corymb; heads narrowly bowl-shaped, 2 to 4 lines high; involucre bracts broadly lanceolate or the outer ones ovate, chartaceous with scarious margins, erose and mostly villous-ciliate; pappus-bristles of the sterile flow-

TRIBE 5. *Inuleae*. EVERLASTING TRIBE

Annual or perennial herbs. Herbage mostly white-woolly (except *Pluchea*). Leaves alternate (opposite in *Psilocarphus*), entire, or more or less dentate in *Pluchea* and *Adenocaulon*. Heads small; rays none. Bracts of the involucre frequently white or scarious. Pistillate flowers mostly with filiform corollas. Sterile flowers either perfect or staminate. Anthers caudate at base. Style-branches stigmatic to the unappendaged summit. Pappus capillary or none. (One species of no. 71 is a shrub.)

62. *MICROPUS* L.

Small floccose-woolly annuals. Leaves alternate, entire. Heads several-flowered, discoid, borne one in a place or somewhat clustered towards the ends of the branches. Receptacle convex. Bracts of the involucre open, scarious, surrounding the flower-bearing bracts of the receptacle. Bracts of the receptacle conduplicate or formed like a flat sac, rounded at apex, beaked on one side and open below the erect beak, almost concealed by the clothing of long loose wool, each one enclosing a pistillate flower; sterile flowers in the center mostly naked. Achenes gibbous, the corolla and style borne laterally, without pappus, remaining enclosed in the sac-like bracts which finally fall away from the receptacle. (Greek micros, small, and pous, foot, in allusion to the soft-woolly heads.)

- Fruiting sacs with the opening not scarious-margined, the beak tipped with a narrow soft or scarious point; bracts of the involucre oblong.....1. *M. californicus*.  
 Fruiting sacs with the opening and the beak broadly scarious-winged, the wing thus forming a broad ovate or obovate membrane facing the staminate flowers in the center; bracts of the involucre orbicular.....2. *M. amphibolus*.

1. *M. californicus* F. & M. Fig. 945. Stem slender, strictly erect, 4 to 13 in. high, commonly branched only at the summit; leaves linear-oblong to oblanceolate, acuminate, 2 to 9 lines long; receptacle low, with several scale-like processes; fruit-bearing bracts 4 to 6, at length indurated, the surrounding bracts of the involucre commonly 5, these orbicular or ovate, scarious, with a green spot in the center; staminate flowers about 3, the corolla filiform, but expanding somewhat toward the throat.—Very common on low hills or in valleys, 25 to 2700 ft.: throughout cismontane Cal.; n. to Ore. Apr.-May. Var. *SUBVESTITUS* Gray. Wool of the bracts short and wholly appressed.—Mt. Diablo; Oakland Hills; Belmont; Arroyo Grande; San Bernardino.

2. *M. amphibolus* Gray. Resembling no. 1 but the fruiting bracts 9 or 10 and comparatively thin and soft; receptacle elevated or oblong; staminate flowers subtended by linear thin chaff-like bracts and with a pappus of few bristles.—Low hills, region of San Francisco Bay: Mt. Tamalpais; Laundry Farm, Oakland Hills; Walnut Creek. It is either very rare or, more probably, overlooked for *M. californicus*.

945. *Micropus californicus* F. & M.; a, habit x 1; b, fr. bract x 4; c, pistillate fl. x 4; d, staminate fl. x 4.

63. *FILAGO* L.

Low woolly annuals with alternate entire leaves. Heads discoid, in small capitate clusters. Receptacle hemispherical or conical, its base bearing a series of concave or boat-shaped bracts, each enclosing a pistillate flower with filiform tubular corolla and destitute of pappus. Center or summit of receptacle bearing a cluster of fertile and sterile flowers and surrounded by a series of scarious or chaff-like bracts; central flowers with capillary pappus or the sterile sometimes without pappus. (Latin flum, a thread, in allusion to the cottony pubescence.)

Uppermost leaves conspicuously surpassing the heads.

Leaves subulate with broadish base; receptacle low, nearly flat. .... 1. *F. gallica*.

Leaves linear; receptacle somewhat obconic or convex. .... 2. *F. arizonica*.

Uppermost leaves scarcely longer than the heads.

Stems erect, simple or branched, 4 to 10 (or 15) in. high. .... 3. *F. californica*.

Stems depressed, diffusely more or less branched, 1 to 3 (or 4) in. high. .... 4. *F. depressa*.

1. *F. gallica* L. Stem erect, branching or simple, 5 to 7 in. high; leaves subulate,  $\frac{1}{2}$  to 1 in. long, those involucre to the heads straight, divaricate, and, in appearance, rigid but really soft; receptacle nearly flat; heads obconical, and somewhat 5-angled,  $1\frac{3}{4}$  to 2 lines high; marginal achenes completely enclosed in the at length indurated base of the bract.—Nat. from Eur. on dry open or brushy slopes, 200 to 1200 ft.: Napa Range; Hydesville, Humboldt Co.; Ione; Milton; Whiteside, Mariposa Co. Apr.-May.

2. *F. arizonica* Gray. Stem branching from or above the base, erect or diffuse,  $1\frac{1}{2}$  to 6 in. high; herbage white-lanulose, the stems soon glabrate, the leaves more tardily; leaves linear, 3 to 11 lines long, the upper ones involucre around and much exceeding the glomerules of heads; glomerules small, separated by elongated filiform internodes ( $\frac{1}{2}$  to  $2\frac{3}{4}$  in. long); marginal pistillate flowers 10 to 15, their bracts firm, ovate, open on the face; achenes oblanceolate, slightly curved, smooth.—Arid flats or valleys, 50 to 2000 ft.: Santa Catalina Isl.; San Diego; Riverside; Ojai Valley; Mohave Desert; e. to Ariz., s. to L. Cal. Apr.

946. *Filago californica* Nutt.; a, habit x  $\frac{1}{2}$ ; b, pistillate fl. with bract x 5; c, pistillate fl. of central cluster x 6; d, staminate fl. x 6.

3. *F. californica* Nutt. Fig. 946. Stem simple or branching, mostly erect, leafy throughout, 4 to 10 (or 15) in. high; herbage white-tomentulose, more or less glabrate, especially on the stems; leaves linear to oblanceolate, 3 to 10 lines long; heads ovate, 2 lines long; receptacle convex, rough or somewhat bur-like; marginal bracts 8 to 10, very woolly, deeply boat-shaped and somewhat incurved at apex, spreading stellately at maturity; inner bracts oblong, plane or merely concave; marginal achenes smooth; central achenes dotted with shining papillae.—Dry hills or flats, 100 to 3500 ft. mostly: Mendocino Co. to coastal S. Cal.; Sierra Nevada foothills from Butte Co. to Mariposa Co.; Ft. Tejon; w. side Colorado Desert; s. to L. Cal. Apr.-June.

4. *F. depressa* Gray. Stem branching from the base, 1 to 4 in. high, the branches decumbent or ascending; herbage white-tomentulose or more or less glabrate; leaves oblong to narrowly obovate,  $1\frac{1}{2}$  to 4 lines long; heads 1 to  $1\frac{1}{2}$  lines high, borne in small glomerules, the glomerules subtended by short ovate or oblong leafy bracts and nearly equaling or sometimes exceeding the upper internodes; marginal pistillate flowers 5 or 6, their enclosing bracts woolly, nearly straight; achenes smooth, the marginal ones obovate, shining, the inner ones oblong or fusiform.—Sandy desert plains or mesas, 100 to 2000 ft.: Colorado Desert; Mohave Desert; Inyo Co. Apr.

#### 64. *STYLOCLINE* Nutt.

Low floccose-woolly annuals with alternate entire leaves. Heads discoid, in small terminal clusters. Pistillate flowers enclosed in ovate boat-shaped bracts, these bracts borne on a slender column-like receptacle and with erect hyaline tip, the sac-like body loosely enclosing the achene; corolla filiform; pappus none. Staminate flowers few in the center, their bracts plane or

barely concave and their pappus caducous or none. (Greek stulos, a column, and kline, a bed, on account of the form of the receptacle.)

Bracts of the staminate (sterile) flowers thin, obtuse or merely acute, inconspicuous; fertile flowers many.

Fruit-bearing bracts narrowly ovate, somewhat keeled and moderately woolly dorsally, the margins broadly scarious and continued upward so as to form an ovate plane wing on the ventral side. . . . . 1. *S. gnaphalioides*.

Fruit-bearing bracts broadly ovate, somewhat obcompressed, heavily woolly on the back, the margins not winged but ending above in a conspicuous membranous ovate tip . . . . . 2. *S. micropoides*.

Bracts of the staminate (sterile) flowers thick, ovate-lanceolate, tapering into a conspicuous rigid hooked cusp; fertile flowers 5 to 9. . . . . 3. *filaginea*.

1. *S. gnaphalioides* Nutt. Fig. 947. Stems several to many from the base, ascending or erect,  $1\frac{1}{2}$  to 7 in. high; herbage loosely white-woolly; leaves broadly linear or the upper oblong, obtuse or rather bluntly apiculate, 2 to 4 lines long; fruit-bearing bracts many, ovate, slightly carinate and moderately woolly dorsally, each margin of the sac bearing a broad wing which is produced upward and thus forms a broadly ovate plane membrane on the ventral side; sterile flowers little shorter than their bracts, with rudimentary ovary and a pappus of few caducous bristles. — Dry grassy plains or mesas, 100 to 2000 ft.: w. side Colorado Desert; coastal S. Cal. and n. to Monterey Co. and the San Joaquin Valley. Apr.

2. *S. micropoides* Gray. Stem branched at or near the base, the branches erect or diffuse, 1 to 3 in. high; leaves linear to oblong-oblanco-olate, 3 to 8 lines long; fruit-bearing bracts numerous, broadly ovate, somewhat obcompressed, heavily woolly on the back (thus resembling pellets of wool), the margins not scarious-winged, ending above in a rather conspicuous ovate membranous tip; sterile flowers naked or subtended by thin glabrous or weakly hairy scales, with a pappus of 2, 3 or 4 caducous bristles. — Sandy river flats or rocky hills, 250 to 7400 ft.: ne. Colorado Desert; Mohave Desert; Inyo Co.; e. to N. Mex., s. to Mex. Apr.-May.

3. *S. filaginea* Gray. Stem branched at or above the base, erect or ascending, 2 to 4 in. high; herbage canescent with fine appressed wool which is later flocculent; leaves narrowly linear or narrowly oblanceolate, 3 to 7 lines long, those involucrate to the heads broader; fertile flowers 5 to 9, their bracts boat-shaped, firm except at the hyaline tip, smaller than the 5 empty bracts which surround the sterile flowers in the center; empty bracts somewhat coriaceous, tapering into a rigid incurved hooked cusp, persistent, and at length stellately spreading. — Dry often brushy slopes, 800 to 2000 ft.: Coast Ranges from San Luis Obispo Co. to Mendocino and w. Colusa Cos.; Mariposa Co. foothills. Apr.-May. Var. *DEPRÉSSA* Jepson n. var. Much branched from the base, the stems stout, prostrate, forming a mat 1 to 4 in. broad. — Siskiyou Co.; w. Tehama Co. (Crane Creek, Jepson, type); Priest Valley, Monterey Co.

#### 65. *PSILOCÁRPHUS* Nutt.

Low or prostrate white-woolly annuals. Leaves opposite, entire, the uppermost involucrate around the small sessile globose heads, which are solitary in the forks or at the ends of the branches, or some clustered. Heads globose,

947. *Stylocline gnaphalioides* Nutt.; a, habit  $\times \frac{3}{4}$ ; b, fertile or outer bract of receptacle, enclosing pist. fl.  $\times 6$ ; c, inner bract  $\times 6$ ; d, stam. fl.  $\times 6$ ; e, pist. fl.  $\times 6$ .

discoid. Bracts all of one kind, clothed with soft wool, crowded on the small globose receptacle, each bract sac-like, half-obcordate or obovate in side view, hooded and rounded at the top with the apex introrse (turned downward and inward) and beaked by a hyaline appendage or scale. Flowers unisexual; pistillate flowers loosely enclosed in the sac-like bracts, with filiform corollas; staminate flowers few, occupying the center of the head and naked, that is, destitute of enclosing or other bracts. Achenes straight or slightly curved. Pappus none. (Greek *psilos*, bare, and *karpheos*, chaff.)

Leaves tapering below; heads numerous, covered with rather close wool.

Plants prostrate, matted; leaves 3 to 8 lines long, rather abruptly narrowed toward base.....1. *P. tenellus*.

Plants erect or diffusely branched; leaves  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long, gradually narrowed toward base.....2. *P. oreganus*.

Leaves not tapering below; heads rather few, covered with very loose wool.

Heads nearly concealed by upper leaves.....3. *P. globiferus*.

Heads not concealed by upper leaves.....4. *P. brevissimus*.

1. *P. tenellus* Nutt. Fig. 948. Plants prostrate, the forking stems forming a dense mat 2 to 10 in. broad; leaves spatulate to oblanceolate, mucronate, 3 to 8 lines long; heads numerous, 2 lines broad; achenes oblong or slightly broader toward the summit, about  $\frac{1}{2}$  line long.—Valleys and low hills, 25 to 3400 ft.: coastal S. Cal.; Coast Ranges; Sierra Nevada foothills from Mariposa Co. n.; Sacramento Valley; n. to Wash. May-June.

948. *Psilocarphus tenellus* Nutt.; a, habit  $\times \frac{2}{3}$ ; b, leaf  $\times \frac{2}{3}$ ; c, involucre bract enclosing pistillate fl.  $\times 4$ ; d, staminate corolla  $\times 6\frac{2}{3}$ .

2. *P. oreganus* Nutt. Stem diffusely branched from base, the few to many branches slender, erect or spreading, 2 to 5 in. long; herbage covered with a close tomentum; leaves spatulate, mostly apiculate,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; heads 2 to  $2\frac{1}{2}$  lines broad, solitary or in clusters of 2 or 3 in the forks and at ends of the branches.—Beds of former vernal pools, 25 to 500 ft.: Coast Ranges; lower San Joaquin Valley; Sacramento Valley; n. to Ore. May.

ing, 1 to 4 in. long; herbage loosely tomentose; leaves linear, 2 to 7 lines long; heads 3 lines broad, in terminal clusters or scattered along the branches or in the forks, more or less concealed by the whorl of subtending leafy bracts; achenes elliptic-oblong.—Low places in fields where water has stood, 50 to 3000 ft. mostly: coastal S. Cal.; Great Valley; e. of the Sierra Nevada from e. Nevada Co. to Modoc Co.

3. *P. globiferus* Nutt. Stem either simple or branching, prostrate or ascending, 1 to 4 in. long; herbage loosely tomentose; leaves linear, 2 to 7 lines long; heads 3 lines broad, in terminal clusters or scattered along the branches or in the forks, more or less concealed by the whorl of subtending leafy bracts; achenes elliptic-oblong.—Low places in fields where water has stood, 50 to 3000 ft. mostly: coastal S. Cal.; Great Valley; e. of the Sierra Nevada from e. Nevada Co. to Modoc Co.
4. *P. brevissimus* Nutt. Dwarfish, the stems several to many from the base but mostly simple, 1 to 3 in. long; leaves obspatulate, obtuse or merely acute, 4 to 6 lines long, the involucre ones partly concealing the heads; heads comparatively few, 4 to 5 lines broad, more loosely woolly than in *P. oreganus*; staminate flowers about 7 or 8; achene cylindrical or slightly clavate, less than 1 line long.—Summer beds of vernal pools: San Luis Obispo Co. to Sacramento Valley; n. to Wash. May-June.

## 66. *EVAX* Gaertn.

Dwarf rigid densely woolly annuals. Leaves alternate, entire. Heads discoid, solitary in the axils or crowded in dense terminal clusters. Bracts of the involucre very closely imbricated, covering but not enclosing the pistillate flowers and forming a short-cylindric head, the receptacle produced upward as a slender or spike-like column tipped with a cup-like whorl of 5 bracts at summit, the cup bearing 2, 3 or 4 staminate flowers. Bracts of the

involucre and of the pistillate flowers becoming hardened, persistent, the upper or sterile bracts deciduous. Pistillate flowers with filiform corollas. Pappus none. (An Arabian chief who wrote to Emperor Nero about simples.)

Bracts of pistillate flowers chartaceous, becoming coriaceous, persistent; receptacle columnar or cylindric; leaves narrowed to a very slender petiole.

Heads mostly scattered; receptacle elongated or slenderly cylindric. ....

1. *E. sparsiflora*.

Heads in terminal clusters; receptacle thick-columnar. .... 2. *E. caulescens*.

Bracts of pistillate flowers scarious, at maturity deciduous; receptacle low hemispheric or merely convex; heads in terminal clusters; leaves sessile by a broad base. .... 3. *E. multicaulis*.

1. *E. sparsiflora* Jepson. Fig. 949. Stem erect, 1 to 4 in. high, simple or commonly branching from the base, the heads in the axils, scattered along the branches or slightly glomerate at the ends of the branches; leaves spatulate, narrowed to a very slender petiole, 3 to 8 lines long; bracts of the receptacle woolly on back and rather densely long-hirsute at base, especially the upper; staminate flowers in center about 4.—Dry adobe or sometimes sandy soil in the hills, 10 to 2000 ft.: Coast Ranges

949. *Evax sparsiflora* Jepson; a, habit x  $\frac{2}{3}$ ; b, head x 7; c, section of head x 7; d, cluster of staminate flowers in terminal cup x 7; e, involucre bract x 7; f, pistillate flower x 7.

950. *Evax caulescens* Gray; a, habit x  $\frac{3}{4}$ ; b, central cluster of stam. fls. with subtending circle of bracts x 4; c, long. sect. of head, the bracts with pistillate fls. in their axils, the terminal cluster staminate x 4; d, bract x 4; e, staminate fl. x 8; f, pistillate fl. x 8.

from Humboldt Co. to San Luis Obispo Co. May. Var. *BREVIFOLIA* Jepson n. comb. Depressed and rosulate, or with stems 1 in. high; leaves small, short-petioled, about  $\frac{1}{4}$  to  $\frac{1}{2}$  in. long.—Humboldt and Napa Cos.; Amador Co. (*E. caulescens* vars. *brevifolia* and *minima* Gray.)

2. *E. caulescens* Gray. Fig. 950. Stems 1 to several from the base, simple, 1 to 8 in. high; heads all crowded in a very dense terminal cluster, the cluster hemispherical, 6 to 9 lines broad and surrounded by a whorl of many leaves, these leaves spatulate-obovate, 6 to 12 lines long, narrowed to a petiole  $\frac{3}{4}$  to 1 in. long; cauline leaves similar, 3 to 5 lines long, on petioles  $\frac{3}{4}$  to 1 in. long.—Dry summer beds of vernal pools, 10 to 300 ft.: Sacramento Valley; Napa Valley. (*E. involucrata* Greene.) Var. *HUMILIS* Jepson. One to 2 in. high, the heads crowded on the short central stem or at the ends of the very short horizontal branches (none in the axils), the close clusters subtended by rosulately arranged leaves.—Antioch.

3. *E. multicaulis* DC. Stems several from the base, diffuse, 2 to 4 in.

long; leaves spatulate to oblong-spatulate, sessile by a broad base, 3 to 6 lines long; heads in terminal glomerules, the glomerules more or less concealed by the bract-like upper leaves; receptacle low-hemispheric; bracts of the pistillate flowers linear, narrowed a little towards the base, chartaceous, with narrow scarious margins, glabrous except at the densely implexed-woolly apex; bracts of the staminate flowers spatulate, woolly on the back. —Mohave Desert; e. to Ariz.

### 67. ADENOCÁULON Hook.

Perennial herbs. Stems slender, leafy only at base, bearing above a panicle of small and few heads of whitish flowers, the upper portion of the stem and the panicle beset with small glands.

Leaves alternate, broad, petioled, green and early glabrate above, white-woolly beneath. Heads of few disk-flowers; ray-flowers none. Marginal flowers of the head pistillate and fertile, the central perfect, sterile and with undivided style; corollas of both sorts tubular. Bracts of the involucre 5 to 9, equal, in a single row, not scarious, reflexed in fruit, at length deciduous. Receptacle flat, naked. Mature achenes much elongated and clavate, covered above with stalked glands. Pappus none. (Greek adenos, a gland, and kaulon, a stem.)

1. *A. bicolor* Hook. Fig. 951. Stems  $1\frac{1}{2}$  to  $2\frac{1}{4}$  ft. high, the lower portion floccose-woolly; leaves deltoid-ovate, cordate at the base, sinuate-dentate,  $1\frac{1}{2}$  to mostly 3 or 4 in. long and as broad or broader; petioles margined; staminate flowers about 10, their corollas 4-lobed; pistillate flowers 3, their corollas as if 2-lipped, the lower lobe turned down, the other lobes approximate-hooded over style; achenes 3 to  $3\frac{1}{2}$  lines long, much longer than bracts of the involucre.

951. *Adenocaulon bicolor* Hook.; a, b, habit x  $\frac{1}{4}$ ; c, head of fls., the central ones perfect, the 3 marginal ones pistillate x 2; d, staminate fl. x 5; e, pistillate fl. x 2.

—Moist or shady woods, 500 to 5500 ft.: along the coast from Santa Cruz Co. to Humboldt Co.; Sierra Nevada from Tulare Co. to Shasta Co.; n. to B. C., e. to Lake Huron. June.

### 68. GNAPHÁLIIUM L. CUDWEED

Woolly herbs with entire sessile or decurrent leaves. Heads discoid, white, yellowish or rose-tinted, disposed in panicles, corymbs, or spikes. Receptacle flat or convex, naked. Bracts of involucre scarious, imbricated. Pistillate flowers in several series with filiform corollas. Central flowers perfect, with tubular 5-lobed corollas. Pappus a single series of capillary bristles. (Greek gnaphalon, a lock of wool, these plants floccose-woolly.)

Pappus-bristles united at base, falling away in a ring; inflorescence spike-like; leaves white-woolly beneath, green above ..... 1. *G. purpureum*.  
Pappus-bristles not united at base, falling separately; inflorescence corymbose, paniculate or cymose.

Involucre imbedded in loose wool, its bracts with scarious tips, rather inconspicuous; low branching annual ..... 2. *G. palustre*.

Involucre woolly only at base, its bracts mainly scarious or silvery, conspicuous; mostly tall biennials or perennials, or nos. 4 and 9 annual or biennial.

Herbage in age becoming green (at least the upper surface of the leaves), more or less glandular.

Inflorescence corymbose; bracts pearly white; herbage balsamic-scented....

3. *G. decurrens*.

Inflorescence paniculate or cymose; bracts white or rose-tinged.

Root annual or biennial; heads loosely paniculate; involucre turbinate.

4. *G. ramosissimum*.

Root woody perennial; heads in close cymes; involucre campanulate.

Stem 1 to 2 ft. high, mostly simple; leaves narrowly linear, short-decurrent at base.....5. *G. leucocephalum*.

Stems 2 to 3 ft. high, branching; leaves oblong or broadly linear (or the upper lanceolate), broadly auriculate at base....

6. *G. bicolor*.

Herbage persistently woolly, not glandular or scarcely so.

Involucre white; inflorescence paniculate or cymose.

Leaves linear (or the lower narrowly spatulate), slightly decurrent; herbage odorless.....7. *G. microcephalum*.

Leaves broader, spatulate to lanceolate, not at all decurrent; herbage fragrant.....8. *G. beneolens*.

Involucre greenish-yellowish, becoming rusty; heads in capitate clusters or the clusters somewhat open-paniculate.....9. *G. chilense*.

1. *G. purpureum* L. PURPLE CUDWEED. Fig. 952. Stem commonly simple and erect from a slightly decumbent base, 4 to 12 in. high, arising from an annual or biennial root; herbage canescent with a close dense coating of white wool, the upper surface of the leaves usually early glabrate; leaves broadly spatulate, obtuse, 1 to 3 in. long and  $2\frac{1}{2}$  to  $7\frac{1}{2}$  lines wide; heads crowded in a spike-like inflorescence which is dense and oblong, or more elongated and more or less interrupted; heads 2 lines long; involucre brownish or purplish; achenes sparsely scabrous.—Open ground along the coast, 50 to 1600 ft.: San Diego Co. to Humboldt Co.; n. to B. C., thence e. to Mass., thence to Tex. May.

952. *Gnaphalium purpureum* L.; a, habit  $\times \frac{1}{2}$ ; b, head  $\times 3\frac{1}{2}$ ; c, pistillate fl.  $\times 5$ ; d, staminate fl.  $\times 5$ .

2. *G. palústre* Nutt. LOWLAND CUDWEED. Fig. 953. Annual; stem commonly branching at the base, the branches erect or ascending, 3 to 8 in. high; herbage loosely floccose with long wool, more or less deciduous from the leaves; leaves spatulate or linear-spatulate, 5 to 12 lines long, a few about the clusters of heads oblong or lanceolate; heads in small clusters at the ends of the branchlets, 1 to  $1\frac{1}{2}$  lines high; bracts of the involucre imbedded in loose wool, linear, with white or chartaceous obtuse often denticulate tips.—

Stream beds or low places in valleys, 10 to 4000 ft.: common throughout cis-montane Cal.; n. to B. C., e. to Wyo. and N. Mex. July-Aug. Var. *NANUM* Jepson. Dwarf, 1 to  $2\frac{1}{2}$  in high; bracts acute.—Dry openly wooded hills, Napa Range. June-Oct.

3. *G. decurrens* Ives var. *californicum* Gray. CALIFORNIA EVERLASTING. Biennial; stem stoutish, 2 to 3 ft. high, corymbosely branched at summit, the branches bearing glomerules of large heads and forming a broad and somewhat flat-topped inflorescence; herbage soon becoming green and more or less glabrate (except on the under surface of the leaves), at maturity glandular and balsamic-scented; lower leaves oblong ( $\frac{1}{2}$  to 1 in. broad and 2 to 5 in. long), diminishing in size upwards and becoming lanceolate, all obviously decurrent; heads roundish or broad, 2 to 3 lines high or slightly more, the involucre bracts white or in age rusty-tinged.—Dry wooded hills, 100 to 2000 ft.: Humboldt Co. to San Luis Obispo Co.; s. to coastal S. Cal. May-June.

953. *Gnaphalium palustre* Nutt.; a, habit  $\times \frac{1}{2}$ ; b, head  $\times 3\frac{1}{2}$ ; c, staminate fl.  $\times 7$ ; d, pistillate fl.  $\times 7$ .

S. Cal., 400 to 1200 ft.: Hollywood; Pasadena; e. to Tex.

6. *G. bicolor* Bioletti. Stem stout, erect, freely branching, arising from a perennial root, 2 to 3 ft. high; branches terminating in a compact or almost capitate cyme; herbage white-tomentose, the tomentum deciduous from the upper side of the leaves, the leaves thus green above and white beneath; leaves oblong to linear or lanceolate, closely sessile by a broad auricled base,  $\frac{1}{2}$  to  $1\frac{3}{4}$  in. long, the margins revolute and a little undulate; involucre campanulate, 2 to  $2\frac{1}{2}$  lines high, their bracts white or sordid, ovate, obtuse, the inner oblong, acute, often greenish.—Sandy fields or dry hills, 25 to 5500 ft.: coastal S. Cal.; n. to Monterey and Tulare Cos.; s. to L. Cal. Mar.-Apr.

7. *G. microcephalum* Nutt. WHITE EVERLASTING. Stems 1 to several from a biennial root, erect,  $1\frac{1}{4}$  to  $2\frac{1}{4}$  ft. high, ending above in a much branched panicle; herbage more or less densely white-lanate, especially when young, the wool persistent; leaves narrowly linear, acute, mucronate,  $1\frac{1}{2}$  to 3 in. long; panicle often narrow and elongated, sometimes broad, 4 to 12 in. long; heads oblong or cylindric, 2 to  $2\frac{1}{2}$  lines high, disposed in rather small glomerules at the ends of the branchlets; bracts of the involucre ovate or oblong, obtuse, the innermost linear, bright white.—Wooded mountain slopes, 500 to 5300 ft.: throughout cismontane Cal.; n. to Ore. Aug.-Sept.

8. *G. benèolens* Dav. Stem erect, simple, arising from a perennial root, 2 to  $2\frac{1}{2}$  ft. high, ending above in a much-branched panicle; herbage persistently white-woolly, not glandular; leaves spatulate-oblong to linear or lanceolate, 1 to 3 in. long; heads in small glomerules, the glomerules many, borne on loose spreading or divergent branchlets; involucre turbinate or ovate, white, very woolly at base, 2 lines long, their bracts thin, oblong, obtuse or acute, the inner often apiculate.—Dry ground, 100 to 3000 ft., coastal S. Cal.: Santa Cruz Isl.; Ballona Marshes; San Gabriel Mts.; Santa Ana Cañon, Orange Co.; e. to Tex. May-Sept.

9. *G. chilense* Spreng. COTTON-BATTING PLANT. Annual or biennial; stems several, erect from a decumbent base (or single and wholly erect), stout,  $\frac{1}{2}$  to  $2\frac{1}{2}$  ft. high, often densely clothed with leaves; leaves narrowly spatulate

4. *G. ramosissimum* Nutt. PINK EVERLASTING. Stems 1 to several from a biennial root, erect, 2 to 5 ft. high, ending above in a much-branched panicle; herbage greenish, a little glandular, sweet-scented, the stems arachnoid, the leaves finely pubescent; leaves linear-lanceolate, attenuate,  $\frac{3}{4}$  to  $2\frac{1}{2}$  in. long; panicle narrow or virgate, or sometimes very broad,  $\frac{1}{4}$  to  $1\frac{1}{4}$  ft. long; involucre narrowly ovate or turbinate, reddish or pinkish, 2 lines high, their bracts ovate, obtuse or acute.—Wooded hills along the coast, 100 to 1200 ft.: Marin and Alameda Cos. to San Gabriel Mts.

5. *G. leucocéphalum* Gray. Stem erect, strict, mostly simple, very leafy, 1 to 2 ft. high, from a perennial root; herbage very white with close wool, the upper side of the leaves green, rather densely glandular-pubescent; leaves narrowly linear, attenuate, commonly erect, 1 to 2 in. long, 1 to 2 lines wide, little broader at the short-decurrent base; heads broadly campanulate, disposed in a cyme, 3 to 12 in. broad; bracts of the involucre ovate, obtuse, thin-papery, much imbricated, pure pearly white.—Coastal

or the uppermost linear or lanceolate,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long, the short decurrent bases rather broad and somewhat auricle-like; heads 3 lines wide and high, numerous in a large close glomerule terminating the main stem, or in several glomerules at the ends of the branches of the more or less open panicle; involucre with a greenish yellowish tinge.—Open ground in valleys or on low hills, 10 to 5000 ft.: throughout cismontane Cal.; e. to Tex. May-Aug. Var. *CONFERTIFOLIUM* Greene. Stem stout, low, densely clothed with linear leaves up to the sessile cluster of heads.—With the species.

#### 69. *ANÁPHALIS* DC. EVERLASTING

Perennial herbs with simple erect equably leafy stems. Leaves green above, closely woolly beneath. Heads disposed in a compound corymb. Bracts of the involucre numerous, pearly white and scarious, imbricated in several series, radiating in age. Flowers yellow, polygamodioecious; staminate heads with only staminate flowers; pistillate heads with pistillate flowers and a few central staminate flowers; staminate flowers with a tubular 5-lobed corolla with spreading limb and an included 2-cleft style; pistillate flowers with filiform toothed corolla and exserted 2-cleft style; pistillate flowers fertile, staminate flowers sterile. Pappus as in *Gnaphalium*. (Ancient Greek name of some "Everlasting.")

1. *A. margaritacea* (L.) B. & H. PEARLY EVERLASTING. Fig. 954. Stems several from the base, 1 to 2 ft. high; leaves broadly to narrowly lanceolate, sessile, with revolute margin, 2 to 5 in. long; corymb  $1\frac{1}{2}$  to 6 in. broad.—Open woods: Coast Ranges, 20 to 4000 ft., from Monterey Co. to Siskiyou Co.; Sierra Nevada, 4000 to 6500 ft., from Eldorado Co. n.; e. to Penn. and Newf., n. to Alas.; Asia. July-Sept. Var. *OCCIDENTALIS* Greene. Leaves sessile by a broad auriculate-clasping base.—Oakland Hills; San Francisco; s. Sierra Nevada from Mariposa Co. to Fresno Co.

954. *Anaphalis margaritacea* B. & H.; a, fl. branchlet  $\times \frac{2}{3}$ ; b, pistillate fl.  $\times 4$ ; c, staminate fl.  $\times 4$ .

#### 70. *ANTENNÁRIA* Gaertn.

Low tomentose perennial herbs. Leaves mostly in basal tufts, the cauline ones alternate, all entire. Heads dioecious, borne in small capitate, corymbose or thyrsoïd cymes, rarely solitary. Involucral bracts scarious, imbricated in several series, the outer shorter, usually woolly. Receptacle convex or flattish, naked. Staminate flowers with filiform corolla, entire or merely notched style and a scanty pappus of clavellate bristles. Pistillate flowers with tubular 5-toothed corolla, 2-cleft often crimson style and copious pappus of capillary naked bristles united at base. (Latin, the sterile pappus fancifully likened to insect antennae.)

Heads solitary, terminating short stems or sessile among the basal leaves; caespitose plants  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. high; pappus bristles of sterile flowers hardly thickened at apex....

1. *A. dimorpha*.

Heads in clusters terminating short or elongated stems; pappus-bristles of sterile flowers with thickened or dilated tips.

Basal leaves roundish-ovate to obovate-spatulate,  $\frac{3}{4}$  to 1 in. wide, the tomentum early deciduous from their upper surface.....

2. *A. plantaginifolia*.

Basal leaves spatulate to oblanceolate, much narrower, not more than  $\frac{1}{2}$  in. wide, the upper surface rarely early glabrous.

Tips of involucral bracts green to pale brown (or in staminate heads whitish).

Heads in a cymose cluster (sometimes solitary); tomentum felt-like, extending well up onto involucre.....

3. *A. alpina*.

Heads paniculate; tomentum silky, extending only to base of involucre.....

4. *A. microcephala*.

Tips of involucral bracts pearly white to deep pink or red.

Tomentum extending only to base of involucre; tips of involucral bracts white.

- Lower leaves spatulate, the upper oblanceolate; staminate heads  $2\frac{1}{2}$  lines wide ..... 5. *A. argentea*.  
 Lower leaves narrowly oblanceolate-spatulate, the upper linear; staminate heads  $1\frac{1}{2}$  lines wide ..... 6. *A. luzuloides*.  
 Tomentum extending well up onto involucre; tips of involucral bracts white to rose-color or red.  
 Stems sparsely leafy above; inflorescence cymose ..... 7. *A. dioica*.  
 Stems densely leafy above; inflorescence paniculate (sometimes somewhat spicate) ..... 8. *A. geyeri*.

1. *A. dimorpha* J. & G. Plants mat-like, the stem freely branched and bearing rosulate clusters of leaves, the heads solitary, sessile in the rosettes or terminal on erect branches  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. high; herbage white-woolly; leaves spatulate to linear-oblanceolate, 3 to 8 lines long; involucre of the staminate heads about  $2\frac{3}{4}$  lines high, their bracts brownish or bluish, obtuse; involucre of the pistillate heads enlarging to 3 to  $4\frac{1}{2}$  lines high, their bracts paler, the innermost narrow and attenuate into a hyaline tip; fruiting pappus of pistillate flowers twice as long as involucre.—Montane, 6000 to 8800 ft.: San Antonio Mts.; Mt. Pinos; Sierra Nevada from Tulare Co. to Modoc Co.; Siskiyou Co.; n. to B. C., e. to Rocky Mts. Mar.-July.

2. *A. plantaginifolia* Hook. Stem scape-like,  $\frac{1}{2}$  to  $1\frac{1}{2}$  ft. high, arising from stolons terminating slender rootstocks, bearing few small leaves (the leaves chiefly basal), and ending above in a small cyme; basal leaves roundish ovate to obovate or spatulate, glabrate and green above, silvery-lanate beneath, mostly 3 to 5-nerved, 1 to 2 in. long, the petioles  $\frac{1}{2}$  to  $\frac{3}{4}$  in. long; cyme consisting of 3 to 5 clusters of heads; involucre very woolly at base; inner bracts of the staminate heads with oblong obtuse tips, those of the pistillate heads with narrow acute tips; achenes minutely glandular.—Montane woods, 4000 ft.: Siskiyou Co.; n. to B. C., e. to Tex. June.

3. *A. alpina* Gaertn. Stems several to many, 1 to 6 in. high, erect or ascending from the branched root-crown, the short basal shoots leafy-tufted and thus forming caespitose plants; herbage white-tomentose; basal leaves spatulate to oblanceolate, 4 to 9 lines long; heads 3 to 6 in a dense terminal cluster; involucre 2 to 3 lines high, livid-brownish or dusky; inner bracts of the staminate heads with whitish oblong tips, of the pistillate heads wholly livid and scarious and acutish to acuminate; pappus-bristles of staminate heads moderately dilated, often spinulose-serrate; achenes glandular.—Alpine, 8000 to 12,500 ft.: Kaweah Peaks to Mt. Dana, Mt. Tallac, Lassen Peak and Mt. Shasta; n. to Alas., e. to Lab. and Col. July-Sept. Var. *MEDIA* Jepson n. comb. Densely caespitose, 1 to 4 in. high; leaves 2 to 4 lines long; involucre about 2 lines high; bracts green or greenish-brown, those of the pistillate heads oblong or linear-oblong, those of the staminate heads oval; pappus-bristles of staminate heads more broadly dilated, often remotely dentate above.—Montane, 9200 to 11,400 ft.: Sierra Nevada; San Bernardino Mts. Aug. (*A. media* Greene. *A. densa* Greene.) Var. *SCABRA* Jepson n. comb. Plant 1 in. high; herbage at first with a dense soft woolly coat, the tomentum promptly deciduous and exposing a dense glandular-scabrous green indument.—Alpine, 12,500 ft., White Mts. July. (*A. scabra* Greene.)

4. *A. microcéphala* Gray. Stems simple, slender, erect, 3 to 7 in. high, more or less leafy, especially below, arising from branching rootstocks, ending above in a small panicle; herbage silvery-lanate; leaves narrowly oblanceolate to oblanceolate-spatulate, narrowed to a more or less margined petiole, the whole  $\frac{1}{2}$  to  $2\frac{1}{2}$  in. long, the upper cauline ones much reduced; panicle  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long; heads  $1\frac{3}{4}$  to  $2\frac{1}{4}$  lines high, on peduncles  $\frac{1}{2}$  to 1 line long, or some sessile in clusters; involucre wholly glabrous, their bracts light brown or dull reddish; bristles of staminate pappus with dilated tips.—Dry gravelly places, eastern slopes or eastern mountain valleys of the Sierra Nevada, 5000 to 5500 ft.: e. Nevada Co.; Sierra Co.; Plumas Co.; e. to Nev. June-July.

5. *A. argentea* Benth. Stems erect from the branched root-crown, 8 to 16 in. high, mostly naked above, scantily leafy at middle or below, the leaves chiefly basal; herbage densely white-tomentose, the leaves sometimes sparsely so above, the tomentum extending only to base of involucre; lower leaves spatulate or narrowly obovate, gradually narrowed to a short or long petiole,

the whole  $\frac{3}{4}$  to  $2\frac{3}{4}$  in. long, the veins prominent in spite of the thick tomentum; upper cauline leaves oblanceolate or linear-oblanceolate, acute, the uppermost reduced to mere bracts; heads 2 to  $2\frac{1}{2}$  lines high, numerous in a compound thyrseoid or corymbose cyme  $\frac{3}{4}$  to  $1\frac{3}{4}$  in. broad; involucre white, the pistillate ones turbinate, becoming campanulate, with the innermost bracts acutish to acuminate, the staminate ones campanulate with the inner bracts ovate, obtuse or acutish, ivory-white, chartaceous; tips of staminate pappus much dilated, obtuse.—Montane, 3500 to 6700 ft.: Sierra Nevada from Fresno Co. to Modoc Co., North Coast Ranges from n. Lake Co. to Siskiyou Co. June-July.

6. *A. lûzuloides* T. & G. Stems slender, erect from a slightly decumbent base, arising from a branched root-crown, 5 to 12 in. high; herbage silky lanate; leaves narrowly linear, or linear-oblanceolate, or oblanceolate-spatulate, drawn down to a narrow base, the whole  $\frac{3}{4}$  to 2 in. long; small uppermost leaves linear-subulate; heads small, 2 to 3 lines high, several to many in a compact cyme  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. broad; involucre glabrous nearly or quite to the base, the inner bracts in the pistillate heads obtuse; achenes glandular, the spatulate petaloid tips of the pistillate pappus obtuse.—Montane, 5000 to 6000 ft.: Plumas Co. to Modoc Co.; n. to B. C., e. to Wyo. May.

7. *A. dioica* Gaertn. Stems erect, sparsely leafy, 2 to 12 in. high, arising from branching stolons or rootstocks tipped by leafy tufts and thus forming broad mats; herbage tomentose, the tomentum extending well up onto the involucre; heads  $2\frac{1}{2}$  lines high, nearly as broad, few to many in a dense or globose cymose cluster; leaves  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long, the basal obovate to spatulate, obtuse or acute, the cauline leaves linear-oblanceolate; involucre bracts obtuse or acute, the tips chartaceous, rose-color or white; achenes smooth and glabrous, sometimes minutely glandular.—Montane, 5100 to 9300 ft.: San Jacinto and San Bernardino mountains; Sierra Nevada from Tulare Co. to Nevada Co.; Mt. Shasta; n. to Alas., e. to Lab. and N. Mex. July-Aug. Var. *ROSEA* Eat. Basal leaves narrowly spatulate; involucre bracts pale pink to deep rose-pink.—Montane, 4000 to 11,000 ft.: Sierra Nevada from Tulare Co. to Modoc Co.; Mt. Shasta; w. Siskiyou Co. June-Aug. Var. *CONGESTA* DC. Leaves in a rosulate tuft on the ends of the prostrate stems, the heads sessile in the rosette.—Sierra Nevada; e. to Col. Var. *CORYMBOSA* Jepson n. comb. Herbage lightly tomentose; basal leaves oblanceolate, cuspidately mucronate, the cauline linear; bracts with a brownish spot at the middle; bracts of staminate heads somewhat erose at apex.—Mariposa Co. (A. corymbosa E. Nels.) Var. *MARGINATA* Jepson n. comb. Older leaves green and glabrate above, the dense tomentum below showing as a narrow white margin; involucre bracts of pistillate heads greenish with white tips, the long inner ones very narrow and acute, those of the staminate heads broadly obovate, erose, brownish at base, the tips pure white.—Montane, 7200 to 11,000 ft.: Sierra Nevada; San Bernardino Mts. (A. marginata Greene.) Var. *KERNENSIS* Jepson n. var. Densely caespitose, 1 to 4 in. high; herbage tomentose; basal leaves spatulate to oblanceolate, 3 lines long, sometimes glabrate above.—High montane, 8500 to 10,500 ft., upper Kern River: Denels Peak; Volcano Mtns.; Siberian Pass (Hall & Babcock 5473, type). July.

8. *A. géyeri* Gray. Stems several, erect, leafy to the inflorescence, 3 to 5 in. high, arising from a branched woody base; herbage densely lanate; leaves spatulate to oblanceolate, 6 to 8 lines long; heads  $2\frac{1}{2}$  to 4 lines high, somewhat spicate or paniculate, the inflorescence 3 to 12 lines long; involucre very woolly, only the inner bracts glabrous; bracts with conspicuous rose-purple or sometimes ivory-white tips, those of the staminate heads narrow, acute, those of the pistillate heads obtuse; staminate pappus with moderately clavate bristles, usually surpassed by the bracts.—Montane, 4000 to 6000 ft.: Eldorado Co. to Modoc Co.; Mt. Shasta; n. to Wash. June-Aug.

#### 71. *PLÛCHEA* Cass.

Tall leafy herbs or shrubs. Heads numerous, hemispheric, clustered in terminal corymb-like cymes, consisting of many purplish disk-flowers and no ray-flowers. Marginal flowers of the head pistillate and fertile, with tubular-filiform truncate or 2 to 4-toothed corollas shorter than the 2-cleft style;

central flowers few, perfect but sterile, with tubular 5-cleft corollas and entire or bifid style. Involucre imbricated. Receptacle flat, naked. Achenes grooved. Pappus a single series of capillary bristles. (The Abbe N. A. Pluche, 18th century naturalist, of Paris.)

Herb; leaves and stems glandular. . . . . 1. *P. camphorata*.  
Shrub; herbage silvery-canescant. . . . . 2. *P. sericea*.

1. *P. camphorata* (L.) DC. SALT-MARSH FLEABANE. Annual; stems stoutish, erect, branching above,  $1\frac{1}{4}$  to  $2\frac{1}{2}$  ft. high; herbage glandular-puberulent; leaves oblong-ovate or lanceolate, glandular-dentate, short-petioled or the upper sessile, the larger 3 to 5 in. long; heads  $2\frac{1}{2}$  lines high, rarely leafy-bracted, in corymb-like cymes; bracts of the involucre ovate-lanceolate; achenes pubescent.—Salt marshes in low valleys: region of San Francisco Bay; Great Valley; coastal S. Cal.; Atlantic coast. Aug.-Oct.

955. *Pluchea sericea* Cov.; a, fl. branchlet  $\times \frac{3}{4}$ ; b, perfect flower  $\times 4$ ; c, pistillate flower  $\times 4$ .

2. *P. sericea* (Nutt.) Cov. ARROW-WEED. Fig. 955. Slender erect shrub 3 to 10 ft. high with silvery-silky herbage; leaves linear to lanceolate, entire, acute at both ends, sessile,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long; heads 3 to 4 lines high; outer involucral bracts ovate, coriaceous, the inner linear, much thinner; pappus-bristles of the sterile flowers geniculate-crinkly and slightly dilated at tip, those of the fertile obscurely if at all so.—River bottoms, 100 to 2200 ft.: coastal S. Cal.; Colorado and Mohave deserts; Inyo Co.; immensely abundant along the Colorado River bottoms from Needles to Yuma; s. to L. Cal., e. to Tex. Also called Mock Willow. (*Tessaria borealis* T. & G.)

#### TRIBE 6. *Heliantheae*. SUNFLOWER TRIBE

Herbs (or shrubs) with mostly opposite or basal leaves and with balsamic-resinous juice. Rays present, almost always showy. Bracts of the involucre herbaceous or foliaceous, or at least not scarious. Receptacle with chaff-like bracts, each subtending a flower. Anthers not caudate. Pappus paleaceous, of rigid awns, or cup-like, never of capillary bristles. Achenes thick or flattened contrary to the subtending chaffy bract, never parallel with it. (Rays none in *Bebbia* and one species in nos. 76, 79, 83, 84 and 87.)

#### 72. *MELAMPÔDIUM* L.

Herbs with opposite ample leaves. Heads medium-sized, in leafy-bracted cymes or panicles. Involucre double, strongly dimorphous. Outer involucre of several loose often foliaceous plane bracts; inner involucre of smaller bracts, each completely enclosing a marginal achene and at length falling with it. Rays yellow or white, their achenes fertile. Pappus none. Disk-flowers yellow, perfect, their achenes sterile. (Greek melas, black, and pous, foot, a plant name capiously transferred by Linnaeus.)

1. *M. perfoliatum* H.B.K. Coarse widely branched annual 3 to 4 ft. high; leaves 4 to 9 in. long, broadly rhomboidal-ovate, dentate, scabrous, acute, narrowed below into a winged petiole, the petioles connate around the stem in pairs; heads on slender peduncles; bracts of the outer involucre ovate to oblong, 5 to 6 lines long, united at base.—Waste places, Los Angeles; introduced from Mex.

73. *ECLIPTA* L.

Low weak riparian herb with opposite leaves and white flowers. Heads solitary in the upper axils, the peduncles long or very short. Involucre broad, its bracts herbaceous and in about 2 series. Bracts of the receptacle awn-like. Rays short. Disk-flowers perfect and fertile, their corollas 4-toothed. Achenes thick, those of the ray 3-sided, those of the disk compressed. Pappus none or of a few short teeth. (Greek ekleipta, wanting, on account of the absence of the pappus.)

1. *E. alba* Hassk. Decumbent, 1 or 2 ft. high; leaves lanceolate or oblong-lanceolate, sparingly serrulate, sessile or the lower short-petioled with a strigose pubescence; disk-achenes at length corky-margined. — Shores of islands in the lower Sacramento River; Tex. to N. J. and Fla.; trop. Am. Sept.

74. *GALINSOGA* R. & P.

Annual herbs with opposite leaves. Heads small, cymose or solitary. Involucre hemispheric, its bracts few, ovate, membranous and striate, in 2 series, often with some additional outer and very small ones. Receptacle conical or elongated, its bracts thin. Ray-flowers 4 or 5, fertile, the rays white, 2 or 3-lobed, often very small. Disk-flowers yellow. Pappus-paleae broad, with fimbriate or almost plumose margins, or none in the ray-flowers. (M. Galinsoga, a Spanish physician and botanist.)

1. *G. parviflora* Cav. Stem with slender ascending branches, leafy almost throughout,  $\frac{2}{3}$  to 2 ft. high; herbage sparsely hispid, the inflorescence glandular-hispid; leaves ovate to lanceolate, acute, entire or serrate, thin,  $\frac{3}{4}$  to 2 in. long; heads peduncled,  $1\frac{1}{2}$  to 2 lines high; rays very small, scarcely exerted; achenes black, turbinate, 4 or 5-angled; paleae of disk-pappus 8 to 16, nearly as long as the achene; pappus of ray-achenes very much reduced, unilateral. — Waste places and along irrigating ditches, Los Angeles; introduced from Mex.

75. *BÉBBIA* Greene

Strongly scented nearly leafless bushes. Stems intricately much branched, the ultimate branchlets ending in 1 (or a cluster of 2 or 3) discoid heads. Involucre about half length of disk, its few bracts imbricate in about 3 rows, striate. Bracts of the receptacle scarious, striate, ciliate-margined, partially enfolding the achenes. Flowers yellow. Achenes linear or turbinate, densely pubescent. Pappus a single series of 15 to 20 long-plumose bristles as long as the corolla and exceeding the achene. (M. S. Bebb, distinguished American salicologist.)

1. *B. júncea* (Benth.) Greene. Roundish bushes  $1\frac{1}{4}$  to 4 ft. high, often twice as broad, the woody stems with gray fibrous bark, the rush-like branches green with remote leaves or almost none; leaves opposite below, alternate above,  $1\frac{1}{2}$  to 2 in. long, linear, or those of the vernal shoots lanceolate and 2 to 3 lines wide, often with 1 or 2 pairs of salient teeth at the middle; involucral bracts lanceolate, the outer canescent; outer bracts of receptacle oblong-ovate, the inner ovate or lanceolate; heads 4 to 5 lines high. — Rocky stream beds in the deserts: Inyo Co.; Mohave Desert; Colorado Desert, thence w. to Orange Co.; s. to L. Cal., e. to Ariz.

76. *RUDBÉCKIA* L.

Chiefly perennial erect herbs. Leaves alternate, simple or compound. Heads commonly showy, peduncled, terminating stems and branches. Rays in ours yellow and sterile, or none; disk purple or dark brown. Receptacle high conic or columnar. (Olaf Rudbeck, father and son, professors of botany at Upsala, two centuries since.)

Rays present.

Pappus none; herbage rough-hairy.....1. *R. hirta*.

Pappus present; herbage pubescent.....2. *R. californica*.

Rays none; pappus present; herbage glabrous or hirsutulose.....3. *R. occidentalis*.

1. *R. hirta* L. BLACK-EYED SUSAN. Stems branched above, 1 to several from a biennial root, channeled, 1 to  $2\frac{1}{4}$  ft. high, the branches terminated by

956. *Rudbeckia californica* Gray; a, leaf  $\times \frac{1}{2}$ ; b, fl. stem  $\times \frac{1}{2}$ ; c, disk-fl.  $\times 2$ .

—Moist ground, montane, 5000 to 7000 ft.: Sierra Nevada from Kern Co. to Mariposa Co.; region of Mt. Shasta; north to sw. Ore.; uncommon.

3. *R. occidentalis* Nutt. Stems simple, 3 to 4 ft. high, terminated by 1 or sometimes 3 columnar heads; herbage glabrous or hirsutulose; leaves ovate, acuminate, mostly rounded or subcordate at base, serrate, 3 to  $6\frac{1}{2}$  in. long, petioled or the upper sessile; disk oblong-conic,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. high; pappus a short but deeply denticulate or fimbriate crown; rays none.—Middle altitudes, Sierra Nevada from Placer Co. to Butte Co.; n. to Wash. and Mont., e. to Nev.

#### 77. VIGUIERA H.B.K.

Herbs, shrubs or shrubby plants. Heads medium-sized. Bracts of the involucre in 2 or 3 series (in ours), shortly caudate-attenuate or linear-lanceolate. Bracts of the receptacle persistent and embracing the lightly compressed or 4-angled disk-achenes. Flowers yellow, the rays sterile. Corolla-tube of disk-flowers bulbous-dilated at the middle. Pappus-scales short, erose or laciniate, and with 2 longer paleaceous awns or lanceolate paleae, one at each angle of the achene, these latter deciduous, or the pappus none. (Dr. A. Viguier, French botanist.)

Leaves alternate or the lowest opposite, petioled; bracts of the involucre indurated and ribbed at base, the base commonly ovate, the apex herbaceous, narrowly and abruptly linear or lanceolate; pappus present; shrubs or shrubby plants.

Leaves lanceolate; involucre green; achenes sparsely pubescent. . . . . 1. *V. laciniata*.

Leaves ovate; involucre cinereous; achenes densely villous.

Pappus dull or yellowish white; leaves green above, scabrous. . . . . 2. *V. deltoidea*.

Pappus pearly white; leaves white-villous above, not all scabrous. . . . . 3. *V. reticulata*.

Leaves chiefly opposite; bracts of the involucre herbaceous throughout; pappus none: herbs.

Leaves conspicuously ciliate; annual. . . . . 4. *V. ciliata*.

Leaves not ciliate; perennial. . . . . 5. *V. multiflora*.

1. *V. laciniata* Gray. Stems leafy to summit, branching to form a round-topped bush, 2 to 4 ft. high; herbage scabrous, resinous; leaves lanceolate from a broad often lobed base, varying from pinnatifid to nearly entire, acute,

single heads; herbage rough hirsute; leaves oblong to lanceolate, somewhat 3-nerved, entire,  $1\frac{1}{2}$  to 3 in. long, narrowed into margined petioles or the upper sessile; rays  $\frac{3}{4}$  to  $1\frac{1}{8}$  in. long; disk globose or ovoid; bracts of the receptacle narrowly linear, acute, hirsute at tip; pappus none.—Introduced in the meadows of the Sierra Nevada from Mariposa Co. to Amador Co.; also occasional along irrigating ditches in Stanislaus Co.; native of e. U. S.

2. *R. californica* Gray. CALIFORNIA CONE-FLOWER. Fig. 956. Stem simple, 2 to  $5\frac{1}{2}$  ft. high, bearing a solitary long-peduncled head; herbage hispidulous or pubescent; leaves ovate to broadly lanceolate, 6 to  $13\frac{1}{2}$  in. long, the basal and lower long-petioled, the uppermost sessile, all entire or the lower ones irregularly incised or toothed, or sometimes 2-parted at base; rays 1 to 2 in. long, much exceeding the loose linear bracts of the involucre; disk short-oblong to columnar, 1 to  $1\frac{1}{2}$  in. long; bracts of the receptacle densely canescent at the very acute summit; achenes angled, flattish; pappus an irregularly 4 toothed cup.

prominently veiny below, shortly petioled,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long; involucre 4 lines high, its outer bracts ovate with abruptly acuminate spreading tips, the inner bracts narrow, erect; rays 5 to 7 lines long; achenes glabrate, very thinly hirsutulose, glabrate; longer pappus-paleae lanceolate, laciniate on the margins, shorter than the achene.—Sw. San Diego Co., common; s. to L. Cal.

2. *V. deltoidea* Gray var. *parishii* Rose. Stems several from the base, forming a compact shrub 1 to  $2\frac{1}{2}$  ft. high; leaves ovate, acute, broad or truncatish at base, subentire or serrate,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long, short-petioled; heads on conspicuous nearly naked peduncles; involucre 3 to 4 lines high, its outer bracts cinereous with a close pubescence, lanceolate, attenuate, loose, the inner bracts linear, erect; rays 3 to 6 lines long; achenes hirsute-pubescent; pappus-awns lanceolate-subulate, almost as long as the achene, the membranous-margins at base more or less laciniate.—Mesas and rocky gullies: e. Mohave Desert; Colorado Desert, thence w. to San Diego Co.; e. to Ariz., s. to L. Cal. (*V. parishii* Greene.)

3. *V. reticulata* Wats. Stems white-barked, several from the base, woody only at base, glabrate, few-leaved, forming a loose but erect bushy plant 2 to 4 ft. high; leaves coriaceous, cordate-ovate, entire, shortly acuminate, densely soft pubescent above, lightly pubescent, strongly veined and reticulate below, ( $1\frac{1}{4}$  or)  $2\frac{1}{2}$  to 4 in. long on petioles  $\frac{3}{4}$  to  $1\frac{1}{8}$  in. long; heads small (3 to 4 lines high), in a corymbose panicle; involucre bracts 2 to 3 lines long, cinereous and somewhat thickened; rays 4 to 6 lines long; pappus-awns subulate from a paleaceous base, more or less lacerate on the sides, shorter than the achene.—Panamint and Funeral ranges.

4. *V. ciliata* (Rob. & Greenm.) Blake. Stem slender, commonly branched from the base, 1 to 2 ft. high, sparsely pubescent or subglabrous; leaves linear, the margin mostly conspicuously ciliate; bracts of the involucre ciliate; flowers as in no. 1 (ex char.).—Santa Monica (introduced); s. Utah and N. Mex. to Sonora, Mex. (*Gymnolomia hispida* var. *ciliata* Rob. & Greenm.)

5. *V. multiflora* (Nutt.) Blake var. *nevadensis* Blake. Stems branching from the base,  $1\frac{1}{2}$  to 2 ft. high; herbage densely or lightly strigulose; leaves linear to linear-lanceolate, entire, revolute,  $\frac{3}{4}$  to  $2\frac{1}{4}$  in. long, mainly opposite; rays 10 to 15, 6 to 8 lines long; involucre bracts narrowly linear, canescent; heads 1 to  $1\frac{1}{4}$  in. broad.—Inyo Co.: Argus Mts.; Panamint Mts.; n. to Ida., e. to N. Mex., s. to Mex.; adventive at Los Angeles and Santa Monica. (*Gymnolomia nevadensis* Nels.)

## 78. HELIANTHUS L. SUNFLOWER

Stout coarse herbs with petioled simple leaves, yellow mostly entire rays and brownish or purplish disk. Leaves (all but the lower or lowest) alternate. Heads large, solitary on the ends of the branches or in terminal corymbs. Bracts of the involucre imbricated. Receptacle flat or convex, low-conic, its bracts persistent and embracing the 4-sided achenes. Pappus of pointed paleae borne at the angle of the achene, often with very small intervening scales, all deciduous. (Greek helios, sun, and anthos, flower, the heads turning toward the sun.)

Annuals; receptacle flat or nearly so.

Involucre bracts ovate, abruptly attenuate.....1. *H. annuus*.

Involucre bracts lanceolate, gradually attenuate.

Foliage green.

Bracts of the receptacle shorter than the disk-flowers, the central ones with hirsute brush-like tips; rays  $9\frac{1}{2}$  to  $11\frac{1}{2}$  lines long; mountain species.....2. *H. petiolaris*.

Bracts of the receptacle equaling or surpassing the disk-flowers, the tips not hirsute nor brush-like; rays 6 to 8 lines long; species of the valley and coast.

Stems scabrous; awn of the chaffy bract equaling the disk-flowers.....

3. *H. bolanderi*.

Stems often hirsute, particularly near the heads; awn of the chaffy bract surpassing the disk-flowers.....4. *H. exilis*.

Foliage white with a strigose pubescence; desert species.....5. *H. niveus*.

Perennials; receptacle convex to low-conical.

Outer bracts lanceolate to linear-subulate, equaling or exceeding disk.

Heads usually solitary; herbage hirsute; n. Sierra Nevada. . . . . 6. *H. cusickii*.

Heads usually corymbose or paniculate; herbage hispidulous to tomentose but not hirsute . . . . . 7. *H. californicus*.

Outer bracts shorter than the disk. . . . . 8. *H. gracilentus*.

1. *H. annuus* L. COMMON SUNFLOWER. Stem erect and simple or more or less branching, 2 to 5 ft. high; herbage rough-hispid; leaves deltoid-ovate, serrate, 3 to 8 in. long, the uppermost narrow and often entire, the petioles  $\frac{1}{2}$  to  $\frac{3}{4}$  as long; bracts of the involucre ovate, slenderly acuminate; disk 1 to  $1\frac{1}{2}$  in. broad; rays 1 to  $1\frac{1}{2}$  in. long.—Moist lands in valleys, introduced from the Great Plains region: Great Valley to coastal S. Cal.

2. *H. pétiolàris* Nutt. Stem simple, slender, erect,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  ft. high; herbage scabrous-hispidulous; leaves lanceolate, entire to obscurely dentate, rarely serrate,  $1\frac{1}{2}$  to 3 (or 4) in. long, on petioles about  $\frac{1}{2}$  as long; heads 2 to 3 in. wide, solitary or 2 or 3 long-peduncled; bracts of the involucre dark green, broadly lanceolate, with long tapering apex, ciliolate-margined; bracts of the receptacle unequally 3-cleft at apex, the middle tooth largest; rays yellow,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long; disk-flowers brown; achenes oblong,  $1\frac{1}{2}$  lines long, villous.—San Bernardino Valley; San Bernardino Mts.; e. Placer Co.; Ariz. to Ore., Tex. and Sask.

3. *H. bolanderi* Gray. Fig. 957. Stems erect or diffusely branching, 1 to 3 ft. high, scabrous-hispid; leaves ovate to oblong-lanceolate, serrate or entire; rays 8 lines long, toothed at apex; disk purple, 9 or 10 lines broad; bracts of the involucre hirsute, oblong-lanceolate, attenuate or acuminate; bracts of receptacle chaffy, 3-toothed, the middle tooth much longer and awn-like.—Low fields: Siskiyou Co.; Sacramento Valley; w. to the coast. Often abundant. Aug.-Nov. (*H. scaberrimus* Benth.)

4. *H. exilis* Gray. Stem slender, often unbranched, 1 to 2 ft. high; leaves ovate-lanceolate to linear-lanceolate; peduncles often hirsute-villous beneath the heads; bracts of the involucre lanceolate, hairy on the lower half; rays 6 to 7 lines long; awn-tip of the chaffy bract surpassing the disk-flowers.—Plains, valleys and foothills, 10 to 3500 ft.: Santa Clara Co.; Lake Co.; Sacramento Valley; Sierra Nevada foothills from Amador Co. to Mariposa Co.

957. *Helianthus bolanderi* Gray; a, fl. branchlet  $\times \frac{3}{8}$ ; b, bract  $\times 1$ ; c, achene and pappus  $\times 1$ .

5. *H. niveus* (Benth.) Bdg. Stem simple, erect, 7 to 12 in. high; herbage silvery-strigose; leaves ovate or lanceolate to narrowly oblong, 1 to  $1\frac{1}{2}$  in. long, more hairy on the upper side, 3-nerved beneath, on petioles  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; heads terminal and in the upper axils, 1 to 2 in. wide; bracts of the involucre lanceolate, slightly longer than the disk-flowers, white-hairy; ray-flowers yellow, the rays 8 or 9-nerved,  $\frac{3}{4}$  in. long, 3 to 4 lines wide; disk-flowers brown; pappus-paleae slender, caducous.—Colorado Desert, rare; s. to L. Cal. (*H. tephrodes* Gray.)

6. *H. cusickii* Gray. Stems several or many from a thick root, forming clumps, 1 to  $2\frac{1}{4}$  ft. high; herbage more or less hirsute; leaves narrowly lanceolate, entire, 2 to 5 in. long, attenuate at base into a short winged petiole; heads usually solitary; involucre 5 to 6 lines high, with linear-lanceolate hirsutulous bracts somewhat surpassing the disk; rays  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long; achenes glabrous.—Lassen Co. to Shasta Co.; n. to Wash. June-July.

7. *H. californicus* DC. Fig. 958. Stems from somewhat tuber-like roots, 4 to 11 ft. high; leaves from oblong to narrowly lanceolate, some of the lower ovate, minutely hispidulous, 5 to 9 in. long including the petiole, the lower opposite, the upper alternate, the larger 3-ribbed; heads 2 to 3 in. broad, in a terminal corymbose panicle; chaffy bracts of the receptacle obtuse; bracts of the involucre lanceolate, tapering into long spreading tail-like tips;

rays about 15 to 20, 1 to  $1\frac{1}{4}$  in. long; achenes flattish, glabrous; pappus of 2 or 3 lanceolate chaffy paleae.—Stream beds and banks, 10 to 1000 ft.: Sacramento Valley; Coast Ranges from Napa Co. to Santa Clara Co. Var. *MARIPOSANUS* Gray. Leaves ample, upper cauline ovate or oblong-lanceolate, entire or nearly so, exceeding the peduncles; pappus not rarely of 4 linear-lanceolate paleae of nearly equal length, or 2 often reduced and short.—Montane, 4000 to 6000 ft.: Sierra Nevada from Modoc Co. to Mariposa Co.; San Jacinto Mts. July-Aug. Var. *PARISHII* Jepson n. comb. Leaves lanceolate, acuminate, strigose to densely white-tomentulose beneath; upper leaf-like bracts commonly exceeding the short peduncles; involucre more or less canescent, the bracts shorter; pappus-paleae linear-subulate.—Los Angeles to San Bernardino Valley. (*H. parishii* Gray.)

958. *Helianthus californicus* DC.; a, leaf  $\times \frac{1}{4}$ ; b, fl. branchlet  $\times \frac{1}{2}$ ; c, disk-fl.  $\times 1\frac{1}{2}$ ; d, achene and pappus  $\times 2$ .

8. *H. gracilentus* Gray. Stem simple or branched above, erect, strict, 2 to 3 ft. high; herbage hispid; leaves opposite with fascicles of smaller ones in the axils, broadly lanceolate to linear-lanceolate, entire or obscurely denticulate, 3-nerved beneath, 2 to 4 in. long, the lower with petioles  $\frac{1}{2}$  to  $\frac{3}{4}$  in. long, the upper sub-sessile, 1-nerved beneath; corymb with 2 to 5 heads, the heads on long (3 to 12 in.) peduncles; bracts of the involucre ovate to lanceolate, hispid; heads  $1\frac{3}{4}$  to 2 in. wide, the involucre shorter than the disk; rays yellow, 7 to 10 lines long, disk-flowers yellow.—Cañons and hillsides, Santa Susana Mts. to San Bernardino and San Diego Co.

#### 79. *BÁLSAMORHIZA* Hook. BALSAM ROOT

Low perennials with thick or tuberous terebinthine-scented roots crowned by a tuft of basal leaves. Stems several, naked or few-leaved, bearing one or few large heads of yellow flowers. Both ray- and disk-flowers fertile. Receptacle flat or merely convex. Disk-achenes 4-sided or -angled and with intermediate nerves. Pappus none. (Greek balsamon, balsam, and rhiza, root.)

Rays none; disk-corollas with a strong longitudinal callous ridge opposite each sinus.—

Sect. *AGNORHIZA*.....1. *B. invenusta*.

Rays present; disk-corollas not longitudinally ridged.

Leaves entire or merely serrate, the principal ones with cordate base.—Sect. *ARTORHIZA*.

Stems with 2 or 3 small leaves, the large leaves basal.

Herbage scabrous with harsh often glandular hairs, or glabrate; involucre not woolly.....2. *B. deltoidea*.

Herbage silvery-tomentulose or canescent, the pubescence soft; involucre woolly.....3. *B. sagittata*.

Stems leafy; herbage green and glabrate.....4. *B. bolanderi*.

Leaves laciniately dentate to pinnately or bipinnately divided, not cordate.—Sect.

*EUBALSAMORHIZA*.

Herbage canescent-pubescent, not at all hirsute; involucral bracts oblong-lanceolate to ovate.....5. *B. hookeri*.

Herbage green, roughish-hirsute or hispidulous, not tomentose; involucral bracts lanceolate or linear-acuminate.....6. *B. hirsuta*.

1. *B. invenusta* Cov. Stems branching, leafy, 2 to 3 ft. high; herbage scabrous; leaves long-ovate to ovate, subcordate or truncatish at base, acute or acuminate, 2 to  $7\frac{1}{4}$  in. long; heads 10 to 11 lines high; bracts of the involucre linear or oblong, acute or acuminate, mostly shorter than the disk;

rays none; corolla-tube with 5 strong callous longitudinal ridges opposite the sinuses; achenes 4-angled, callous-ridged at the angles and with a weaker ridge between the angles, glabrous; summit of the achene thickened with 4 rounded knobs or tubercles at the angles and often with one small tubercle between the large ones.—Montane, 5500 to 6000 ft.: Sierra Nevada from Fresno Co. to Kern Co.

2. *B. deltoidea* Nutt. Stems 1 or several from a dense tuft of old leaf-bases on the root-crown, 1 to 2¼ ft. high; herbage green and scabrous or scabridulous, or the involucre and basal portions somewhat tomentose; basal leaves cordate-ovate, acute, entire or serrate, 6 to 12 in. long; bracts of the involucre linear-lanceolate or oblong, acute, more or less puberulent; rays ¾ to 1¼ in. long.—Middle altitudes in the mts., 3000 to 5500 ft.: San Rafael Mts. and e. to Kern Co., thence n. through the Sierra Nevada to Siskiyou Co., thence w. to Humboldt Co.; far n. to B. C. Apr.-June.

3. *B. sagittata* Nutt. Stems usually several from a dense tuft of old leaf-bases, 1 to 2 ft. high; herbage silvery-tomentulose or canescent; basal leaves cordate-oblong or -ovate, entire or nearly so, 4 to 8 in. long, 2 to 4 (or 5½) in. wide at base, on petioles of greater length; cauline leaves few and inconspicuous, linear or lanceolate to spatulate; rays 1 to 1¾ in. long; outer 5 bracts of the involucre oblong-lanceolate, white-woolly, the inner linear-oblong, usually shorter, less woolly or glabrate.—Sandy and rocky points or opens, 5000 to 8000 ft.: west slope of the Sierra Nevada from Mariposa Co. to Tehama Co., east side from Inyo Co. to Modoc Co.; e. to the Rocky Mts. June-July.

4. *B. bolanderi* Gray. Stems leafy, ½ to 1½ ft. high; herbage green and glabrate; leaves ovate to suborbicular, subcordate or truncatish at base, entire or nearly so, 2 to 4¼ in. long, very reticulate-veiny when mature, the cauline similar to and as large as the basal ones; outer bracts of the involucre ovate, foliaceous, ¾ to 1 in. long; disk-achenes apparently flattened.—Interior foothills, 1000 to 2500 ft.: w. Tehama Co.; Sierra Nevada from Placer Co. to Mariposa Co. Apr.-May.

5. *B. hookeri* Nutt. Stems scape-like, ½ to 1½ ft. high, from a thickened fusiform root, equaling or exceeding the leaves; herbage pubescent or canescent; leaves 7 to 10 in. long, pinnately divided (sometimes merely incised irregularly), the divisions serrate or again pinnately divided; bracts of the involucre oblong-lanceolate or ovate, acuminate, the outer with green tips; heads 1¾ to 2½ in. broad, including the ample rays.—Dry flats or hillslopes: Mt. Hamilton Range to the Oakland Hills; Sierra Nevada (3500 to 5000 ft.) from Mariposa Co. to Modoc Co., thence w. to Tehama and Siskiyou Cos.; n. to Wash., e. to Utah. Mar.-June. Var. *incana* Gray. Herbage loosely white-tomentose or shaggy.—Siskiyou Co.; n. to Wash., e. to Wyo. (*B. incana* Nutt.)

6. *B. hirsuta* Nutt. Stems 1 to 2 ft. high; herbage green, roughish-hirsute or hispidulous, not tomentose; leaves mostly basal, broadly lanceolate, pinnately parted or divided, the divisions incisely toothed or again pinnatifid; involucre hirsute-pubescent or glabrate, the outer bracts lanceolate or linear-acuminate, often with roundish-dilated base.—“Ne. Cal.”; e. to Utah, n. to B. C. May.

#### 80. *WYETHIA* Nutt.

Perennial herbs with a basal tuft of ample leaves and several simple stems bearing mostly few and smaller leaves and one or few large heads. Root very stout, crowned by a short caudex. Leaves mostly entire. Involucre hemispherical or campanulate, its bracts in 2 or 3 series, the outermost often foliaceous and enlarged, the innermost small and bract-like. Receptacle flat or nearly so, its bracts rigid, linear or lanceolate, either flattish or partially folded around the achenes. Flowers yellow, both ray and disk fertile, the latter perfect; ligule of ray-corollas elongated and very conspicuous. Branches of the style in perfect flowers produced into subulate-filiform hispid appendages. Disk-achenes prismatic-quadrangular, sometimes flattened, those of the ray 3-angled. Pappus firm and persistent, consisting of a crown of unequal scales, or with rigid awns at the angles. (Capt. Nath. J. Wyeth, with whom Nuttall crossed the continent in 1834.)

Involucres campanulate, the bracts relatively few (about 10 to 16); achenes compressed quadrangular; rays few (5 to 8 or 14).

Herbage tomentose or woolly, often glabrate in age.

Rays hardly surpassing the involucre; pappus-crown short, 4 to 6-cleft; proper awns none; leaves roundish ovate, mostly rounded or truncatish at base; Sierra Nevada in Tulare Co.; San Jacinto Mts. and s. . . . .1. *W. ovata*.

Rays conspicuous, 1 to 1½ in. long; pappus a crown of short scales with 2 to 5 subulate awns; leaves oblong-ovate, mostly acute at base; n. Sierra Nevada and North Coast Ranges. . . . .2. *W. mollis*.

Herbage glabrous or only weakly puberulent; Humboldt Co. . . . .3. *W. longicaulis*.

Involucres hemispherical, the bracts more numerous (about 20 to 40); rays many (10 to 27).

Heads relatively small (½ to 1 in. high); bracts of the involucre shorter than or little surpassing the disk; disk-achenes slightly compressed.

Pappus a crown of short denticulate scales, awns none; leaves mostly subcordate or truncatish at base.

Herbage glabrous, scabridulous; Eldorado Co. . . . .4. *W. reticulata*.

Herbage tomentose or glabrate in age; Mariposa Co. . . . .5. *W. elata*.

Pappus a chaffy crown with 1 to 4 subulate awns; herbage pubescent; wide-spread species. . . . .6. *W. angustifolia*.

Heads very large and broad; outer bracts of the involucre large, ovate or oblong, much surpassing the disk and sometimes much exceeding the rays; achenes very stout and thick.

Herbage minutely or floccose-tomentose. . . . .7. *W. helenioides*.

Herbage glabrous but minutely resinous. . . . .8. *W. glabra*.

1. *W. ovata* T. & G. Stems few or several from the root-crown, very short, 2 to 4 in. high, much exceeded by the leaves; herbage white-tomentulose when young, more or less glabrate; leaves round-ovate to elliptic-ovate, 3 to 6 in. long, on petioles 1½ to 4 in. long; heads on short (½ to 1½ in. long) peduncles, somewhat hidden by the leaves, 1 to 1¾ lines broad; bracts of the involucre linear or dilated above, 1 to 1½ times as long as the disk; bracts of the receptacle whitish-pubescent at tip; rays 5 to 8, 5 to 9 lines long; pappus bearing a lobed or fimbriate crown.—Open or openly wooded montane slopes, 3000 to 6000 ft.: mts. of s. Sierra Nevada in Tulare Co.; mts. of coastal S. Cal. (San Gabriel Mts., San Jacinto Mts., Palomar Mt., Cuyamaca Mts., Laguna Mts.); s. to L. Cal. May-June.

2. *W. mollis* Gray. Stems 1½ to 3 ft. high, bearing solitary or few heads; herbage white-woolly when young, in age greenish and merely pubescent; leaves oblong-ovate to obovate, acute or rarely obtuse at base, 7 or 10 to 19 in. long, long-petioled, the cauline few and usually small, rounded at base, short-petioled; heads campanulate, 6 to 7 lines high; bracts of the involucre lanceolate to ovate-lanceolate; rays 6 to 8 (or 14), 1 to 1½ in. long; achenes with acute angles, quadrangular or in the disk compressed, of a glaucous or dark slate hue, often glandular-dotted, their upper portion (and the pappus) minutely pubescent; pappus an irregular crown of scales with 2 to 5 subulate awns at the angles, the disk mostly with 2 awns or none.—Dry open ridges and pine flats, 5000 to 8500 ft.: Sierra Nevada from Mariposa Co. to Shasta and Modoc Cos.; n. Lake Co.

3. *W. longicaulis* Gray. Slender, 1 to 2 ft. high; herbage puberulent or the basal leaves glabrous; leaves all serrulate, the basal oblong-lanceolate, tapering to each end, about 10 in. long, short-petioled, the cauline smaller, short-petioled or the upper ones sessile; heads solitary or corymbose, on long slender peduncles; involucres campanulate, their outer bracts linear-oblong, mostly surpassing the inner and the disk; rays 6 to 9, ¾ to 1 in. long; achenes with a short erosely denticulate crown.—Ridges and opens of e. Humboldt Co.

4. *W. reticulata* Greene. Stems rather slender, 14 to 19 in. high, leafy up to the inflorescence; leaves ovate, subcordate at base, acute, 3 to 6 in. long; the veins reticulate and shining beneath, all petioled; heads hemispherical, 6 to 7 lines high; bracts of involucre linear-oblong, obtusish, short, the outer 1 or 2 sometimes loose; rays 13 to 17, narrow, 1 in. long; pappus an extremely short erose-denticulate crown; no awn.—Sierra foothills in Eldorado Co. (Sweetwater Creek).

5. *W. elata* Hall. Stems 1½ to 3 ft. high, leafy; herbage puberulent, the stems minutely glandular, the under side of the leaves tomentulose; leaves ovate, mostly subcordate or truncatish at base, shortly acuminate, 4 to 7 in.

959. *Wyethia angustifolia* Nutt.; a, leafy base  $\times \frac{1}{2}$ ; b, fl. stem  $\times \frac{1}{2}$ ; c, bract of receptacle  $\times 1\frac{1}{2}$ ; d, disk-fl.  $\times \frac{2}{3}$ ; e, achene  $\times 1\frac{1}{2}$ .

long, becoming coriaceous, the cauline all petioled; bracts of the involucre typically much shorter than the disk; rays narrow, 12 to 16,  $1\frac{1}{4}$  to  $1\frac{3}{4}$  in. long; pappus a crown of very short denticulate scales.—Mariposa Co., about 3500 ft.

6. *W. angustifolia* Nutt. Fig. 959.

Stems 1 to 2 ft. high, hirsute; herbage green; leaves elongated-lanceolate to narrowly or oblong-ovate, acuminate at both ends, entire or occasionally serrulate, the basal and lower ones  $\frac{1}{2}$  to  $1\frac{1}{4}$  ft. long, the upper smaller, sessile or short-petioled; bracts of the involucre numerous, oblong-ovate to linear or lanceolate, hirsute- or villous-ciliate, commonly purplish-black at the often somewhat contracted base; bracts of the receptacle tipped with a short subulate hispidulose point; rays 10 to 17,  $1\frac{1}{4}$  to 2 in. long; achenes minutely pubescent at summit, 3 lines long, bearing 1 or 2 (or those of the ray 3 or 4) stout minutely hirsute awns, with some very

short intervening chaffy scales, all more or less united at base, rarely awnless.—Common on open plains and low hills, 200 to 2500 ft., sometimes montane up to 4000 or 5000 ft.: Coast Ranges from Siskiyou Co. to Monterey Co.; Sierra Nevada from Shasta Co. to Mariposa Co. The green shoots are eaten raw by the Hupas. Var. *SOLANÉNSIS* Jepson n. var. Leaves very narrow, 4 to 5 (or 6) lines wide.—Borders of low hills, 100 to 200 ft., Solano Co.: Montezuma Hills (Jepson, type); Araquipa Hills. Var. *FOLIOSA* Hall. Herbage roughish pubescent; heads smaller than in the species; bracts more pubescent and less markedly ciliate.—Sierra Nevada from Fresno Co. to Mariposa Co., in the north passing by intergrades into the species.

7. *W. helenioides* Nutt. Stems 1 to 2 ft. high, soft-tomentose, almost glabrous in age; basal leaves 1 to 2 ft. long, 4 to 6 in. wide, acute at base and apex, often undulate, long-petioled; cauline leaves 3 or 4, much smaller, more commonly oblong-ovate, short-petioled; heads  $2\frac{1}{2}$  or often 3 in. broad; outer bracts of the involucre ovate-lanceolate or ovate, sometimes toothed; involucre mostly subtended by 1 or 2 conspicuous bract-like but short-petioled leaves; rays 12 to 18, 1 to  $1\frac{1}{4}$  in. long; upper portion of achenes and pappus slightly pubescent, at least when young; pappus-paleae short, unequal.—Common in the foothills and bordering plains from Solano Co. to San Luis Obispo Co., the Great Valley and Sierra foothills.

8. *W. glabra* Gray. MULE-EARS. Similar to no. 7; herbage green and glabrous throughout, minutely resinous-glandular or viscid, and scabrous, at least when dry; leaves as in no. 7 or broader and obtuse, sometimes toothed, rarely undulate; rays 12 to 27; achenes and pappus glabrous.—Open hills, Napa Co. to San Luis Obispo Co. Less common than no. 7.

81. *HELIANTHÉLLA* T. & G.

Low perennial herbs with the entire leaves chiefly in a basal tuft, the reduced cauline ones mostly opposite. Heads solitary, long-peduncled. Flowers yellow, the central cluster of the disk (in ours) sterile, the ray sterile. Involucre hemispherical, its bracts linear-lanceolate and loosely imbricated, the outer mostly foliaceous and attenuate-acuminate, the innermost shorter and chaff-like. Receptacle flat or convex, its bracts embracing the achenes. Achenes in ours compressed, with thin or margined edges and emarginate summit. Pappus a short awn or tooth from each margin with minute intermediate scales, or pappus none. (Diminutive of *Helianthus*.)

Involucral bracts not inflexed; rays  $1\frac{1}{2}$  to 3 lines broad; achenes  $1\frac{1}{2}$  to 2 lines broad; cauline leaves opposite ..... 1. *H. californica*.  
 Involucral bracts inflexed over disk after anthesis; rays 3 to  $4\frac{1}{2}$  lines broad; achenes 3 lines broad; cauline leaves alternate ..... 2. *H. castanea*.

1. *H. californica* Gray. Stems slender, 1 to 2 ft. high, occasionally branched; herbage glabrous, minutely scabrous; leaves oblong-lanceolate, 3 to 7 in. long, tapering into petioles, the cauline mostly opposite; heads mostly 1 to  $1\frac{1}{2}$  (or 2) in. broad; rays  $\frac{1}{2}$  to 1 in. long, usually little longer than the involucre; bracts of receptacle obtuse; achenes narrowly obovate, glabrous, narrowly margined, when young microscopically ciliate near the summit; pappus none or the achene when young with 1 or 2 very minute bristles and a few obscure teeth.—Higher ridges of the Coast Ranges, 2000 to 3000 ft., from Santa Clara Co. to Napa Co. May-June. Var. *NEVADENSIS* Jepson n. comb. Achene with 2 short persistent awns and usually several intermediate scales.—Sierra Nevada, 3000 to 5000 (or 7000) ft., from Mariposa Co. to Siskiyou Co., thence s. to Trinity Co. (*H. nevadensis* Greene.)

2. *H. castanea* Greene. Stems several from the root-crown, 10 to 13 in. high, simple or branched below, bearing large solitary heads; herbage hispidulose, especially the stems; leaves oblong-ovate to oblong-lanceolate, 3 to 6 in. long, petioled, the cauline alternate; heads  $1\frac{3}{4}$  to 2 in. broad; rays 11 to 16; bracts of the involucre linear-acuminate, densely hispid-ciliate, otherwise sparingly pubescent or subglabrous; bracts of the receptacle densely hispidulous at the obtuse tips, subtended by 1 or few large leafy bracts; achenes broadly obovate, not margined, the outer ones distinctly thickened; pappus none.—Mt. Diablo region. Var. *CANNONAE* Jepson n. comb. Involucre subtended by several leaf-like petioled bracts; bracts pubescent.—San Francisco. (*H. cannonae* Eastw.)

### 82. *ENCELIOPSIS* A. Nels.

Perennial herbs, the thick leaves in a sub-basal tuft and covered with a close dense silvery felt. Heads large, solitary on the naked scapes. Flowers yellow, the ray sterile. Receptacle flat. Bracts of the receptacle soft, scarious. Pappus a denticulate crown with 2 short subulate awns at the angles. Achenes flat, dark or black, bordered by a narrow callous border. (*Encelia*, and Greek *opsis*, likeness, in habit resembling the genus *Encelia*.)

1. *E. argophylla* A. Nels. var. *grandiflora* Jepson n. comb. Stem very short, branched and forming a crown with many clusters of basal leaves, the many scapes 1 to 2 ft. high; leaves rhomboid-obovate, obtuse or obscurely acute. 2 to 3 in. long, contracted to a margined petiole about  $\frac{1}{3}$  to  $\frac{1}{2}$  as long; bracts of the involucre lanceolate, abruptly attenuate; rays about 24 to 26, 1 to 2 in. long; achenes obovate, notched at apex, 5 lines long.—Cañons on the w. side of the Panamint Mts.; e. to southern Nev. (*Encelia grandiflora* Jones.)

### 83. *ENCÈLIA* Adans.

Ours low shrubs or suffrutescent plants. Leaves entire or remotely toothed, often 3-nerved from near the base. Heads mostly showy; rays yellow, often wanting; disk yellow or purple. Ray-flowers neutral. Involucral bracts in 2 or 3 series. Bracts of the receptacle scarious, striate, partially or quite enfolding the achenes. Achenes obovate, black, bordered by a rather obscure callous line; disk-achenes very flat, notched or truncate at summit, with conspicuously ciliate margins. Pappus in ours none, or rarely of 2 slender awns. (*C. Encel*, a writer on oak-galls acc. Asa Gray.)

Heads solitary on elongated peduncles; peduncles pubescent or scaberulous, naked above.

Disk purple; rays  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long; involucre densely hairy or white-villous; leaves green ..... 1. *E. californica*.

Disk yellow; involucre canescent.

Rays none; leaves green ..... 2. *E. frutescens*.

Rays  $\frac{1}{4}$  to  $\frac{1}{2}$  in. long; leaves whitened ..... 3. *E. actoni*.

Heads in cymes, the peduncles smooth; rays  $\frac{1}{2}$  in. long; disk yellow; involucre sparsely pubescent; leaves silvery-tomentose ..... 4. *E. farinosa*.

1. *E. californica* Nutt. Stems slender, forming a spreading clump 2 to  $3\frac{1}{2}$  ft. high, woody only at base: leaves ovate to lanceolate, acute, mostly

entire, green, minutely scabrous or glabrate,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  in. long, on short petioles; heads large, solitary, terminating elongated nearly naked peduncles; disk purple,  $\frac{1}{2}$  to  $\frac{3}{4}$  in. broad; involucre densely white-villous, equaling the disk-corollas; rays 16 to 25, bright lemon-yellow,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long; corolla-lobes of disk either glabrous or pubescent.—Dry hillsides and slopes of barrancas, Santa Barbara to San Diego and e. to Riverside. Mar.-May.

2. *E. frutescens* Gray. Roundish bush 2 to 3 ft. high, broader than high with white stems and green leaves; leaves scabrous, the stems cinereous-scabrous; leaves ovate or oblong,  $\frac{1}{2}$  to 1 in. long, petioled from a mostly rounded base; heads 5 to 7 lines broad, on long peduncles naked above; involucre whitish-hispid, rather shorter than the disk; disk-corollas yellow, with glandular teeth; rays none; pappus wanting, or of 2 long-villous awns.—Dry hills in the deserts: Colorado and Mohave deserts; Panamint Mts.; e. to Ariz.

3. *E. actoni* Elmer. Habit of and near *E. frutescens*, of which it may be only a radiate variety; leaves commonly broadly ovate, whitish-pubescent,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long; heads larger, the disk  $\frac{3}{4}$  to 1 in. broad; rays 8 to 18, 3 to 7 lines long.—Acton (Los Angeles Co.) to San Jacinto; ne. through the Mohave Desert to the Greenhorn Mts. and Inyo Co., thence e. to Utah.

4. *E. farinosa* Gray. INCLENZO. One to 3 (or 5) ft. high, usually with distinct trunk, the numerous short branches very leafy at the ends and forming a low round-topped white bush from the summit of which arise the naked peduncles; peduncles cymosely-branched with several to many heads or simple and 1-headed; leaves ovate, silvery-tomentose or glabrate, 3-nerved, entire,  $\frac{3}{4}$  to  $2\frac{1}{2}$  in. long, the petioles about  $\frac{1}{4}$  as long; rays 8 to 18, broadly obovate or oblong, 4 to 6 lines long; involucre very short; lobes of disk-corollas glabrous.—Low hills or valleys or desert benches: San Gabriel Mts. to San Diego Co., mostly rare; Colorado and Mohave deserts; Inyo Co.; e. to Ariz., s. to Mex. Apr.-May.

#### 84. *GERAËA* T. & G.

Annual herbs with alternate dentate leaves. Heads usually few, paniculate, large. Flowers yellow; rays sterile. Involucre hemispheric, its linear or oblong bracts in 2 or 3 series. Receptacle flattish, its bracts soft, scarious, conduplicate. Style-branches long, villous. Achenes black with conspicuous white-callous margins, strongly flattened, narrowly cuneate; pappus-awns 2, naked, continuous from the sides of the achene, joined at base by a conspicuous crown. (Greek geraios, old, the achenes white-hairy.)

Rays 4 to 10 lines long.....1. *G. canescens*.  
Rays none.....2. *G. viscida*.

1. *G. canescens* T. & G. DESERT SUN-FLOWER. Fig. 960. Annual, usually branching from the base, 1 to 2 ft. high, hirsute with white hairs; leaves broadly ovate to lanceolate, acute, entire or few-toothed,  $1\frac{1}{2}$  to 4 in. long, sessile or narrowed to short margined petioles; heads 1 to several on long leafless branches or paniculate; bracts of the involucre linear-lanceolate, rather shorter than the disk, green but the margins copiously white-ciliate; rays 12 to 16, 4 to 10 lines long; achenes retuse between the awns which are as long as the disk-corollas.—Sandy soil in the deserts: Colorado and Mohave deserts; Inyo

960. *Geraea canescens* T. & G.; a, fl. stem  $\times \frac{1}{2}$ ; b, sect. of stem with leaves  $\times \frac{1}{2}$ ; c, bract  $\times 1\frac{1}{2}$ ; d, achene  $\times 1\frac{1}{2}$ .

Co.; e. to Nev. and Ariz. Also called Coyote Tobacco. Apr. (*Encelia eriocephala* Gray.)

2. *G. viscida* (Gray) Blake. Stems coarse, erect,  $1\frac{1}{4}$  to  $2\frac{1}{4}$  ft. high, coarsely viscid-pubescent and hirsute, the flowering branches mostly leafy and terminating in heads  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. broad; leaves oblong-ovate, cordate-clasping at base, irregularly and often obscurely serrate,  $1\frac{1}{4}$  to 4 in. long; rays none; bracts of the involucre oblong, acute, viscid-pubescent, shorter than the disk-corollas; achenes truncate between the awns which are half as long as disk-corollas.—Mts. of s. San Diego Co. (Campo, Potrero, Jacumba); n. L. Cal. June-July. Probably annual. (*Encelia viscida* Gray.)

### 85. VERBESINA L. CROWNBEOARD

Erect branching herbs with simple dentate or entire leaves. Heads commonly on more or less elongated peduncles. Involucre hemispheric or campanulate, herbaceous, its ovate to linear bracts in 2 or 3 series. Receptacle usually conical, its bracts concave, folded about the outer edge of the achenes. Both disk- and ray-flowers yellow in our species. Achenes strongly flattened laterally, usually oblong or obovate, winged on each edge. Pappus of two awns, one to each edge of the achene. (Meaning of name unknown.)

Leaves sessile, green on both sides; achenes 5 to 6 lines long, thin-winged. . . . 1. *V. dissita*.  
Leaves petioled, canescent at least beneath; achenes  $2\frac{1}{2}$  to  $3\frac{1}{2}$  lines long, corky-winged. . . .

2. *V. encelioides*.

1. *V. dissita* Gray. Stem 2 to 3 ft. high, probably from a woody perennial base; herbage green and glabrous; leaves mostly opposite, ovate, serrate to entire, obscurely scabrous, 2 to 4 in. long, commonly sessile by a broad or narrow base; heads short-peduncled, few in a terminal panicle; involucre 4 to 5 lines high, equaling or shorter than the disk, their bracts puberulent, linear and acute or the outer oblong-spatulate; achenes nearly glabrous, the body oblanceolate, the wings very broad above and narrow below, the whole fruit thus obovate; pappus-awns slender, coalescent with the wings at base.—San Bernardino Mts.; Orange Co.; s. to L. Cal.

2. *V. encelioides* Gray var. *exauriculata* Rob. & Greenm. Stem freely branching, 1 to 4 ft. high; herbage canescent; leaves ovate-lanceolate to broadly ovate, saliently dentate, strigose-whitened below, green above,  $1\frac{1}{4}$  to 4 in. long, on petioles about  $\frac{1}{2}$  as long; involucre bracts lanceolate, 3 to 4 lines long; rays 12 to 15, orange-color, deeply 3-toothed, 5 to 6 lines long; achenes broadly winged on each edge when fully mature and thus obovate, obtuse, the wings becoming corky-thickened; awns of the pappus short.—Low plains and summer beds of winter flood streams, introduced into Cal. from the eastward: Salinas River; Glendale; Cahuenga Pass; Riverside; Ariz. to Tex., Col. and Mont.

### 86. COREÓPSIS L.

Perennials with thickened fleshy stems or annuals. Leaves dissected into linear or filiform lobes. Flowers yellow, in showy heads on long naked peduncles. Rays several or numerous, oblong or obovate, 3-toothed at apex. Involucre double; bracts of the inner series 8 to 12, erect, membranous; bracts of the outer series 5 to 8, narrow, loose and foliaceous. Receptacle nearly flat, its bracts thin, scarious, linear or lanceolate, falling with the fruit. Achenes flattened, more or less wing-margined. Pappus a minute ring or cup, or consisting of linear paleae. (Greek *koris*, a bug, and *opsis*, appearance.)

Perennials; stems stout, leafy; heads 2 to  $3\frac{1}{2}$  in. broad; pappus none.

Peduncles scattered, 7 to 14 in. long; leaf divisions linear or broadly linear. . . . .

1. *C. maritima*.

Peduncles corymbosely clustered, 3 to 6 in. long; leaf divisions narrowly linear to filiform . . . . . 2. *C. gigantea*.

Annuals; stems slender, usually decumbent at base; heads  $\frac{3}{4}$  to 2 in. broad.

Achenes alike in disk and ray, callus-margined, not ciliate; pappus none.

Stems naked, the leaves all basal; ring of the disk-corollas usually bearded. . . . .

3. *C. douglasii*.

Stems leafy; ring of the disk-corollas beardless. . . . . 4. *C. stilmanii*.  
Achenes unlike in disk and ray, those of the disk ciliate-villous; pappus of 2 linear paleae.

Stems leafy; ring of the disk-corollas pubescent. . . . . 5. *C. calliopsidea*.  
 Stems naked, the leaves all basal; ring of the disk-corollas beardless. . . . . 6. *C. bigelovii*.

1. *C. maritima* (Nutt.) Hook. Stem very stout, hollow, much branched above, 1 to 2½ ft. high; herbage somewhat fleshy, glabrous; leaves 3 to 5½ in. long, twice or thrice pinnately divided into linear or broadly linear lobes, the lobes ½ to 1¼ in. long, widely divergent; heads 2¼ to 3½ in. broad, on peduncles 7 to 14 in. long; outer bracts about 8, herbaceous, oblong, 6 to 10 lines long; inner bracts as long or shorter, broader than the outer, acute, yellowish; flowers yellow; ray-flowers mostly 17 to 20, the rays 3-toothed or deeply notched, ¾ to 1¼ in. long; ring of disk-corollas beardless; achenes oblong, glabrous.—Along the coast from s. Santa Barbara Co. to San Diego Co.; Santa Barbara Islands; s. to L. Cal. Mar. (*Leptosyne maritima* Gray.)

2. *C. gigantea* (Kell.) Hall. Erect shrub 1 to 4 (or 6) ft. high, the main trunk very thick and fleshy, the primary branches distant, horizontal or ascending, leafy only towards the ends; herbage glabrous; leaves 3 to 12 (or more) in. long, twice or thrice pinnately divided into narrowly linear to filiform lobes, the lobes 5 lines to 2 in. long; petioles widened at base; heads many, cymosely clustered, 2 to 3 in. broad; outer bracts few, lanceolate, herbaceous, 3 to 6 lines long; inner bracts longer, ovate, acuminate, yellowish; ray-flowers yellow, the rays 8 to 12 lines long, 2½ to 4½ lines broad; disk-flowers yellow, 3 lines long, the corolla ring beardless; achene oblong, flattened, thinly and narrowly winged; pappus none.—Seacoasts: Santa Barbara Co. to Los Angeles Co.; Santa Rosa, Santa Cruz and Santa Catalina Islands. (*Leptosyne gigantea* Kell.)

3. *C. douglasii* (DC.) Hall. Stems 1 to several, scapose, erect, 5 to 14 in. high, the leaves in a basal tuft; herbage glabrous; scapes simple, one-headed; leaves narrowly linear to filiform, entire or pinnately parted into a few slender remote lobes, 1 to 3 in. long; heads (½ or) 1 to 1½ in. broad; outer bracts linear-lanceolate, 2½ to 3 lines long, herbaceous; inner bracts ovate, yellowish, thinner; rays 7 to 12, yellow, or frequently white on the upper third, 4½ to 6 lines long; disk-flowers yellow, the ring in the tube usually bearded; achenes thick, margined with a round corky wing, a thin corky ridge along the inner face; pappus none or reduced to a mere cup.—Valleys and mesas: San Luis Obispo Co. s. to coastal S. Cal.; Mohave and Colorado deserts; e. to Ariz., s. to Mex. and L. Cal. (*Leptosyne douglasii* DC.)

4. *C. stillmanii* (Gray) Jepson. Stems 9 to 12 in. high, stoutish, leafy below, usually branched; leaves 1 to 2 in. long, pinnately divided into few remote linear lobes, the lobes entire or with one or few coarse salient teeth; leaf-divisions 1 line broad; involucre commonly somewhat hairy at base; disk-corollas beardless; achenes surrounded by a thick and corky rugose wing, smooth and glabrous on the back, the inner face sparsely papillose, or with a row of tubercles on the median ridge; pappus-cup either entire or 2-lobed.—Sacramento Valley; lower San Joaquin Valley. (*Leptosyne stillmanii* Gray.)

*C. TINCTORIA* Nutt. Annual; stem solitary, slender, erect, 2 to 3 ft. high; herbage glabrous; leaves few, pinnately divided into 3 to 7 (or the

961. *Coreopsis bigelovii* Hall; a, habit x ¼; b, head x 1; c, inner bract x 2½; d, ray-achene x 2½; e, disk-achene x 2½.

lower 2) linear segments; heads several, corymbose; involucre hemispherical, the outer bracts ovate,  $\frac{1}{2}$  to 1 line long, the inner bracts broadly ovate, often reddish, 2 lines long; rays 4 to 6 lines long, yellow, the basal portion brown; achenes wingless, the pappus an obscure border or none.—Garden plant, introduced from cent. U. S.: an escape at Redding and Kaweah.

5. *C. calliopsidea* (DC.) Bol. Stem leafy,  $\frac{1}{2}$  to 1 (or 2) ft. high; leaves 1 to 2 in. long, the lower  $\frac{1}{2}$  or  $\frac{2}{3}$  petiole-like but broad or ligulate, the upper portion pinnately parted, the lobes entire or deeply few-toothed; outer bracts of the involucre broadly ovate, conspicuously shorter than the narrowly ovate inner ones; rays  $\frac{1}{2}$  to 1 in. long, 3 to 7 lines wide, 15 to 20-nerved; ring of the disk-corollas pubescent; achenes of the ray- and outer disk-flowers oval, flat and glabrous; disk-achenes cuneate-oblong, long-villous on the margins and inner face; pappus-paleae 2, linear.—Moist hillsides: South Coast Ranges; Mohave Desert. (*Leptosyne calliopsidea* Gray.)

6. *C. bigelovii* (Gray) Hall. Fig. 961. Stems 1 to several, commonly simple, scape-like and erect from a basal tuft of leaves, 8 to 14 in. high; leaves pinnately parted into linear lobes, sometimes linear and entire, 2 to 4 in. long; bracts of the outer involucre narrowly linear, loose or spreading; inner involucre  $3\frac{1}{4}$  to 5 lines high, its bracts quadratish or broadly ovate, erect; flowers yellow; rays  $4\frac{1}{2}$  to 9 lines long; ring of disk-corollas beardless; achenes oblong, very flat; ray-achenes glabrous, with a narrow winged margin, pappus none; disk-achenes with a conspicuous marginal fringe of villous hairs; pappus-paleae 2, linear-lanceolate, finely ciliate,  $\frac{1}{2}$  as long as the achene.—Desert flats, 2000 to 4000 ft.: Colorado and Mohave deserts; n. to Kern and Inyo Cos. Apr.-May. (*Leptosyne bigelovii* Gray.)

### 87. *BIDENS* L. BUR MARIGOLD

Herbs with opposite leaves and yellow flowers. Heads many-flowered; rays 3 to 9, sterile. Involucre double, the outer bracts linear-oblong, foliaceous, the inner elliptic to ovate, membranous. Achenes somewhat flattened parallel with the scales of the involucre or slender and 4-sided, those of the disk crowned with 2, 3, or 4 rigid persistent barbed awns. (Latin *bidens*, 2-toothed.)

Leaves simple; rays 3 to 9, conspicuous; achenes downwardly barbed on the margin.

Outer involucre little or not at all surpassing the disk; rays very showy, golden yellow. ....

1. *B. laevis*.

Outer involucre foliaceous and surpassing the disk; rays usually light yellow, smaller. ....

2. *B. cernua*.

Leaves pinnately 3 to 5-divided; rays inconspicuous or lacking; achenes upwardly barbed on the margin.

Outer involucral bracts much exceeding the inner, usually longer than the disk; rays 1 to 5, inconspicuous. ....

3. *B. frondosa*.

Outer involucral bracts barely equaling the inner, shorter than the disk; rays none. ....

4. *B. pilosa*.

1. *B. laevis* B. S. P. BUR MARIGOLD. Fig. 962. Annual (or in the south perennial); stem often decumbent at base, 1 to 3 or even 5 ft. high, glabrous; leaves lanceolate, usually tapering to the sessile base, evenly serrate, more or less connate at base, 3 to 8 in. long; outer involucre rather longer than the inner, the bracts often serrulate; rays oval,

962. *Bidens laevis* B. S. P.; a, fl. branchlet x  $\frac{1}{2}$ ; b, bract x 2; c, disk-fl. x 2; d, achene x 2.

963. *Bidens frondosa* L.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, disk-fl.  $\times 3$ ; c, ray-fl.  $\times 3$ ; d, achene  $\times 2$ .

Fig. 963. Annual; stem erect, 3 or 4 ft. high, glabrous or slightly pubescent; leaves 3 to 5-divided, the divisions or leaflets petiolulate, lanceolate, coarsely toothed; rays 1 to 5, inconspicuous, usually shorter than the greenish yellow disk; achenes very flat, cuneate-oblong, 4 to 5 lines long, dentate on the margin with barbs upwardly pointed (except at the summit), 2-awned; heads erect in fruit, usually surpassed by the outer foliaceous bracts.—Wet lowlands: San Joaquin Valley; Sacramento Valley; n. to B. C., e. to N. S. and Fla. Sept.

4. *B. pilosa* L. Annual; stem  $\frac{2}{3}$  to 4 ft. high, usually branched from the base; herbage pilose-pubescent to nearly glabrous; leaves pinnate; leaflets 3 to 5, ovate, serrate,  $\frac{1}{2}$  to 1 in. long; heads about  $4\frac{1}{2}$  lines broad, scattered, the peduncles commonly  $\frac{3}{4}$  to  $2\frac{1}{4}$  in. long; rays usually none, small and yellowish white when present; achenes linear, tetragonal, about  $4\frac{1}{2}$  lines long, marked with scattered ascending barbs; awns 2 to 4.—Native of the tropics, naturalized along irrigating ditches and water courses: coastal S. Cal.; n. to San Luis Obispo Co.

Tribe **Calenduleae**. MARIGOLD TRIBE. Bracts of the involucre in 1 or 2 rows. Receptacle naked. Ray-flowers perfect, disk-flowers staminate. Achenes of ray-flowers large, crescent-shaped or coiled into a ring, roughly warty-ridged on the back. Pappus none. *CALÉNDULA OFFICINÁLIS* L. Pot Marigold. Annual; leaves oblong, entire, sessile; heads showy; flowers yellow.—Garden plant from Eur., adv. at Sonoma.

#### TRIBE 7. **Madieae**. TARWEED TRIBE

Ours commonly annuals. Herbage commonly glandular, viscid or heavy-scented. Leaves alternate or opposite. Bracts of the involucre in a single series, each partly or completely enclosing an achene. Bracts of the receptacle commonly in a single series between disk- and ray-flowers and often united into a cup, or sometimes scattered among the disk-flowers. Rays always present, showy or inconspicuous. Anthers not caudate. Ray-achenes always fertile, without pappus (except nos. 93 and 98 and sometimes in no. 94); disk-achenes fertile or sterile, their pappus paleaceous, awn-like or none.

golden brown,  $\frac{3}{4}$  to 1 in. long; disk brownish; heads in fruit erect or nodding; achenes flat or flattish, cuneate, distinctly carinate on the sides and retrorsely hispid on the marginal angles; awns 2 or 3.—Low wet ground, marshes or river lowlands, 10 to 1200 ft.: coastal S. Cal.; South Coast Ranges; San Joaquin and Sacramento valleys; e. to Mass. and Fla., s. to Mex. Sept.-Oct. (*B. chrysanthemoides* Michx. *B. expansa* Greene.)

2. *B. cernua* L. NODDING BUR MARIGOLD. Annual; stems 8 to 20 in. high, glabrous or setulose-hispid; leaves oblong-lanceolate, rather irregularly serrate, mostly not connate; outer involucre bracts exceeding the disk, spreading, foliaceous; rays 6 to 10, mostly light yellow, 3 to 6 lines long, sometimes none; heads strongly nodding in fruit; achenes 4-angled and usually 4-awned.—Wet soil, infrequent: San Francisco; Mt. Shasta; Yreka; n. to Can., e. to N. Car.

3. *B. frondosa* L. BEGGAR-TICKS.

88. **BLÉPHARIPÁPPUS** Hook.

Annuals with alternate narrowly linear entire leaves. Stem paniculately branched, the heads terminating the branchlets. Bracts of involucre linear-oblongate, nearly equal, in 1 or 2 series. Receptacle convex, all the flowers subtended by bracts, the bracts distinct, narrow, thin or scarious. Flowers white, both ray and disk. Ray-flowers 3 to 6; disk-flowers 7 to 12. Fertile disk-flowers with filiform 2-cleft style; sterile disk-flowers with entire style. Achenes turbinate, silky-villous. Pappus present in both disk and ray, consisting of many paleae, the paleae linear or oblong, scarious or hyaline, inconspicuous, lacerate or fimbriate; or pappus sometimes none. (Greek blepharis, eyelash, and pappos, pappus, in allusion to the fringed paleae.)

1. **B. scàber** Hook. Stem erect, simple below, paniculately branched above, leafy, 5 to 9 in. high; leaves 2 to 8 lines long; heads 2 to 3 lines high.—Dry hills, 1800 to 2500 ft.: Siskiyou Co.; n. to southern Ore. and to Ida.

89. **CENTROMÀDIA** Greene. SPIKEWEED

Rigidly branching annuals with alternate spinescent leaves, the lower pinnatifid, the upper entire. Herbage more or less glandular and scented. Heads racemose along the branches and terminal, sometimes sessile in the forks. Involucral bracts spinescent. Receptacle with chaffy bracts throughout, none of the outer united or connate. Flowers yellow, with 25 to 40 small bifid rays. Disk-achenes chiefly sterile, with or without narrowly linear or bristle-like paleae. Ray-achenes more or less triangular, smooth or roughish on the back, the inner terminated by an erect beak-like apiculation. (Greek kentron, a prickle, and Madia, an allied genus.)

Herbage yellowish green, sparsely hirsute, sweet- or honey-scented; floral leaves little or not all surpassing the heads. . . . . 1. *C. pungens*.  
Herbage dark, rather densely villous-hirsute, ill-scented; floral leaves often conspicuously surpassing the heads. . . . . 2. *C. fitchii*.

1. **C. pungens** (T. & G.) Greene. COMMON SPIKEWEED. Fig. 964. Stem rigidly and freely branching, commonly from near the base, sometimes only above,  $\frac{3}{4}$  to 2 or 3 ft. high; herbage sparsely hirsute or hispid with spreading hairs, seldom viscid or glandular; leaves (especially of the flowering branches) linear-subulate, spinose, entire, the lower and lowest pinnately parted into oblong lobes, or pinnatifid, the lobes or teeth spinosely or pungently tipped; bracts of the receptacle cuspidate; pappus of disk none; ray-achenes roughish, somewhat laterally 2-nerved on back, the inner edge terminated by a short beak-like apiculation.—Plains and valley floors, especially in alkaline or subsaline areas, 10 to 500 ft.: San Joaquin Valley; South Coast Ranges; coastal S. Cal. On the alkaline plains of the upper San Joaquin Valley this species covers tens of thousands of acres and often forms thickets 4 or 5 ft. high. It is a valued bee plant. (*Hemizonia pungens* T. & G. *C. maritima* Greene.) Var. **PARRYI** Hall. Herbage minutely glandular; bracts of receptacle thin, obtuse or acute and tapering to a weak spine; disk-achenes with 3 to 5 slender almost bristle-like paleae as long as the corolla; ray-achenes semi-obcordate in outline.—Sacramento and Napa valleys to coastal S. Cal. May-Oct. (*Hemizonia parryi* Greene.) Var. **CONGDONII** Jepson n. comb. Herbage not glandular; involucrel

964. *Centromadia pungens* Greene; a, fl. branchlet  $\times \frac{1}{2}$ ; b, head  $\times 1\frac{1}{2}$ ; c, bract  $\times 3$ ; d, disk-fl.  $\times 3$ ; e, achene  $\times 4\frac{1}{2}$ .

bracts much exceeding the flowers; bracts of receptacle thin, not rigid nor spinose; disk-flowers with pappus of 3 linear-subulate awns exceeding the corolla.—Monterey and San Luis Obispo Cos. May-Sept. (*Hemizonia congdonii* Rob. & Greenm. *H. pungens* var. *congdonii* Jepson.)

2. *C. fitchii* (Gray) Greene. *FITCH'S SPIKEWEED*. Stem diffusely branched above or at the base, 9 to 16 in. high; herbage hirsute or villous with spreading hairs; leaves of the basal tuft pinnately parted into remote narrowly linear pungent lobes; cauline leaves linear and entire, tapering into a subulate or pungent tip, those about the head spreading and star-like, mostly all bearing stipitate glands; bracts of the involucre subulate, usually far exceeding the flowers, those of the receptacle pointless, soft, hairy; ray-achenes flattened laterally, nearly semi-circular in outline, smooth or tuberculate, with a short thick beak; pappus of disk-achenes of 8 to 12 linear paleae as long as the corolla and hairy and fimbriate at the tip.—High sandy land in the valleys and foothills, 100 to 2700 ft.: Sierra Nevada foothills from Mariposa Co. to Butte Co.; lower San Joaquin Valley; Sacramento Valley; North Coast Ranges from Napa and Sonoma Cos. to Mendocino and Siskiyou Cos.; n. to southern Ore. May-Sept. (*Hemizonia fitchii* Gray.)

#### 90. HOLOCÁRPHA Greene

Corymbosely branching annual with very viscid-glandular herbage. Leaves of the axillary fascicles and those about the heads narrowly linear, beset with stipitate glands and tipped with a truncate gland. Heads solitary or commonly glomerate at the ends of the branches. Bracts of the convex receptacle each subtending a flower, the outer and those of the involucre abundantly covered with slender or clavate colorless gland-tipped processes. Ray-flowers many, with short yellow ligules; achenes 4-ridged on back, the ventral angle ending in a beak. Disk-flowers with sterile achenes. Pappus none. (Greek *holos*, whole, and *karphe*, chaff, the whole receptacle chaffy.)

1. *H. macradenia* (DC.) Greene. Stem corymbosely branching from above the base,  $\frac{3}{4}$  to 1 ft. high; herbage thinly hirsute, unpleasantly odorous; leaves linear, serrate or entire,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long, those of the branchlets and fascicles linear, 1 to 8 lines long; heads  $\frac{1}{2}$  in. broad; rays 9 to 13.—Low dry fields about San Francisco Bay: San Lorenzo; Berkeley; Ross Valley. Aug.-Sept.

#### 91. HEMIZÓNIA DC. TARWEED

Annuals (or two species perennial) with viscid-glandular heavy-scented herbage. Leaves narrow, alternate (or the lowest sometimes opposite). Flowers yellow or white, in mostly numerous heads. Disk-flowers surrounded by a circle of chaffy and often slightly united bracts or the disk chaffy throughout. Ray-achenes fertile, without pappus, thick, short, turgid, half enclosed by the lower part of the bract of the involucre which falls with it or is at least deciduous; areola of the ray-achenes borne on the inner angle at apex, or most commonly raised on an intra-apical and very distinct beak. Disk-achenes sterile or fertile, with or without pappus. (Greek *hemi*, half, and *zonía*, zone, the bracts but half enclosing the fruit.)

##### A. Receptacle with chaffy bracts throughout.

Ray-achenes not beaked, obovate-triangular; ray-flowers white or light yellow.

Heads paniculate or corymbose ..... 1. *H. congesta*.

Heads racemously disposed along simple branches ..... 2. *H. clevelandii*.

Ray-achenes beaked, somewhat 5-nerved or angled; rays 4 or 5 (to 8), yellow; leaves crowded on the branchlets ..... 3. *H. virgata*.

##### B. Receptacle with a cup-like circle of bracts between disk and ray; flowers yellow.

Pappus of disk-achenes present (rarely none in *H. corymbosa*); ray-achenes beaked.

Rays mostly 5 (3 to 8); disk-flowers not over 10; annuals.

Disk-flowers 6 or 7.

Heads shortly peduncled ..... 4. *H. wrightii*.

Heads mostly sessile in small clusters ..... 5. *H. fasciculata*.

Disk-flowers 3 ..... 6. *H. lobbii*.

Rays 8 to 20; disk-flowers as many or more.

Annuals; at least the involucre glandular.

Disk-achenes well formed and with pappus of oblong obtuse pubescent or erose paleae.

Beak of ray-achenes curved; some of the cauline leaves pinnatifid. . . . .

7. *H. paniculata*.

Beak of ray-achenes straight; cauline leaves all entire. . . . .

Disk-achenes wholly sterile and with pappus of minute fimbriate scales or wanting . . . . .

9. *H. corymbosa*.

Perennials.

Lower part of stem with woolly flocs in the old leaf axils; leaves thin, not glandular, 1 to 3 in. long; flowering branchlets rather sparsely leafy, the involucre almost concealed by the leafy bracts; involucre about equaling the flowers; ray-achenes with flat face; insular. . . . .

10. *H. clementina*.

Lower leaf axils not woolly; leaves thickish, those of the branchlets sometimes subterete, glandular-stipitate,  $\frac{1}{2}$  to 3 lines long; flowering branchlets densely leafy, somewhat heath-like; involucre scarcely leafy-bracteate or only sparsely and shortly so; flowers half larger than the involucre; ray-achenes with a longitudinal median angle on the face; mainland . . . . .

11. *H. minthorntii*.

Pappus none; ray-achenes not beaked; rays 5 or 6, bright yellow; marginal bracts of receptacle distinct; leaves entire, annual. . . . .

12. *H. wheeleri*.

1. *H. congesta* DC. Stem erect, corymbosely branching above the base, 12 to 16 in. high; herbage soft-hirsute or villous, a little glandular; leaves narrowly linear or oblanceolate, remotely and minutely toothed or entire, 1 to 4 in. long; heads in small clusters on the ends of the branchlets, somewhat leafy-bracteate; bracts of the involucre densely long-villous, commonly little surpassed by the white rays; outer bracts of the receptacle either lightly connate or nearly distinct; achenes with conspicuous inflexed stipe.—Coast ranges from Humboldt Co. to San Luis Obispo Co. July. Var. *LUZULAEFOLIA* Jepson n. comb. Hayfield Tarweed. Fig. 965. Stem diffusely branched or erect, 1 to 2 ft. high; lower leaves crowded and more or less tufted, narrowly linear, mostly tapering somewhat to the apex, 3 to 5 in. long, 3 to 5-nerved, canescent with appressed soft silky hairs which are more or less floccose-deciduous; upper leaves much reduced; tips of the involucre bracts acute or obtuse, short; outer bracts of the receptacle united into a cup; rays 6 to 10, white or pink-tinged; achenes with very short stipe.—Dry valleys and low hills, 20 to 1500 ft.: Great Valley; Coast Ranges from Napa Co. to San Luis Obispo. July-Oct. (*H. luzulaefolia* DC.) Var. *LUTESCENS* Jepson n. comb. Similar to var. *luzulaefolia* except that the flowers are yellow.—Fields near the coast from Monterey Co. to Marin and Napa Cos. May-Nov. (*H. luzulaefolia* var. *lutescens* Greene.) Var. *TRACYI* Jepson n. comb. Herbage non-glandular, glabrous below, viscid-pubescent to puberulent above; lower leaves few.—Humboldt Co. July-Sept. (*H. congesta* subsp. *tracyi* Babc. & Hall.) Var. *CALYFULATA* Jepson n. comb. Branches of inflorescence widely spreading or divaricate; leafy bracts much longer than heads; inflorescence widely branched; plants commonly 4 to 9 in. high.—Nw. Lake Co.; Mendocino Co. (*H. congesta* subsp. *calyculata* Babc. & Hall.)

965. *Hemizonia congesta* var. *luzulaefolia* Jepson; a, fl. branchlet x 1; b, ray-fl. x 3; c, achene x  $4\frac{1}{2}$ .

2. *H. clevelandii* Greene. Stem erect, usually simple below, branched mostly at the middle or above, 1 to 2 ft. high; herbage commonly much less glandular than in no. 1; bracts of the involucre rather markedly ciliate with white hairs, especially at base; heads disposed to be racemose on the branches as well as terminal.—Dry flats or hills, 1000 to 4000 ft.: Sonoma Co. to

966. *Hemizonia virgata* Gray; a, habit  $\times \frac{1}{2}$ ; b, head  $\times 4\frac{1}{2}$ ; c, disk-fl.  $\times 3$ ; d, leaf of upper branchlet  $\times 1\frac{1}{2}$ .

Humboldt Co. and e. to Lake, w. Colusa and w. Glenn Cos.; n. to southern Ore. July-Sept.

3. *H. virgata* Gray. Fig. 966. Stem erect, 1 to  $1\frac{1}{2}$  ft. high, commonly branching at the middle into several virgate branches bearing numerous racemously disposed heads on short lateral branchlets; herbage viscid-glandular or minutely stipitate-glandular, glabrous or nearly so; leaves linear, serrate to somewhat saliently toothed, sometimes entire, 1 to  $2\frac{1}{4}$  in. long; leaves of the branches linear,  $\frac{1}{2}$  to 5 lines long, crowded on the branchlets and fascicled in the axils, those of the branchlets truncate and tipped with a disk-like or saucer-shaped gland; involucre oblong, the bracts 5, stipitate-glandular on the back, the involute tip ending in a truncate gland; ray-flowers 4 or 5; disk-flowers 7 to 10; ray-achenes shining black, beaked with a thick beak; pappus of disk-flowers none.—Dry valley floors and low hills, 10 to 2500 ft.: Sierra Nevada foothills; Great Valley; Lake Co.; South Coast Ranges; coastal S. Cal. July-Oct. Var. *HEERMANNII* Jepson n. comb. Herbage viscid, pubescent or somewhat hirsute, heavy-scented; leaves of the flowering branchlets minute, less crowded; involucre hemispherical, their bracts beset with stalked glands; ray-flowers 5 to 8; disk-flowers 10 to 15; ray-achenes with a somewhat conspicuous beak and stipe.—Sierra Nevada; Mt. Diablo Range; Sierra Nevada foothills from Calaveras Co. to Kern Co.; s. to Ventura Co. May-July. (*H. heermannii* Greene.)

4. *H. wrightii* Gray. Stem erect, paniculately branching, 1 to 3 ft. high, the heads on very slender or filiform peduncles; herbage mostly hispid, especially below, somewhat glandular above; leaves broadly linear, pinnately parted or coarsely toothed to entire, 1 to 2 in. long, those of the filiform flowering branchlets linear or linear-lanceolate, often dilated at base, 1 to 7 lines long; heads narrow; ray-flowers 5, the rays 2 to  $2\frac{1}{2}$  lines long; ray-achenes slightly curved, roughened on the beak and sides, beaked, short-stipitate; disk-flowers about 6 or 7; pappus of about 8 to 10 linear paleae irregularly lacerate at summit.—Valley flats and foothills, 500 to 5000 ft.: coastal S. Cal.; w. Mohave Desert; Great Valley; inner South Coast Ranges; s. Sierra Nevada foothills. June-Aug. Var. *KELLOGGII* Jepson n. comb. Paleae united almost to the summit, sometimes only at base.—Sacramento and San Joaquin valleys. (*H. kelloggii* Greene.)

5. *H. fasciculata* T. & G. Fig. 967. Stem erect, paniculately branched above the base,  $\frac{3}{4}$  to 2 ft. high; herbage sparsely hirsute and hispid, or disposed to be nearly glabrous; leaves of the main stem oblong, pinnately cleft, few-toothed or entire,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long; leaves of the branches and branchlets linear or sub-lanceolate, entire, 1 to 7 lines long, some a little dilated at base; heads small, usually fascicled in dense small clusters, the clusters 5 to 10 lines broad; bracts of the involucre glabrous or glandular-hispidulous, those of the receptacle slightly united; ray-flowers 5; ray-achenes smoothish or transversely rugose, with a very short beak; disk-flowers 6; disk-achenes with a pappus of 6 to 10 linear paleae minutely lacerate at tip.—Dry valley floors or low hills, 50 to 1500 ft.: South Coast Ranges coastal S. Cal. June-July.

6. *H. lóbbii* Greene. Similar to no. 5; stem erect, more or less diffusely branched,  $1\frac{1}{2}$  to 3 ft. high, the branches long and slender, the branchlets with very small and numerous leaves; herbage, at least the inflorescence, usually resinous-glandular; clusters of fewer heads or the ultimate branches often 1-headed; ray-flowers 3 (or 4); disk-flowers 3 (or 4), each subtended and partly enclosed by a distinct bract.—Hillsides and valley flats, 250 to 1000 ft.: Santa Clara Co. to Monterey and San Luis Obispo Cos. July.

7. *H. paniculata* Gray. Stem erect, commonly simple below, diffusely branched above, 1 to 3 ft. high; herbage more or less thinly hirsute, especially below, glandular-viscid above; leaves oblong, laciniate-pinnatifid,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long, those of the branchlets linear, entire, erect, more or less crowded, 2 to 7 lines long; ray-flowers about 8, their achenes rugose or pitted dorsally, shortly beaked; disk-achenes 12 to 19, often well formed and apparently fertile, pubescent, their pappus-paleae 8 to 10, oblong, laciniate or erose at summit.—Dry hills or valleys, 50 to 1500 ft.: San Luis Obispo Co. to San Diego Co. May-July.

8. *H. floribunda* Gray. Stem stout, erect, very leafy,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  ft. high, ending above in an elongated raceme of heads; herbage villous, minutely glandular; leaves linear, entire,  $\frac{3}{4}$  to 1 in. long, those of the branchlets and fascicles 2 to 4 lines long; ray-flowers 15 to 20, the rays  $2\frac{1}{2}$  lines long; ray-achenes rugose-tuberculate, beaked; pappus-paleae of disk-flowers 5 to 8, hairy.—Dry hills, s. San Diego Co.

9. *H. corymbosa* (DC.) T. & G. COAST TARWEED. Stem corymbosely and widely branching, 1 to  $1\frac{1}{2}$  ft. high; herbage hirsute-pubescent and glandular, sweet-scented; leaves oblong to linear,  $\frac{3}{4}$  to  $3\frac{1}{2}$  in. long, pinnately divided into linear lobes, the lobes in lower leaves entire or sometimes toothed, those in upper leaves sometimes only 1 or 2 pairs; uppermost leaves or those of the flowering branchlets linear, entire, 2 to 6 lines long; heads 7 to 10 lines broad; rays 13 to 20, oblong-cuneate, bright yellow, 2 to 4 lines long, 3 or 4-toothed; ray-achenes beaked; pappus of the disk-achenes of minute fimbriate-bristly or entire scales, or none.—Valley flats and hillsides, 50 to 1500 ft.: Humboldt Co. to San Luis Obispo Co., thence e. to western Kern Co. May-Aug. Var. *ANGUSTIFOLIA* Jepson n. comb. Diffusely branched; stem leaves mostly linear and entire.—Along the coast from Monterey Co. to San Mateo Co. Aug.-Sept. (*H. angustifolia* DC.) Var. *BÁRCLAYI* Jepson n. comb. Disk-flowers with more conspicuous laciniate pappus.—Monterey Co.; Kern Co. May-Sept. (*H. angustifolia* var. *barelayi* Gray.)

10. *H. clementina* Bdg. Stems several from the base, woody below, 1 to 2 ft. high, freely branched above, the branchlets ending in 1 to few heads; herbage hirsute, a little viscid above; leaves linear, entire or with a few remote and short but somewhat salient teeth, 1 to 3 in. long, those of the branchlets or axillary fascicles 3 to 6 lines long; heads markedly leafy-bracteate; rays about 12 to 20, yellow, 2 lines long; ray-achenes rugose-tuberculate, stipitate, beaked; pappus-paleae of disk-achenes 9 or 10, linear-subulate, unequal, about equaling or little exceeding proper tube of corolla.—Santa Catalina Isl.; San Clemente Isl.

967. *Hemizonia fasciculata* T. & G.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, disk-cup and disk-fls.  $\times 1\frac{1}{2}$ ; c, disk-fl.  $\times 3$ ; d, ray-fl.  $\times 3$ .

11. *H. minthörnii* Jepson n. sp. Stems several from the short woody crown of a very stout root, slender, erect or diffuse, racemosely or corymbosely branched,  $\frac{1}{2}$  to 2 ft. high; herbage villous and viscid-glandular; leaves of the branchlets linear, entire,  $\frac{1}{2}$  to 3 lines long; lowest leaves unknown; branchlets densely leafy, mostly with a single terminal head; heads 5 lines high; rays 4 to 8, yellow,  $2\frac{1}{2}$  to 4 lines long; ray-achenes smoothish, stipitate, beaked; disk-flowers about 18; pappus-paleae 8 to 12, linear-lanceolate, unequal, sparsely or somewhat irregularly fibrillose or ciliate, mostly twice as long as the proper tube of the corolla.—Santa Susana Mts., Ventura Co. (T. W. Minthorn, type).

12. *H. wheeleri* Gray. Stem erect, simple below, corymbosely few-branched above, sparsely leafy, 1 to  $1\frac{1}{2}$  ft. high; herbage thinly hirsute, or rather densely so on the young parts, and glandular-stipitate above; leaves (the lowest opposite) linear, entire, 1 to 3 in. long; heads 6 to 9 lines broad, solitary or in clusters of 2 or 3 at the ends of the branchlets, leafy-bracteate, the foliaceous bracts twice or thrice surpassing the heads; involucre 2 to 3 lines high; ray-flowers 5 to 12, the rays  $2\frac{1}{2}$  to  $3\frac{1}{2}$  lines long; ray-achenes compressed with acutish ventral angle and rounded back, not beaked; disk-achenes without pappus.—Montane meadows or sandy flats, 5300 to 9800 ft.: San Jacinto and San Bernardino mountains; Inyo and Tulare Cos. June-Sept. (*Madia tenella* Greene.)

## 92. CALYCADENIA DC. ROSIN WEED

Erect annuals. Stems simple, or with virgate branches, or repeatedly branched. Herbage hirsute or hispid, or almost glabrous. Leaves all entire, narrowly linear, becoming filiform by revolution of the margins, at least those near the heads and those of the fascicles in the axils bearing at apex tack-shaped or saucer-shaped glands. Heads oblong or narrow. Receptacle flat, naked in center but with a circle of bracts between disk- and ray-flowers, these bracts more or less united and forming a toothed disk-cup, or at length separating. Flowers white or yellow. Ray-flowers few (1 to 5 or 8), the ligules broad and palmately 3-lobed or -parted; ray-achenes obovoid-triangular, the areola at summit quite or nearly in the center; pappus none. Disk-flowers enclosed in the disk-cup; disk-achenes with conspicuous paleaceous pappus. (Greek *kalux*, covering, and *adenos*, a gland, on account of the glands on the involucre.)

Rays 5 to 8; flowers yellow; plants for the most part very glabrous, the smaller leaves with tack-shaped glands at apex.....1. *C. truncata*.

Rays 1 to 5.

Stems repeatedly branched; branches filiform.

Ray-flowers 1 or 2; disk-flowers 3; uppermost and axillary leaves bearing tack-shaped glands.....2. *C. pauciflora*.

Ray-flowers 3 to 5; disk-flowers 5; tack-shaped glands entirely lacking.....3. *C. tenella*.

Stems simple or with virgate branches.

Floral and upper leaves tipped with a tack-shaped gland; pappus-paleae mostly 10 to 11.

Leaves alternate or the lowest crowded but not opposite and sheathing.

Floral leaves subterete or revolute-terete, truncate at tip.

Disk-cup not glandular (except no. 4); rays trifid or deeply lobed.

Ray-achenes hairy.

Flowers white.....4. *C. villosa*.

Flowers yellow.....5. *C. hispida*.

Ray-achenes glabrous.

Peduncles or branchlets sparsely leafy; corolla-lobes hispidulose.....6. *C. ciliata*.

Peduncles or branchlets densely imbricated with leaves; corolla-lobes barely pubescent.....7. *C. spicata*.

Disk-cup glandular; rays 3-toothed, the teeth unequal; disk-flowers pink or carmine, the rays white or pink; pappus-paleae as long as corolla, not awned.....8. *C. bicolor*.

Floral leaves plane or merely revolute-edged; pappus-paleae unequal; flowers white.....9. *C. multiglandulosa*.

Leaves, at least the lowest, sometimes all, opposite, the lowest connate into sheaths 1 to 2 lines long.....10. *C. oppositifolia*.

Floral and upper leaves bearing large greenish saucer-shaped glands, but not tipped with a gland; pappus-paleae 5 or 6; rays commonly yellow, sometimes white.....11. *C. mollis*.

1. *C. truncata* DC. ROSIN WEED. Stem erect, reddish brown,  $\frac{1}{2}$  to 3 ft. high, simple below, branching above into a panicle of long straight slender branches along which the heads are scattered; herbage glabrous or the leaves and outer involucral bracts somewhat hirsute or hirsute-ciliate; leaves linear, entire, 1 to 2 in. long, or the upper reduced and bract-like; smaller leaves with glands at apex; heads oval, 4 to 6 lines high; rays 5 to 8, broad, 4 to 5 lines long; ray-achenes glabrous, triangular, roughish; disk-flowers 10 to 20; pappus of 7 to 10 unequal oblong fimbriate paleae shorter than the achene, or rarely obsolete.—Dry hills, 500 to 3000 ft.: Coast Ranges from Mt. Hamilton to Shasta Co., thence se. in the Sierra Nevada to Mariposa Co.; n. to Ore. July-Oct. (*Hemizonia truncata* Gray.) Var. *SCABRÉLLA* Jepson n. comb. More slender, the heads fewer flowered,  $2\frac{1}{2}$  to 3 lines high; involucral bracts glabrous or bristly-ciliate and somewhat hispid; pappus lacking.—Dry hills, 500 to 3000 ft.: Santa Lucia Mts. to Shasta Co., thence se. to Placer Co. June-Sept. (*Hemizonia scabrella* Drew.)

2. *C. pauciflora* Gray. Stem erect, freely branching above the base, 10 to 18 in. high, the branches simple or dichotomous; herbage sparingly hairy, the leaves (particularly about the heads or of the axillary fascicles) stipitate-glandular; leaves linear, 3 to 6 lines long; heads cylindric or narrowly oblong, scattered singly along the branches and terminal, rarely in clusters of 2; flowers white or rose-tinged; rays 1 or 2, 3-parted, 1 to  $1\frac{1}{2}$  lines long; bracts of receptacle 3 to 5, joined into a cylindric cup lobed at apex and containing 3 or 4 flowers; disk-achenes pubescent; pappus of 5 subulate awns and 5 small paleae, the paleae commonly truncate, often fimbriolate; ray-achenes glabrous, smooth, carinate dorsally, with a short stout but obscure stipe, the enclosing bract more or less villous-ciliate.—Dry hill slopes, 500 to 2000 ft.: inner North Coast Range from the Vaca Mts. to Lake and w. Colusa Cos.; Eldorado Co. July-Aug. (*Hemizonia pauciflora* Gray.) Var. *ÉLEGANS* Jepson n. comb. More slender, the branches more numerous and zigzag; leaves filiform; heads mostly in the forks or terminal.—Lake Co. to Glenn and Colusa Cos. May-July. (*C. elegans* Greene.)

3. *C. tenella* (Nutt.) T. & G. Stem erect, 6 to 12 in. high, repeatedly branched above the base, forming a broad cymose-paniculate plant, the branches and branchlets slender or wiry, the ultimate branchlets ending in a single head; leaves linear,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long, the upper tending to be filiform and 3 to 8 lines long, all or nearly all ciliate with long white hairs; heads subtended by a few bract-like leaves; involucre 2 to  $2\frac{1}{2}$  lines high; rays white with a central transverse purple spot; ray-achenes 3 to 5, rugose, with a median dorsal nerve, beaked, substipitate; disk-achenes 5; pappus of 4 or 5 subulate awns, scabrous, as long as the corolla, alternating with as many paleae  $\frac{1}{2}$  to  $\frac{1}{2}$  as long; paleae oblong, truncate, finely lacerate at apex.—Dry hills and valleys, 300 to 1200 ft.: coastal S. Cal. May-June. (*Hemizonia tenella* Gray.)

4. *C. villosa* DC. Stems 1 or several from the base, rigidly erect, simple or branching, 6 to 13 in. high, hirsute and glandular-puberulent; leaves filiform-linear, hirsute-ciliate,  $\frac{1}{2}$  to  $3\frac{1}{2}$  in. long, chiefly in a dense basal tuft; upper and floral leaves thick, tipped with a stipitate gland and also somewhat stipitate-glandular; heads shortly peduncled or sessile in the leaf-axils from below the middle and thus spicate; bracts of the involucre tipped with a stipitate gland, densely hirsute-ciliate; disk-cup more or less glandular towards the top; flowers yellow or white and pinkish- or purplish-tinged; ray-flowers 1 to 3, the rays 2 to 3 lines long; disk-flowers about 7 to 9, with glandular-hispidulous corolla-lobes; ray-achenes hairy, carinate-ridged on back; disk-achenes hairy; pappus-paleae 11 to 13, subulate, about  $\frac{1}{2}$  as long as corolla.—Plains and open hills, 100 to 3500 ft.: San Joaquin Valley; inner South Coast Ranges from Contra Costa Co. to Monterey, San Luis Obispo and n. Santa Barbara Cos. Aug.-Oct. (*Hemizonia villosa* Jepson. *H. douglasii* Gray.)

5. *C. hispida* Greene. Stem stout, robust, erect, densely leafy at base,  $1\frac{1}{2}$  to 2 ft. high, densely clothed above with short or sometimes long branchlets, the branchlets densely leafy; heads terminating the branchlets or racemose

on the branches; floral leaves many; leaves and bracts with apical and a few stipitate glands; rays 3 to 5, broad, yellow,  $2\frac{1}{2}$  to 3 lines long; ray-achenes densely villous with appressed hairs; disk-flowers about 10; pappus-paleae about 10, lanceolate, as long as the corolla or nearly.—Plains, Merced Co. Sept. (*Hemizonia villosa* var. *hispida* Jepson.)

6. *C. ciliōsa* Greene. Stem erect, simple or with long slender branches above the base or from the middle,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  ft. high, densely leafy at base; herbage villous-pubescent with ascending hairs, sometimes quite glandular, the axillary branchlets sometimes white-villous; leaves linear,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; leaves of the axillary fascicles 3 to 6 lines long; floral leaves white-ciliate, tipped with a stipitate gland; heads ovate, 4 to 5 lines high, subsessile and racemose along the branches; disk-cup conspicuously white-villous, its bracts 8 to 10; flowers yellow or white; rays 3 or 5, trefoil-shaped, about 1 line long; ray-achenes smooth, glabrous, with a sharp dorsal keel; disk-flowers about 10; corolla-lobes glandular-hispidulose; pappus-paleae reddish brown, about 10 to 17, ovate or oblong, acute or truncatish, not awned, about  $\frac{1}{2}$  as long as the corolla.—Dry slopes in the foothills, 500 to 2500 ft.: Lake and Mendocino Cos. to Shasta Co., thence se. in the Sierra Nevada foothills to Butte Co.; n. to southern Ore. July-Sept. (*Hemizonia ciliosa* Jepson.)

7. *C. spicāta* Greene. Similar to *C. villosa*; axillary branchlets and peduncles densely imbricated with terete leaves 1 to 3 lines long; corolla-lobes weakly pubescent.—Lower Sierra Nevada foothills from Eldorado Co. to Madera Co. Aug. (*Hemizonia villosa* var. *spicata* Jepson.)

8. *C. bicolor* Greene. Stem erect, simple or branched above the base, 8 to 12 in. high, sparsely leafy, the heads sessile or short-peduncled in the axils from above the middle and thus loosely spicate; herbage subcanescent, only slightly hirsute; leaves filiform, 1 to  $4\frac{1}{2}$  in. long, those of the axillary fascicles ciliate, gland-tipped and somewhat stipitate-glandular, 1 to 3 lines long; heads 3 to  $3\frac{1}{2}$  lines high; bracts of the cup 5 (or 6 to 7); ray-flowers 3 (1 to 4), the rays white, varying to pink or carmine, 3 to  $4\frac{1}{2}$  lines broad, 3-toothed, broader than long, central tooth acute, the lateral rounded, much larger; ray-achenes hairy; disk-flowers 3 to 8, pinkish, their achenes hairy.—Dry hills, 500 to 4500 ft.: Sierra Nevada foothills from Nevada Co. to Fresno Co. May-July. (*Hemizonia bicolor* Jepson.)

9. *C. multiglandulōsa* DC. Fig. 968. Stem erect, simple or sometimes freely branched, 6 to 16 in. high; herbage with a pleasant balsamic odor, sparingly hirsute or hispid, especially toward the base of the leaves; floral leaves and involucre glands with stipitate glands; leaves narrowly linear to filiform, mostly straight and rigid but brittle, 1 to  $3\frac{1}{4}$  in. long, the upper somewhat divaricately spreading and mostly 2 or 3 times longer than the heads and floral leaves in the axils; leaves of the axillary fascicles 3 to 4 lines long; heads solitary in the axils or 2 or 3 in clusters on short axillary branchlets or crowded towards or near the summit and spicate; flowers white; ray-flowers 1 to 3; disk-flowers about 5; pappus-paleae commonly 10, some (commonly 5) lanceolate or subulate, others (com-

968. *Calycadenia multiglandulosa* DC.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, ray-fl.  $\times 2$ ; c, disk-fl.  $\times 2$ ; d, achene and pappus  $\times 2$ .

monly 5) shorter and often blunt; disk-achenes appressed-villous; ray-achenes glabrous, somewhat rugulose-channeled or -pitted on back, also on face either side of the median linear scar.—Dry open hills, 20 to 3000 ft.: Coast Ranges from Mt. Hamilton Range and Santa Cruz Mts. to Marin, Napa and Humboldt Cos. July-Sept. (*Hemizonia multiglandulosa* Gray.) Var. *CEPHALOTES* Jepson n. comb. Heads in a terminal capitate cluster.—Marin Co. to Lake Co. (*Hemizonia multiglandulosa* var. *cephalotes* Gray.)

10. **C. oppositifolia** Greene. Stems erect, slender or wiry, 1 or several from or near the base, simple or sparingly branched, 3 to 13 in. high, a little canescent; leaves all or the lowest opposite, narrowly or elongated linear, scaberulous, ciliate at base, 1 to  $2\frac{1}{2}$  in. long, the lowest ones connate at base into membranous sheaths 1 to 2 lines long; leaves of the axillary fascicles crowded, 2 to 3 lines long, gland-tipped; floral leaves 2 to 4 times exceeding the heads; heads in dense terminal clusters or sometimes racemose along the branches; flowers white, sometimes purple on same plant; ray-flowers 2 or 3, the rays parted nearly to the base into 3 elliptic or obovate lobes, 3 to  $3\frac{1}{2}$  lines long; bracts of disk-cup 5, the disk-cup enclosing 4 to 8 flowers; ray-achenes smooth, slightly carinate on back, bearing a very short thick beak at summit; pappus-paleae subulate, awned, about  $\frac{1}{2}$  as long as corolla, with about as many short bluntish paleae; disk-achenes a little hairy.—Dry flats or grassy slopes in the foothills, 400 to 1500 ft.: Sierra Nevada foothills from Tulare Co. to Butte Co.; Lake Co. to e. Humboldt Co. June-July. (*Hemizonia oppositifolia* Jepson. *H. multiglandulosa* var. *sparsa* Gray.)

11. **C. mollis** Gray. Stem erect, simple or more commonly with long paniculate branches, 13 to 22 in. high; herbage cinerulous or villous; leaves narrowly linear, 1 to  $2\frac{1}{2}$  in. long, rather strictly erect; heads 2 or 3 in small clusters, the clusters racemosely disposed in short branchlets and terminal; bracts and floral leaves sprinkled with large saucer-shaped greenish glands; flowers yellow (or white); ray-flowers 3, the rays  $2\frac{1}{2}$  lines long, much broader than long; ray-achenes glabrous, smooth but irregularly a little channeled transversely; bracts of the disk-cup 5; disk-flowers about 8, their achenes a little pubescent; pappus-paleae 4 to 6, attenuate to an awn,  $\frac{3}{4}$  as long as the corolla, with 2 or 3 short ones at base.—Montane slopes or flats, 2000 to 4000 ft.: Tuolumne Co. to Fresno Co. June-July. (*Hemizonia mollis* Gray.)

### 93. **BLÉPHARIZONIA** Greene

Stout annuals with glandular-viscid ill-scented herbage. Cauline leaves linear and entire, those of the branches oblong to oval. Flowers yellow, the heads arranged in panicles. Ray-flowers 7 to 10, with 3-lobed ligules; disk-flowers 10 to 25, the outer ones subtended by 1 or 2 series of linear bracts. Achenes silky-hirsute, 10-striate; those of the disk more or less fertile, crowned by a pappus of about 15 to 18 short and stout densely plumose awns; those of the ray fertile, elongated-turbinate, the pappus like that of the disk or minutely setulose. (Greek *blepharis*, an eyelash, and *zonias*, a girdle, in reference to the circle of pappus-awns.)

1. **B. plumosa** (Kell.) Greene. Stem erect, freely branched, 2 to 3 ft. high; leaves, stems and involucres copiously beset with tack-shaped glands, the stems also glandular-puberulent; leaves on the branchlets small and bract-like; heads 15 to 20-flowered, paniculately disposed; bracts of the involucre short; ray-achenes with a minute crown of short scales; disk-achenes with nearly erect plumose bristles as long as the achene.—Fields and stream beds, 10 to 50 ft.: Stockton; Antioch; Los Medanos. Aug.-Oct. Var. **SUBPLUMOSA** Jepson n. comb. Stem 3 to 6 ft. high; heads larger, borne singly at the ends of the branches, 20 to 25-flowered; pappus of disk-achenes short and spreading, less plumose, only  $\frac{1}{2}$  as long as the achene; ray-achenes similar.—Sierra Nevada foothills in Tuolumne Co.; lower San Joaquin Valley (*Hemizonia plumosa* var. *subplumosa* Gray.)

94. *MADIA* Mol. TARWEED

Erect annuals or perennial herbs with glandular-viscid heavy-scented herbage. Leaves, at least the upper, alternate, entire or serrulate. Heads axillary and terminal. Flowers yellow, opening in the evening and closing before noon of the next day. Involucre angled by the salient carinate or almost conduplicate bracts. Bracts in 1 series, completely enfolding the laterally compressed ray-achenes, and with free moderately long or short tips. Receptacle flat or convex, bearing a single row of chaffy bracts between ray- and disk-flowers, these bracts often united and forming a disk-cup. Disk-corollas in ours more or less pubescent. Rays few to many, 3-lobed. Bracts of involucre deciduous with the mature ray-achenes. Ray-achenes not beaked (except in nos. 4 and 9). Disk-achenes fertile or abortive. Pappus commonly none in ray-achenes, sometimes present in the disk-achenes. (Madi, the Chilian name.)

Perennials (sometimes biennials); rays well exserted, conspicuous, without pappus; disk-flowers with manifest pappus.

Heads with only the ray-achenes fertile; involucre 2½ to 3 lines high; plants slender.

1. *M. madioides*.

Heads with outer disk-achenes fertile; involucre 4 to 6 lines high; plants stout.

2. *M. bolanderi*.

Annuals; pappus none in both disk and ray except no. 5.

Disk-flowers few to many.

Rays well exserted, conspicuous.

Receptacle fimbriate-hirsute; ray-achenes very slightly if at all curved; pappus wanting or rudimentary . . . . . 3. *M. elegans*.

Receptacle naked; ray-achenes incurved.

Pappus absent; plants stout; rays 4 to 8 lines long . . . . . 4. *M. radiata*.

Pappus present in both ray and disk; plants slender; rays ½ to 2½ lines long . . . . . 5. *M. yosemitana*.

Rays usually little or not at all exserted, inconspicuous; receptacle naked; ray-achenes curved.

Involucre suborbicular or broader than long; heads 8 to 6 lines high; plants (½ or) 1 to 4 ft. high.

Plants stoutish, viscid-glandular (at least above); heads in clusters . . .

6. *M. sativa*.

Plants slender, moderately glandular; heads scattered.

Bracts of the disk-cup distinct . . . . . 7. *M. divaricata*.

Bracts of the disk-cup united . . . . . 8. *M. citriodora*.

Involucre elongate, longer than broad . . . . . 9. *M. glomerata*.

Disk-flower 1; heads 1 to 1½ lines high; plants 4 to 7 (or 12) in. high . . . 10. *M. exigua*.

1. *M. madioides* (Nutt.) Greene. WOODLAND MADIA. Stems 1 or several, slender, erect, simple, arising from a perennial (or biennial) root, 1 to 2½ ft. high, ending above in a terminal corymbose cyme; herbage hirsute below, glandular above; some or most of the leaves opposite, linear, a few varying to lanceolate, entire or denticulate, 1½ to 4 in. long, chiefly basal and on lower part of stem, much reduced above; cyme consisting of a few long slender and nearly naked branches; bracts of the involucre 8 to 12, with short tips; rays acutely 3-lobed, 3 to 5 lines long; ray-achenes fertile, much flattened, curved and somewhat obovate, the surface covered with minute muriculations and the sides with many striae, the pappus represented by a mere crown; disk-flowers sterile, the pappus of very short fimbriate or hairy paleae.—Woods near the coast from Monterey Co. to Humboldt Co.; n. to B. C. June-July. (*M. nuttallii* Gray.)

2. *M. bolanderi* Gray. Stem stout, erect, simple below, ending above in a corymbose cyme, 1½ to 3 ft. high, arising from a rootstock which also bears a few short stolons with leafy tufts; herbage hirsute below, glandular-hirsute above; leaves linear, entire, 3 to 7 (or 10) in. long, 2 to 4 lines wide; heads few in the corymb, long-peduncled; involucre campanulate, 4 to 6 lines high; bracts and rays 12 to 16; bracts of the receptacle linear and unconnected; ray-achenes linear-falcate, 1 or 2-nerved on the narrow faces, finely muriculate, commonly with a rudiment of pappus; disk-achenes numerous, straighter, hispid, outer ones fertile, all with a pappus of slender hirsute-ciliate paleae, these disk paleae shorter, sometimes much shorter than the corolla.—Montane woods, 4000 to 6350 ft.: Sierra Nevada from Mariposa Co. to Plumas Co.; n. to Modoc Co., thence w. to Siskiyou Co. July-Aug.

3. *M. elegans* Don. COMMON MADIA. Fig. 969. Stem erect, simple below the corymbose inflorescence,  $\frac{3}{4}$  to 2 ft. high; herbage hispid or hirsute, more or less viscid above with short gland-tipped hairs, the involucre and peduncles more or less hirsute with white hairs; lower leaves linear, entire or obscurely denticulate, 3 to 5 in. long, short-hirsute, often densely so; upper leaves much reduced in size, linear-lanceolate; heads few to many, long-peduncled in a corymbose panicle; bracts long-tipped; receptacle convex, fimbriate-hirsute; rays 9 to 15, 4 to 8 (or 11) lines long, yellow or with a red spot at base; achenes flattish, light brown or blackish, muriculate.—Dry hillsides and valley flats, 2000 to 3500 ft., common: throughout cismon-tane Cal. in the hills and mts.; n. to Ore., e. to Nev. June-Aug. (*M. corymbosa* DC.) Var. *DENSIFOLIA* Jepson. Taller; leaves densely crowded toward the base or tufted.—With the species. Var. *HISPIDA* Hall. Herbage villous with long spreading hairs, the hairs not glandular; involucre and peduncles densely villous or almost shaggy; leaves commonly opposite; rays 4 to 5 lines long.—Kern Co. to n. Cal. June. (*M. hispida* Greene.)

969. *Madia elegans* Don; a, fl. branchlet  $\times \frac{1}{2}$ ; b, head  $\times 1$ ; c, disk-fl.  $\times 2$ ; d, ray-fl.  $\times 2$ .

4. *M. radiata* Kell. Stem usually stout, erect, leafy, branching from about the middle,  $1\frac{1}{2}$  to 3 ft. high; herbage short-hirsute and viscid; lower leaves lanceolate, slightly and remotely denticulate, 2 to 4 in. long, the upper cauline leaves reduced, entire; bracts of the involucre 10 to 20, with short tips; rays light yellow,  $\frac{1}{2}$  to  $\frac{3}{4}$  in. long, obtusely 3-toothed; chaffy bracts between ray and disk united; disk-flowers very numerous on a nearly flat glabrous receptacle, fertile except the central ones, somewhat clavate and 4-angular; ray-achenes narrowly obovate-falcate, flat.—Open fields: e. Contra Costa Co. s. to the San Carlos Range. Apr.-May.

5. *M. yosemitana* Parry. Stems erect, slender, 1 or several from the base, simple below, ending above in a very loose corymb, 9 to 18 in. high, or depauperate forms only 2 to 5 in. high; herbage somewhat hirsute below, the stems and peduncles and upper leaves sparsely glandular; leaves linear, entire,  $\frac{1}{2}$  to 2 in. long; heads on long slender peduncles; involucre  $1\frac{1}{2}$  to 2 lines high, the bracts with short narrow tips; rays 5 to 10, obtusely 3-cleft, 3 to 4 lines long (in depauperate forms 1 to 2 lines long); disk-flowers 3 to 10, sterile; bracts of the receptacle 4 to 8, more or less connate by their margins; ray-achenes semi-obovate or slightly lunate, the pappus reduced to a ciliolate crown; disk-flowers with a pappus of about 5 sparsely barbellate awns, the awns nearly equaling the corolla.—Gravelly flats in the mts., 2700 to 6200 ft.: Sierra Nevada from Fresno Co. to Eldorado Co. May-July. (*M. rammii* Greene.)

6. *M. sativa* Molina. CHILE TARWEED. Stem erect, robust, simple or branching above, 1 to 4 ft. high; herbage ill-scented, hairy or more or less glandular-hirsute, the stems and upper parts or sometimes the entire plant beset with pedicellate very viscid glands; leaves from broadly lanceolate to linear, entire, 1 to 2 in. long; heads 4 to 6 lines high, short-peduncled or sessile, disposed in the upper axis and at the ends of short branches; involucre 3 to

3½ lines high, the bracts with lanceolate tips; rays 5 to 12, with pale yellow ligules about 2 lines long; bracts of receptacle united into a campanulate cup and enclosing many disk-achenes, these cuneate-oblong and 4-angled, often prominently 1-nerved on the sides and 2 lines long; ray-achenes somewhat falcate-obovate, either with or without an obvious nerve on the sides.—Waysides and vacant lots of towns and villages, valleys and low hills, common: Coast Ranges and coastal S. Cal.; Sierra Nevada foothills (but less common); doubtless naturalized from Chile. July-Aug. Var. *CONGESTA* T. & G. Stem stout, simple or branching, 1½ to 2½ ft. high; herbage very viscid-glandular, honey-scented; heads larger than in the species, capitate-congested at the ends of the branchlets.—Waste places and fields, w. Cal.; Ore. June-July. (*M. capitata* Nutt.)

7. *M. díssitiflora* (Nutt.) T. & G. GUM-WEED. Stem erect, very slender, simple or loosely branching, 1 to 2 ft. high; herbage hirsute with spreading hairs, moderately viscid above, scarcely so below; leaves linear, entire or remotely denticulate, 1½ to 2½ in. long; inflorescence loosely paniculate, the heads 1 to 3 on the ends of the branchlets, sometimes slightly racemose; flowers sulphur-yellow; cup of receptacle ovoid but not closed, containing few disk-flowers; rays 5 to 8, 1½ to 2 lines long; achenes short and broad, more or less compressed, 1 to 2 lines long.—Stream banks, open bushy places or wooded slopes in the mts., 1400 to 7000 ft.: throughout cismontane Cal. June-July. Var. *ANÓMALA* Jepson n. comb. Herbage fragrant; chaffy bracts of receptacle not joined into a cup, enclosing 3 flowers only; achenes all gibbously obovate, those of the rays 3 to 5.—Marin, Lake and Eldorado Cos. (*M. anomala* Greene. *Hemizonia anomala* Gray.)

8. *M. citriodora* Greene. Stem slender, erect, simple below, ½ to 1¼ ft. high, with short-pedunculate corymbosely panicle heads, or loosely branched above and heads more scattered; herbage villous-hirsute, somewhat glandular above; leaves linear, entire or remotely denticulate, 1 to 3¼ in. long; heads terminal on the branchlets in a corymbose panicle; involucre 2½ to 3 lines high, the 8 or 9 bracts rounded on the back, with the lower part half enclosing the ray-achenes; rays 8 or 9, greenish yellow, ½ line long, little exserted; ray-achenes semi-obovoid, somewhat obcompressed, rounded on the back, 1½ lines long; bracts of the receptacle between disk and ray lightly united into a toothed cup.—Hillslopes, 500 to 2600 ft.: foothills of Sacramento and Eldorado Cos.; Napa Range; Siskiyou Co.; n. to Wash. and Ida. May. *Hemizonia citriodora* Gray.)

9. *M. glomerata* Hook. Stem with many branches at or above the base, sometimes simple, rigid, leafy, 6 to 19 in. high; herbage rather densely hirsutulose, glandular only toward the inflorescence; leaves narrowly linear, entire, ½ to 1½ in. long; heads more or less glomerate in a rather narrow or sometimes strict panicle; rays 2 to 5 or sometimes none, not exceeding the few disk-flowers; achenes narrow, 2 lines long, those of the disk 4 or 5-angled; ray-achenes somewhat curved, 1-nerved on each face.—Montane slopes or flats, 6000 to 6700 ft.: Sierra Nevada from Mariposa Co. to Plumas Co.; Modoc Co.; Humboldt Co.; n. to Wash., e. to Col. June-Aug. Var. *RAMOSA* Jepson n. comb. Stem usually slender and loosely branched above, less rigid than in the species; heads in a loose cyme or the lower scattered.—Sierra Nevada, 4000 to 7000 ft., from Mariposa Co. to Modoc Co.; n. to Wash. June-Aug. (*M. ramosa* Piper.)

10. *M. exígua* (Sm.) Greene. Stems slender, paniculately much branched throughout, or often nearly simple, 4 to 7 (or 12) in. high; herbage hirsute, glandular above, sweet-scented; leaves narrowly linear, entire, 4 to 8 lines long; heads solitary on naked filiform peduncles; involucre 1 to 1½ lines high, broader than high, the 4 to 8 bracts lunate and strongly connate with minute tips; rays inconspicuous; bracts of the receptacle united; disk-flowers solitary, sometimes 2; ray-achenes compressed, strongly incurved, shortly beaked.—Open woods in the hills, 100 to 4000 ft., common: throughout cismontane Cal.; Siskiyou Co. to Modoc Co.; n. to B. C. May-June. (*Madia filipes* Gray. *Harpaecarpus exiguus* Gray.)

95. *LAYIA* H. & A.

Vernal annuals with alternate leaves (or the lowest opposite in one species) and usually showy heads of flowers terminating the branches. Disk-corollas yellow. Ray-flowers 8 to 20, yellow, white, or yellow tipped with white. Bracts herbaceous, the thin margins at base enfolding the achene and usually deciduous with it. Receptacle broad and flat, with a row of thin bracts between ray- and disk-flowers, and sometimes with additional ones among the disk-flowers. Ray-achenes flattened, without pappus, almost always glabrous. Disk-achenes commonly pubescent, with a pappus of 5 to 20 paleae or bristles or rarely none. (G. Tradescant Lay, botanist to the Beechey Expedition which visited California in 1827.)

A. INVOLUCRAL BRACTS WITH TOOTH-LIKE BRISTLES CHIEFLY ON OR NEAR THE FOLD WHERE THE LOWER PORTION IS INFOLDED AROUND THE ACHENE, THE MIDDLE PORTION OFTEN GLABROUS OR NEARLY SO; HERBAGE WITHOUT STIPITATE GLANDS.

Achenes of both disk and ray glabrous; pappus none. . . . . 1. *L. chrysanthemoides*.

Achenes of disk pubescent or hairy; pappus present. . . . . 2. *L. calliglossa*.

B. INVOLUCRAL BRACTS WITH HAIRS OR BRISTLES OR BRISTLE-TIPPED TEETH UNIFORMLY DISTRIBUTED OVER THE SURFACE (IN NO. 6 SOMETIMES MOSTLY ON OR NEAR THE FOLD), OR AT LEAST THE MIDDLE PORTION NOT GLABROUS; HERBAGE WITH STIPITATE GLANDS (EXCEPT NO. 3).

1. *Pappus of naked paleae, awns or bristles, not hairy (no. 3 has a few free hairs).*

Pappus paleaceous at base.

Peduncles without dark glands; pappus-paleae ovate to broadly lanceolate, awn-tipped. . . . . 3. *L. fremontii*.

Peduncles with stipitate dark glands; pappus-paleae not awn-tipped.

Leaves ciliate, mostly lobed or pinnatifid, all alternate; plants 6 to 24 in. high; pappus-paleae ovate or oblong-ovate; San Luis Obispo. . . . . 4. *L. jonesii*.

Leaves hispid on upper surface, entire, the lower ones opposite; plants 4 to 7 in. high; pappus-paleae narrowly lanceolate; Napa and Sonoma Cos. . . . . 5. *L. nutans*.

Pappus consisting of bristles, not at all paleaceous.

Rays yellow, white-tipped; pappus of 15 to 20 stout scabrous bristles. . . . . 6. *L. platyglossa*.

Rays golden-yellow; pappus of 5 (or fewer) smooth or non-scabrous bristles or sometimes wanting. . . . . 7. *L. pentachaeta*.

2. *Pappus of paleae, awns or bristles which are plumose or hairy at base.*

Inner hairs of pappus-paleae or bristles woolly and interlaced (except in no. 9, var. heterotricha); rays showy (except in no. 9, var. hispida).

Rays yellow (rarely white-edged); pappus of stout barbellate bristles. . . . . 8. *L. elegans*.

Rays white; pappus of narrowly lanceolate-subulate paleae. . . . . 9. *L. glandulosa*.

Hairs of pappus-paleae or bristles straight (no woolly inner ones).

Rays white or pink; herbage pubescent to glabrate (except no. 10); stems uniformly colored, not brown-spotted.

Rays 1 to 3 lines longer than bracts; leaves not succulent; pappus of narrowly lanceolate-subulate paleae with rather few hairs all near the base. . . . . 10. *L. douglasii*.

Rays scarcely longer than bracts; leaves succulent; pappus of bristles plumose to above the middle; seashore. . . . . 11. *L. carnosa*.

Rays yellow or yellow and white; herbage hispid, the stems often brown-spotted at base of the bristles (except in no. 12).

Rays showy, 4 to 7 lines long.

Leaves all entire (rarely toothed); rays lemon-yellow or cream-color. . . . . 12. *L. graveolens*.

Leaves not all entire; rays yellow or white above the middle in var.; pappus-bristles twice or little longer than the soft basal hairs. . . . . 13. *L. gaillardiioides*.

Rays short, 1 to 2 (or 3) lines long. . . . . 14. *L. hieracioides*.

1. *L. chrysanthemoides* (DC.) Gray. Fig. 970. Stems 1 or several from base, erect or somewhat spreading, 4 to 14 in. high, glabrous below, the upper portion pubescent; leaves oblong, pinnately cleft or parted or the upper linear and entire,  $\frac{1}{2}$  to 2 in. long, hispid-ciliate; involucre 3½ to 4½ lines high, the upper portion of the bracts linear-attenuate and shortly hispid-ciliate, the lower portion broader and strongly hispid-serrate along the marginal fold where infolded around the achene; bracts of receptacle with dark tips; achenes glabrous, elongate-obovate, without a disk at summit; pappus none.—Region of San Francisco Bay.

2. *L. calliglossa* (H. & A.) Gray. Similar in habit to no. 1; herbage comparatively glabrous, the stems for the most part puberulent only above and

970. *Layia chrysanthemoides* Gray; *a*, fl. branchlet  $\times 1$ ; *b*, disk-fl.  $\times 2$ ; *c*, *d*, achenes  $\times 2$ .

the leaves usually only finely ciliate; leaves  $\frac{1}{2}$  to 3 in. long, the lower ones pinnately parted or lobed, the upper entire; most disk-flowers with dark-tipped chaffy bracts; achenes villous-pubescent or partly glabrate; pappus of about 10 to 18 lanceolate, unequal and rigid subulate awns, which are somewhat scabrous or slightly hirsute near the dilated or paleaceous base, the marginal ones rather shorter than the corolla, the smaller hardly half as long.—Region of San Francisco Bay, common. (*Calliglossa douglasii* H. & A., 1840, but not *L. douglasii* H. & A., 1840.) Var. *OLIGOCHAËTA* Gray. Lower leaves often less lobed; pappus of only 2 slender (and often short) marginal awns or with some intervening rudiments.—Marin, Sonoma and Napa Cos. May-June.

3. *L. fremontii* Gray. Stems 1 to several from base, simple or branched,  $\frac{1}{2}$  to 1 ft. high; herbage minutely pubescent; leaves mostly pinnately parted,  $\frac{1}{2}$  to  $1\frac{3}{4}$  in. long; heads 1 to  $1\frac{1}{4}$  in. broad; rays white, 5 to 8 lines long; pappus-paleae ovate- to oblong-lanceolate, tapering into a subulate awn, nearly equaling the corolla, the margin entire, accompanied by some long villous free hairs.—Upper Sacramento Valley; Sierra Nevada foothills from Eldorado Co. to Tuolumne Co. Apr.-May.

4. *L. jonesii* Gray. Stem usually simple below, branching above,  $\frac{1}{2}$  to 2 ft. high, stipitate-glandular; leaves hispidulous-ciliate, narrowly linear, pinnatifid,  $\frac{1}{2}$  to  $2\frac{1}{2}$  in. long, or the upper ones often entire; heads  $\frac{3}{4}$  to 1 in. broad; involucre 3 to 4 lines high; rays  $2\frac{1}{2}$  to 3 lines long; receptacle with only marginal bracts; paleae of the pappus ovate or oblong-ovate, acuminate, often erose-denticulate, about equaling or little longer than the proper corolla-tube.—San Luis Obispo Co.

5. *L. nutans* (Greene) Jepson. Stem 4 to 7 in. high, the branches slender and divergent; herbage hirsute, especially the leaves, the stems reddish brown; leaves linear, all entire, the lower pairs opposite; peduncles somewhat stipitate-glandular; heads 5 to 7 lines broad, erect in flower, nodding in bud and fruit; rays 5 to 7, yellow,  $2\frac{1}{2}$  to  $3\frac{1}{2}$  lines long; achenes  $1\frac{1}{2}$  lines long, hispidulous; pappus-paleae narrowly lanceolate, acuminate, 8 to 10, unequal, with barbellate margins.—Mountain slopes: Napa Range; Hoods Peak Range. May.

6. *L. platyglóssa* (F. & M.) Gray. TIDY TIPS. Fig. 971. Stem simple or more commonly branching below, erect or sometimes diffuse, 4 to 16 in. high; herbage short-hirsute and stipitate-glandular; leaves linear and entire or the lower commonly pinnatifid into short linear or oblong

971. *Layia platyglóssa* Gray; *a*, fl. branchlet  $\times 1$ ; *b*, fl.  $\times 2$ .

lobes; peduncles turbinate-thickened beneath the heads; heads 1 to  $1\frac{1}{4}$  in. broad; involueral bracts linear, denticulate-ciliate on the lower half; rays 13, 5 to 6 lines long, sulphur-yellow, the tips white; disk-achenes somewhat flattened,  $1\frac{1}{2}$  lines long, densely clothed with upwardly pointing silky hairs; pappus-bristles 15 to 20, nearly as long as the corolla.—Valleys and foothills, 100 to 4600 ft.: throughout cismontane Cal.; w. side Colorado Desert. Apr.-May. Var. *BREVISËTA* Gray. Pappus only  $\frac{1}{2}$  as long as the corolla.—Los Angeles Co. to San Luis Obispo Co.

7. *L. pentachaëta* Gray. Stem slender, erect, paniculately branched, 1 to 2 ft. high; herbage somewhat hirsute and viscid-pubescent; stipitate glands minute and sparse; cauline leaves mostly pinnatifid or the lower laciniately bipinnatifid, the lobes narrowly linear; rays golden- or orange-yellow, ample,  $\frac{1}{2}$  in. or more long; disk-achenes minutely pubescent or glabrate; pappus of 5 or rarely fewer rigid and smooth bristles, or sometimes none (ex char.).—Stanislaus Co. foothills. Obscure and too little known plant.

8. *L. elegans* (Nutt.) T. & G. Stem simple or diffusely branched, 8 to 11 (or 24) in. high; herbage short-hispid, the stems often brown-dotted; stipitate glands small and scattered; leaves linear, 1 to 3 in. long, the lower pinnately toothed or parted; rays yellow, 6 to 9 lines long, sometimes white-edged; pappus white or sordid, the villous hairs copious but much shorter than the barbellulate awn-like bristles.—Plains and foothills, 300 to 1500 ft.: coastal S. Cal.; Napa Co.; Mendocino Co.; s. to L. Cal. Apr.-May.

9. *L. glandulosa* (Hook.) H. & A. Stem simple or commonly branching from the base, erect or diffuse, 5 to 10 (or 14) in. high; leaves and stems (particularly near the heads) with scattered or abundant stipitate dark glands, more or less hispid with white hairs; leaves lanceolate or linear,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long, the lower pinnatifid or toothed, the upper entire; heads 1 to  $1\frac{1}{2}$  in. broad; involucre 4 lines high; rays 8 to 10, pure white, 5 to 7 lines long; pappus bright white, of 10 to 12 scabrid narrowly lanceolate-subulate paleae, with straight hairs toward the base outside and woolly tangled hairs inside; achenes  $1\frac{1}{2}$  to  $2\frac{1}{2}$  lines long.—Plains and foothills, 50 to 1500 ft.: throughout cismontane Cal.; w. side Mohave Desert; Modoc Co.; n. to B. C. Apr. Var. *HETERÓTRICHA* Hall. Stem simple or branched,  $\frac{1}{2}$  to 2 ft. high; herbage often rough-hispid; rays 10 to 18; inner woolly hairs of pappus wanting.—Sandy fields: Lake Co.; San Joaquin Valley; Tulare Co.; Kern Co.; Mohave Desert; Inyo Co. (*Madaroglossa heterotricha* DC.) Var. *HISPIDA* Jepson n. comb. Stems simple or branched from the base, 4 to 12 in. high; herbage densely hispidulous throughout; leaves narrow, all entire; involucre 4 lines high; rays white, 3 to 4 lines long; pappus-bristles 10, slender, bearing copious short interlaced hairs.—Mt. Diablo; Kern Co.; San Diego Co. (*L. hispida* Greene.)

10. *L. douglasii* H. & A. Stems usually branched from base, 4 to 10 in. high; herbage hirsute or hispid, above somewhat stipitate-glandular; basal leaves oblong, toothed or pinnatifid, 1 to  $1\frac{1}{2}$  in. long, the cauline narrowly oblong to linear, entire, 3 to 7 lines long; rays white, broad, surpassing the involueral bracts by 1 to 3 lines; disk-achenes villous; pappus of narrowly lanceolate-subulate paleae with scabrous margins and rather few soft hairs toward base.—East side Sierra Nevada from Inyo Co. to Lassen Co.; n. to B. C., e. to Nev. Near no. 9.

11. *L. carnosa* T. & G. BEACH LAYIA. Stem diffusely branched, 3 to 9 in. high, somewhat pubescent, with a few scattered stipitate glands, basal leaves 1 to  $1\frac{1}{2}$  in. long, succulent, spatulate to linear-oblong, toothed, those of the branches narrower, rarely toothed; heads 3 to 4 lines broad; rays  $\frac{1}{2}$  line long; pappus-bristles 23 to 28, sparsely plumose with straight soft hairs; bracts of the receptacle ciliate; disk-achenes thickly covered with short hairs; ray-achenes puberulent, sometimes glabrous.—Seabeach sands: Humboldt Co. to Monterey Co.

12. *L. graveolens* Greene. Stem very stout, commonly simple below, sparingly branched above, 1 to  $1\frac{3}{4}$  ft. high; herbage short-villous and with numerous black stipitate glands, sometimes succulent and nearly glabrous; leaves lanceolate to linear-lanceolate, obtuse, rarely toothed,  $\frac{1}{2}$  to  $2\frac{1}{2}$  in.

long; heads  $1\frac{1}{2}$  to 2 in. broad; involucre  $3\frac{1}{2}$  to 6 lines high; rays lemon-yellow or cream-color, 5 to 7 lines long; achenes slenderly clavate; pappus bright white or often sordid, its bristles 15 to 20 with straight erect hairs.—Foothills, 1000 to 5000 ft.: Tehachapi Range; Mt. Pinos; San Carlos Range.

13. *L. gaillardoides* H. & A. Stem rather freely branching, 8 to 24 in. high, hispid, the stems dark-dotted; leaves narrowly or broadly linear, more or less lacinate-pinnatifid, or the upper entire; heads  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. broad; rays orange-yellow, 4 to 9 lines long; pappus dull white or rusty, the bristles 15 to 20, twice as long as or little exceeding the soft basal hairs.—Humboldt Co. to the upper San Joaquin Valley. Var. *NEMOROSA* Jepson. Leaves entire or sparingly dentate, the larger  $\frac{1}{4}$  to 1 in. broad; rays white, pale yellow below the middle.—San Mateo, Contra Costa and Marin Cos. (*Blepharipappus nemorosus* Greene.)

14. *L. hieracioides* (DC.) H. & A. Coarse erect plant, 2 to 3 ft. high; stem mostly simple below and branching above, hispid with hairs arising from dark spots; herbage with dark stipitate glands; lower leaves oblong, 2 to 4 in. long, 3 to 9 lines wide, lacinate-dentate, usually somewhat narrowed at base; upper leaves broadest at the sessile base, the teeth fewer and mostly towards the apex; heads 5 to 7 lines broad; rays yellow, short, little exceeding the disk; pappus-bristles about 15.—Wooded hill slopes, 500 to 1500 ft.: Mendocino Co. to Santa Barbara Co. May-June.

#### 96. *HEMIZONELLA* Gray

Low annual. Leaves mainly opposite, narrow, entire. Stems somewhat dichotomously branched. Heads subsessile or shortly peduncled in small clusters, or with longer peduncles and solitary. Bracts of the involucre 4 or 5, broad on the back, the margins infolded for their whole length and completely enclosing the ray-achenes. Bracts of the receptacle united into a 3 to 5-toothed cup surrounding the 1 to 4 disk-achenes. Flowers minute, yellow. Ray-achenes fertile, obcompressed, incurved. Pappus none. (Diminutive of *Hemizonia*, in allusion to the relationship and size of these plants.)

972. *Hemizonella minima* Gray; a, habit  $\times \frac{1}{2}$ ; b, head  $\times 2$ ; c, ray-fl. with involucre  $\times 3$ ; d, disk-fl.  $\times 3$ .

1. *H. minima* Gray. Fig. 972. Stems 1 and erect to several, divergently and more or less dichotomously branched, 1 to  $4\frac{1}{2}$  in. high, arising from a rosette of basal leaves; herbage villous-hirsute, the upper parts and the involucre stipitate-glandular; leaves sessile, 2 to 7 lines long, the basal ones linear-spatulate, the cauline ones linear; involucre 1 to  $1\frac{1}{2}$  lines high.—Montane slopes and ridges, 3500 to 8000 ft.: mts. of coastal S. Cal.; Sierra Nevada from Tulare

Co. to Shasta Co.; Humboldt Co. to Siskiyou Co. Apr.-July. (*H. parvula* Gray. *H. durandi* Gray.)

#### 97. *LAGOPHYLLA* Nutt.

Villous or hirsute annuals with rigid and brittle stems. Leaves alternate or the lower opposite, mostly entire. Flowers pale yellow. Heads small, subtended by foliaceous bracts. Bracts of the involucre 5, thin-herbaceous, flat on the back, with margins at base infolded and completely enclosing an

obcompressed achene, with which it is deciduous. Receptacle small and flat, bearing about 5 perfect disk-flowers, these surrounded by a single row of distinct chaffy bracts. Rays 5, cuneate, palmately 3-cleft. Achenes glabrous; ray-achenes obcompressed, obovate-oblong, smooth, nearly straight, pointless; disk-achenes slender, sterile. Pappus none. Bracts and achenes all deciduous at maturity. (Greek lagos, a hare, and phullon, leaf, the upper leaves sometimes copiously villous on the margin.)

Herbage canescent; rays  $\frac{1}{2}$  to 2 lines long, usually little exserted; lower leaves early deciduous.....1. *L. ramosissima*.

Herbage not canescent; rays fanshaped or nearly, 4 to 5 lines long, nearly as wide, usually much exserted; lower leaves less promptly deciduous.

Stems racemose or paniculately branched above; involucre and often the branchlets sprinkled with tack-shaped glands, its inner bracts greenish or stramineous; achenes carinate down the ventral face; cauline leaves linear.....

2. *L. glandulosa*.

Stems more or less falsely dichotomously paniculate; herbage non-glandular, the inner bracts of the involucre dusky; achenes without nerve or keel on ventral face; cauline leaves spatulate.....3. *L. dichotoma*.

1. *L. ramosissima* Nutt. Stems 1 or several from the base, erect, simple below, commonly paniculately branched above, or essentially simple throughout, 1 to  $1\frac{1}{4}$  ft. high; leaves (especially the upper) silky-hirsute, the short ones subtending the heads densely villous-ciliate; leaves oblanceolate or linear-lanceolate, often narrowed at base to a slender petiole, the whole 1 to  $2\frac{1}{2}$  in. long, often becoming concave or involute when dry; heads almost sessile, borne in small crowded clusters on the ends of the leafy branchlets or racemose along them; rays commonly barely exserted, pale yellow; fertile achenes carinately 1-nerved down the inner face.—Dry hills and plains, 100 to 3200 ft.: common throughout cismontane Cal. except in the Redwood belt; Lassen Co. to Siskiyou Co.; e. to Nev., n. to Wash. and Ida. May-Aug. Var. *CONGESTA* Jepson. Stem robust, nearly simple with very short branches, or much branched, 1 to 3 ft. high; heads larger, in thick glomerules.—Dry hill slopes and valleys, 1000 to 2500 ft.: Mt. Hamilton; North Coast Ranges from Marin and w. Solano Cos. to Humboldt and Lake Cos.; Sierra Nevada foothills from Calaveras Co. to Eldorado Co. (*L. congesta* Greene.)

2. *L. glandulosa* Gray. Stem erect, slender, with racemose branches or paniculately branched, 1 to  $2\frac{1}{4}$  ft. high, villous or glabrate, the leaves cinereous-puberulent; leaves linear, entire, sessile,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long, the basal ones linear-oblanceolate, entire or obscurely serrulate, narrowed to a short or long petiole, the whole  $\frac{3}{4}$  to 3 in. long; involucre and occasionally the small upper leaves and the branchlets sprinkled with small tack-shaped glands, or sometimes these absent; bracts of the involucre and the outer supplementary bracts resembling the ordinary leaves, inconspicuously if at all ciliate; achenes nearly as in no. 3.—Dry hills, 500 to 1500 ft.: Sierra Nevada foothills from Mariposa Co. to Shasta Co. June-Aug.

3. *L. dichotoma* Benth. Stem erect, 3 to 11 in. high, glabrous or nearly so, sparsely leafy, paniculately branched above (only obscurely dichotomous), the branchlets filiform and flexuous; leaves strigulose-pubescent; cauline leaves linear or linear-oblanceolate, entire,  $\frac{1}{2}$  to 2 in. long, sessile or nearly so, the basal ones oblong-oblanceolate, remotely serrate, 1 in. long, narrowed to petioles  $\frac{1}{2}$  as long; leaves of the branchlets short, hirsute-ciliate; involucre bracts broadish, not glandular or the glands sparse; rays 5, fanshaped, 4 to  $4\frac{1}{2}$  lines long and nearly as wide; achenes obovate, much obcompressed, without nerve or keel on the ventral face.—Slopes of mts. bordering or near the Sacramento Valley, 1200 to 3000 ft.: Napa Range to w. Colusa and Glenn Cos.; Sierra Nevada foothills from Eldorado Co. to Butte Co. May-June.

#### 98. HOLOZÓNIA Greene

Perennial herb with creeping rootstocks. Stems slender and branches almost filiform. Leaves opposite or the upper alternate. Heads solitary, on slender or filiform peduncles, without leafy bracts. Flowers white or rose-tinted; rays 5. Bracts of the involucre 5, completely enclosing and deciduous with the obcompressed ray-achenes. Bracts of the receptacle 9 to 12, connate into a cup surrounding the few to several disk-flowers. Ray-achenes

crowned with a small saucer-shaped cupule in place of pappus; disk-achenes with a pappus of 2 to 5 slender deciduous bristles. (Greek holos, whole, and zonia, zone, the bracts completely enclosing the ray-achenes.)

1. *H. filipes* (H. & A.) Greene. Stem simple below, paniculately branched above,  $1\frac{1}{2}$  to  $2\frac{3}{4}$  ft. high, very leafy; herbage villous-pubescent, especially the leaves; leaves linear, or the lower ones linear-lanceolate, entire or sparsely denticulate, sessile, 1 to 3 in. long, those of the filiform branchlets oblong to linear, 1 to 2 lines long, furnished with marginal short-stipitate glands; involucre loosely villous, their bracts little longer than the achene; bracts of receptacle chaffy, united half-way.—Dry hills, 300 to 1200 ft.: North Coast Ranges from Mt. Tamalpais to the Napa Range; Sierra Nevada foothills from Eldorado Co. to Mariposa Co. July-Aug.

### 99. *ACHYRACHAENA* Schauer

Soft-pubescent annual with narrow leaves, the lower opposite. Involucre

973. *Achyrachaena mollis* Schauer; a, fl. stem  $\times 1$ ; b, fr. head  $\times \frac{2}{3}$ ; c, achene and pappus  $\times 1\frac{1}{2}$ .

oblong-campanulate, its bracts lanceolate, herbaceous, each enfolding a ray-achene. Bracts of the receptacle membranous, in a single outer series. Receptacle low-convex, naked. Flowers reddish brown. Ray-flowers 5 to 8, little exceeding the disk, their ligules short and broad, palmately 3-cleft. Achenes linear-clavate, all the ribs or the alternate ones scabrous. Disk-achenes with a pappus of about 10 silvery scales, the outer as long as the achene, the inner nearly twice as long. (Greek achuron, chaff, and Latin achaenium, an achene, on account of the very chaffy pappus borne on the fruit.)

1. *A. mollis* Schauer. BLOW-WIVES Fig. 973. Stem erect, simple or branching, 9 to 18 in. high, pilose-pubescent; branches more or less peduncle-like, each 1-headed; leaves linear, entire or serrulate, 5 in. long or less; heads in flower  $\frac{3}{4}$  in. high, in fruit expanding and forming a globose cluster  $1\frac{1}{2}$  in. broad; achenes black; palene of the achenes also expanding or diverging rotately.—Adobe soil, plains, valleys and low hills, 20 to 2600 ft.: throughout cismontane Cal.; n. to southern Ore. Apr.-May.

### TRIBE 8. *Ambrosieae*. RAGWEED TRIBE

Coarse homely weeds or shrubs with small greenish or white heads. Leaves alternate or the lowest opposite in no. 102. Flowers unisexual, the staminate and the pistillate in separate heads (the staminate heads in a raceme or spike above the pistillate heads, which are few and axillary) or in the same head (heads solitary in the axils). Receptacle of the staminate or of the perfect heads with chaff-like bracts. Rays none. Corolla of pistillate flowers none or a mere rudiment. Anthers distinct or scarcely coherent, not caudate. Pappus none. Fruit commonly a bur.

### 100. *IVA* L.

Ours coarse perennial herbs. Leaves thickish, alternate (or the lower opposite), entire. Flowers greenish white, borne in small nodding spicate heads. Involucre hemispherical, its rounded bracts about 5. Receptacle with chaff-like linear or spatulate bracts. Marginal flowers of the head pistillate,

1 to 5 in number, their corollas tubular or none. Disk-flowers perfect, sterile, with 5-lobed funnelliform corolla and undivided style. Anthers almost distinct. Achenes flattened, glabrous. Pappus none. (After *Ajuga iva* of the Mint Family, on account of the similar odor.)

Bracts of the involucre united into a lobed cup.....1. *I. axillaris*.  
Bracts of the involucre distinct.....2. *I. hayesiana*.

1. *I. axillaris* Pursh. POVERTY WEED. Fig. 974. Stems many, erect from a decumbent or prostrate base, 6 to 10 in. high; leaves narrowly obovate, varying to lanceolate or linear, entire, sessile; heads solitary in the axils, short-peduncled, surpassed by the leaves; bracts of the involucre united into a lobed or merely toothed cup.—Alkaline plains and borders of salt marshes; throughout Cal.; n. to B. C., e. to Neb. Aug.-Sept. It is called Death Weed in Siskiyou Co., on account of persistently crowding out other plant life in cultivated fields. Var. PUBESCENS Gray. Herbage loosely villous; involucre turbinate, almost entire.—Near San Francisco Bay.

2. *I. hayesiana* Gray. Stems woody below, branched from the base, the ascending branches 2 to 3 ft. high; herbage strigose-puberulent; leaves spatulate-oblong to linear, very obtuse, entire, narrowed to the base,  $1\frac{1}{4}$  to 2 in. long, the upper ones lanceolate and only slightly surpassing the heads; involucre bracts distinct.—Brackish or alkaline soil: w. San Diego Co.; s. to L. Cal.

974. *Iva axillaris* Pursh; a, fl. branchlet  $\times \frac{1}{2}$ ; b, head  $\times 2$ ; c, pistillate fl.  $\times 4$ ; d, perfect fl.  $\times 4$ .

#### 101. OXYTÈNIA Nutt.

Shrubby erect perennial. Leaves alternate, 3 to 5-parted into filiform divisions, or the upper ones entire. Flowers unisexual, the heads borne in a panicle of spikes. Involucral bracts 5, rigidly acuminate at apex. Bracts of the receptacle slender, with dilated tips. Pistillate flowers about 5, destitute of corolla; staminate flowers 10 to 21. Achenes obovate, very villous with long soft hairs. Pappus none or a mere vestige. (Greek oxytenes, pointed, referring to the narrow rigid leaves.)

1. *O. aceròsa* Nutt. Stems half-woody, leafless and rush-like or sometimes densely leafy, 3 to 7 ft. high; leaves  $1\frac{1}{2}$  to 3 in. long; heads 2 lines high; involucre bracts roundish; bracts of receptacle incised at apex.—Alkaline plains, Death Valley region; e. to Ariz. and Utah.

#### 102. DICÒRIA T. & G.

Annual herbs, white-hirsute with appressed hairs. Leaves alternate or the lower opposite. Flowers unisexual, greenish yellow. Heads small, nodding, borne in slender nearly leafless spikes, the spikes commonly paniculate. Involucre of 4 or 5 oblong or obovate short bracts. Heads of 2 kinds, androgynous and staminate. Staminate heads consisting of staminate flowers only. Androgynous heads consisting of staminate flowers and pistillate flowers: inner flowers 4 to 13, staminate only; corollas funnelliform, 5-lobed; filaments united to form a slender tube, the tube funnelliform at apex and 5-toothed, each tooth bearing an anther; anthers distinct or lightly coherent; ovary and style very rudimentary; subtending bracts slender or filiform; marginal flowers 2 (or 1), pistillate, without corolla and stamens, consisting

975. *Dicoria canescens* T. & G.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, staminate head  $\times 2\frac{1}{2}$ ; c, androgynous head  $\times 2\frac{1}{2}$ ; d, staminate fl.  $\times 3\frac{1}{2}$ ; e, pistillate fl.  $\times 3\frac{1}{2}$ .

many flowered; receptacle of at least the outer flowers with slender bracts; corollas funnelform, 5-lobed. Pistillate heads in the axils of the upper leaves at the base of the staminate racemes:—involucres oblong or turbinate, closed, containing but a single flower; corolla none; pappus none; fruit an achene-like bur which is beaked or pointed and is armed near the top with a single row of prickles. (Ancient Greek name.)

Plants 2 to 6 ft. high; leaves pinnately incised. . . . . 1. *A. psilostachya*.  
Plants  $\frac{3}{4}$  to 1  $\frac{1}{4}$  ft. high; leaves 2 to 3 times pinnatifid into short crowded oblong lobes. . . . . 2. *A. pumila*.

1. *A. psilostachya* DC. WESTERN RAGWEED. Fig. 976. Stem simple, erect, 1, 2 or more ft. high, from slender running rootstocks; herbage pubescent and somewhat strigose; leaves once or the lower twice pinnatifid; fruit an obovoid turgid bur, mostly solitary in the axils, bearing 4 protuberances or sometimes unarmed.—Uncultivated lands in the valleys, 10 to 1500 ft.: throughout cismontane Cal.; e. to Ill., n. to Can. Sept.-Oct.

of an ovary and deeply parted style, each subtended by a much enlarged thin-scarious roundish bract of the receptacle. Achene flattened or flat-tish, ridged on each side, margined with a deeply and coarsely pectinate border. Pappus of several very small scales. (Greek dis, twice, and koris, a bug, from the aspect of the two achenes.)

1. *D. canescens* T. & G. Fig. 975. Bushy branching, 1 to 2  $\frac{1}{2}$  ft. high, or sometimes simple dwarfs only 4 in. high; leaves oblong-lanceolate to ovate,  $\frac{1}{2}$  to 1  $\frac{1}{4}$  in. long, on short petioles; the lower opposite, the upper alternate; heads 3 to 4 lines high, scarious bracts of the receptacle, subtending achenes, 3 to 4 lines long, 2 to 3 times as long as the involucre; central bract of the staminate cluster often elongated and greenish at tip.—Sandy washes or alkaline flats: Colorado and Mohave deserts; Inyo Co.; e. to Utah.

### 103. AMBRÓSIA L. RAGWEED

Ours coarse homely but aromatic perennial herbs with alternate pinnatifid leaves. Flowers inconspicuous, greenish, unisexual. Staminate heads disposed in erect catkin-like racemes:—involucres broadly hemispherical,

976. *Ambrosia psilostachya* DC.; a, inf.  $\times \frac{1}{2}$ ; b, stam. head  $\times 3$ ; c, bract  $\times 3$ ; d, stam. fl.  $\times 6$ ; e, pist. fl.  $\times 3$ .

2. *A. pumila* Gray. Stems branching from the base, erect, 5 to 9 (or 15) in. high from slender running rootstocks; herbage whitish-pubescent with soft white hairs; leaves 1 to 5 in. long, 2 to 3 times pinnatifid into short lobes, also with similar reduced pinnae or lobes extending more or less down the petiole; lobes of the leaves oblong, crowded, 1 to 3 lines long; fruit obovoid, mucous, pubescent, 1 line long.—Vicinity of San Diego.

#### 104. *FRANSÈRIA* Cav.

Perennial (or annual) herbs, or bushes. Leaves chiefly alternate. Flowers inconspicuous, greenish, unisexual, the staminate and pistillate in separate discoid heads. Staminate heads nodding in catkin-like spikes or racemes, the pistillate heads in the axils of the upper leaves at the base of the staminate inflorescence or rarely scattered throughout. Involucre of the staminate heads bowl-shaped or turbinate; corolla funnelform, 5-lobed. Involucre of the pistillate heads closed, 1 to 4-celled, 1 to 4-beaked or pointed, armed with several rows of spines and in fruit becoming a bur; corolla none or rudimentary. Bur hairy or glabrous but always more or less minutely glandular. (Ant. Franser, Spanish botanist.)

Herbs; leaves pinnatifid or pinnately parted, or merely toothed in no. 4.

Bur 1 to 1½ lines long, its spines mostly hooked at tip.....1. *F. tenuifolia*.

Bur 3 to 4 lines long, its spines not hooked.

Burs glabrous; staminate heads 1 to 2 lines broad; spines thin; inland species...

2. *F. acanthicarpa*.

Burs more or less hairy; staminate heads 2½ to 3½ lines broad; spines thick; seashore species.

Leaves twice or thrice pinnatifid or pinnately parted....3. *F. bipinnatifida*.

Leaves merely serrate or some (usually the lower) incised.4. *F. chamissonis*.

Low shrubs, or at least woody at base.

Leaves petioled, the blades not spinose.

Bur with straight spines.

Leaves pinnately parted; spines of bur glabrous or minutely pubescent....

5. *F. dumosa*.

Leaves pinnatifid or with salient lanceolate teeth; spines of bur conspicuously and densely white-villous.....6. *F. eriocentra*.

Bur with uncinat spines woolly at base; leaves ovate, crenate or nearly entire...

7. *F. chenopodiifolia*.

Leaves sessile, the blades spinosely dentate.....8. *F. ilicifolia*.

1. *F. tenuifolia* Gray. Erect perennial herb 1 to 2 ft. high; herbage hispidulose; leaves bipinnately parted or dissected into narrowly oblong or linear lobes, the primary rachis with interposed small lobes, the terminal lobes, elongated; staminate heads borne in a panicle of spikes; pistillate involucres glomerate below, obovate with narrow base, 1¼ lines long, usually 2-flowered; bur about 1¼ lines long, minutely glandular-pubescent, its spines stout, incurved and commonly hooked, a pit with a cartilaginous border above each.—Commonly dry plains, coastal S. Cal.; e. to Col., s. to Mex.

2. *F. acanthicarpa* (Hook.) Cov. Annual; stems diffusely branching or sometimes rather strict, 1 to 2 ft. high; herbage scaberulose, sometimes canescent; leaves broadly ovate in outline, once or twice pinnatifid into rather broad and short often toothed lobes, 1¼ to 3½ in. long, on petioles nearly as long; staminate racemes in panicles, pistillate involucres in the axils below, solitary or 2 or 3 together, 1-flowered, glabrous but minutely glandular; spines flat, thin, lanceolate-subulate, the tips straight or slightly curved but not uncinat.—Sandy plains and summer beds of winter flood streams from Monterey Co. to San Diego Co., thence n. through the Mohave Desert to Mono Co.; n. to Wash., e. to Col.

3. *F. bipinnatifida* Nutt. Perennial herb; stems procumbent, herbaceous, 2 or 3 ft. long, somewhat hirsute; leaves twice or thrice pinnately parted into oblong lobes, canescent or almost silky; spikes dense; bur narrowly ovate, its spines somewhat flattened or semiterete, some of them curved at the tip.—Common on sandy seabeaches along the coast from San Diego Co. to Del Norte Co.; n. to B. C., s. to L. Cal. Aug.-Oct.

4. *F. chamissonis* Less. Fig. 977. Habit of no. 3; leaves narrowly ovate to oblong, sometimes broadly ovate or obovate, cuneate at base, serrate, or the lower lacinate or incised, silky, ½ to 1½ in. long; bur thicker, sparsely hirsute and minutely and often obscurely glandular, the spines distinctly

977. *Franseria chamissonis* Less.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, staminate head  $\times 2$ ; c, staminate fl.  $\times 3$ ; d, fr. head  $\times 2$ .

broader and channeled or somewhat trough-like above.—Seabeaches along the coast, less common than no. 3: Santa Cruz Co. to Humboldt Co.; n. to B. C.

5. *F. dumosa* Gray. BURRO-WEED. Low rounded bush 10 to 20 in. high, with rigid brittle branches, the slender branchlets terminating in a spicate inflorescence and becoming in the second year naked, indurated and spine-like; stems whitened and the foliage grayish with a fine close pubescence; leaves small (6 to 8 lines long, rarely to  $1\frac{1}{4}$  in. long), once, twice or thrice pinnately parted into a few very short very obtuse lobes; fertile involucre globular, mostly 2-flowered, glabrous or pubescent, their spines long, sparingly villous, tapering from a broad flat base to a straight tip.—Exceedingly abundant on the Colorado and Mohave deserts; e. to Utah, s. to Mex. It is commonly associated with *Larrea*. Also called Sand-bur.

6. *F. eriocentra* Gray. Spreading bush 1 to 3 ft. high, with numerous slender but rigid white-barked branches; herbage whitened with a

minute tomentum, the leaves soon glabrate and green above; leaves cuneate-oblong to lanceolate, saliently few-toothed or lobed to sparingly and irregularly sinuate-pinnatifid, nearly sessile by an attenuate base, 1 to  $1\frac{1}{2}$  (or 2) in. long; staminate involucre bowl-shaped, 2 to  $2\frac{1}{2}$  lines high, deeply lobed, its lobes very acute; pistillate involucre one-flowered, the body and its straight rigid subulate spines villous, the long white hairs tufted at the ends of the spines; beak single, subulate, as long as the body.—Sandy deserts, e. Mohave Desert (New York Mts.); e. to southern Nev. and northern Ariz.

7. *F. chenopodiifolia* Benth. Low (8 to 12 in. high), much branched, woody only at base; leaves broadly ovate, crenate, obtuse, cuneate to subtruncate at base, white-tomentulose below, glabrate and greenish above, 1 to  $1\frac{1}{4}$  in. long, the petioles 3 to 6 lines long; pistillate involucre globose, 2 or 3-flowered, woolly between the spines; spines lanceolate-subulate, hooked at the tip.—Sw. San Diego Co.; s. to L. Cal.

8. *F. ilicifolia* Gray. Much-branched shrub about 3 ft. high, the branches hirsute or hispid, very leafy up to the inflorescence; leaves oblong or ovate, rigidly coriaceous, scabrous, reticulate-veiny below, coarsely and very unequally spinose-dentate, 1 to  $3\frac{1}{2}$  in. long, sessile by a clasping auriculate base; involucre shortly peduncled; staminate involucre with lanceolate acerose lobes; pistillate involucre ovoid, glandular-pubescent, 6 to 7 lines broad including the very numerous slender uncinat prickles; beak stout, 2-toothed.—Desert mts., Colorado Desert: Santa Maria Mts.; Signal Mt.; s. to L. Cal.

#### 105. *HYMENOCLEA* T. & G.

Shrubs with slender diffuse branches. Leaves alternate, filiform, entire or the lower parted into filiform lobes. Heads numerous, small, unisexual, the staminate and pistillate intermixed in profuse panicles or the latter in the lower axils. Staminate heads several-flowered; involucre bowl-shaped, 4 to 6-lobed; corolla scarious, 4 or 5-lobed; bracts of the receptacle obovate or spatulate, or the innermost filiform, or none. Pistillate flowers solitary in

ovoid or fusiform involucre; involucre beaked at tip and winged on the sides with broad silvery-scarious scales; corolla none. (Greek, humen, membrane, and kleio, to enclose.)

Pistillate involucre covered with spirally disposed scales. . . . 1. *H. salsola*.

Pistillate involucre with only a single whorl of scales at the middle. . . . . 2. *H. monogyra*.

1. *H. salsola* T. & G. Fig. 978. Spreading bush  $1\frac{1}{2}$  to 3 ft. high; leaves sparse,  $\frac{1}{8}$  or mostly  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long, the canescent band beneath soon concealed by the revolute margins; bracts of the staminate involucre lightly ciliate-erose; scales of the pistillate involucre spirally arranged from the base to near the middle, orbicular-reniform, that is, broader than long,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  lines long, the margins commonly erose, often with an apical mucro; panicles often very heavy with the shining fruit, weighting down the branches. —Common in sandy washes and stream beds and in alkaline soil, mostly in the deserts: Colorado and Mohave deserts to Inyo Co., extreme southern Sierra Nevada, upper San Joaquin Valley and adjacent inner South Coast Range; e. to Nev. and Ariz., s. to L. Cal.

2. *H. monogyra* T. & G. Branches commonly more strict and more leafy than in no. 1; scales of the pistillate involucre 7 to 9, in a single whorl around the middle of the involucre, obovate, that is, longer than broad,  $\frac{1}{2}$  to 1 line wide, the margin erose or with one apical tooth most prominent. —Desert washes: San Diego; e. to Tex., s. to L. Cal.

978. *Hymenoclea salsola* T. & G.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, staminate head  $\times 3$ ; c, staminate fl.  $\times 3$ ; d, pistillate fl.  $\times 1\frac{1}{2}$ .

#### 106. *XANTHIUM* L.

Coarse (by some called vile) annual weeds with widely branching and very stout stems. Leaves alternate, toothed or lobed, petioled. Heads unisexual, composed of greenish flowers. Staminate heads subglobose, in a terminal cluster:—involucre of several distinct narrow bracts in a single row; receptacle cylindrical; flowers many, separated by the bracts of the receptacle; corolla tubular. Pistillate heads axillary, situated below the staminate:—involucre closed, 2-celled (each cell containing one flower), forming in fruit an ovoid or oblong indurated bur covered all over with hooked prickles and 1 or 2-beaked; corolla none; pappus none; style 2-cleft, its branches exerted through the beaks. (Greek xanthion, yellow, from its yielding a hair-dye of that color.)

Leaves lanceolate; stems bearing spines by the sides of the leaves. . . . . 1. *X. spinosum*.  
Leaves deltoid-ovate; stems not spiny.

Burs oblong or elliptic in outline,  $\frac{1}{2}$  to 1 in. long.

Spines not crowded (the body of the bur visible between them); body and the lower part of spines covered with short glandular hairs. 2. *X. canadense*.

Spines densely packed (concealing the body), nearly free from glands and hairs.

3. *X. calvum*.

Burs ovoid, 1 to  $1\frac{1}{4}$  in. long; spines (on lower part) and body densely covered with whitish glandular hairs. . . . . 4. *X. campestre*.

1. *X. spinosum* L. SPINY CLOTHUR. Fig. 979. Stems puberulent, much branched; leaves lanceolate or ovate-lanceolate, acute or acuminate, 2 or 3-lobed or -cut, or the upper entire, narrowed at base into a short petiole, green above, white-pubescent beneath, 2 to 5 in. long; by the sides of the

979. *Xanthium spinosum* L.; a, fl. branch-  
let  $\times \frac{1}{2}$ ; b, bract of stem. head  $\times 4$ ;  
c, stem. fl.  $\times 4$ .

b

c

a

leaves are borne yellowish 3-pronged spines 1 in. long; corolla pubescent with short rusty hairs; bur narrowly oblong,  $\frac{1}{2}$  in. long, sparsely prickly; beaks inconspicuous, only one spinose. —Naturalized European weed, everywhere a common summer tenant of barnyards and neglected fields. It is also called Spanish Thistle.

2. *X. canadense* Mill. COCKLE BUR. Fig. 980. Stems about 2 ft. high, not prickly; leaves deltoid-ovate or somewhat cordate, irregularly serrate, or somewhat incised, often distinctly 3-lobed, rough, hispidulous and green both sides, 3 to 4 in. long, on petioles nearly as long; bur  $\frac{1}{2}$  to 1 in. long, thick, glandular-pubescent on the body and on the lower part of the crowded spines and bearing at apex a pair of strong beaks hooked or incurved at tip; spines about  $1\frac{1}{4}$  to 2 lines long. —Naturalized weed, native of the e. U. S., exceedingly abundant in low or marshy lands, often covering hundreds of thousands of acres. Flowering in summer and fruiting in autumn. Var. PALUSTRE Jepson n. comb. Spines sparser and shorter (about 1 line long).

—Suisun Marshes. (*Xanthium palustre* Greene.)

3. *X. calvum* M. & S. Burs 5 to 6 lines long, the body narrowly oblong, densely packed with spines, rarely sparsely spinose; spines glabrous or nearly so. —Low ground, San Francisco Bay region.

4. *X. campéstre* Greene. Burs ovoid in outline, 1 to  $1\frac{1}{4}$  in. long, 10 to 11 lines in diameter; spines  $1\frac{3}{4}$  to 2 lines long, rather densely clothed with whitish glandular hairs in the lower part. —Butte Co. plains.

#### TRIBE 9. Helenieae. SNEEZEWEED TRIBE

Herbs or some Eriophyllums suffruticose. Leaves alternate or opposite. Flowers commonly yellow. Rays present or none in some species. Anthers not caudate. Receptacle commonly naked. Bracts of the involucre in 1 or 2, sometimes in 3 or 4 series. Pappus of paleae, awns or bristles, or often wanting.

#### 107. PERÍCOME Gray

Perennial herb, with long-acuminate alternate leaves and yellow flowers. Heads small, corymbosely clustered in a loose panicle. Rays none. Bracts of the involucre numerous, narrow, in a single series and

980. *Xanthium canadense* Mill.; a, fl. branch-  
let  $\times \frac{1}{2}$ ; b, stem. head  $\times 2$ ; c, bract of  
stem. head  $\times 4$ ; d, stem. fl.  $\times 4$ ;  
e, stamen-column  $\times 4$ .

very lightly united by their edges into a cup. Achenes flattened, the fertile ones black and with a cord-like border, all strongly hirsute-ciliate around the margin. Pappus a crown of lacerate scales. (Greek *peri*, around, and *come*, a tuft of hairs around the margin of the achene.)

1. *P. caudata* Gray. Stems slender, tall, widely branching, 4 to 5 ft. high, forming thick clusters, glabrous; leaves opposite, sometimes alternate, triangular, lanceolate, attenuate, saliently dentate just above the truncate base, green, membranous, microscopically and remotely hispidulose,  $1\frac{1}{4}$  to  $2\frac{1}{2}$  in. long; heads 5 lines high; involucre bracts narrowly linear, densely tomentulose at tip inside; achenes 3 to  $3\frac{1}{2}$  lines long; pappus of 2 or 3 broad lacerate hyaline paleae, "also sometimes a slender awn from one or both margins of the achene."—Moist rocky slopes, 4000 to 6500 ft.: east slopes of the s. Sierra Nevada in Tulare Co.; Inyo Co.; e. to Col. and N. Mex.

#### 108. *LASTHENIA* Cass.

Glabrous slightly succulent annuals. Leaves opposite, entire, sessile and more or less connate at base. Heads on slender peduncles. Flowers yellow; rays 5 to 15. Bracts of the involucre more or less united into a hemispherical or campanulate toothed cup. Receptacle conical or subulate, covered with projecting points which bear the linear or linear-oblong flattened achenes. Pappus of 5 to 10 paleae or none. (Named for a Greek girl who attended the lectures of Plato in the garb of a man.)

Pappus none; rays conspicuous. . . . . 1. *L. glabrata*.  
Pappus of 5 to 10 paleae, 2 or 3 awn-pointed; rays very inconspicuous. . . . . 2. *L. glaberrima*.

1. *L. glabrata* Lindl. Stem usually branching at or above the base, 11 to 17 in. high; leaves linear and entire or sometimes the upper pair broadly lanceolate and toothed, conspicuously connate and sheath-like at base, 1 to  $1\frac{3}{4}$  in. long; peduncles long, erect; involucre broadly hemispherical; rays 3 to 5 lines long.—Borders of salt marshes: Coast Ranges; Great Valley. Var. *CALIFORNICA* Jepson. Leaves less or scarcely at all connate; peduncles corymbose.—Plains and low hills, Sierra Nevada foothills. May. Var. *COUTLERI* Gray. Achenes smaller and narrower, with obtuse edges, sprinkled with minute rough or callous points.—Saline marshes: upper San Joaquin Valley; coastal S. Cal.

2. *L. glaberrima* DC. Stem ascending, simple or sparingly branched, 5 to 15 in. long; leaves linear, entire, 1 to 3 in. long; heads on short peduncles, nodding after anthesis and before maturity, about 3 lines broad, seemingly rayless, the rays very small ( $\frac{1}{2}$  to  $\frac{3}{4}$  line) and inconspicuous; involucre with about 15 short teeth; corollas all shorter than their achenes; achenes with scattered short stiff hairs; pappus of 5 to 10 rigid paleae, erose or lacinate at apex or some of them subulate-pointed or short-awned.—Half-aquatic in winter pools or in wet fields, 10 to 5000 ft.: Coast Ranges from Humboldt Co. to Alameda Co.; Great Valley; n. to Ore. May-June.

#### 109. *BAERIA* F. & M. GOLD FIELDS

Low and mostly slender annuals (except no. 1). Herbage commonly pubescent but never hoary. Leaves opposite, linear to oblong, entire or lacinate-pinnatifid. Flowers yellow, the heads on slender peduncles. Rays 5 to 15, showy for the size of the heads, or sometimes fewer and very short. Involucre campanulate or hemispherical, rarely cylindric, its bracts as many as the rays, ovate or oblong and becoming more or less carinate below the middle. Receptacle subulate-conical, or dome-shaped in no. 7. Achenes linear but somewhat broadened upward. Pappus of paleae or awns or both or none. (The Russian zoologist, Baer.)

Perennial, with horizontal rootstock. . . . . 1. *B. macrantha*.  
Annuals.

Heads hemispherical to broadly campanulate.

Lower leaves (and usually all) entire or sometimes hispidly ciliate towards the base, not lacinate-pinnatifid (except sometimes in no. 3); pappus of 1 kind (awns or paleae tapering into awns) or pappus lacking.

Rays exceeding the disk-flowers (except in depauperate forms of no. 4); bracts mostly more than 6.

Leaves fleshy, obtuse, 1 to 4 lines broad. . . . . 2. *B. hirsutula*.

- Leaves thin, acute,  $\frac{1}{4}$  to 1 (or  $1\frac{1}{2}$ ) lines broad.  
 Pappus of 4 or 5 ovate paleae tapering into slender awns or pappus lacking; plants mostly glabrous; bracts strongly keeled. . . . . 3. *B. platycarpa*.  
 Pappus of 2 to 4 awns slightly broadened at base or pappus none; plants pubescent; bracts not strongly keeled. . . . . 4. *B. chrysostoma*.  
 Rays not or rarely exceeding the disk-flowers; bracts 5 or 6; stems weak. . . . . 5. *B. debilis*.  
 Lower leaves (and sometimes the upper) lacinate-pinnatifid; pappus of 2 kinds (awns and paleae) or pappus lacking.  
 Herbage somewhat glandular; receptacle foveolate, conical; leaves all lacinate; plants 4 to 12 in. high. . . . . 6. *B. aristata*.  
 Herbage not glandular; receptacle strongly muriculate.  
 Stems erect or at length spreading; rays elliptic or oblong, longer than the disk-flowers; plants  $2\frac{1}{2}$  to 10 in. high.  
 Receptacle with broad base and rounded top, hairy; stems erect. . . . . 7. *B. fremontii*.  
 Receptacle conical, not hairy; stems erect or spreading. . . . . 8. *B. uliginosa*.  
 Stems weak, decumbent, succulent; rays oval, scarcely equaling the disk-flowers; insular and coast species. . . . . 9. *B. maritima*.  
 Heads cylindric; rays so inconspicuous as to seem lacking; bracts 3 or 4, oblong. . . . . 10. *B. microglossa*.

1. *B. macrantha* Gray. Stems simple or nearly so, 8 to 24 in. high, arising from tuberous horizontal roots; leaves linear, entire, 1 to 4 (or 10) in. long, 1 to  $3\frac{1}{2}$  lines wide, obtuse, hispidly ciliate and saliently toothed towards the base; heads 9 to 12 lines broad, on peduncles 4 to 12 in. long; bracts about 12, hirsute-pubescent, ovate; rays 5 to 8 lines long; pappus of 1 to 4 brown bristles slightly thickened at base, or pappus none; achenes hispidulose.—Along the coast from Marin Co. to Mendocino Co. Var. *LITTOREALIS* Jepson n. name. Stout, 4 to 7 in. high, hispid; leaves  $\frac{1}{2}$  to 1 in. long, 3 to  $5\frac{1}{2}$  lines broad; heads 1 to  $1\frac{1}{2}$  in. broad; pappus none; achenes glabrous or papillate.—Seacoast: Dillons Beach, Marin Co. (*Burrielia chrysostoma* var. *macrantha* Gray.) Var. *PAUCIARISTATA* Gray. Six in. high; rays 4 to 5 lines long; pappus of 1 to 3 subulate awns, little shorter than achene.—Mendocino coast.

2. *B. hirsutula* Greene. Fig. 981. Stem branching at base and diffusely spreading or erect and branching above, 2 to 7 in. high; herbage hirsute-pubescent; leaves rather succulent, linear to oblong or sometimes spatulate, obtuse, often with saliently projecting teeth, 1 to 3 in. long, 1 to 3 (or 4) lines wide, hirsute; heads 8 to 14 lines broad; bracts about 12, obovoid, acutish, hirsute; rays oblong; pappus of 2 to 5 brownish awn-like bristles slightly thickened at base and as long or longer than achene, or pappus none; achenes hirsutulose, or glabrous when pappus is lacking.—Hillsides near the coast: San Luis Obispo; San Mateo Co.; San Francisco; Pt. Reyes. (*Lasthenia hirsutula* Greene). The slender forms seem to grade into *B. chrysostoma* var. *gracilis* Hall.

981. *Baeria hirsutula* Greene; a, habit  $\times \frac{1}{2}$ ; b, disk-fl.  $\times 4$ .

3. *B. platycarpa* Gray. Stems wiry and purplish, several from the base and erect or diffusely branched, 4 to 10 in. high; herbage essentially glabrous, sometimes scantily villous; leaves entire or laciniately cleft, linear, 3 to 8 (or 10) lines long; heads 4 to 9 lines wide; bracts 6 or 7, oblong, 3-nerved at base, the mid-nerve carinately thickened; pappus-paleae 4 to 7, broadly ovate, bright white, lanceolate-attenuate into an

awn, the whole as long or slightly longer than the achene, or pappus none.—Salt marsh and alkaline plains: Sacramento Valley; Sonoma Co.; San Joaquin Valley; S. Cal. The smaller forms from S. Cal. grade into *B. chrysostoma* var. *gracilis* Hall. (*Burrielia platycarpa* Gray. *Baeria carnos*a Greene.)

4. *B. chrysostoma* F. & M. GOLD FIELDS. Stems slender, mostly erect, simple or freely branching, 5 to 9 in. high (or  $1\frac{1}{2}$  to 3 in. high in depauperate forms); herbage villous-pubescent to hirsutulous; leaves linear, entire, 3 to 18 lines long,  $\frac{1}{4}$  to 1 line wide; heads  $2\frac{1}{2}$  to 4 lines high; rays and bracts of the broad involucre 7 to 15, or in depauperate plants fewer; rays 3 to 4 lines long; achenes linear-clavate, smooth (seldom pubescent) and shining, or papillate; pappus typically none.—Lower foothills, valleys and plains, 100 to 2500 ft.: throughout cismontane Cal.; n. to southern Ore. It is everywhere abundant, often coloring leagues and leagues of interior hills. Var. *GRACILIS* Hall. Habit of the species; pappus of 1 to 4 awns from small ovate or lanceolate paleae.—Open hills, 500 to 4000 ft.: Humboldt Co. and Nevada Co. to coastal S. Cal. (*B. gracilis* Gray. *Burrielia gracilis* DC.)

5. *B. débilis* Greene. Stems few or several from the base, ascending, 2 to 10 in. long; herbage thinly pilose; leaves linear, entire or saliently few-lobed.  $\frac{3}{4}$  to  $2\frac{1}{2}$  in. long; involucre 2 to 3 lines high; rays hardly over 1 line long; anther-tips ovate-lanceolate; pappus of 3 or 4 firm ovate-lanceolate and awned paleae, or in some heads none, then the achene with narrower apex.—Upper San Joaquin Valley from Fresno Co. to Kern Co. and the bordering Sierra Nevada foothills. Apr.

6. *B. aristata* (Nutt.) Cov. Stems slender, simple or freely branching, 4 to 12 in. high; herbage minutely glandular-pubescent; leaves laciniately pinnatifid into linear divisions; heads 3 to 7 lines broad; rays about 12 (or 6 to 8 in smaller forms), 2 to 4 lines long; pappus of (6 or) 8 to 12 lanceolate paleae, mostly tapering into awns, or pappus lacking.—San Diego to San Bernardino and Los Angeles Cos. Mar.-Apr. (*B. affinis* Gray. *Ptilomeris aristata* Nutt.)

7. *B. fremontii* (Torr.) Gray. Stems erect, slender, one or several from the base, 5 to 10 in. high; herbage nearly glabrous below, rather finely pubescent on the peduncles and involucre, or the involucre subcanescent; leaves 6 to 12 lines long, narrowly linear and entire or more commonly pinnately parted into linear lobes; involucre broad, their bracts 10 to 12, broadly ovate; receptacle broad, hairy; ray-flowers as many or fewer, with oval rays shorter than the width of the disk; pappus of about 4 slender awns and as many or more numerous very small paleae, or pappus seldom none.—Plains: Sacramento Valley; San Joaquin Co.; Contra Costa Co. Mar.-Apr. (*Dichaeta fremontii* Torr.)

8. *B. uliginosa* (Nutt.) Gray. Stems stout and somewhat succulent, lax and at length diffusely branched,  $2\frac{1}{2}$  to 5 in. long; herbage villous-tomentose (when young) to glabrate; leaves linear-lanceolate,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long, laciniate-pinnatifid into few broad lobes, or the upper entire; bracts and rays 10 to 13; awns 2 to 4 (commonly 3 or 4), with short intervening paleae, or pappus none.—

982. *Baeria uliginosa* var. *tenella* Gray; a, fl. branchlet x 1; b, lower leaf x 1; c, disk-flower x 4.

Low grounds, San Francisco to Santa Barbara. Apr.-June. (*Dichaeta uliginosa* Nutt.) Often similar in appearance to no. 9. Passes into var. *TENÉLLA* Gray. Fig. 982. Stems few, simple, commonly erect, 5 to 12 in. high, or lower and branched; awns 2, sometimes 1.—Tulare, Contra Costa and Mariposa Cos. (*B. tenella* Greene. *Dichaeta tenella* Nutt.)

9. *B. maritima* Gray. Stems stout, sometimes 3 lines broad, succulent, spreading and diffusely branching,  $3\frac{1}{2}$  to 10 (or 24) in. long; herbage villous to glabrate; leaves oblong-linear to oblong, sparingly broadly toothed or entire,  $\frac{3}{4}$  to  $1\frac{1}{4}$  (or 3) in. long, 2 to 4 (or 9) lines wide; rays 6 or 8, short and broad; pappus of 3 to 5 slender awns, with intervening lacinate paleae; achenes appressed-pubescent.—Coastal from Monterey Co. to Humboldt Co.; n. to Vancouver Isl.

10. *B. microglóssa* Greene. Stem very slender, 2 to 6 in. high; leaves linear, entire, 3 to 12 lines long,  $\frac{1}{2}$  to  $\frac{3}{4}$  line wide; heads about 7 to 9-flowered; involucre very narrowly cylindrical; rays very short ( $\frac{1}{4}$  line long) and inconspicuous, thus apparently rayless; bracts of the involucre 3 or 4, narrowly oblong; achenes narrowly linear-clavate, thinly hirsutulose; pappus-paleae 2 to 4, subulate below, attenuate into a bristle.—Valley floors and low hills: foothills on w. side Sacramento Valley; South Coast Ranges; coastal S. Cal. (*Burrielia microglossa* Gray.)

# 110. MONOLOPIA DC.

White-woolly annuals. Leaves alternate, sessile, entire, low-denticulate or lobed. Heads large, peduncled. Flowers golden yellow. Involucre hemispherical, its bracts united into a cup with broad or triangular teeth, or distinct to the base. Receptacle conical. Rays broad, 2 to 4-toothed, bearing at base and opposite the ligule an oblong or roundish denticulate appendage. Achenes angular, black. Pappus none. (Greek mono, single, and lópos, husk, on account of the bracts of the involucre.)

983. *Monolopia major* DC.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, head  $\times 1$ ; c, disk-fl.  $\times 3$ .

entire,  $\frac{1}{2}$  to 4 in. long; bracts of the involucre united into a broadly campanulate cup (6 to 7 lines broad) with triangular teeth; rays 8 (or 9), 3 or 6 to 10 lines long.—Grassy hills or valleys in adobe soils, 25 to 1500 ft.: Great Valley and South Coast Ranges to San Diego Co. May.

Rays 3 or 4-toothed at apex and bearing at base on the opposite side of the style a roundish denticulate appendage; heads on erect peduncles; leaves entire or nearly so, sessile or partly clasping by a broadish base; back of corolla-lobes with a fringe of bristles or of very short hairs; corolla-tube and lower part of throat with scattered short gland-tipped hairs outside.

Bracts united into a toothed cup. . . . .

1. *M. major*.

Bracts distinct to the base. . . . . 2. *M. gracilens*.

Rays barely 2 or 3-toothed at apex, destitute of basal appendage; heads, at least in age, on more or less curved peduncles; leaves pinnately lobed (or the upper entire), narrowed at base; involucre bracts separate to the middle; back of corolla-lobes glabrous; lower part of corolla-throat shaggy-villous outside. . . . . 3. *M. bahiaefolia*.

1. *M. major* DC. Fig. 983. Stem stoutish, simple or branching, 8 to 20 in. high; tomentum floccose and tardily deciduous; leaves mostly oblong-lanceolate, low-denticulate or commonly

2. *M. gracilens* Gray. Stem slender, paniculately branched above or from near the base,  $\frac{1}{2}$  to 2 ft. high; leaves narrowly oblong to linear-lanceolate, low-denticulate or entire,  $1\frac{1}{2}$  to  $3\frac{1}{2}$  in. long; involucre 3 to 6 lines broad, its bracts distinct to the base; rays 2 to 6 lines long; achenes  $\frac{3}{4}$  to 1 line long.—Hill slopes, 100 to 1500 ft.: Santa Cruz Mts. to Santa Barbara Co.; e. to inner South Coast Range in Fresno Co. June.

3. *M. bahiaefolia* Benth. Stem simple, erect or ascending, 2 to  $4\frac{1}{2}$  in. high, terminated by a solitary peduncled head, or rarely branched above and bearing 2 or 3 heads; herbage white-tomentose, becoming flocculent; leaves spatulate to oblanceolate or linear, entire, toothed, pinnately cleft or parted, 3 to 9 lines long, 2 to 3 lines broad; bracts of the involucre distinct to about the middle.—Hill slopes, Sierra Nevada foothills and bordering plains: Yuba Co.; Auburn; Snelling.

### 111. *ERIOPHYLLUM* Lag.

Annual or perennial herbs or woody-based plants. Herbage white-woolly, the tomentum often deciduous or floccose. Leaves alternate, divided or incised, or sometimes entire. Involucre oblong to hemispherical, its bracts distinctly rigid and permanently erect. Receptacle flat or convex, naked (except in no. 8). Rays 4 to 13 or 15, broad (sometimes wanting). Tube of disk-corolla commonly glandular and hairy. Achenes linear or cuneate-linear. Pappus of firm paleae or none. (Greek erion, wool, and phullon, leaf, the herbage woolly.)

A. Heads 2 to 8 lines broad, in rather dense terminal clusters or corymbs, sessile or on peduncles  $\frac{1}{2}$  to 6 lines long.

Perennials (or biennials), somewhat woody at base,  $\frac{3}{4}$  to  $3\frac{1}{2}$  ft. tall, erect or at base decumbent; heads peduncled.

Leaves pinnately divided, clothed on both sides with persistent white tomentum, the lower 3 to 5 (or 7) in. long; cymes broad, heavily clustered; insular species.

1. *E. nevini*.

Leaves entire to pinnately parted, usually glabrous or glabrate on the upper surface,  $\frac{1}{2}$  to 2 in. long; cymes fewer-flowered; rays 1 to 2 lines long; mainland species.

Stems ( $1\frac{1}{2}$  or) 2 to  $3\frac{1}{2}$  ft. high; involucre 2  $\frac{1}{2}$  to 3 lines high; rays 6 to 8....

2. *E. staechadifolium*.

Stems  $\frac{3}{4}$  to 2 ft. high; involucre 1  $\frac{1}{2}$  to 2 lines high.....

3. *E. confertiflorum*.

Annuals, low ( $\frac{1}{2}$  to 5 in. high) and spreading; leaves lobed at the apex; receptacle flat or nearly so; heads sessile or nearly so.

Rays present.....

4. *E. multicaule*.

Rays none; caespitose plants.

Involucral bracts about 8; pappus-paleae 4 or 5.....

5. *E. pringlei*.

Involucral bracts 3; pappus-paleae 11 to 13.....

6. *E. mohavense*.

B. Heads not clustered, solitary or loosely corymbose, their peduncles  $\frac{1}{2}$  (sometimes less in no. 7) to about 8 in. long.

Annuals; heads 5 to 15 lines broad.

Leaves entire to merely toothed.

Pappus-paleae equal in length or subequal, or wanting; peduncles not swollen toward the summit.

Stems compact, densely woolly; peduncles 3 to 9 lines long; anther-tips linear-subulate.....

7. *E. wallacei*.

Stems erect or spreading, less woolly; peduncles  $\frac{3}{4}$  to 4 in. long; anther-tips obtuse or acute.....

8. *E. ambiguum*.

Pappus-paleae very unequal in length; stems rigid, ascending; peduncles swollen towards the summit.....

9. *E. congdonii*.

Leaves mostly pinnately parted; pappus none.....

10. *E. heermannii*.

Perennials (or biennials); heads  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. broad, long-peduncled.

Heads mostly loosely corymbose.....

11. *E. jepsonii*.

Heads mostly solitary.

Montane or inland species; leaves entire, toothed or pinnately parted or cleft into narrow lobes, the lobes mostly  $\frac{1}{4}$  to 1 line wide; herbage white-woolly, sometimes more or less glabrate, the upper surface of the leaves often green; vars. of.....

12. *E. lanatum*.

Sea bluffs and beaches; herbage white-tomentose, the upper surface of the leaves green and glabrate.....

13. *E. caespitosum*.

1. *E. nevini* Gray. Stems ascending, 1 to 3 ft. high, woody below; leaves white-tomentose, mostly basal or on lower part of stem, the stems glabrate; leaves ovate in outline, 3 to 5 (or 7) in. long, once or twice pinnately parted into numerous lobes, the lobes oblong, obtuse, 3 to 9 lines long; heads numerous, 3 to 4 lines high, densely crowded in broad flattish compound cymes, their peduncles naked or nearly so; bracts oblong, obtuse, rather

984. *Eriophyllum confertiflorum* Gray; a, habit  $\times \frac{1}{2}$ ; b, disk-fl.  $\times 3$ ; c, ray-fl.  $\times 3$ .

loose; rays 7 to 10, yellow, little longer than the bracts; pappus of 4 to 6 erose paleae, often unequal, the longer ones lanceolate and acute.—Santa Barbara Isls. May-Aug.

2. *E. staechnadifolium* Lag. LIZARD TAIL. Diffuse bush  $1\frac{1}{2}$  to 3 ft. high; leaves 1 to  $1\frac{3}{4}$  in. long, linear, narrowed toward the base, entire, or rarely with 1 or few teeth, the margins revolute and the under surface white with a dense felt-like tomentum; upper surface of leaves green and the tomentum of the stems eventually deciduous; heads disposed in close compact corymbs; involucre broadly oblong or somewhat turbinate,  $2\frac{1}{2}$  to 3 lines high, their bracts linear; rays 6 to 8, 1 to 2 lines long; pappus-paleae 7 to 9, unequal. — Seabeaches: Monterey; Santa Cruz. Var. *ARTEMISIAEFOLIUM* (Less.) Mcbr. Leaves ovate to roundish-ovate in outline,  $\frac{1}{2}$  to  $1\frac{3}{4}$  in. long, pinnately parted into 5 to 7 lobes, the lobes a little remote and entire or again pinnately parted or toothed; petioles broad or ligulate, 2 to 7 lines long.—Rocky bluffs and beaches along the seacoast, 10 to 100 ft.: Del Norte Co. and Cape Mendocino to Santa Barbara; Santa Barbara Isls. May. (*Bahia artemisiaefolia* Less.)

3. *E. confertiflorum* Gray. Fig. 984. Plants  $\frac{3}{4}$  to 2 ft. high, the stems several to many from the root-crown, soon parted into erect or ascending mostly simple branches, the branches very leafy below, ending above in a compact or even head-like cyme; herbage closely tomentose, the tomentum at length deciduous; leaves 2 to 4 (or 12) lines long, ternately or pinnately parted into 3 to 7 narrowly linear divisions; petioles broad,  $\frac{1}{2}$  to as long; heads many in compact terminal clusters; involucre obovoid-oblong,  $1\frac{1}{2}$  to 2 lines high, the bracts about 5, ovate; rays 4 or 5, sometimes wanting,  $1\frac{1}{2}$  to 2 lines long; paleae 8 (or 9), nearly equal, about  $\frac{1}{2}$  as long as the achene.—Ridges and dry slopes in the hills and mts., 25 to 7500 ft.: coastal S. Cal.; Sierra Nevada; Coast Ranges. June-July. (Var. *trifidum* Gray. Var. *latum* Hall.) Var. *TANACETIFLORUM* Jepson n. comb. Plants coarse,  $2\frac{1}{4}$  ft. high; leaves  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; cymes fewer (3 to 6)-headed.—Mariposa Co. (*E. tanacetiflorum* Greene.) Var. *LAXIFLORUM* Gray. Inflorescence more lax, the heads umbellate or umbellately corymbose.—Mts. of S. Cal.; n. to Santa Lucia Mts. Var. *DISCOIDEUM* Greene. Plants condensed; heads broader, rayless.—Montane, 2000 to 7000 ft.: Sonoma Co. to San Gabriel Mts.

4. *E. multicaulis* Gray. Stem branching mostly at the base, the branches usually many, erect or diffuse or sometimes forming loose mats,  $\frac{1}{2}$  to 5 in. long; upper part of plants white-woolly, sparsely woolly below; leaves cuneate, trifid or 5-toothed at apex, 2 to  $4\frac{1}{2}$  lines long; heads 1 to 2 lines high, leafy-bracteate, clustered at the ends of the branches; receptacle nearly flat; rays 3 to 7, yellow, 1 line long; achenes with scanty appressed hairs or subglabrate; pappus-paleae 10 to 15, narrow, awned, somewhat fimbriate, or lacking.—Sandy flats or mesas 10 to 1500 ft.: coastal S. Cal.; n. to the upper Salinas Valley and San Carlos Range; e. to Ariz. Apr.-June.

5. *E. pringlei* Gray. Stems many from the base, forming dense tufts 1 to  $2\frac{1}{4}$  in. high; herbage densely white-woolly, or the stems glabrate in age; leaves 3-lobed at apex, narrowed to a slender base, 2 to 5 lines long; heads 2 to  $2\frac{1}{2}$  lines high, numerous, in close clusters at the ends of the branches; involucre narrow-campanulate, densely white-woolly; rays none; pappus-

paleae 4 or 5, broadly oblong to broadly lanceolate, silvery-scarious, erose or lacinate at apex.—Desert flats or arid slopes in mountain ranges near or bordering the Mohave Desert, 3400 to 6000 ft.: Hesperia; Swarthout Cañon; Little Rock Creek; Elizabeth Lake; Mt. Pinos; Greenhorn Range; Inyo Co.; e. to Ariz. May-June.

6. *E. mohavense* Jepson n. comb. Caespitose plant, the stems, leaves and heads forming a dense rounded tuft  $\frac{1}{2}$  in. high; leaves cuneate-obovate, coarsely 3-toothed at apex; heads 3 or 4-flowered,  $1\frac{3}{4}$  lines high, borne on slender peduncles; involucre cylindric, their bracts 3 or 4, linear, obtuse; pappus-paleae 11 to 13, linear to obovate, mostly obtuse.—Sandy gullies, Barstow, Mohave Desert. May. (*Eremonanus mohavensis* Jtn.)

7. *E. wallacei* Gray. Fig. 985. Densely woolly compact plant with several to many ascending stems, 1 to 4 in. high; leaves spatulate to obovate, obtuse, mostly entire,  $2\frac{1}{2}$  to 6 lines long; heads showy, on peduncles 3 to 9 lines long; involucre  $1\frac{1}{2}$  to 2 lines high, their bracts overlapping, distinct; rays 6 to 10, oblong, yellow, 2 lines long; achenes very black, the pappus clear bright white; pappus-paleae 6 to 8, broad, short, obtuse, erose,  $\frac{1}{4}$  to  $\frac{1}{2}$  as long as the corolla.—Sandy flats or mesas, 1200 to 3200 ft.: coastal S. Cal.; Colorado and Mohave deserts: Inyo Co.; e. to Ariz. and Utah. Mar.-May. Var. *RUBELLUM* Gray. Rays white or pale purple or rose-color and white.—Sw. side Colorado Desert: San Felipe; Vallecito. (*Bahia rubella* Gray.)

8. *E. ambiguum* Gray. Stem branched at and above the base, the branches slender, erect, ascending or diffuse, 3 to 12 in. high; herbage with rather thin tomentum, tardily deciduous above; leaves narrowly oblanceolate or spatulate to linear, entire or few-toothed,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; heads 5 to 7 lines broad, solitary at the ends of the branches, usually long-peduncled; involucre 2 to 3 lines high, the rigid carinate bracts about 8, distinct to the base or lightly united for about  $\frac{2}{3}$  the way from the base; receptacle acutely conical, chaffy to scrobiculate; rays about 8 (5 to 9), yellow, 2 to  $4\frac{1}{2}$  lines long; achenes appressed-pubescent; pappus-paleae quadratis, fimbriate, or none.—Montane, 4000 to 5700 ft.: Greenhorn Range; Inyo Co. May-June. (*E. paleaceum* Bdg.)

9. *E. congdonii* Bdg. Stem freely branched from near the base, erect or ascending, 9 to 15 in. high; herbage loosely tomentose or floccose, or the stems more or less glabrate; leaves oblanceolate or spatulate, entire or the lower somewhat toothed, 5 to 10 lines long; heads solitary at the ends of the branches, long-peduncled; involucre campanulate to sub-cylindric, 3 lines high; rays 2 lines long; corolla-tube of disk-flowers slightly or not at all glandular; achenes hirsutulose; pappus of 4 erose paleae alternating with 4 longer lanceolate ones.—Mariposa Co.: Merced Cañon; mts. near Hennesy.

10. *E. heermanni* (Dur.) Greene. Stem branching at and above the base or sometimes simple, 3 to 7 in. high; leaves pinnately parted, 5 to 7 lines long, the lobes mostly toothed or again lobed or divided; petioles nearly as long or a little longer; heads 5 to 15 lines broad, solitary on peduncles terminating the branches, the peduncles often curved or recurved in fruit; involucre  $1\frac{1}{2}$  to  $3\frac{1}{2}$  lines high, their bracts about 8, distinct nearly to the

985. *Eriophyllum wallacei* Gray; a, habit x  $\frac{1}{2}$ ; b, ray-fl. x 5; c, disk-fl. x 5; d, anther-column x 11.

base; receptacle conical; rays yellow, conspicuous; disk-corollas glandular-pubescent on tube; achenes clavate, slightly pubescent; pappus none.—Foot-hills, 500 to 1500 ft.: Sierra Nevada foothills from Eldorado Co. to Tulare Co.; Tehachapi Mts. Apr.-June.

11. *E. jepsónii* Greene. Similar to no. 10; plants bushy,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  ft. high; stems woody below, white with tomentum, the leaves soon green or greenish; leaves pinnately divided into 5 to 7 long narrowly linear lobes; heads peduncled in a loose corymb; involucre broadly campanulate-hemispherical,  $2\frac{1}{2}$  to 3 lines high, 8 to 12 lines broad, the bracts 6 to 8, ovate; rays elliptical or oblong, 4 lines long; achenes hispidulous; pappus-paleae in 2 unequal series, those of the inner set exceeding the outer.—Mt. Hamilton Range; Mt. Diablo. May.

12. *E. lanatum* (Pursh) Forbes var. *integrifolium* (Hook.) Smiley. Loose plants 5 to 11 in. high, the stems many from the branching root-crown; herbage white-woolly or partly glabrate; leaves obovate to linear, entire, toothed or lobed, drawn down to a narrow base,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long; heads 6 to 10 lines broad, solitary on long naked peduncles; involucre broadly campanulate, 4 lines high; corolla-tube glandular; achenes pubescent, at least towards apex; pappus-paleae 6 to 8, subequal, lacerate, equaling or nearly equaling corolla-tube.—Montane, 4000 to 7000 ft.: Sierra Nevada from Tulare Co. to Lassen Co.; Lake Co. to Salmon Mts. July. (*Bahia integrifolia* DC.) All the varieties intergrade freely and intermediate states are abundant. Var. *CUNEATUM* Jepson n. comb. Similar to var. *integrifolium*; basal leaves spatulate-obovate or roundish-obovate, 3 (or 5)-toothed at apex, drawn down to a cuneate base or winged petiole, 3 to 9 lines long, much shorter than the cauline leaves, these oblanceolate or linear, entire or coarsely few-toothed; achenes glabrous, striate, sometimes papillate, sometimes pubescent; pappus rather short.—Montane, 4000 to 6000 ft.: Placer Co. to Lassen Co. (*Bahia cuneata* Kell.) Var. *CROCEUM* Jepson n. comb. Stems few or several from the base, 6 to 9 in. high, the heads 1 or 2 (or 3) and rather long-peduncled; leaves oblong-obovate to obovate, serrate or coarsely crenate on upper half, or entire, cuneate and entire below, thin, glabrate and green above, white-arachnoid beneath, 3 to 9 lines wide,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long; heads 1 to  $1\frac{1}{4}$  in. wide; corolla-tube very glandular, granuliferous; achenes striate, minutely papillate, glabrous; pappus a minute ring of paleae or obsolete.—Open woods in the mts., 3500 to 5500 ft.: Sierra Nevada from Butte Co. to Tulare Co. June. (*Eriophyllum croceum* Greene.) Var. *OBOVATUM* Hall. Stems several to many from a decumbent base, usually simple, 9 to 12 in. high; herbage clothed with a dense woolly persistent tomentum; leaves ovate, obovate or oblong-obovate to oblanceolate or lanceolate, entire or nearly so,  $\frac{1}{2}$  to 1 in. long; heads solitary, 7 to 14 lines broad, on long mostly naked peduncles; involucre hemispheric, 4 to 5 lines high; rays about 11 to 13, deep yellow, 4 to 5 lines long; disk-corollas with glandular-puberulent tube; achenes glabrous or nearly so, striate, the paleae erose, obtuse.—San Bernardino Mts., 4000 to 7000 ft. June-July. (*E. obovatum* Greene. *E. brachylepis* Rydb.) Var. *LANCEOLATUM* Jepson n. comb. Stems  $\frac{3}{4}$  to  $1\frac{1}{2}$  ft. high; herbage loosely but abundantly white- or yellowish-tomentose; leaves obovate to oblong, serrate at apex or above the middle, 1 to  $1\frac{1}{4}$  in. long; naked peduncles 1 to 6 in. long, a little enlarged upward; heads 1 to  $1\frac{1}{2}$  in. broad; rays about 13; achenes slightly hispidulous, slightly glandular.—Humboldt Co. to Siskiyou Co., 500 to 4000 ft.; n. to Ore. June-July. (*E. lanceolatum* Howell.) Var. *GRANDIFLORUM* Jepson. Stems several from the root-crown, simple or branched, erect, 12 to 17 in. high; under surface of leaves white-woolly, the upper surface green or greenish, the stems tending to become glabrate; leaves linear, entire or saliently toothed, pinnately and remotely few-lobed, 1 to 2 in. long; naked peduncles mostly very long (3 to 11 in. long); heads mostly 1 to  $1\frac{1}{2}$  in. broad.—Foothills, 200 to 4000 ft.: Sierra Nevada from Calaveras Co. to Butte and Plumas Cos.; w. Solano Co. to Humboldt and Siskiyou Cos. May-June. (*E. caespitosum* var. *grandiflorum* Gray.) Var. *ACHILLAEOIDES* Jepson n. comb. Stems several to many from the shortly branched root-crown, erect or ascending, simple or branched,  $\frac{2}{3}$  to  $2\frac{1}{4}$  ft. high; herbage thinly tomentose or glabrate, the upper surface of the leaves green or only

subglabrate, the lower surface persistently white-tomentose; leaves 6 to 10 lines long, once or commonly twice ternately divided into narrow lobes, the lobes  $\frac{1}{4}$  to  $\frac{3}{4}$  line wide, entire or toothed; petioles winged, 2 to 7 lines long; naked peduncles  $1\frac{1}{2}$  to 4 in. long; heads  $\frac{3}{4}$  to  $1\frac{1}{8}$  in. broad.—Dry hills, 500 to 5000 ft.: Napa Co. to Siskiyou Co., thence se. to Eldorado Co. May-June. (*Bahia achillaeoides* DC. *E. idoneum* Jepson.) Var. *ARACHNOIDEUM* Jepson n. comb. Similar to var. *achillaeoides*; leaves 1 to 3 in. long, not so deeply parted, pinnately and usually irregularly incised, green and glabrate above, thinly tomentulose below or subglabrate.—Hill slopes, 50 to 1500 ft.: Marin Co. to Humboldt Co. (*Bahia arachnoidea* Fisch. & Ave.-Lall.) Var. *MONOENSE* Jepson n. comb. Stems many, simple, erect or ascending from the depressed woody branches of the root-crown, 3 to 7 in. high, mostly leafy on lower part and at base; herbage persistently white-woolly; leaves linear-spatulate to spatulate-obovate or roundish-obovate with narrow base, entire or toothed at apex, 3 to 9 lines long; heads 8 to 11 lines broad; involucre 4 to 5 lines high; achenes striate.—High montane, 6000 to 11,000 ft.: Sierra Nevada from Fresno and Mono Cos. to Plumas Co. (*E. monoense* Rydb.)

13. *E. caespitosum* Dougl. Stems several from the woody root-crown, branching, somewhat woody below,  $\frac{1}{3}$  to  $1\frac{1}{2}$  ft. high; herbage white-tomentose, the upper surface of the leaves green and glabrate; leaves somewhat rhombic, 4 to 9 lines long, deeply 3 to 5-lobed, the lobes dentate or entire, with revolute margins; petioles  $\frac{1}{4}$  to 3 lines long, broadly winged; heads 1 to  $1\frac{1}{4}$  in. broad; naked peduncles 1 to 2 in. long; involucre campanulate, 3 to 4 lines high; rays rather broad, 4 to 5 lines long; disk-corollas with densely glandular-hispid tube; achenes glabrous; pappus-paleae very small or lacking.—Bluffs or slopes along the sea, 10 to 500 ft.: Mendocino Co. to Marin Co. May-Sept. (*E. brownii* Eastw.) It intergrades to *E. lanatum* var. *arachnoideum* and var. *achillaeoides*.

### 112. *SYNTRICHOPAPPUS* Gray

Low white-woolly annuals. Leaves entire or 3-lobed at the apex, mostly alternate. Heads small, radiate. Ray-flowers yellow or rose-purple; disk-flowers yellow. Involucre narrow, its bracts 5 to 8, narrow, partly enfolding the ray-achenes. Receptacle flat. Achenes linear-turbinate, pubescent. Pappus of numerous bristles united at base, or none. (Greek syn, together or united, thrix, hair, and pappos, pappus.)

Leaves alternate; rays yellow; pappus of numerous awns... 1. *S. fremontii*.  
Leaves chiefly opposite; rays rose-purple, edged or marked with white; pappus none.... 2. *S. lemmonii*.

1. *S. fremontii* Gray. Fig. 986. Stem much branched from the base, diffuse,  $1\frac{1}{2}$  to  $5\frac{1}{2}$  in. high; leaves linear, linear-spatulate or cuneate, sometimes 3-lobed at apex, gradually drawn down to a petiole-like base, the whole 3 to 9 lines long; heads numerous, terminal on the branchlets, short-peduncled; involucre  $2\frac{1}{2}$  to 3 lines high, its bracts narrowly scarious-margined; rays golden yellow,  $1\frac{1}{2}$  to  $3\frac{1}{2}$  lines long; pappus bright white, the numerous barbelate bristles somewhat united at base, deciduous.—Desert plains and mountain slopes, 2000 to 3000 ft.: Mohave Desert and slopes of its bordering mountains; Inyo Co.; e. to Utah and Ariz. May.

986. *Syntrichopappus fremontii* Gray; a, habit x  $\frac{3}{4}$ ; b, ray-fl. x  $2\frac{1}{2}$ ; c, disk-fl. x  $2\frac{1}{2}$ ; d, portion of pappus spread out x 5.

2. *S. lémmonii* Gray. Stem much-branched from the base and diffuse, or sometimes nearly simple and erect,  $1\frac{1}{4}$  to  $2\frac{1}{4}$  in. high; herbage glabrate in age; leaves linear or entire,  $2\frac{1}{2}$  to 4 lines long; involucre 2 to  $2\frac{1}{2}$  lines high, their bracts 6 to 8, narrowly oblong, linear-spatulate, scarious-margined; rays 7 or 8, commonly almost white above, deep rose or pink with dark-red veins beneath, the margins white; pappus none.—Arid valley floors or cañon flats, 2000 to 4300 ft.: Antelope Valley, w. Mohave Desert; Cajon Pass.

### 113. *BAHIA* Lag.

Herbs. Leaves opposite, or in ours alternate, finely divided. Heads radiate, in loose cymes. Involucre hemispherical, about 20 to 50-flowered, its bracts plane or merely concave, equal, in a single series or nearly so. Flowers yellow. Achenes 4-sided, or somewhat flattish and keeled on both sides.

Pappus of several scarious paleae or none. (J. F. Bahia, Professor of Botany, University of Bologna.)

1. *B. dissécta* (Gray) Britt. Fig. 987. Stems erect, 9 to 12 in. high, few or several from a shortly branched biennial or perennial root-crown; herbage puberulent, the inflorescence and involucre with gland-tipped hairs; leaves round-ovate or orbicular in outline, 6 to 8 lines long, once or twice divided or cleft into elliptic or oblong lobes; heads 6 to 7 lines broad; rays 2 lines long; corolla-tube villous-glandular; achenes striate, subglabrate or very sparsely hispidulose; pappus none.—Montane, 6600 to 8600 ft.: South Fork Santa Ana River, San Bernardino Mts. (F. W. Peirson); e. to Wyo., Col. and N. Mex. (*B. chrysanthemoides* Gray. *Villanova dissecta* Rydb.)

987. *Bahia dissecta* Britt.; a, b, habit  $\times \frac{1}{2}$ ; c, ray-fl.  $\times 3$ ; d, disk-fl.  $\times 3$ .

disk-flowers perfect but sterile. Achenes obovate, densely covered with minute papillae. Pappus none. (Greek blenna, mucus, and sperma, seed, the surface of the achene becoming conspicuously mucilaginous when moistened.)

1. *B. californicum* T. & G. Stem branching at or near the base, the branches becoming diffuse, 3 to 7 in. high, often naked above; herbage glabrous, slightly succulent; leaves parted into narrowly linear remote lobes; involucre greenish with purple markings; ray-flowers 8 to 13, the ligule of the corolla 2 to 3 lines long, or the alternate pistils destitute of corolla; style-branches of ray-flowers broad; disk-flowers 20 to 45, shorter than the involucre, their styles undivided, capitate at summit; achenes obscurely 8 to 10-ribbed.—Moist ground, low open hills, 50 to 1000 (or 3000 ft.): Placer Co.; Coast Ranges from Mendocino and Lake Cos. to San Luis Obispo Co.; s. to Cuyamaca Mts. Feb.-Apr.

### 115. *PERITYLE* Benth.

Annual or biennial herbs. Herbage glabrous or viscid-pubescent. Leaves alternate, petioled, the lower often opposite. Heads numerous, radiate, many-flowered. Involucral bracts in a single series, the margins overlapping, carinate on the outside, grooved inside and partly embracing the ray achenes.

Rays short, white or yellow. Disk-flowers yellow, 4-toothed. Achenes flat, callus-margined, the margin ciliate. Pappus in ours a crown of scales, commonly with a slender awn from one or both angles. (Greek, peri, around and tyle, callus, the achenes callous-margined.)

1. *P. emoryi* Torr. Stem freely branching,  $\frac{1}{2}$  to 2 ft. high, the branches striate, widely spreading; herbage glandular-pubescent, ill-scented; leaves cordate in outline,  $\frac{1}{4}$  to  $1\frac{1}{2}$  in. wide, palmately and rather shallowly 5 to 9-lobed or -cleft, the divisions toothed or serrate; petioles  $\frac{1}{2}$  to  $1\frac{1}{2}$  times as long; peduncles  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; heads  $3\frac{1}{4}$  lines high; outer involueral bracts oblong, acute, the inner narrower, scarious-margined; rays about 12 to 15,  $\frac{3}{4}$  to  $1\frac{1}{2}$  lines long; corollas glandular-pubescent; achenes somewhat flattened, oblong to subclavate, black, glabrous or rarely puberulent on the sides, the margins hispid-ciliate; pappus an inconspicuous erose or lacerate crown and a single slender awn about as long as the achene, or the awn often wanting.—Hill slopes: cismontane S. Cal. (infrequent); Colorado Desert; e. Mohave Desert; Panamint Range; e. to Ariz., s. to Mex. (*P. californica* Benth.)

#### 116. *EATONÉLLA* Gray

Floccose-woolly annuals. Leaves mostly alternate or basal. Flowers white or yellow. Heads subsessile in small glomerules or short-peduncled. Involucral bracts 5 to 8, oval or oblong, obtuse, distinct. Receptacle hardly convex. Rays very small or none. Disk-corollas 4-toothed. Achenes black, flattened, callous-margined, densely ciliate-villous. (Daniel Cady Eaton, one-time Professor of Botany in Yale College, author of *Ferns of North America* and the *Compositae of King's Expedition*).

Plants forming compact or depressed tufts,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. high; leaves entire; rays little exceeding the disk; pappus-paleae awned.....1. *E. nivea*.  
Plants loosely branching, with several stems from the base, 3 to 12 in. high; leaves sinuate-dentate; ray-flowers none; pappus-paleae not awned.....2. *E. congdonii*.

1. *E. nivea* Gray. Plant forming a compact depressed densely leafy tuft  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. high, the stems very short, few or several, and the leaves mostly basal; herbage loosely white-woolly; leaves spatulate-obovate to linear-spatulate, entire, 3 to 11 lines long, equaling or surpassing the heads; involucre of 8 to 12 linear bracts; rays purplish or yellowish,  $\frac{3}{4}$  to 1 line long, little exceeding the disk; achenes linear-clavate, compressed, the black sides polished and shining, the margin heavily ciliate-villous with long white hairs; pappus-paleae 2, broadly ovate, or quadratish, sparingly toothed or erose, produced at apex into a subulate awn as long as the paleaceous portion.—Washes or sandy flats, 4000 to 5500 ft.: e. side Sierra Nevada from Inyo Co., Cal., to Washoe Co., Nev.; n. to eastern Ore.

2. *E. congdonii* Gray. Stems several or many from the base, ascending, sparsely leafy, 3 to 12 in. high; herbage floccose-woolly; leaves linear to oblong, sparsely sinuate-dentate or some subentire, sessile or narrowed to a margined petiole, the whole  $\frac{1}{2}$  to 2 in. long; heads short-peduncled or nearly sessile in terminal clusters; involueral bracts 5 or 6, ovate, herbaceous; ray-flowers none; achenes oblong, flattened, or some of the outermost triangular-obcompressed, the sides black, shining, glabrate, the margin with very dense or matted border of long yellowish hairs; pappus-paleae 2 to 4, quadratish, erose-laciniate, very thin, not awned, much shorter than the ciliate hairs.—Low foothills bordering the upper San Joaquin Valley and the neighboring plains, 400 to 1200 ft.: Alcalde; Lerdo; Oil City; Deer Creek. Apr.

#### 117. *LAPHAMIA* Gray

Ours a low perennial herb. Leaves small, petioled. Flowers yellow, in small heads terminating the branches or branchlets. Involucral bracts in a single series. Rays in ours none; disk-corollas 4-toothed. Pappus none or of 1 to many bristles. Achenes flat. (Dr. I. A. Lapham, amateur Wisconsin botanist.)

1. *L. megacéphala* Wats. Stems several to many from the crown of a thick taproot, forming an intricately branched rounded bushy plant 12 to 15 in. high; herbage minutely puberulent; leaves alternate, ovate, few-toothed above the base or entire, 2 to 5 lines long, on petioles half to nearly as long;

heads bright brownish yellow,  $3\frac{1}{2}$  to 4 lines high; involucre bracts oblanceolate or narrow-obovate, slightly glandular-puberulent, sometimes woolly at tip; achenes puberulent or somewhat ciliate; pappus-bristles 1 or none.—White Mts., Inyo Co.; e. to southern Nev. (*Monothrix megacephala* Rydb.)

### 118. *RIGIOPAPPUS* Gray

Slender annuals. Leaves alternate, very narrowly linear, entire. Heads small, turbinate, solitary on the simple stems or on the branches, which are proliferous. Receptacle flat. Bracts subulate, similar to the upper leaves. Flowers yellow. Ray-corollas not exceeding the disk, the ray not longer than the tube. Disk-corollas small, with 3 to 5 short erect teeth. Pappus in disk and ray of 3 to 5 subulate awns. Achenes linear. (Greek *rigios*, stiff, and *pappos*, pappus.)

1. *R. leptocladius* Gray. Fig. 988. Plants 3 to 11 in. high, the branches filiform; herbage short-hairy or nearly glabrous; leaves  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long; heads 2 to 3 lines high in anthesis; achenes hispidulous.—Wooded hills, 500 to 5000 ft.: n. Los Angeles Co. to Santa Barbara Co.; Coast Ranges from Monterey and w. Fresno Cos. to Humboldt and Siskiyou Cos.; Sierra Nevada foothills from Kern Co. to Lassen Co.; n. to Wash. Apr.-June. Var. *LONGIARISTATUS* Gray. Involucres 2 lines high; pappus-awns mostly 3, more slender, subulate-dilated at base, exceeding the corolla, somewhat longer than the achene.—Rattlesnake Bar.

988. *Rigiopappus leptocladius* Gray; a, habit  $\times \frac{1}{2}$ ; b, disk-fl.  $\times 3$ ; c, involucre bract  $\times 2\frac{1}{4}$ .

### 119. *AMBLIOPAPPUS* H. & A.

Low annual with gummy sweet-scented herbage. Leaves linear and entire, or the lower pinnately divided into 3 or 5 filiform segments. Heads small, discoid, yellowish, in a terminal cymose panicle. Involucre bracts 5, in a single series, broadly obovate, concave, wholly herbaceous. Receptacle small, conical. Achenes short-clavate, 4-angled. Pappus of 8 to 12 short obtuse paleae, often colored. (Greek, *amblyus*, blunt, and *pappos*, pappus.)

1. *A. pusillus* H. & A. Stem simple below, paniculately branching above, 4 to 8 (or 16) in. high; involucre campanulate,  $1\frac{1}{2}$  lines high; flowers in a head 14 to 23; pappus-paleae oblong to roundish.—Near the sea, in saline soils or borders of salt marshes: San Luis Obispo Co. to San Diego Co.; Santa Barbara Isls.; s. to L. Cal.; Peru; Chile.

### 120. *CHAENACTIS* DC.

Annual or perennial herbs. Leaves alternate, pinnately parted or dissected or sometimes entire. Heads peduncled, solitary or cymosely arranged. Flowers white or yellow. Bracts of the campanulate or turbinate involucre herbaceous, linear to lanceolate, commonly equal and in one series. Receptacle flat, naked (except in *C. carphoclinia*). Corollas regular, with short tube and long throat, the marginal corollas in some species with the limb palmately enlarged, forming a kind of ray. Pappus of hyaline paleae, the paleae in the outer flowers of the head commonly shorter and fewer. (Greek *chaino*, to gape, and *aktis*, ray, in reference to the marginal flowers of one section of the genus.)

## A. Annuals.

- Pappus none or of deciduous erose or fimbriate paleae.  
 Leaves 2 or 3 times pinnately parted or divided; heads many-flowered..... 1. *C. artemisiaefolia*.  
 Leaves linear or filiform, entire; heads 4 to 8-flowered..... 2. *C. thysanocarpa*.  
 Pappus of persistent entire or erose paleae.  
 Flowers yellow..... 3. *C. glabriuscula*.  
 Flowers white or purplish-tinged.  
 Stamens exserted from corolla-tube.  
 Involucral bracts attenuate at apex into a setaceous or awn-like point; receptacle with slender or awn-like bracts..... 4. *C. carphoclinia*.  
 Involucral bracts obtuse or acute; receptacle naked.  
 Leaves pinnatifid with short thick lobes..... 5. *C. stevioides*.  
 Leaves entire or with elongated slender lobes.  
 Marginal corollas often much enlarged, sometimes developing a 4 or 5-cleft ligule; pappus-paleae in one circle, the paleae equal or unequal..... 6. *C. fremontii*.  
 Marginal corollas scarcely larger than the inner; pappus-paleae in 2 very unlike and unequal circles..... 7. *C. xantiana*.  
 Stamens included in corolla-tube..... 8. *C. macrantha*.

## B. Perennials (or no. 11 sometimes biennial); pappus of 8 to 15 equal paleae.

- Alpine dwarf 1 to 3 in. high; involucre and peduncles permanently tomentose, not glandular; peduncles not bracteate..... 9. *C. nevadensis*.  
 Plants mostly  $\frac{1}{2}$  to 2 ft. high; involucre and peduncles densely glandular-pubescent (except in no. 12); peduncles commonly bracteate, sometimes very sparingly so.  
 Involucral bracts equal, linear-attenuate, acuminate, equaling or slightly exceeding the corollas; leaf-divisions linear..... 10. *C. suffrutescens*.  
 Involucral bracts usually more or less unequal, linear, acute or obtuse, mostly surpassed by the corollas.  
 Heads several to many in a corymbose cluster; stems leafy..... 11. *C. douglasii*.  
 Heads solitary or the stems forked and 2 or 3-headed.  
 Herbaceous; leaves basal or sub-basal,  $1\frac{1}{2}$  to 4 in. long..... 12. *C. santolinoides*.  
 Woody below; stems more or less leafy, the leaves about  $\frac{1}{2}$  to 1 in. long..... 13. *C. parishii*.

1. *C. artemisiaefolia* Gray. Fig. 989. Stem erect, branching, leafy, 1 to 3 ft. high; herbage mealy-pubescent below, the upper portion of the stem and involucre glandular-hirsute and viscid; leaves broadly ovate in outline, 2 to 7 in. long, twice or thrice pinnately parted or divided into oblong or linear divisions; petioles 2 lines to 2 in. long; heads hemispheric,  $\frac{1}{2}$  to 1 in. broad; involucre 4 to 6 lines high, their bracts linear-lanceolate, mostly in a single series; flowers white, the marginal corollas not obviously enlarged; corolla transparent or lucid, its lobes a little roughened inside; achenes linear-clavate, flattened, glabrous or somewhat hispid; pappus none or rarely of deciduous fimbriate paleae.—Foothills, 500 to 2500 ft.: Santa Monica and San Gabriel mountains to San Diego Co. June.

2. *C. thysanocarpa* Gray. Stem slender, branched, 3 to 9 in. high; herbage arachnoid, glabrate in age; leaves linear or filiform, entire,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; heads terminal on the branches, 3 to 4 lines high; involucral bracts 4 to 8, linear-oblong, 4 to 8-flowered; corollas yellow; achenes clavate, striately and finely many-nerved, glandular-dotted; pappus-paleae 11 to 17, narrow-obovate, erose or irregularly laciniate on the sides, deciduous in a ring.—Granitic sand,

989. *Chaenactis artemisiaefolia* Gray; a, leaf x  $\frac{1}{2}$ ; b, portion of an infl. x  $\frac{1}{2}$ ; c, fl. x 2.

8000 to 10,000 ft., region of Mt. Whitney: Whitney Mdws.; Soda Creek; Long Mdw. Aug.-Sept. (*Bahia palmeri* Wats. *Orochaenactis thysanocarpa* Cov.)

3. *C. glabriuscula* DC. Stem branching at or above the base, 5 to 11 (or 19) in. high, the branches ending in rather long one-headed peduncles; herbage thinly floccose, at length glabrous; leaves oblong to roundish in outline,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long, once or twice pinnately parted into narrowly linear lobes, the lobes most commonly short, 1 to 3 lines long, or sometimes to 8 lines long; uppermost leaves linear and merely toothed or entire; heads 4 to 5 (or 8) lines broad; bracts of the involucre thickish; marginal corollas ample, conspicuously longer than those of the disk; pappus-paleae 4 (sometimes 5), oblong-lanceolate, those of the disk equal, those of the marginal achenes 1 or 3 long and 3 short; short paleae of the ray achenes relatively broader or even elliptical.—Foothills and valleys, 300 to 4000 ft.: coastal S. Cal.; South Coast Ranges; Sierra Nevada foothills from Kern Co. to Shasta Co. Apr.-June. Var. *FILIFOLIA* Jepson n. comb. Very slender; leaves or the lobes very slenderly filiform; heads  $2\frac{1}{2}$  to  $3\frac{1}{2}$  lines broad; marginal corollas little enlarged; pappus-paleae commonly 5, unequal, oblong-oblanolate, with 2 very small roundish outer ones.—Dry hills: Napa Range; San Diego Co. (*C. filifolia* H. & G. *C. gracilentia* Greene.) Var. *ORCUTTIANA* Hall. Stouter than var. *tenuifolia*; leaves 2 or 3 times pinnatifid, the lobes very short, obtuse; peduncles and involucre a little glandular-puberulent; involucre bracts linear, acute; marginal corollas regular; pappus-paleae of disk-flowers nearly equaling the corolla, acute.—Seabeaches, San Diego Co. May-June. (*C. tenuifolia* var. *orcuttiana* Greene.) Var. *LANOSA* Hall. Plants 4 to 12 in. high, leafy only at base and bearing at the base naked simple scape-like peduncles ending in large (8 to 9 lines broad) heads; herbage lanate or the tomentum deciduous; leaves thickish, simply pinnate with few narrowly linear and mostly short lobes or the upper entire; pappus equal or nearly equal, narrowly oblong or oblong-lanceolate, acutish.—Sandy valleys or flats: coastal S. Cal.; sw. Mohave Desert; Monterey Co.; lower San Joaquin Valley. Mar.-June. (*C. lanosa* DC.) Var. *HETEROCARPHA* Hall. Stem branching at or above the base (as in all the following varieties except the last); heads on long peduncles; pappus-paleae of disk-achenes 4 or 5, elliptic-oblong, nearly equaling the corolla, and with an outer series of 2 or more, these roundish, very short or minute; paleae of marginal flowers much shorter.—North Coast Ranges; upper Sacramento Valley; Sierra Nevada. (*C. heterocarpa* Gray.) Var. *CURTA* Jepson n. comb. Heads frequently small; pappus-paleae 4 or 5, in one series, broadly oblong, equal or unequal, less than half as long as the corolla, sometimes reduced to a mere crown.—Greenhorn Mts. to San Luis Obispo Co. and w. Riverside Co. (*C. heterocarpa* var. *curta* Gray.) Var. *TENUIFOLIA* Hall. Slender; leaves or their divisions usually filiform and often elongated; involucre bracts linear, thin, acute; marginal corollas often enlarged but seldom exceeding the disk; pappus-paleae of disk-flowers equaling the corolla, acute, those of the marginal flowers similar or much shorter and obtuse.—Light sandy soil, frequent: Santa Barbara to San Diego, e. to San Jacinto Mts. (*C. tenuifolia* Nutt.)

4. *C. carphoclinia* Gray. Stem freely branched from above the base, often bushy, 4 to 12 (or 22) in. high, the branches slender; stems, leaves and involucre finely mealy-pubescent; leaves  $\frac{1}{2}$  to 2 in. long, once or twice pinnately parted into linear or filiform quite remote lobes; heads numerous, 3 to 6 lines broad; involucre 3 to  $3\frac{1}{2}$  lines high, their bracts linear-lanceolate, tapering into subulate often pinkish awns; receptacle with 5 to 10 rigid persistent and filiform or awn-like bracts about equaling the flowers; achenes villous with ascending hairs; paleae of disk-achenes usually 4, narrowly lanceolate, acuminate, a little shorter than the corollas, the marginal or sometimes the inner ones short, broad and obtuse.—Deserts, 100 to 2000 ft.: Colorado Desert; Mohave Desert; Inyo Co.; e. to Nev., Utah and Ariz., s. to L. Cal. Apr.-May. Var. *ATTENUATA* Jones. Pappus-paleae of even the central flowers very short, obtuse or acute,  $\frac{1}{2}$  as long as the corolla.—Inyo Co.; Colorado Desert; e. to Ariz., s. to L. Cal. (*C. attenuata* Gray.)

5. *C. stevioides* H. & A. Stem branching at or above the base, erect, 3 to 12 (or 16) in. high; herbage floccose- or arachnoid-tomentose, more or less glabrate; leaves  $\frac{1}{2}$  to  $1\frac{3}{4}$  in. long, once or twice pinnately parted into few or many linear lobes 1 to 3 lines long, or some of the upper entire; heads on short slender peduncles in an open or somewhat close cyme; some of the marginal corollas more or less enlarged; involucre 2½ to 3½ lines high; bracts obtuse or acutish; achene hispidulous; pappus-paleae of disk-achenes 4, quadratish to oblong-lanceolate, acute, unequal,  $\frac{1}{2}$  to nearly as long as the corolla.—Sandy flats in the deserts, 2000 to 6000 ft.: Colorado and Mohave deserts; e. to Ariz. and Nev., thence n. to Ida. June. Var. *BRACHYPAPPA* Hall. Leaf-segments thick and short; marginal corollas not enlarged; pappus reduced to a mere crown of obtuse or erose paleae or sometimes one of the paleae twice as long ( $\frac{1}{2}$  to 1 line) as the others.—Desert slopes, 5000 to 7500 ft.: Ventura, n. Los Angeles, Kern and Inyo Cos.; Ord Mts., Mohave Desert; Colorado Desert. Mar.-June.

6. *C. fremontii* Gray. Stem branching at or above the base, 2 to 16 in. high; herbage glabrate, sometimes slightly woolly; leaves  $\frac{3}{4}$  to 2 in. long, narrowly linear and entire, or once pinnately parted into linear lobes; branches ending in a long peduncle bearing a single head; involucre bracts broadly linear, acutish; marginal corollas often much enlarged and irregular, sometimes developing a cuneate 4 or 5-cleft ligule; achenes hispidulous; pappus-paleae of central flowers usually 4 to 6, lanceolate, nearly equaling the corolla, sometimes the paleae, especially in marginal flowers, 1 long and several shorter.—Inyo Co.; Mohave and Colorado deserts; e. to Ariz. Mar.-May.

7. *C. xantiána* Gray. Stem branched at or above the base, 7 to 13 in. high, the branches stout and somewhat fistulose; herbage glabrate or some woolliness persistent; leaves  $\frac{3}{4}$  to  $1\frac{3}{4}$  in. long, linear and entire or pinnately parted into linear lobes, sessile or shortly petioled; heads  $\frac{1}{2}$  to  $\frac{3}{4}$  in. broad, borne on stout peduncles; involucre bracts strongly 1-nerved, shorter than the disk or often with spreading foliaceous tips longer than the disk; flowers white or flesh-color, the marginal ones scarcely enlarged; achenes hispid; pappus double, the inner row of paleae linear, 3 to 4 lines long, as long or nearly as the corolla, the outer row of paleae orbicular,  $\frac{1}{2}$  line long.—Ranges bordering or in the deserts, 3500 to 6500 ft.: e. San Diego Co.; San Gabriel Mts. to Mt. Pinos; s. Sierra Nevada in Tulare Co.; New York Mts.; n. along e. side Sierra Nevada to Lassen Co.; n. to eastern Ore. May-June.

8. *C. macránta* Eat. Stems few or several from the base, ascending, 3 to 7 in. high, leafy at base and sparingly so upward, simple and ending in a single head or branched and 2 to several-headed, the peduncles  $\frac{1}{2}$  to 3 in. long, sparingly bracteate or naked; herbage floccose-tomentulose; leaves ovate to roundish in outline, 3 to 9 lines long, once or twice pinnatifid, the lobes oblong, crowded; petioles nearly as long to twice as long; heads broadly turbinate, 2½ to 5 (or 6) lines broad; involucre bracts linear, acuminate; corollas pinkish, much exceeding the involucre; pappus-paleae 4, oblong-linear,  $\frac{1}{2}$  as long as the corolla, also with 2 very short outer ones or these sometimes obsolete.—Desert plains and slopes, 2000 to 4000 ft.: Mohave Desert; Inyo Co.; e. to Utah and Ariz. May.

9. *C. nevadénsis* Gray. Stems several, ascending, 1 to 3 in. high, arising from the simple or branched crown of the taproot and ending above in one-headed peduncles, the leaves borne in tufts on the root-crown or the end of its branches; herbage permanently white-tomentose, not glandular; leaves ovate or roundish in outline, 2 to 9 lines long, once or twice pinnatifid or pinnately parted into obovate or spatulate-linear lobes about 1 or 2 lines long; heads 2½ to 4 lines broad, the peduncles  $\frac{1}{2}$  to 2 in. long; involucre bracts linear, obtuse.—Alpine, 8500 to 12,000 ft.: Sierra Nevada from Mt. Whitney to Pyramid Peak, Mt. Rose and Lassen Peak; nw. to Mt. Shasta. July-Sept.

10. *C. suffrutescens* Gray. Stems several to many, erect or ascending from short decumbent woody branches of the root-crown, 8 to 14 in. high; herbage

990. *Chaenactis douglasii* H. & A.; a, habit  $\times \frac{1}{2}$ ; b, leaf  $\times 1$ ; c, disk-fl.  $\times 1\frac{1}{2}$ .

somewhat unequal; pappus-paleae 9, ligulate to narrowly cuneate,  $\frac{1}{2}$  to  $\frac{3}{4}$  as long as the corolla, or in marginal flowers shorter and broader.—Montane, on sandy or gravelly flats, 4000 to 9000 ft.: Sierra Nevada from Tulare Co. to Modoc Co.; North Coast Ranges from Lake Co. to Siskiyou Co.; n. to Wash., e. to Col. June-July. Var. *ALPINA* Gray. Dwarf tufted perennial from a somewhat woody base, 3 to 5 in. high; herbage densely white-tomentose below, the involucre and peduncles densely glandular-puberulent; leaf-divisions very broad and obtuse.—Montane, 6000 to 8500 ft.: Nevada Co. to Siskiyou Co.; n. to Wash., e. to Wyo. July-Aug.

12. *C. santolinoides* Greene. Fig. 991. Stems scapose and 1-headed, or sometimes forked and 2 or 3-headed, 2 to 11 in. high, arising from a basal tuft of leaves crowded on the branched root-crown; basal herbage densely and permanently white-tomentose, the upper parts glandular-pubescent; leaves oblong in outline,  $1\frac{1}{2}$  to 4 in. long, pinnately parted into many divisions, the divisions oblong, short, few-lobed, crispate; heads broadly turbinate, 5 to 7 lines broad; involucre bracts oblong, obtuse, obscurely nerved, a few of the outer ones commonly very short and spreading; achenes densely hispid; pappus-paleae 8 to 10, exceeding or a little shorter than the corolla.—Montane, dry slopes or open pine forest, 5500 to 9000 ft.:

white-tomentose or the leaves eventually green and more or less glabrate; involucre and peduncles densely glandular-pubescent; leaves ovate in outline,  $\frac{1}{2}$  to 2 in. long, pinnately parted into 5 to 7 lobes, the lobes narrowly linear, entire or rarely 1 or 2-toothed; petioles about as long; heads 6 to 11 lines broad, long-peduncled, solitary on the ends of the stems or branches; involucre bracts linear-attenuate; pappus-paleae 10 to 13, linear or narrowly oblong, a little shorter than the corolla, or in the outermost flowers much shorter.—Dry plains or slopes, 3800 to 6800 ft., Siskiyou Co.: Toad Lake; Edgewood; Shasta Valley; Mt. Shasta. June.

11. *C. douglasii* H. & A. Fig. 990. Stem simple or branching, erect,  $\frac{1}{2}$  to 2 ft. high; herbage flocculent-tomentose to glabrate; peduncles and involucre glandular-puberulent; leaves ovate to oblong-lanceolate in outline,  $\frac{1}{2}$  to 2 in. long, bipinnately parted into crowded lobes, the lobes short, obtuse,  $\frac{1}{4}$  to 2 lines long; heads several to many, corymbosely cymose, 5 to 8 lines broad; involucre  $3\frac{1}{2}$  to 5 lines high, their bracts linear, mostly obtuse,

991. *Chaenactis santolinoides* Greene; a, habit  $\times \frac{1}{2}$ ; b, fl.  $\times 1\frac{1}{2}$ .

San Bernardino Mts.; Mt. San Antonio; Mt. Pinos; Pah Ute Peak, Kern Co. June.

13. *C. parishii* Gray. Stems several to many, erect, arising from a branched woody base,  $\frac{3}{4}$  to 2 ft. high, leafy at base and on lower part, sparingly leafy-bracteate or nearly naked above and bearing a single head or branched and bearing 2 or 3 long-peduncled heads; herbage white with close wool, glabrate above; involucre sometimes minutely glandular; leaves oblong in outline,  $\frac{1}{2}$  to 1 in. long, pinnately parted, the lobes linear, obtuse, mostly entire, about 2 lines long; heads 5 to 8 lines broad; involucre bracts very unequal, loose, linear, obtuse, pappus-paleae 9 to 15, linear, nearly as long as the corolla.—Montane, 5000 to 7000 ft.: San Jacinto and Santa Rosa mountains; s. to L. Cal. June-July.

#### 121. PALAFÓXIA Lag.

Herbs or sometimes woody-based plants. Stem branching, bearing loosely cymose heads. Leaves alternate, entire. Flowers whitish, but the heads pinkish on account of the elongated pink styles. Heads discoid, rather narrow. Involucre oblong or campanulate. Bracts of the involucre subequal, linear, mostly in a single series, lightly clasping the outer achenes. Receptacle flat. Corollas all alike or sometimes the outer with unequal lobes; throat long. Style-branches elongated, puberulent throughout. Achenes slender, pubescent, as long as the involucre, the exserted pappus conspicuous. Pappus of 4 to 8 slender unequal paleae nearly as long as the achene. (Jose Palafox, Spanish patriot and general, noted defender of Saragossa against Napoleon's armies.)

1. *P. linearis* Lag. Fig. 992. Erect branching annual  $\frac{3}{4}$  to 2 ft. high, the branches ending above in loosely cymose heads, or some of the plants becoming perennial, woody at base and diffuse; herbage scabrous or hispid, the leaves canescent; leaves linear or linear-lanceolate,  $\frac{3}{4}$  to  $2\frac{1}{2}$  in. long, the petioles 2 to 5 lines long; involucre 6 lines long, the flowers 10 lines long with long-exserted pink styles; paleae 4 (sometimes 5), narrowly linear, acute, unequal, with very strong midrib and narrow membranous margins, or with 2 or all of the paleae very short and blunt, especially in the outer flowers.—Desert washes or dunes, Colorado and Mohave deserts; n. to Coso Mts.; e. to Ariz., s. to Mex. Pappus paleae sometimes notched.

992. *Palafoxia linearis* Lag.; a, leaf  $\times \frac{1}{2}$ ; b, fl. branchlet  $\times \frac{1}{2}$ ; c, fl.  $\times 1\frac{1}{2}$ .

#### 122. TRICHOPTILIUM Gray

Low loosely woolly desert annual. Leaves alternate or the lower opposite. Heads yellow, discoid, solitary on slender ascending peduncles, or the earlier peduncles scape-like. Involucre hemispherical, its bracts 15 to 20, somewhat in 2 series, nearly equal, ovate-lanceolate, acute, a few inner ones spatulate and obtuse. Corolla with very short proper tube and elongated throat, the short lobes pubescent externally, spreading; outer corollas slightly enlarged. Style-branches linear, obtuse. Achenes oblong-turbinate, hirsute. Pappus-paleae 5, dissected into slender bristles, the middle ones of each

palea little shorter than the corolla, the outer regularly shorter. (Greek trichos, hair, and ptilon, feather, the pappus-paleae feathery-dissected.)

1. *T. incisum* Gray. Stem diffusely much-branched, forming plants 2 to 6 in. high and sometimes twice as broad; leaves and branches loosely white-woolly, the leaves at last green and subglabrate; leaves rather densely tufted on the upper part of the branches, narrowly spatulate to obovate, entire or incised-serrate,  $\frac{1}{2}$  to 2 in. long, narrowed below to a margined petiole; peduncles slender, naked, glandular-pubescent, not woolly, 1 to  $3\frac{1}{4}$  in. long; heads 3 to 4 lines high; bracts of the involucre linear-lanceolate; pappus clear white, sometimes reddish brown.—Stony soil in the deserts, 100 to 1500 ft.: Colorado Desert; e. to Ariz., s. to L. Cal.

### 123. *HYMÈNOPAPPUS* L'Her.

Perennial herbs with sulcate or channeled stems. Leaves mostly basal, the cauline alternate, pinnately parted or divided. Heads discoid, borne in an open panicle or solitary and terminal on the elongated peduncles. Involucre campanulate or hemispheric, its bracts 6 to 12, in 2 series, broad, the margins scarious and often colored. Corolla with narrow tube, the throat cylindric, abruptly dilated, its lobes spreading or recurved. Achenes obpyramidal, 4 or 5-angled. Pappus of 10 to 20 thin obtuse or awned paleae, sometimes reduced or none. (Greek humen, membrane, and pappos, pappus, the paleae hyaline.)

Pappus-paleae not awn-tipped; flowers yellow.....1. *H. filifolius*.  
Pappus-paleae awn-tipped; flowers white or purplish.....2. *H. wrightii*.

1. *H. filifolius* Hook. Stems several, erect, arising from the branched root-crown, 10 to 22 in. high, naked or nearly so, the cauline leaves mostly few, scattered and reduced; herbage densely white-woolly or slightly glabrate, the root-crown often with dense persistent flocs of wool; basal leaves ovate or oblong in outline, 1 to 3 in. long, bipinnately divided into linear lobes, the petioles 1 to  $1\frac{1}{2}$  times as long; panicle very open, the few heads or peduncles 1 to  $5\frac{1}{4}$  in. long; heads 5 to 6 lines high; bracts oval to oblong, obtuse, mostly equal, the scarious margins usually greenish; flower yellow; corolla-throat cylindric or a little narrowed downward, longer than the tube; achenes rather densely long-villous, at least on the angles; pappus-paleae about 14, equaling or a little exceeding the corolla-tube.—Foothills and mountain slopes and summits in or bordering the deserts, 4000 to 8000 ft.: Providence Mts.; e. to southern Nev., Ariz. and Neb. May-July. Var. *LUGENS* Jepson n. comb. Bracts more distinctly unequal, the short outer ones with reddish brown margins, the inner ones with scarious-greenish margins.—Mountain slopes and summits, 5000 to 6500 ft.: San Bernardino Mts.; Santa Rosa Mts.; Cuyamaca Mts.; s. to L. Cal. June. (*H. lugens* Greene.)

2. *H. wrightii* Gray var. *viscidulus* Jepson n. var. Stems erect, few or several from the branched root-crown, 10 to 12 in. high; herbage glandular and hirsute; leaves roundish to ovate in outline,  $\frac{1}{2}$  to  $\frac{3}{4}$  in. long, pinnately twice or thrice divided into somewhat crowded linear lobes, the petioles  $\frac{1}{2}$  to  $\frac{2}{3}$  as long; heads 4 to 5 lines high, few in open cymes; flowers white or purplish; involucre bracts linear-oblong, with broad scarious obtuse often erosulate types; achenes villous; pappus-paleae linear or lanceolate, the midrib continued as an awn nearly as long as the corolla.—Cuyamaca Mts., San Diego Co. (T. Brandegee, type). Oct.

### 124. *HYMENÓXYS* Cass.

Erect herbs with leafy stems bearing 1 to many cymose heads. Herbage aromatic. Leaves alternate, thickly punctate, pinnately parted or divided in ours. Heads radiate, long-peduncled, in loose cymes or solitary. Bracts of the involucre rigid, coriaceous, in 2 distinct series, the outer ones united at base. Receptacle convex or low conic. Flowers yellow. Ray-flowers fertile, the rays short and often broad, 3-toothed. Disk-flowers fertile. Achenes turbinate, hairy-pubescent. Pappus paleaceous, the paleae 5 to 12 hyaline, obtuse to awn-pointed. (Greek humen, membrane, and oxus, sharp, referring to the thin pointed pappus scales.)

- Paleae of the pappus obtuse, erose at summit; outer bracts not punctate or only sparingly so ..... 1. *H. cooperi*.  
 Paleae of pappus acuminate or cuspidate.  
 Involucre hemispheric, about 6 lines broad; outer bracts 10 to 14, punctate.  
 Stems densely leafy; pappus-paleae lanceolate, gradually acuminate; achenes silky-villous with rusty hairs; Siskiyou Co. .... 2. *H. lemmonii*.  
 Stems sparsely leafy; pappus-paleae ovate, abruptly acuminate; achenes silky-villous with white hairs; e. Mohave Desert. .... 3. *H. biennis*.  
 Involucre campanulate, 2½ to 4 lines broad; outer bracts 8 to 10, not punctate. .... 4. *H. chrysanthemoides*.

1. *H. cooperi* (Gray) Ckll. Stem simple, leafy and leafy-tufted at base, 1½ to 1¾ ft. high, arising from a perennial root, ending above in a cyme; herbage minutely puberulent; leaves ¾ to 3¼ in. long, pinnately 3 to 5-divided into 5 to 9 lobes, the lobes very narrowly linear, remote, ½ to 1½ in. long, or the lower twice-parted; cyme corymbose, few to several-headed; involucre hemispherical, their outer bracts 6 to 10; rays 3 to 5 lines long; achenes densely rusty-villous with ascending hairs; pappus-paleae 5, ovate or oblong, obtuse, erose at summit, about ½ or ⅓ as long as the pubescent or somewhat pruinose disk-corollas.—Providence Mts., e. Mohave Desert; e. to northern Ariz. June-Sept.

2. *H. lemmonii* (Greene) Ckll. Stems simple below, few or several from the branched perennial root-crown, leafy, 1 to 1½ ft. high; herbage glabrous; leaves 3 to 7 in. long, pinnately once or twice divided into long linear segments, the petioles ½ to 1½ times as long; heads several in somewhat corymbose cymes, the peduncles long or short; involucre hemispheric; outer bracts lanceolate, united at base, punctate; inner bracts ovate, erosulate, mucronate; rays about 12, 4 to 6 lines long; disk-flowers densely glandular; achenes densely silky-strigose with rusty hairs; pappus-paleae lanceolate, gradually acuminate, rusty-red.—Open valleys, 2000 to 3000 ft., Siskiyou Co.: Edgewood; Shasta Valley; Yreka; Montague; e. to Nev. June-July.

3. *H. biennis* (Gray) Hall. Stems 1 or several from the base, usually much branched, purplish-brown, channeled, slightly mealy-pubescent, 1½ to 2¼ ft. high, arising from a biennial root; leaves 1 to 3 in. long, 3 to 5-parted into narrowly linear lobes, puberulent; heads loosely cymose, pedunculate; involucre hemispheric; outer bracts 12 to 14, broadly lanceolate, punctate, glandular-puberulent, united about ⅓ the way from the base; inner bracts slightly longer, with shortly acute tips; rays 10 to 14, yellow, 6 to 8 lines long; achenes densely silky-strigose; pappus-paleae round-ovate to lanceolate, erose, cuspidate-awned, about ¼ as long as the tomentulose disk-corolla.—Montane, 4000 to 6000 ft.: New York Mts., e. Mohave Desert; e. to Ariz. and Utah. July. (*Actinella biennis* Gray. *Hymenoxys canescens* var. *nevadensis* Ckll.)

4. *H. chrysanthemoides* DC. var. *excurrens* Ckll. Annual; stem freely branching at or above the base, 10 to 20 in. high, the many branches ending in rather long-peduncled heads; herbage minutely pubescent, the growing parts somewhat tomentulose; leaves 1 to 1½ (or 2½) in. long, 3 to 5-parted into nearly filiform lobes, the lobes sometimes again divided; petioles about 2 to 10 lines long; involucre campanulate or subcylindric, 2¼ to 3 lines high; outer bracts commonly 7 or 8, oblong or lanceolate; inner bracts ovate, about half longer than the outer; rays 8 to 10 (or 12), yellow, 2½ to 4 lines long, merely toothed at apex; pappus-paleae ovate, pointed, ⅓ as long as the corolla.—Lowlands along the Colorado River from Palo Verde Valley to Yuma, 150 to 450 ft.; e. to Ariz., s. to Mex.

#### 125. HULSEA T. & G.

Biennial or perennial montane herbs. Herbage balsamic-scented. Leaves mainly basal, sometimes alternate and sessile on the stems, the basal ones mostly drawn down to broad petioles. Heads rather large, radiate, yellow or purple, solitary or corymbose. Involucre many-flowered, its bracts in 2 or 3 series, narrow, acute. Receptacle flat. Achenes linear-cuneate, flattened or somewhat three-angled, soft-villous, especially on the margins. Pappus of mostly 4 truncate hyaline paleae, nearly entire or lacerate at the summit. (G. W. Hulse, U. S. army surgeon, who collected in California.)

Herbage viscid-pubescent (not woolly); stems equably leafy; leaves sessile; middle altitudes.

Rays 10 to 17, yellow, glabrous,  $1\frac{1}{2}$  lines broad.....1. *H. brevifolia*.

Rays 50 to 70, purple, hairy,  $\frac{1}{2}$  line broad.....2. *H. heterochroma*.

Herbage white-woolly when young, more or less denudate in age; leaves mostly with a broad petiole; rays yellow.

Leaves linear; alpine plants.

Involucral bracts oblong to ovate, acute; leaf-margins crinkled or crenate.....

3. *H. nana*.

Involucral bracts narrowly linear-attenuate; leaves low or saliently dentate.....

4. *H. algida*.

Leaves round-ovate to spatulate; mostly middle altitudes.

Rays  $1\frac{1}{2}$  to 5 (or 7) lines long; flowering plants mostly with white-woolly leaves.

5. *H. vestita*.

Rays 6 to 8 lines long; flowering plants mostly with green leaves. 6. *H. californica*.

1. *H. brevifolia* Gray. Stems slender, several from the crown of a perennial taproot, 1 to  $1\frac{1}{2}$  ft. high, the stem or simple branches ending in a single head; leaves spatulate-oblong to linear, denticulate, 1 to  $1\frac{3}{4}$  in. long; heads smaller than in *H. heterochroma*; involucre 5 lines high, its bracts linear, acute, rather loose; rays 10 to 17, light yellow, 4 to 5 lines long; paleae of the pappus merely erose. — Montane, about 7500 ft., Mariposa Co.: Clouds Rest; Snow Creek; Indian Cañon; Buck Camp.

993. *Hulsea heterochroma* Gray; a, part of fl. stem  $\times \frac{1}{2}$ ; b, ray-fl.  $\times 2$ ; c, disk-fl.  $\times 2$ .

2. *H. heterochroma* Gray. Fig. 993. Robust branching annual  $1\frac{1}{2}$  to 3 ft. high; herbage very viscid-villous with a rank odor; leaves narrowly elliptic to oblong, saliently dentate, 2 to 3 (or 5) in. long; heads corymbosely or racemosely disposed; involucral bracts lanceolate, attenuate, 6 to 7 lines long; rays 50 to 70, narrowly linear, purple,  $2\frac{1}{2}$  to 3 lines long; disk-corollas yellow, their tubes hirsute; achenes with straight spreading hairs; pappus-paleae 4, in 2 unequal pairs, lacerate. — Montane, 3000 to 8000 ft.: San Jacinto, San Bernardino and San Gabriel mountains; Santa Lucia Mts.; sw. San Benito Co.; Sierra Nevada from Tulare Co. to Mariposa Co.

3. *H. nana* Gray. Stems 2 to 7 in. high, one to several from the crown of a stout perennial root, simple, stoutish, terminated by a single rather large head; herbage viscid-pubescent, the cottony wool early deciduous; leaves narrow to broadly linear, irregularly crinkled or dentate or pinnately sinuate, 1 to 3 (or 4) in. long, mostly basal, those of the stem few and smaller; involucre sparingly tomentose, viscid, 6 lines high, its bracts narrowly oblong, acute; rays numerous, yellow, linear, 4 to 5 lines long; pappus-paleae equal or unequal, fimbriate. — Loose volcanic rocks, peaks of n. Cal., 8000 to 11,000 ft.: Lassen Peak; Mt. Shasta; Mt. Eddy; n. to Cascade Mts. of Ore. and Wash. (Var. *larsenii* Gray.)

4. *H. algida* Gray. Similar to *H. nana*; leaves low or sometimes saliently dentate; heads somewhat larger; involucre loosely woolly, the wool more persistent; bracts linear-attenuate. — High peaks, 11,000 to 14,000 ft.: Sierra Nevada from Mt. Whitney to Mt. Rose; White Mts.; n. to eastern Ore.

5. *H. vestita* Gray. Stems scape-like and one-headed, 4 to 12 in. high, arising from a perennial root and a rosette of white-tomentose leaves; leaves roundish (or sometimes oblong) -spatulate, entire or sinuate-dentate, drawn down below to a long winged petiole, 1 to  $1\frac{1}{2}$  in. long; stems and involucre viscid-pubescent; bracts of the involucre linear-lanceolate, acute, 5 to 6

lines long; rays yellow 3 to 4 ( $1\frac{1}{2}$  to 7) lines long, sometimes very short or none; pappus-paleae about 4, silvery, quadratish, lacerate.—Loose gravelly or sandy soil, higher crests and slopes of ranges bordering the deserts, 6000 to 9500 ft.: Sierra Nevada from Madera Co. to Kern Co.; Frazier Mt.; San Bernardino Mts.; also in sw. Nev. Var. *PYGMAEA* Gray. Subalpine or alpine dwarf; heads on short peduncles or even subsessile in the tuft of basal leaves; rays deep dull yellow.—High peaks, 8000 to 11,000 ft.: San Bernardino Mts.; s. Sierra Nevada in Tulare Co. Var. *CALICARPHA* Hall. El Caparossa. Biennial or perennial; stems branching from near the base or at the middle,  $\frac{3}{4}$  to 3 ft. high; leaves basal and along the stems,  $1\frac{1}{2}$  to  $4\frac{1}{2}$  in. long; rays yellow, sometimes with purplish base.—Open or pine-covered slopes, 4000 to 6000 ft.: San Gabriel, San Jacinto, Palomar and Cuyamaca mountains.

6. *H. californica* Gray. Robust branching biennial; stems leafy throughout, 2 to 3 ft. high; leaves ample, oblong-spatulate, irregularly dentate or sinuate, 3 to  $5\frac{1}{2}$  in. long, the uppermost ovate to lanceolate, smaller; heads racemose or corymbose towards the ends of the branches, rather short-peduncled; bracts of the involucre lanceolate; rays many, 6 to 8 lines long; pappus-paleae oblong-quadratish, erose, in somewhat unequal pairs or sometimes equal.—S. San Diego Co. (Campo); s. to L. Cal.

## 126. *VENEGASIA* DC.

Perennial herb with tall leafy stems. Leaves alternate, petioled, ovate, cordate or truncate at base. Heads large, radiate, few in the upper axils and terminal, short-peduncled. Involucre of 2 or 3 series of broadly oval mostly membranous bracts, the outermost loose and herbaceous, the innermost broader and membranous. Receptacle flat. Corolla-tube densely glandular-bearded at base. Rays numerous, showy, yellow. Achenes many-nerved. Pappus none. (Michael Venegas, Jesuit missionary.)

1. *V. carpesioides* DC. Stem erect, sparingly branched, 3 to 8 ft. high, with the aspect of *Helianthus*; herbage glabrous, or minutely pubescent above; leaves thin, serrate or subentire, 2 to 6 in. long, on petioles about  $\frac{1}{2}$  as long; rays 13 to 20, about  $\frac{1}{2}$  to 1 in. long, entire and acute, sometimes toothed or irregularly lacerate at tip; achenes about 12-nerved, papillose-roughened.—Coastal region from Santa Barbara Co. to w. Riverside Co. and to San Diego Co.

## 127. *JAUMEA* Pers.

Perennial glabrous herbs. Leaves linear, entire, fleshy, opposite and connate at base. Heads middle-sized, many-flowered, solitary, terminating the branches, radiate. Flowers yellow, all fertile, the rays pistillate. Involucre cylindraceous-campanulate, its bracts broad and imbricated, the outermost short and fleshy. Receptacle conical. Corolla glabrous. Style-branches of the disk-flowers thickened upward and papillose. Achenes linear, striately 10-nerved. Pappus (in ours) none. (I. H. Jaume St. Hilaire, French botanist.)

1. *J. carnosa* Gray. Stems simple, erect, 4 to 6 in. high, arising from the root-crown, or the second year with the lower portion persistent and prostrate, rooting at the nodes on the under side, and sending up erect stems above; leaves thick,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long; heads 6 to 7 lines high; rays 9 to 12,  $1\frac{1}{2}$  lines long.—Salt marshes and beaches along the California coast; n. to B. C. June-Oct.

## 128. *HELENIUM* L. SNEEZEWEED

Erect perennial herbs with resinous-dotted herbage. Leaves alternate, sessile except the lower, and often decurrent on the stem. Heads solitary or corymbose, borne on long naked peduncles. Flowers golden-yellow, or the disk-corollas turning yellowish or brown. Rays several to many, usually drooping or deflexed. Bracts of the involucre linear, reflexed. Receptacle globose or hemispherical. Achenes turbinate, ribbed. Pappus of 5 to 12 thin or hyaline paleae, in ours short-pointed. (Greek name of some plant, perhaps named after Helenus, son of Priam.)

- Leaves not decurrent on the stem; rays relatively narrow, spreading; bracts of the involucre tardily reflexed ..... 1. *H. hoopesii*.  
 Leaves decurrent on the stem; rays very broad, deflexed; bracts of the involucre reflexed.  
 Rays shorter than the disk, 3 to 5 lines long ..... 2. *H. puberulum*.  
 Rays as long or longer than the disk, 7 to 9 lines long.  
 Disk subglobose; pappus about half as long as the disk-corolla ..... 3. *H. bigelovii*.  
 Disk broader than high; pappus nearly as long as the disk-corolla. 4. *H. bolanderi*.

1. *H. hoopesii* Gray. Stem stout,  $1\frac{1}{4}$  to 3 ft. high, leafy, bearing 3 to 13 large heads; herbage tomentulose or soon glabrate; leaves thickish, entire, oblong-oblancheolate, somewhat nervose, 5 to 10 in. long, the basal with long tapering base,  $\frac{1}{2}$  to  $1\frac{1}{2}$  ft. long; disk hemispherical,  $\frac{1}{2}$  to  $\frac{3}{4}$  in. high; rays 14 to 19, showy, 8 to 10 lines long, tardily reflexed; paleae of the pappus ovate-lanceolate, attenuate-acuminate,  $\frac{3}{4}$  as long as the corolla; achenes densely tawny-hairy.—High montane, 6300 to 9500 ft.: Sierra Nevada from Tulare Co. to Tuolumne Co.; Warner Range; n. to Ore., e. to the Rocky Mts. The herbage is markedly poisonous to sheep, less so to cattle.

994. *Helenium puberulum* DC.; a, fl. branchlet  $\times \frac{1}{4}$ ; b, leaves  $\times \frac{1}{4}$ ; c, head  $\times 1$ ; d, e, rays  $\times 5$ ; f, achene and pappus  $\times 10$ .

2. *H. puberulum* DC. ROSILLA. Fig. 994. Stem erect, paniculately branched, 2 to 5 ft. high, the branches ending in long slender peduncles; herbage puberulent; leaves lanceolate or narrowly linear or the longest oblong, sessile and strongly decurrent on the stem; globose disk of flowers 5 to 7 lines broad; rays and bracts of the involucre reflexed, short and inconspicuous; disk-flowers red-brown; scales of pappus ovate, short-awned.—Creek beds, stream banks and about springy places, 5 to 2000 ft.: coastal S. Cal.; Coast Ranges; Sierra Nevada foothills in Butte Co.; s. to L. Cal. July-Nov.

3. *H. bigelovii* Gray. BIGELOW SNEEZEWEED. Stem 2 to 4 ft. high, branching above into several erect peduncle-like branches, rarely simple; leaves lanceolate to broadly oblong-lanceolate or linear, thickish, 4 to 10 in. long, glabrous or minutely tomentose, not so conspicuously decurrent as in *H. puberulum*; rays showy, 7 to 9 lines long; disk brown or brownish yellow; pappus-paleae 5 to 8, ovate-lanceolate, tapering into a slender awn; achene sparingly hairy.—Marshy or springy ground: San Jacinto and San Bernardino mountains and Sierra Nevada, 3500 to 7500 ft.; North Coast Ranges, 5 to 3500 ft.; e. to Ariz., n. to southwestern Ore. Var. *FESTIVUM* Jepson n. var. Upper leaves sessile and decurrent, often broader than the basal (sometimes 2 in. broad); heads  $1\frac{1}{2}$  to  $2\frac{1}{2}$  in. broad; rays 20 to 30, very broadly cuneate, 1 in. long, 4 to 6 lines wide, 3 (4 or 2)-lobed at apex, rather densely short hairy on the under side; pappus-paleae about 6 to 9, awn-tipped; achenes of the 2 or 3 outer rows somewhat obovate, rather broader than the oblong central ones.—Humboldt Bay (J. P. Tracy 1204, type).

4. *H. bolanderi* Gray. Stems stout, often simple,  $1\frac{1}{2}$  to 2 ft. high, somewhat flocculent-pilose; leaves oblanceolate to ovate-lanceolate; peduncles thick, a little enlarged upwardly; disk 10 to 13 lines broad, decidedly broader than high; rays 9 to 12 lines long; paleae of pappus lanceolate or subulate, with a slender bristle almost equaling the disk-corolla.—Boggy places along the seacoast, Mendocino and Humboldt Cos.: Ft. Bragg; Cleone; Shelter Cove.

129. *ACTINÉLLA* Nutt.

Perennial herbs. Leaves thickly punctate, in basal tufts or alternate. Heads radiate, commonly solitary on scape-like peduncles. Bracts of the involucre many, nearly equal, in 2 or 3 series. Receptacle low-conical. Rays inclined to persist and turn pale. Achenes silky-villous. Pappus of 5 to 7 hyaline paleae. (Diminutive of *Actinea*, from Greek *aktis*, ray.)

1. *A. acúlis* Nutt. Stems naked, scape-like, 3 to 6 in. high, the leaves in dense basal tufts, both stems and leaves borne on the short stout branches of the root-crown; herbage white-villous, the long hairs mostly deciduous except at base; leaves linear-oblongate or spatulate, entire, drawn down to a narrow base,  $\frac{1}{2}$  to 2 in. long; heads 3 to 5 lines high; involucre hemispheric, their bracts oblong, obtuse; rays yellow, 3 to 5 lines long, 3 to 4 lines wide, 3-toothed at apex; paleae oblong to quadratish, bristle-tipped.—Desert mesas, 4000 to 8000 ft.: e. Mohave Desert (New York Mts.); Nev. to N. Mex. and Mont. May.

130. *PSILOSTROPHE* DC.

Herbs or low shrubs. Leaves narrow, alternate. Heads conspicuously radiate, solitary or cymose, the flowers all fertile. Ray-flowers 3 to 8, the rays yellow, persistent and becoming papery. Disk-flowers 5 to 12, their corollas with short proper tube. Style-branches truncate-capitate. Achenes narrow, terete, obscurely striate or angled. Pappus of 4 to 6 hyaline paleae. (Greek *psilos*, bare, and *strophe*, to turn.)

1. *P. cóoperi* (Gray) Greene. Low shrub 1 to  $1\frac{3}{4}$  ft. high, the stems and branches densely white-lanate, the leaves whitish-tomentulose, more or less glabrate and green in age; leaves linear to narrowly spatulate, entire,  $\frac{1}{2}$  to 2 in. long; involucre  $2\frac{1}{4}$  to 3 lines, its bracts 15 to 30, the inner ones soft, the outer ones rigid, oblong; rays 4 to 8, quadratish or broadly oval, 6 to 9 lines long, 4 to 6 lines wide, 3-toothed at the broad apex; pappus-paleae oblong or lanceolate, entire or erose-laciniate, shorter than the achene.—Desert mesas: e. Mohave Desert (Providence Mts. and Leastalk); Chuckawalla Bench, Colorado Desert; e. to Ariz. and southern Nev., s. to L. Cal. (*Riddellia cooperi* Gray.)

131. *BÁILEYA* Harv. & Gray

Densely floccose-woolly desert herbs. Leaves alternate, pinnatifid or entire. Heads solitary, radiate, peduncled. Involucre hemispherical, of many distinct linear bracts very woolly on the back. Ray-flowers pistillate, the rays persistent, bright yellow and showy when young, becoming papery and reflexed in age. Disk-flowers perfect and fertile, the corolla-teeth with a dense short beard on the back. Achene oblong-linear or clavate, truncate at the obscurely toothed apex, glabrous, strongly many-nerved, muriculate on the nerves. Pappus none. (J. W. Bailey of West Point, early American microscopist.)

Rays 5 to 8; peduncles mostly  $\frac{1}{4}$  to 1 in. long. .... 1. *B. pauciradiata*.  
Rays 25 to 50; peduncles mostly 3 to 10 in. long. .... 2. *B. multiradiata*.

1. *B. pauciradiata* Harv. & Gray. Perennial but flowering the first year; stems erect, freely branching, leafy,  $\frac{3}{4}$  to  $1\frac{1}{2}$  ft. high; herbage white with a loose or pilose tomentum; leaves bipinnatifid with remote lobes, the upper leaves (or sometimes nearly all) linear and entire; heads  $\frac{1}{2}$  to  $\frac{3}{4}$  in. broad; bracts strongly 3-nerved; rays roundish-oval, 3 to 4 lines long.—Sandy soil in the deserts, common: Mohave and Colorado deserts; e. to Ariz. Apr.-May.

2. *B. multiradiata* Harv. & Gray. Annual or perennial, 6 to 18 in. high; stems several to numerous from the base, simple, erect or nearly so, leafy mostly at base, soon passing into elongated naked one-headed peduncles; herbage appressed white-woolly; leaves pinnatifid with mostly close-set lobes, the upper few-toothed or entire; heads 1 to  $1\frac{1}{4}$  in. broad; involucral bracts weakly 3-nerved; rays oblong to quadrate, truncatish at apex, 4 to 6 lines long.—Loose or sandy soil, e. Mohave Desert: New York Mts.; Leastalk; e. to Tex., s. to Mex. Var. *PLENIRADIATA* Cov. Stems several to numerous from the base, branching and leafy nearly throughout; peduncles mostly

very much shorter and more or less leafy below; heads smaller (about  $\frac{3}{4}$  in. broad); rays clear lemon-yellow.—Inyo Co.; e. Mohave Desert; ne. Colorado Desert; e. to Ariz. and N. Mex., s. to L. Cal.

### 132. *WHITNEYA* Gray

Perennial herbs. Stems from filiform rootstocks, bearing 2 to 4 pairs of opposite leaves. Leaves mostly on lower part of stem. Heads radiate, on long peduncles in a 3 (or 5)-flowered cyme or solitary. Involucre campanulate, its bracts 9 to 12, oblong or lanceolate, nearly in a single series. Receptacle narrow-conical, rather densely hairy. Flowers yellow. Ray-flowers 7 to 9, fertile, the rays 10 to 16-nerved, persistent and becoming thin-chartaceous. Disk-flowers sterile, the corollas persistent. Fertile (or ray) achenes oblong, slightly obcompressed, hirsutulose. Pappus none. (J. D. Whitney, Director of the California Geological Survey, 1860 to 1870.)

1. *W. dealbata* Gray. Plant with the aspect of *Arnica*; stems erect, one or few from the root-crown, 8 to 16 in. high; herbage whitish or pale with a minute close canescence; leaves ovate to oblong-lanceolate or -oblanceolate, obtuse, mucronate, entire,  $1\frac{1}{2}$  to 4 in. long, gradually attenuate into petioles  $\frac{3}{4}$  to 2 in. long, the lower petioles somewhat connate at base; upper leaves small, lanceolate or linear; heads 5 to 7 lines high; rays 9 to 11 lines long.—Montane, 5000 to 7000 ft., Sierra Nevada, rare: Millwood, Fresno Co.; Cherry Creek, Tuolumne Co.; Pole Creek, Truckee River; Jonesville, n. Butte Co.; Eagle Lake, Lassen Co.

### 133. *POROPHYLLUM* Vaill.

Perennial herbs. Herbage very glabrous, the involucre and rarely the leaves dotted with oil-glands. Leaves alternate, narrowly linear, entire. Heads in open cymes or solitary, narrow, discoid. Involucre of 5 equal broadly linear bracts, naked at base. Style appendages subulate. Achenes black, rusty-pubescent. Pappus of numerous capillary bristles. (Greek poros, a passage, and phyllon, leaf, the involucreal leaves with translucent oil-glands.)

1. *P. gracile* Benth. Plants  $\frac{1}{2}$  to  $2\frac{1}{2}$  ft. high, the branched woody base bearing numerous erect branches, these slender and sparingly leafy and somewhat rush-like; herbage ill-scented; leaves filiform or linear, entire,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long; heads cylindric, 7 to 9 lines high; involucreal bracts hyaline-margined; flowers dull white or purple.—Arid plains and hillsides: Riverside; El Cajon; Needles; Ariz. to Nev., Tex. and Mex.

995. *Nicollétia occidentalis* Gray; a, fl. branchlet  $\times \frac{1}{2}$ ; b, pappus-palea  $\times 3\frac{1}{2}$ ; c, ray-fl.  $\times 2$ ; d, disk-fl.  $\times 2$ ; e, pappus-bristle  $\times 3\frac{1}{2}$ .

### 134. *NICOLLÉTIA* Gray

Perennial herbs with very glabrous and somewhat succulent herbage. Leaves alternate, pinnately parted. Heads large, radiate, the rays purplish or pinkish, the disk-corollas yellow, aging pink. Involucre short-oblong, its bracts 8 to 12, oblong, abruptly acute, all equal or often with 2 or 3 very short outer ones, all dotted with a few conspicuous oil-glands. Achenes narrowly clavate, rusty-pubescent. Pappus double, the outer of many capillary bristles, the inner of 5 thin lanceolate paleae tipped with a scabrous awn. (J. N. Nicollet, early American astronomer and explorer).

1. *N. occidentalis* Gray. Fig. 995. Stems several from the deep-seated crown of a taproot,  $\frac{1}{2}$  to 2 ft. high, corymbosely branched at summit, leafy up to the heads; herbage with a heavy sickening odor; leaves  $\frac{1}{2}$  to  $1\frac{3}{4}$  in. long, with short linear pungent lobes; heads 6 to 8 lines high; principal bracts of the involucre with a broad and a narrow one alternating; rays 8, pink-purple, striped with pink on the back, 2 to 3 lines long.—Deep sandy soil or sandy washes, Mohave Desert.

### 135. *DYSODIA* Cav.

Ours strong-scented perennial herbs with conspicuously striate stems. Herbage glabrous or scaberulous, the involucre and leaves blotched with conspicuous oil-glands. Heads rather large, solitary, terminating naked peduncles. Flowers yellow; rays present or none. Involucre with an inner series of strongly ridged nearly or quite distinct bracts and an outer or accessory series of much shorter calyculate ones. Achenes striate, glabrous. Pappus-paleae 10 or 12, each deeply divided into 4 to 6 very unequal slender bristles. (Greek *dysodia*, a disagreeable smell.)

Heads about 1 in. broad; rays 3 to 5 lines long.....1. *D. cooperi*.  
Heads about  $\frac{1}{2}$  in. broad; rays few and inconspicuous, 1 line long....2. *D. porophylloides*.

1. *D. cooperi* Gray. Stems many from the branching woody crown of a thick root, 11 to 14 in. high; herbage scaberulous; leaves alternate, obovate to oblong, spinulose-dentate, 5 to 10 lines long, the apex often provided with an oil-gland, the base commonly with a pair; peduncles dilated upwards; bracts with 1 to 3 oblong oil-glands, a conspicuous one just below the abruptly subulate-acuminate tip; rays 12 to 16, 3 to 5 lines long; pappus 3 to 4 lines long.—Dry ravines, Mohave and Colorado deserts; e. to Ariz.

2. *D. porophylloides* Gray. Habit of no. 1; leaves alternate or some of the lower opposite, lower leaves pinnately 3 to 5-parted into linear or oblong cuspidate lobes, the tips of the lobes blotched with an oblong oil-gland, the basal part of the leaf usually with a pair; involucre bracts acute, mostly with a series of linear or oblong glands on each margin above the middle; pappus 4 to 5 lines long.—Colorado Desert and n. to the southern part of the Mohave Desert at Dale; e. to Ariz. Herbage glabrous.

### 136. *PÉCTIS* L.

Low herbs with glabrous herbage. Leaves narrow, opposite, bearing large elliptic glandular dots, hence often aromatic. Heads small, radiate (in ours), cymose or solitary. Flowers yellow. Involucre cylindric or campanulate, its equal narrow bracts in a single series, strongly carinate and partially embracing the ray-achenes. Style hispidulous. Achenes slender, striate, fertile in both disk and ray. Pappus of bristles, awns or paleae, or sometimes none. (Greek *pecteo*, to comb, the leaves in some species, regularly setiferous.)

1. *P. papposa* Gray. CHINCH-WEED. Fig. 996. Low annual, divergently much branched from the base, the branches 2 to 4 (or 8) in. long; herbage with a strong disagreeable odor; leaves narrowly linear,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long, about  $\frac{1}{2}$  line wide, entire, bearing at base 1 to 5 pairs of bristles; heads 3 lines high, on short peduncles in cymose clusters or

996. *Pectis papposa* Gray; a, leaf  $\times 1\frac{1}{2}$ ; b, habit  $\times \frac{1}{4}$ ; c, head  $\times 1\frac{1}{2}$ ; d, ray-fl.  $\times 8$ ; e, disk-fl.  $\times 3$ .

sometimes solitary; bracts with a callous foot; rays yellow,  $1\frac{1}{4}$  to 2 lines long; achenes scantily rusty-pubescent; ray-pappus a mere crown, rarely with 1 or 2 awns; disk-pappus of 12 to 20 barbellate or almost plumose bristles, or sometimes none.—Sandy soil, 50 to 4000 ft.: Colorado Desert and n. to the Panamint Range; e. to Utah, s. to Mex.

TRIBE 10. **Anthemideae**. MAYWEED TRIBE

Strong-scented or aromatic plants. Leaves alternate, all or some of them finely dissected, pinnately parted or pinnatifid, except in no. 142. Bracts of the involucre imbricated, commonly dry and scarious or with scarious margins. Receptacle naked or with chaff-like bracts. Flowers white, yellow or greenish. Rays present or none. Anthers not caudate. Pappus none or a short scarious crown.

137. **ANTHEMIS** L. CHAMOMILE

Branching herbs. Leaves alternate, finely and pinnately dissected. Heads solitary on terminal peduncles,  $\frac{3}{4}$  to 1 in. broad. Ray-flowers white, pistillate, the spreading rays at length reflexed; disk-flowers yellow. Involucre hemispherical, its bracts scarious and at length dry, imbricated in several series. Receptacle conical, with chaff-like bracts toward the summit. Achenes angled or striate, not hairy. Pappus none. (Ancient Greek name of the Chamomile.)

997. *Anthemis cotula* L.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, disk-fl.  $\times 5$ ; c, bract of receptacle  $\times 5$ ; d, receptacle  $\times 2\frac{1}{2}$ ; e, achene  $\times 6$ .

1. *A. cõtula* L. MAYWEED. Fig. 997. Annual, 1 to 2 or rarely 3 ft. high; herbage ill-scented, nearly glabrous; bracts narrow and acute, or awl-like; ray-flowers 14 to 20, sterile; achenes rugose, 10-ribbed.—Nat. from Eur.; abundant in pastures and waste lands. May-Aug. Also called Dog Fennel.

*A. NÖBILIS* L. Garden Chamomile. Perennial; peduncles erect from decumbent branches, 4 to 8 in. high; herbage pubescent, aromatic; achenes smooth, with a narrow membranous border.—Garden plant from Eur.; an escape at Ft. Bragg.

138. **ACHILLÈA** L. YARROW

Perennial herbs with alternate leaves, in ours pinnately divided into

many fine segments. Heads in a terminal corymb, radiate; rays few, white; disk-flowers yellow; both disk and ray fertile. Involucre oblong or ovoid, its bracts imbricated, with scarious margins. Receptacle chaffy, nearly flat. Achenes strongly obcompressed, callous-margined, destitute of pappus. (In honor of Achilles.)

Rays white,  $\frac{1}{2}$  to  $\frac{1}{2}$  as long as the involucre; bracts of the involucre pale, rarely brown-margined; leaves villous.....1. *A. millefolium*.  
Rays white or pink,  $\frac{1}{2}$  to  $\frac{3}{4}$  as long as involucre; bracts of the involucre dark brown-margined; leaves silky-pubescent.....2. *A. borealis*.

1. *A. millefolium* L. var. *lanulosa* Piper. COMMON YARROW. MILFOIL. Fig. 998. Stem simple, erect or ascending at the very base,  $1\frac{1}{4}$  to 3 ft. high; herbage loosely villous or a little arachnoid, sometimes shaggy-villous; leaves linear-lanceolate in outline, the multifid divisions crowded on the rachis, the ultimate segments linear; corymb compound, flat-topped or convex; rays 4 or 5; achenes rather broadly margined.—Open slopes or open woodlands, low

hills to high mts., 200 to 9000 ft.: throughout Cal.; n. to Wash., e. to Mich. Mar.-July. (*A. lanulosa* Nutt.) Var. **MARITIMA** Jepson n. var. Stem densely leafy; herbage villous-pubescent; ultimate leaf-segments narrowly ovate; corymb flat-topped.—Seabeaches, San Francisco Bay (West Berkeley, Jepson, type). Var. **CALIFORNICA** Jepson n. comb. Stem sparsely pubescent; leaves green, glabrate; leaf-segments spinulose-tipped; achenes narrowly margined.—Coastal S. Cal. (*A. californica* Pollard.)

2. **A. borealis** Bong. Alpine dwarf 4 to 7 in. high; bracts of the involucre somewhat scarious, with red-brown margins; achenes slender, winged.—High montane, 8500 to 11,000 ft., rare in Cal.: Mariposa Co.; Silver Mt., Alpine Co.; Mt. Shasta; n. to Alas. and Can., e. to Rocky Mts.

### 139. **CHRYSANthemum** L.

Annual or perennial herbs, ours with toothed or incised leaves. Heads large, solitary on leafy-bracted peduncles. Disk-flowers yellow; rays yellow or white. Receptacle flat or hemispherical, naked. Achenes glabrous, at least those of the disk 5 to 10-ribbed all around. (Greek *chrysos*, gold, and *anthemon*, a flower.)

Lower leaves mostly clasping; bracts ovate; rays deep yellow, with broad base, conspicuously notched at apex, 2 to 4 lines wide. . . . . 1. *C. segetum*.  
Lower leaves petioled; bracts lanceolate; rays white, with tapering base, inconspicuously notched at apex, 1 to 3 lines wide. . . . . 2. *C. leucanthemum*.

1. **C. segetum** L. **CORN CHRYSANTHEMUM**. Annual, erect, 1 to 2 ft. high; herbage glabrous; lower leaves pinnatifid or incised; upper merely denticulate, sessile by a clasping base; heads  $1\frac{1}{4}$  to 2 in. wide; ray-achenes broad, 3-sided, lateral angles winged and few-toothed; disk-achenes cylindric.—Open fields, nat. from Eur.: West Berkeley; Caspar; Mendocino City. May-June.

2. **C. leucanthemum** L. **OX-EYE DAISY**. Perennial; stem erect, simple or branched above, 1 to 3 ft. high; herbage essentially glabrous; lower leaves obovate or spatulate, tapering to a long petiole, coarsely toothed; cauline leaves oblanceolate, clasping,  $\frac{1}{2}$  to  $2\frac{1}{2}$  in. long, dentate; bracts lanceolate, edged with a brown line and scarious-margined; heads  $1\frac{1}{4}$  to 2 in. wide; rays white.—Fields, nat. from Eur.: Eureka; Sisson; Crescent City. Aug.-Sept.

### 140. **TANACETUM** L.

Strong-scented perennial herbs. Leaves entire, somewhat cleft or 2 or 3 times pinnately divided into numerous small lobes. Heads globular, discoid, many-flowered, borne in a corymb-like peduncled cluster or in a cyme. Flowers yellow. Involucre of numerous scale-like bracts. Receptacle flat or low, naked. Achenes 5-ribbed or 3 to 5-angular, with broad truncate summit bearing a low crown-like pappus or none. (Name obscure.)

Heads flat, low-convex,  $\frac{1}{2}$  in. broad; pappus coroniform-dentate; receptacle flat. . . . . 1. *T. camphoratum*.

Heads globular, smaller; pappus obsolete or none; receptacle convex or conical.

998. *Achillea millefolium* var. *lanulosa* Piper; a, fl. branchlet x 1; b, leaf x 1; c, disk-fl. x 3; d, ray-fl. x 3.

Herbaceous; leaves dissected; heads 3 to 4 lines in diameter; receptacle densely fimbriate-hirsute ..... 2. *T. potentilloides*.  
 Suffrutescent at base; leaves simply or pedately cleft or entire; receptacle not hirsute. 3. *T. canum*.

1. *T. camphoratum* Less. DUNE TANSY. Fig. 999. Stems robust, decumbent or ascending, 1 to 2½ ft. long; herbage with the aroma of camphor, villous-tomentose when young, the wool more or less deciduous in age; primary and secondary divisions of leaves much crowded, the latter oval or oblong, the margin more or less revolute; achenes glandular.—Sand-dunes along the coast: San Francisco to Humboldt Bay. Aug.-Nov.

999. *Tanacetum camphoratum* Less.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, pinna  $\times 2$ ; c, pinnule  $\times 4$ ; d, fl.  $\times 4$ .

spheric, 2 to 3 lines broad; bracts of the involucre very short-ovate or round-ovate, villous, with scarious margins; disk-flowers golden yellow.—Easterly valleys of the higher Sierra Nevada in Sierra, Nevada and Eldorado Cos.; e. to Nev., n. to southeastern Ore.

3. *T. canum* Eat. Stems erect, leafy, several from the somewhat branched and woody root-crown, 3 to 5 in. high; herbage canescent with a close tomentum; leaves linear, simple or divided to the middle into 3 (or 4) linear lobes, 3 to 5 (or 8) lines long, sessile; corymbs compact, with 2 to 5 heads; heads 1½ to 3 lines wide, with rounded base; bracts of the involucre ovate, canescent, scarious-margined; disk-flowers lemon-yellow.—High montane cliffs and rocky slopes, 8000 to 11,000 ft.: Sierra Nevada from Mt. Dana to Mt. Whitney and Olancho Peak; e. to Nev., n. to southeastern Ore.

#### 141. *MATRICARIA* L.

Ours glabrous annuals with pinnately dissected leaves. Heads solitary or somewhat corymbose, with many greenish yellow flowers. Receptacle slender-conical, naked. Bracts of the involucre imbricated, with scarious margins, persistent. Corollas tubular, without limb. Rays none. Pappus reduced to a membranous crown or border, or none. Achenes glabrous, 3 to 5-nerved on the sides, rounded on the back. (Latin matrix, because used medicinally.)

Heads 2 to 4 lines high; achenes with an obscure margin at summit ..... 1. *M. suaveolens*.  
 Heads mostly 4 to 6 lines high; achenes with a broad or unequally lobed crown ..... 2. *M. occidentalis*.

1. *M. suaveolens* (Pursh) Buch. PINEAPPLE WEED. Fig. 1000. Stem branching, 2 to 10 in. high; herbage sweet-scented; heads short-peduncled, 2 to 3 (or 4) lines high; bracts of the involucre broadly ob-

1000. *Matricaria suaveolens* Buch.; a, habit  $\times 1$ ; b, long. sect. of head  $\times 1\frac{1}{2}$ ; c, fl.  $\times 5$ .

long.—Common in beaten roadways, about old farm buildings and in pasture lands throughout Cal. Apr.-May. Doubtfully native. (*M. discoidea* DC. *M. matricarioides* Porter.)

2. *M. occidentalis* Greene. Stem either branching or unbranched below the corymbose summit,  $1\frac{1}{2}$  to 2 ft. high; herbage not so strongly scented; heads as much as  $\frac{1}{2}$  in. high; achenes sharply angled, with a broad crown-like margin, or the crown lobed and 1-sided.—Rich soil of fields: Sacramento Valley and South Coast Ranges to coastal S. Cal.

#### 142. *ARTEMISIA* L. SAGEBRUSH

Herbs and evergreen shrubs, mostly bitter and aromatic, with alternate leaves. Heads small, nodding or erect, in paniced spikes or racemes. Flowers yellow or purplish; rays none. Disk-flowers perfect and marginal ones pistillate, or all perfect. Corollas of the pistillate flowers 2 or 3-toothed, of the perfect flowers 5-toothed. Involucre imbricated, dry and scarious. Receptacle nearly flat, naked (or chaffy in one species). Achenes obovoid or oblong, mostly with a small terminal disk or areola. Pappus none. (*Artemisia*, wife of Mausolus, king of Caria.)

##### *A. Heads consisting wholly of perfect fertile flowers.*

Plants wholly or nearly herbaceous, the stems and upper surface of leaves green or greenish; receptacle chaffy, most of the flowers being subtended by scale-like bracts. . . . .

1. *A. palmeri*.

Shrubs or shrubby, the herbage canescent or silvery with fine close tomentum; receptacle naked. . . . .

Heads comparatively small (1 to 2 lines long), 5 to 9-flowered; bracts rather firm.

Plants 3 to 6 ft. high; leaves mostly 3-toothed or the upper entire. . . . . 2. *A. tridentata*.

Plants  $\frac{3}{4}$  to 2 ft. high.

Leaves deeply lobed or cleft or some entire.

Heads few; leaves 3-lobed. . . . . 3. *A. arbuscula*.

Heads numerous; leaves 3 to 5-lobed. . . . . 4. *A. trifida*.

Leaves entire, rarely toothed. . . . . 5. *A. cana*.

Heads larger and broader, 7 to 14-flowered; inner bracts more nearly scarious.

Pubescence minute and very close; bracts of involucre broad. . . . . 6. *A. rothrockii*.

Pubescence looser; inner bracts of involucre narrow. . . . . 7. *A. bolanderi*.

##### *B. Heads with the marginal flowers pistillate, the central ones perfect.*

Flowers all fertile; style 2-cleft.

Shrub; achenes with a minute squamellate crown-shaped pappus at the summit. . . . . 8. *A. californica*.

Herbs (or slightly woody at base); achenes wholly destitute of pappus.

Biennial; wholly glabrous. . . . . 9. *A. biennis*.

Perennial; more or less hairy.

Leaves without white-cottony tomentum. . . . . 10. *A. norvegica*.

Leaves white-cottony beneath, green or glabrate above. . . . . 11. *A. vulgaris*.

Only the marginal pistillate flowers fertile, the central perfect ones infertile; style mostly entire.

Achenes and flowers beset with long cobwebby and crisped hairs; leaves 2 to 3 times pedately dissected; spinescent dwarf shrub. . . . . 12. *A. spinescens*.

Achenes nearly glabrous; perennial (or biennial) herbs, not spinescent.

Leaves dissected into spatulate or linear lobes, densely silky-villous. . . . . 13. *A. pycnocephala*.

Leaves mostly entire; herbage glabrous. . . . . 14. *A. dracunculus*.

1. *A. palmeri* Gray. Stems slender, erect, herbaceous or a little woody at base, 2 to 3 ft. high, minutely pubescent; leaves pinnately divided into 3 or 5 remote linear lobes or some linear and entire,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  in. long, almost glabrous above, white-pubescent beneath, the margins revolute; heads mostly erect, sometimes nodding in age, rather densely disposed on the branches of the elongated panicle; involucre hemispheric, 1 to  $1\frac{1}{2}$  lines high; bracts of the receptacle scarious, subtending many of the flowers.—Sw. San Diego Co.: San Diego; National City; Jamul Valley; s. to L. Cal.

2. *A. tridentata* Nutt. COMMON SAGEBRUSH. Fig. 1001. Erect much-branched shrub 3 to 6 ft. high, with a distinct trunk and shreddy bark; herbage aromatic, canescent or silvery throughout with a fine and close tomentum; leaves narrowly cuneate or oblanceolate, 3 (or 4)-toothed at apex or entire,  $\frac{3}{4}$  to  $1\frac{3}{4}$  in. long; panicle diffuse (or sometimes narrow),  $\frac{1}{2}$  to  $1\frac{1}{2}$  ft. long; heads narrow, 4 to 6-flowered,  $1\frac{1}{2}$  to 2 lines high; accessory bracts short, broadly ovate.—High plains and arid mountain slopes, 1500

1001. *Artemisia tridentata* Nutt.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, head  $\times 3$ ; c, bract of involucre  $\times 5$ ; d, fl.  $\times 5$ .

to 6000 ft., exceedingly abundant in the main parts of its range: Siskiyou Co. to Modoc Co., thence s. along e. side of Sierra Nevada to Inyo Co.; w. slope Sierra Nevada from Mariposa Co. to Kern Co.; Tehachapi Mts.; mts. on w. side Mohave Desert; desert slopes San Gabriel, San Bernardino, San Jacinto and Santa Rosa mountains; only occasional in coastal S. Cal.; e. to Col., n. to Mont. and B. C. Var. *PARISHII* Jepson n. comb. Bush 1 to 3 ft. high; herbage densely and closely cinereous-pubescent; leaves spatulate, strongly 1-nerved, mostly entire but some of the lower ones 2 or 3-toothed at apex, the margins revolute,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long; heads oblong, 5 to 7-flowered, 1 to  $1\frac{1}{2}$  lines high, inclined to nod when mature, in small close glomerules on short branchlets of the rather loose oblong panicle; achenes cobwebby-villous. — Western margins of the Mohave Desert: Newhall; Rosamond; Santa Clara River; also w. Nev. (*A. parishii* Gray. *A. tridentata* subsp. *parishii* Hall.)

3. *A. arbúscula* Nutt. BLACK SAGE. Dwarf bush 7 to 13 in. high, the main branches stout, the flowering branches slender; leaves cuneate or fanshaped, 3-parted or -divided, the lobes spatulate to linear or oblong, sometimes again 2-lobed,  $1\frac{1}{2}$  to  $3\frac{1}{2}$  lines long, those subtending the heads usually entire and narrow; panicle naked, strict, or the inflorescence often simple and spike-like; heads sessile, 5 to 9-flowered. — High mts. and elevated arid plains, 5000 to 9000 ft.: Nevada and Eldorado Cos.; e. to Utah and Wyo., n. to Ida.

4. *A. trifida* Nutt. Much branched shrub  $\frac{3}{4}$  to 2 ft. high; herbage silvery or canescent with a very fine close tomentum; leaves cuneate or fanshaped, 3-cleft at apex or 3-divided into linear lobes, 3 to 8 lines long; heads oblong or ovate, 5 to 8-flowered, 1 to 2 lines long, borne in a narrow panicle or simple spike; involucre canescent, the accessory bracts oblong or lanceolate; achenes resinous-granuliferous. — Elevated open plains, rare in Cal.: Lancaster, Mohave Desert; e. Ore. to Mont. and Col.

5. *A. càna* Pursh. Shrub 1 to 3 ft. high; herbage mostly silky-canescenscent; leaves linear, acute, 1 to 2 in. long, entire or rarely with 1 or 2 irregular teeth or lobes; heads erect, 6 to 15-flowered, sessile in small glomerules, the glomerules disposed in a narrow leafy panicle; involucre campanulate. — Plains and low mts. of the arid interior: e. side Sierra Nevada from Mono Co. to Nevada Co.; n. to Can., e. to N. Mex. and Neb.

6. *A. rothrockii* Gray. Low erect shrub  $\frac{1}{2}$  to  $1\frac{1}{2}$  ft. high; stems whitened, the leaves canescent or some of them greenish; leaves spatulate, obtuse, entire or sometimes trifid at the dilated apex, 6 to 9 lines long; heads oval, 7 to 12-flowered, 2 to 3 lines long, in close glomerules, the glomerules disposed in spikes and subtended by reduced leaves; involucre bracts broadly or narrowly obovate; achenes nearly glabrous, glandular-granuliferous. — High plateaus, 7000 to 10,000 ft.: Sierra Nevada from Mt. Dana to Olancho Peak; San Bernardino Mts.; e. to Col., n. to Wash.

7. *A. bolanderi* Gray. Shrub 1 to 2 ft. high; leaves narrowly linear, 6 to 11 lines long,  $\frac{1}{2}$  to 1 line wide, entire and acutish, or some 3-cleft at apex; heads numerous, densely glomerate-paniculate, 14-flowered, mostly equaled or surpassed by 1 or 2 linear-subulate accessory bracts. — East slope of the Sierra Nevada in Mono Co., 7500 to 9000 ft.

8. *A. californica* Less. CALIFORNIA SAGEBRUSH. OLD MAN. Fig. 1002. Gray shrub  $2\frac{1}{2}$  to 4 ft. high; leaves with a minutely appressed pubescence, the lowest palmately once or twice parted into linear-oviform segments, the upper entire and more or less fascicled; heads many, nodding in long racemose panicles; involucre  $1\frac{1}{2}$  or 2 lines broad; achenes with a minute squamellate crown-shaped pappus.—Exposed slopes of hills, often gregarious, 10 to 2500 ft.: Marin Co., sw. Solano Co. and Mt. Diablo to coastal S. Cal.; w. side Colorado Desert; s. to L. Cal.

9. *A. biennis* Willd. Erect virgate biennial herb 1 to 3 ft. high; herbage glabrous, inodorous, tasteless; leaves 2 to  $4\frac{1}{2}$  in. long, bipinnately divided into lanceolate or broadly linear incised or serrulate divisions, or the uppermost merely pinnatifid; heads crowded on the short branchlets, the whole inflorescence spike-like and more or less leafy; achenes with small epigynous disk.—Weed in river bottoms or borders of marshes, introduced from Eur.: lower Sacramento River; West Berkeley; Palo Alto; Laguna, Orange Co.

1002. *Artemisia californica* Less.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, leaf  $\times \frac{1}{2}$ ; c, head  $\times 3$ ; d, staminate fl.  $\times 7$ ; e, pistillate fl.  $\times 7$ .

10. *A. norvegica* Fries var. *saxatilis* Jepson n. comb. Stems rather stout,  $\frac{1}{2}$  to 2 ft. high, herbaceous; herbage thinly villous to glabrate; leaves ovate in outline, 3 to 5 in. long, twice pinnately parted into linear or lanceolate segments, the segments 2 to 10 lines long; heads large (commonly 4 to 5 lines broad), nodding, loosely racemose or racemose-paniculate, most of them long-peduncled; bracts of the involucre with broad scarious brown margins; corolla yellow or turning brown, loosely pilose, rarely almost glabrous.—High montane, 5000 to 9000 ft.: Sierra Nevada from Tulare Co. to Placer Co.; e. to Col., n. to Alb. and Alas.; Siberia. (*A. norvegica* subsp. *saxatilis* Hall. *A. chamissoniana* var. *saxatilis* Besser.)

1003. *Artemisia vulgaris* var. *heterophylla* Jepson; a, fl. branchlet  $\times \frac{1}{2}$ ; b, leaf  $\times \frac{1}{2}$ ; c, head  $\times 3$ .

11. *A. vulgaris* L. var. *discolor* Jepson n. comb. Stems erect, simple or branching, mostly slender, 10 to 15 in. high, from running rootstocks, glabrous or glabrate; leaves ovate in outline, 1 to 2 in. long, pinnately divided into 5 narrow segments, the segments entire or again toothed or cleft, green and glabrate above, white-tomentulose beneath; heads 1 or 2 lines high, 20 to 30-flowered, glomerate, the glomerules disposed in an interrupted spike-like or virgate panicle; involucre

hemispherical-campanulate, greenish and scarious, glabrous or glabrate, 20 to 30-flowered.—Sierra Nevada, both slopes, 4000 to 5000 ft., uncommon; n. to B. C., e. to Mont. and Col. (*A. discolor* Dougl. *A. vulgaris* subsp. *discolor* Hall.) Var. *HETEROPHYLLA* Jepson n. comb. California Mugwort. Fig. 1003. Stems from running rootstocks, erect, woody at base, strict, 3 to 6 ft. high; leaves lanceolate to oblong, ovate or elliptic, sparingly pinnatifid (with downward incisions), cleft or often entire (especially the upper), green above, white-tomentose beneath, sometimes glabrous, 2 to 6 in. long; heads mostly erect, in dense spikes in an open or more commonly dense terminal panicle, the main axis leafy; involucre oblong, glabrous; marginal flowers pistillate, disk-flowers perfect, all fertile.—Common along stream-banks and flats, 10 to 3500 ft.: throughout Cal.; n. to B. C. and Sask., e. to western Nev., s. to L. Cal. (*A. heterophylla* Nutt. *A. vulgaris* subsp. *heterophylla* Hall.) Var. *LITTORALIS* Suksdorf. Stems 2 to 5 ft. high; involucre ovoid, nearly glabrous, 1 to  $1\frac{1}{2}$  lines wide; disk-flowers 3 to 7.—Along the coast, Humboldt Co.; n. to B. C. Var. *GNAPHALODES* (Nutt.) Ktze. Stem erect, 1 to  $3\frac{1}{4}$  ft. high; leaves densely white-tomentose on both surfaces, the tomentum usually persistent.—San Diego Co.; San Jacinto Mts.; Modoc Co.; n. to Can., e. to Mo. and Tex. (*A. gnaphalodes* Nutt. *A. vulgaris* subsp. *gnaphalodes* Hall.) Var. *LINDLEYANA* Jepson n. comb. Stems erect, 5 to 15 in. high; leaves narrow, entire or slightly lobed; heads in a narrow short spike-like panicle.—Sierra Nevada in Tulare Co.; e. through the Great Basin. (*A. lindleyana* Besser. *A. vulgaris* subsp. *lindleyana* Hall.) Var. *LUDOVICIANA* (Nutt.) Ktze. Stems simple, erect, from running rootstocks, 1 to  $3\frac{1}{2}$  ft. high, herbaceous or essentially so; herbage white-tomentulose or the leaves glabrate above; leaves 1 to 2 in. long, narrowly to broadly lanceolate, dilated above and coarsely toothed, or linear and 3-cleft at apex, or sometimes pinnately divided into 5 linear remote lobes; upper leaves becoming narrow and entire, acute; heads erect or horizontal, disposed in dense spikes, the spikes in a narrow compact panicle leafy-bracteate below; involucre hemispheric, 15 to 25-flowered,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  lines high.—Montane in S. Cal., 5000 to 6800 ft.: Santa Rosa Mts.; San Bernardino Mts.; Providence Mts.; e. to Tex., n. to Wash. (*A. ludoviciana* Nutt. *A. vulgaris* subsp. *ludoviciana* Hall.)

12. *A. spinescens* Eat. BUD SAGE. Low compact dwarf (4 to 8 in. high), the woody stems very stocky; herbage, especially the young branches, white-tomentose; leaves 2 to 5 lines long (the petioles  $1\frac{1}{2}$  times as long to almost none), pedately 5-parted and the divisions once or twice 3-lobed, the lobes spatulate; heads 5 to 12-flowered, spicate on short lateral branches which persist and in the year following become indurated naked spines; involucre globose,  $1\frac{1}{2}$  lines broad; bracts 5 or 6, obovate; both corolla and achene villous-cobwebby.—Desert mesas and plains, 2000 to 3000 ft.: Mohave Desert; Inyo Co. and n. along e. side Sierra Nevada to Lassen Co.; n. to Ore. and Mont., e. to Wyo., Col. and N. Mex.

13. *A. pycnocephala* DC. Stems stout, simple,  $1\frac{1}{2}$  to  $2\frac{1}{4}$  ft. high, somewhat woody at base, crowded with leaves up to the inflorescence; herbage densely silky; leaves once to thrice pinnately divided into linear lobes; heads erect, in spikes, the spikes crowded in a dense virgate panicle; heads almost or quite 2 lines in diameter; involucre densely villous.—Sand hills along the coast, Monterey Co. to Humboldt Co.; n. to Ore. (*A. campestris* L. subsp. *pycnocephala* Hall.)

14. *A. dracunculus* L. Stem erect, paniculately branched above, 2 to  $4\frac{1}{2}$  ft. high, herbaceous, arising from a rootstock; herbage glabrous, not aromatic; leaves linear to lanceolate, entire or the lowermost deeply 3-cleft,  $\frac{3}{4}$  to  $2\frac{1}{2}$  in. long; heads numerous, 1 to 2 lines broad, nodding on very short peduncles in a close or open panicle, the clusters sometimes secund on the slender branches; marginal flowers fertile, disk-flowers perfect but sterile.—Rare in Cal.: San Leandro; Santa Catalina Isl.; Ballona; San Bernardino Mts.; L. Cal. to Col. and Can. (*A. dracunculoides* Pursh.) Var. *GLAUCA* Jepson n. comb. Herbage glabrate, the young parts silky; panicle dense; heads 1 to  $1\frac{1}{2}$  lines broad.—Inyo Range; e. to Tex., n. to B. C. and Man.; Siberia. (*A. glauca* Pall. *A. dracunculus* subsp. *glauca* Hall.)

143. *COTULA* L.

Low strong-scented herbs. Leaves alternate, dissected or lobed, or with some entire on the same plant. Flowers yellow. Heads slender-peduncled, discoid, low-hemispherical. Bracts of involucre greenish, in about 2 ranks. Receptacle flat or nearly so, naked. Outer series of flowers pistillate only and apetalous. Disk-flowers with 4-toothed corolla, fertile or infertile. Mature achenes raised on pedicels, compressed, spongy-margined or narrowly winged, destitute of pappus. (Greek kotule, small cup or low vessel.)

Annual; leaves pinnately dissected; pistillate flowers in 2 or 3 rows.....1. *C. australis*.  
Perennial; leaves some pinnatifid and some entire, sheathing at base; pistillate flowers in a single row.....2. *C. coronopifolia*.

1004. *Cotula australis* Hook.; a, fl. branchlet  $\times 1$ ; b, fl.  $\times 8\frac{1}{2}$ ; c, achene  $\times 8\frac{1}{2}$ .

1. *C. australis* Hook. f. Fig. 1004. Slender branching annual 2 to 5 (or 12) in. high; herbage with scattered soft spreading hairs; leaves pinnately or bipinnately dissected into linear lobes; heads very small, 1 to  $1\frac{1}{2}$  lines broad; bracts of involucre brownish-tipped and with scarious edges; pistillate flowers in 2 or 3 rows, pediceled; disk-flowers nearly or quite sessile; marginal achenes somewhat compressed, minutely hispid on both faces but the margin glabrous.—Nat. from Austr. in streets of towns and cities: Eureka; Berkeley; Oakland; San Francisco; Pasadena; Riverside; San Diego. Jan.-Mar.

2. *C. coronopifolia* L. BRASS BUTTONS. Fig. 1005. Perennial, somewhat succulent, often subaquatic; stems commonly many and clustered, decumbent,  $\frac{1}{2}$  to 1 ft. long; leaves linear, lanceolate, or oblong, entire, coarsely toothed or pinnatifid on the same plant, dilated at base into a short sheath round the stem; heads depressed, 4 to 5 lines broad; pistillate flowers in a single row, on pedicels as long as the involucre, without corolla; disk-flowers on much shorter pedicels.—Nat. from S. Afr. along the coast in saline localities or springy places in the hills, most abundant in the salt marshes: Eureka and San Francisco Bay to coastal S. Cal. Mar.-Dec.

b

c

1005. *Cotula coronopifolia* L., a, fl. branchlet  $\times \frac{1}{2}$ ; b, disk-fl.  $\times 5$ ; c, achene  $\times 5$ .

144. *SOLIVA* R. & P.

Small depressed annual with rigid short branches, petioled and pinnately dissected leaves, and discoid heads of greenish flowers sessile in the forks. Involucre of 7 or 8 greenish nearly equal bracts. Receptacle flat. Outer series of flowers pistillate and apetalous; innermost flowers perfect but sterile, the corolla 4-toothed. Achenes obcompressed, callus-margined or winged and pointed with the hardened persistent style. Pappus none. (Dr. Salvador Soliva of Spain.)

1. *S. sessilis* R. & P. Plants 2 to 4 (or 10) in. across, minutely pubescent or rusty-villous; one, two or three heads sessile at the very base, the somewhat tortuous stems radiating

from under these; involucre bracts 7 or 8, oblong, acute, pilose-pubescent; pistillate flowers 9 to 12; each wing of the achene terminating above in an incurved tooth; staminate flowers fewer than the pistillate, 7 to 9; styles stout, subulate, conspicuously exerted beyond the disk-corolla. — Moist ground: Hupa; Mendocino Co.; Howell Mt.; Oakland; San Francisco; Santa Cruz Mts.; Santa Barbara. Mar.-May. Perhaps nat. from Chile.

#### TRIBE 11. *Seneciòneae*. GROUNDSEL TRIBE

Herbs or a few shrubs or woody-based plants. Leaves alternate or basal. Bracts of the involucre little or not at all imbricated, mostly in 1 or 2 rows. Receptacle naked. Flowers of both disk and ray yellow, except *Petasites*. Anthers not caudate. Pappus-bristles soft, commonly copious, most often white.

#### 145. *CROCÍDIUM* Hook.

Small annual herbs. Stems simple, several from a tuft of basal leaves and bearing a single terminal head, naked above, the cauline leaves only on lower third or half and often reduced. Basal leaves fleshy. Herbage flocculent-woolly or glabrate above. Heads with disk- and ray-flowers, all the flowers fertile. Involucre broadly hemispherical, its bracts 8 to 12, nearly equal, thin-herbaceous. Receptacle conical. Flowers golden yellow. Anthers with deltoid-ovate acute tips. Style-branches short and broad, terminated by a large deltoid appendage. Achenes covered with oblong papillae, these developing spiral threads when wetted. Disk-flowers with pappus, commonly none in the ray. Pappus-bristles equal, white, barbellate, soon deciduous. (Diminutive of Greek *croce*, loose thread, in reference to the wool persistent in the leaf axils.)

1. *C. multicáule* Hook. Stems erect, 3 to 6½ in. high; herbage flocculent-woolly when young, soon glabrate; basal leaves obovate or spatulate, 2 to 7 lines long, the cauline ones only on lower part of stem, lanceolate, abruptly attenuate, 1 to 2 lines long; ray-flowers 8 to 12, the rays elliptic to oblong, 2 lines long.—Open cool slopes of hills, 1500 to 4000 ft.: Mariposa; Arroyo Mocho, Mt. Hamilton Range; Mendocino Co. to Siskiyou Co.; n. to B. C. and Ida. Mar.-May.

#### 146. *PSATHÝROTES* Gray

Low annuals with scurfy or tomentose herbage. Leaves alternate, broad and rounded, petioled. Heads discoid, the flowers all perfect and fertile. Involucre hemispheric, its bracts in 2 or 3 series. Receptacle flat. Corolla yellow, sometimes turning purplish, with the proper tube very short (the filaments thus inserted near the base), the throat elongated-cylindric, and the short lobes woolly. Style-branches flattish, obtuse. Achenes narrow-turbinate, densely white or rusty villous. Pappus-bristles numerous, short, scabrous, white or rusty. (Greek *psathurotes*, brittleness, referring to the stems.)

Outer involucre bracts with recurved or spreading tips; leaves thick... 1. *P. ramosíssima*.  
Outer involucre bracts with erect tips; leaves thinner..... 2. *P. annua*.

1. *P. ramosíssima* (Torr.) Gray. Stem widely and more or less dichotomously much-branched, forming a low compact rounded and densely leafy plant 2 to 6 in. high and 3 to 12 in. broad; herbage white with a close tomentum, strongly turpentine-scented; leaves roundish, subcordate or cuneate at base, thick, irregularly toothed above base, 4 to 9 lines broad, the petioles 1 to 4 lines long; heads 3 to 4 lines high, solitary on axillary peduncles, the naked peduncles at maturity recurved.—Desert floors and washes, 100 to 4000 ft.: Inyo Co.; e. Mohave Desert; Colorado Desert; s. to L. Cal., e. to Ariz. Apr.-May.

2. *P. annua* (Nutt.) Gray. Stem freely and somewhat openly branched from the base, forming plants 1 to 6 in. high and 1½ times as broad; herbage puberulent, the leaves scurfy-pubescent; leaves fan-shaped, irregularly dentate, 4 to 9 lines broad, on petioles ½ to as long; heads 3 lines high, borne in terminal glomerules and solitary on peduncles in the forks, the peduncles about 2 to 8 lines long.—Desert cañons and flats, rare in Cal.: Rabbit Sprs.,

s. Mohave Desert; Rock Cañon, e. Kern Co., Lone Pine, Inyo Co.; e. to Nev., Utah and Ariz.

#### 147. *RAILLARDELLA* Gray

Low perennial herbs. Leaves narrow, entire, mostly basal, the cauline alternate or none. Heads commonly solitary, or rarely in 2s or 3s, with yellow flowers, mostly discoid, sometimes radiate. Involucral bracts linear, in a single series, barely overlapping. Receptacle flat. Disk-corollas with short tube, elongated throat, and 5 short glabrous lobes. Style-appendages flattish, hispidulous, with lanceolate or cuspidate tips. Achenes linear, pubescent. Pappus of 10 to 25 slender soft-plumose bristles. (Diminutive of *Raillardia*, a shrubby Composite genus of the Hawaiian Isls.)

Stems leafy, arising from the branched crown of a very short root; leaves linear; pubescence hirsute.

Leaves acute; lowest leaves not sheathing; heads discoid; pappus-bristles longer than the achene; herbage greenish; s. Sierra Nevada.....1. *R. muirii*.

Leaves obtuse or obtusish; lowest very small leaves opposite, distinctly sheathing at base, 2 to 3 lines long; heads with 2 or 3 rays; pappus-bristles shorter than the achene; herbage hirsute-canescens; mts. of n. Lake Co.....2. *R. scabrida*.

Stem scapose or with occasionally a few small leaves below; leaves crowded in a basal tuft or on short sterile shoots; pubescence not hirsute.

Herbage silvery-tomentose; scapes  $\frac{1}{2}$  to 4 in. high, arising from the branched crown of a stout root; rays none.....3. *R. argentea*.

Herbage green, not tomentose; scapes mostly 4 to 11 in. high, arising from a horizontal rootstock; rays none or present.....4. *R. scaposa*.

1. *R. muirii* Gray. Stems erect, several from the branched root-crown, 9 to 12 in. high; herbage roughish-hirsute, the stems glandular-villous above the base and up to involucre; leaves linear or lanceolate-linear, acute, sessile; heads terminal and 1 or 2 lateral, 5 to 7 lines high, wholly discoid; involucre campanulate, hirsute and glandular-villous; pappus-bristles 10 to 12, 4 lines long.—Southern Sierra Nevada, 4000 to 7000 ft., in Fresno Co.: Tehipite Valley; Mt. Woodworth.

2. *R. scabrida* Eastw. Stems several, assurgent or ascending from the short branches of the root-crown, 5 to 8 in. high; leaves linear, sessile, obtuse or sometimes auricled at base, 4 to 6 lines long; lowest leaves 2 to 3 lines long, opposite, sheathing at base; heads broadly cylindric, 6 lines high, solitary or 2 or 3 in loose cymes; rays 2 or 3,  $1\frac{1}{2}$  lines long; pappus-bristles  $1\frac{1}{2}$  lines long.—Gravelly crests or slopes, 6500 to 7600 ft., n. Lake Co.: Snow Mt.; Mt. Hull.

3. *R. argentea* Gray. Scapes  $\frac{1}{2}$  to 4 in. high, reddish and puberulent; leaves narrowly oblanceolate, acute, covered with a silvery felt,  $\frac{1}{2}$  to 1 or 2 in. long; heads 7 to 10 lines high; involucre narrowly campanulate,  $3\frac{1}{2}$  to  $4\frac{1}{2}$  lines high, the bracts linear, acuminate; corolla yellow.—High montane, 10,000 to 11,500 ft.: Mt. San Geronio; Sierra Nevada from Tulare Co. to Lassen Peak; White Mts.; n. to southern Ore.

4. *R. scaposa* Gray. Fig. 1006. Scapes 2 or 4 to 11 in. high, from stoutish rootstocks; herbage viscid-glandular and sparingly pilose; leaves narrowly linear-oblanceolate, 1 to 4 in. long; flowering heads 7 to 10 lines high; involucre cylindraceous, 10 to 40 flowered; corolla light yellow; rays none or sometimes 1 to 3 or 5 and 1

1006. *Raillardella scaposa* Gray; a, habit  $\times \frac{1}{3}$ ; b, fl.  $\times 1\frac{1}{2}$ .

to 2 lines long.—Montane meadows, 7800 to 11,000 ft., Sierra Nevada from Tulare Co. to Tuolumne Co. Var. *PRINGLEI* Jepson n. comb. Rays 4 or 5, very conspicuous, 6 to 9 lines long, 3 to 7 lines wide, deeply 2 or 3-notched at apex.—High montane: Scott Mts.; Mt. Silliman; Farewell Gap. (*R. pringlei* Greene.)

#### 148. *CACALIOPSIS* Gray

Floccose-woolly perennial herbs, the stoutish stems from stout rootstocks. Leaves mostly basal, round-cordate, palmately cleft or parted. Heads few, corymbosely disposed at the summit of the nearly naked stem, rayless, the flowers yellow, numerous. Involucre broadly campanulate, its bracts many, linear-lanceolate, acuminate, rigid rather than herbaceous. Anthers entire at base. Style puberulent below the slightly flattened branches. Achenes 10-nerved. Pappus copious, soft and white, equaling the corolla. (Greek *kakalia*, ancient Greek name of some plant, and *opsis*, likeness.)

1. *C. nardosmia* Gray. Stem erect, 1 to 1½ ft. high; basal leaves 2½ to 6½ in. broad, the divisions broad, cleft or toothed, the petioles 2½ to 4 in. long; cauline leaves few, similar to the basal but smaller; heads about 1 in. high; flowers honey-scented.—Montane, 3000 to 6000 ft.: Geysers, Sonoma Co.; n. Lake Co.; Mendocino and Humboldt Cos.; n. to Wash. Apr.-May.

#### 149. *PETASITES* Gaertn. SWEET COLTSFOOT

Perennial herbs with creeping rootstocks from which arise in early spring scape-like flowering stems (with many scale-like leaves) and later ample leaves. Heads in a dense corymb, subdioecious, i. e., the plants mostly sterile or mostly fertile, the whitish sterile flowers with tubular 3 to 5-cleft corolla, and the pinkish fertile flowers with ligulate corolla. Achenes 5 to 10-ribbed. Pappus elongating with age, very soft and white. (Greek *petasos*, a broad-brimmed hat, in allusion to the large leaves.)

1007. *Petasites palmata* Gray; a, leaf arising from rootstock  $\times \frac{1}{4}$ ; b, scaly stem and inf. arising from rootstock  $\times \frac{1}{4}$ ; c, ray-fl.  $\times 1\frac{1}{2}$ ; d, disk-fl.  $\times 1\frac{1}{2}$ .

1. *P. palmata* (Ait.) Gray. Fig. 1007. Stem erect, 7 to 10 in. high, glandular-pubescent, its bract-like scales 1½ to 2½ in. long; leaves roundish in outline, palmately cleft to below the middle into 7 to 10 lobes, green and nearly glabrous above, densely white-tomentose beneath, at least when young, 5 to 16 in. wide, the lobes denticulate, sinuately toothed or 3-lobed at apex; petioles 4 to 16 in. long; heads 6 to 7 lines high; "sterile" heads with mostly perfect (sterile) flowers but the marginal ones pistillate; "fertile" heads with mostly pistillate flowers and few central perfect ones.—Deep shades

of wooded cañons in ranges near the coast from the Santa Lucia and Santa Cruz mountains to Humboldt Co., thence e. to Siskiyou Co.; n. to Alas., e. to N. Eng.

#### 150. *LUNA* Benth.

Low perennial herbs with many erect simple stems. Leaves alternate, entire, sessile. Heads rayless, 10 to 19-flowered, disposed in terminal corymbs. Flowers yellow. Involucre oblong-campanulate, its bracts 8 to 12, linear,

rigid, carinately 1-nerved, equal. Corolla-throat very narrowly funnelform, equaling the narrow tube, which is slightly enlarged downward. Anthers sagittate at base. Style glabrous, its flattened branches papillose on the back. Pappus soft and white. (Anagram of *Inula*.)

1. *L. hypoleuca* Benth. var. *californica* Gray. Stems several from the shortly branched woody crown of a very stout root, erect, 7 to 10 in. high, white-tomentulose; leaves oblong-ovate to elliptic, white-tomentose beneath, becoming glabrous and green on the veiny-reticulate upper surface, 1 to 2 in. long; heads 5 to 6 lines high; achenes glabrous.—Barren rocky cliffs in the coast region, 20 to 5000 ft., a rare plant: Santa Cruz Mts.; Chimney Rock, Mendocino Co.; Grouse Mt., Humboldt Co.; Requa, Del Norte Co.

#### 151. *ERECHTITES* Raf. FIREWEED

Coarse annuals with rank odor. Leaves alternate, ours auriculate-dilated or lobed at base. Heads discoid, paniculately cymose, the whitish or yellowish flowers of 2 kinds: central flowers perfect, their corollas with filiform tube and 4 or 5-lobed cupshaped limb; marginal flowers pistillate, their corollas filiform, slightly dilated at summit and 2 to 4-toothed. Pappus-bristles elongated, very soft and fine. (Greek name of a groundsel in Dioscorides' *Materia Medica*.)

Leaves deeply pinnatifid; heads little calyculate.....1. *E. arguta*.  
Leaves denticulate; heads markedly calyculate.....2. *E. prenanthoides*.

1. *E. arguta* DC. NEW ZEALAND FIREWEED. Stem stout, erect, freely branching, 2 to 4 ft. high; herbage white-tomentulose, early glabrate, at least in part; leaves oblong-ovate in outline, deeply pinnatifid, 3 to 4½ in. long, the petiole winged, auriculate-dilated at base and toothed or incised, the upper leaves smaller and less lobed; heads in glomerate or in loose cymes, the cymes disposed in panicles; involucre cylindric, 2 lines high; pappus white; achenes 5-nerved, hispidulose, with a callus-like cup at summit.—Redwood forest, Mendocino Co. to Del Norte Co.; introduced from New Zealand or Australia.

2. *E. prenanthoides* DC. AUSTRALIAN FIREWEED. Stem erect, 4 to 8 ft. high; herbage obscurely puberulent or nearly glabrous, the leaves green above, pale and minutely arachnoid beneath; leaves linear-lanceolate, irregularly denticulate, 3 to 6½ in. long, attenuate below to a strongly auriculate base; panicle large, widely branched (½ to 1 ft. broad), the pedicels of the heads filiform, 1 to 4 lines long; heads 3 lines high.—Native of Australia, naturalized in 1918 in Humboldt Co., since spreading rapidly.

#### 152. *SENECIO* L. GROUNDSEL

Herbs or shrubs with alternate leaves. Heads in terminal cymes or sometimes solitary, the cymes corymbose, paniculate, glomerate or capitate. Heads many-flowered. Flowers yellow in both disk and ray, the latter pistillate or none. Involucre cylindrical to campanulate, with 1 or 2 rows of bracts of equal length, naked or with some small short bracts at base; bracts erect or connivent. Achenes terete. Pappus of abundant white and soft hairs. (Latin *senex*, an old man, on account of the white hair-like pappus.)

##### A. Stems erect or ascending, never climbing.

##### 1. PERENNIALS.

##### a. Stems with mostly many and nearly equal leaves.

- Leaves pinnately lobed or parted or sometimes the upper narrowly linear and entire.  
Herb; stem simple; leaves comparatively broad, saliently pinnatifid and lacinate or dentate.....1. *S. clarkianus*.  
Low shrubs or bushes.  
Leaves once pinnately divided into 3 to 9 linear or filiform divisions; involucre bracts herbaceous; mainland.....2. *S. douglasii*.  
Leaves once or twice pinnately divided into many narrow or linear segments; involucre bracts fleshy or thickened; insular.....3. *S. lyoni*.  
Leaves entire or dentate, or some lacinate-dentate, never narrowly linear.  
Plants low, 2½ to 10 in. high; heads solitary and terminal, or few in a terminal cyme; bracts of the involucre penicillate at tip.....4. *S. fremontii*.

- Plants tall, 1 or 2 to 6 ft. high; heads cymose or corymbosely cymose.  
 Heads radiate.  
 Herbage glabrous or glabrate or nearly so; pubescence, if any, never viscid; rays commonly 5; stems commonly few or several from the base.  
 Leaves (4 or) 6 lines to 2 in. wide.  
 Leaves cordate to truncate at base, conspicuously and abruptly petioled ..... 5. *S. triangularis*.  
 Leaves cuneate or tapering at base, passing gradually into a winged petiole or sessile ..... 6. *S. serra*.  
 Leaves  $\frac{1}{2}$  to  $1\frac{1}{2}$  lines wide (linear and entire) ... 7. *S. multicapitatus*.  
 Herbage with a viscid pubescence; San Bernardino Mts. .... 8. *S. parryi*.  
 Heads rayless; S. Cal. coast. .... 9. *S. as Stephanus*.
- b. *Stems few-leaved, naked above or the upper leaves reduced in size.*
- Stems solitary, tall and simple, arising from a cluster of coarsely fibrous roots.  
 Bracts of the involucre not black-tipped.  
 Rays present.  
 Leaves entire; herbage glabrous; involucre bracts herbaceous. .... 10. *S. hydrophilus*.  
 Leaves dentate or denticulate, sometimes a little saliently incised; involucre bracts, a little thickened or fleshy. .... 11. *S. mendocinensis*.  
 Rays only 1 or 2 or none. .... 12. *S. aronicoides*.  
 Bracts of the involucre commonly blackish-tipped; stem leafy to middle. .... 13. *S. lugens*.  
 Stems few to several, often in tufts, mostly from rootstocks.  
 Bracts of the involucre blackish-tipped; stems 1 to 3, almost naked, arising from a stout horizontal rootstock. .... 14. *S. covillei*.  
 Bracts of the involucre not black-tipped.  
 Herbage glaucous or glaucescent, mostly glabrous; rays short, few. .... 15. *S. clevelandii*.  
 Herbage not glaucous or glaucescent; rays conspicuous.  
 Plants low, commonly only 1 to 6 in. high.  
 Rays yellow; leaves entire; alpine.  
 Involucre cylindric; herbage glabrate; leaves plane. .... 16. *S. petrocallis*.  
 Involucre campanulate; herbage white-tomentose; leaves with the margin more or less revolute. .... 17. *S. muirii*.  
 Rays deep orange; involucre hemispheric; leaves dentate or serrate; low montane ..... 18. *S. greenii*.  
 Plants taller, mostly 1 to 3 (or 5) ft. high.  
 Herbage permanently canescent with pannose tomentum (rarely glabrate); leaves entire.  
 Leaves mostly roundish or elliptic-ovate, white above and below. .... 19. *S. canus*.  
 Leaves linear-oblongate, white-tomentose below, glabrate and green above ..... 20. *S. howellii*.  
 Herbage not permanently canescent or tomentose.  
 Heads mostly 6 to 8 lines high.  
 Leaves entire to serrate or pinnately parted.  
 Leaves entire or serrate, not lobed or divided, gradually passing into the petiole; rare.  
 Herbage green; leaves entire or serrate, acute, apiculate at apex. .... 21. *S. fastigiatus*.  
 Herbage white-tomentulose; leaves serrate, obtuse. .... 22. *S. neomexicanus*.  
 Leaves rather abruptly petioled, orbicular, or pinnately parted or divided with the terminal division mostly orbicular; herbage glabrate; mts. of S. Cal. .... 23. *S. ionophyllus*.  
 Leaves mostly once pinnately divided into separate or nearly distinct divisions, the divisions again lobed or incised or toothed.  
 Herbage more or less tomentulose; North Coast Ranges mostly ..... 24. *S. eurycephalus*.  
 Herbage glabrous; South Coast Ranges mostly ..... 25. *S. breweri*.  
 Heads mostly 4 to 5 lines high; leaves (at least the basal ones) abruptly or definitely petioled.  
 Leaves pinnately divided into nearly distinct roundish leaflets; stems very slender. .... 26. *S. bolanderi*.  
 Leaves (at least the basal ones) mostly oval, crenulate, sometimes pinnatifid at base. .... 27. *S. pauciflorus*.
2. ANNUALS.
- Indigenous species; involucre bracts not black-tipped, sometimes brownish or yellowish.  
 Rays conspicuous; involucre nearly naked at base. .... 28. *S. californicus*.  
 Rays none; involucre naked at base. .... 29. *S. mohavensis*.  
 Introduced species (except no. 32).  
 Bracts of the involucre black-tipped, the involucre with small bracts at base; rays none ..... 30. *S. vulgaris*.

Bracts of the involucre not black-tipped, the involucre naked at base; rays very inconspicuous, recurved.

Herbage pubescent; involucre cylindric.....31. *S. sylvaticus*.

Herbage glabrous; involucre somewhat flask-shaped.....32. *S. aphanactis*.

### B. Stems climbing.

Perennial herb; introduced species.....33. *S. mikanioides*.

1. *S. clarkianus* Gray. Stem simple, erect, striate-angled, 3 to 4 ft. high; leaves lanceolate or sometimes oblong in outline, 2 to 9 in. long, pinnatifid or lacinate-dentate, the salient lobes or teeth lanceolate or triangular and very acute; cauline leaves sessile, the basal narrowed to a long winged petiole; inflorescence cymose or somewhat paniculate; heads several to many, about 6 lines high; bracts of involucre linear, subulate at apex, the calyculate bracts several, slender, loose; rays about 7 or 8, 4 to 5 lines long, narrow.—Moist ground 7000 to 9000 ft.: Sierra Nevada from Mariposa Co. to Tulare Co. Aug.-Sept.

2. *S. douglasii* DC. CREEK SENECEO. Fig. 1008. Much-branched bush 2 to 6 ft. high, leafy up to the inflorescence; herbage at first whitish-tomentose, later more or less or even quite glabrate; leaves 1 to 3 in. long, pinnately divided into 3 or 5 to 9 lobes, the lobes rather remote, narrowly linear, revolute, the upper pinnately 3-lobed with the middle lobe several times longer, or the uppermost leaves entire; heads 6 to 7 lines high; involucre campanulate or broadly turbinate, the bracts linear with attenuate tips, dorsally carinate below; rays 10 to 13, 5 lines long; achenes linear, canescent, 2 lines long.—Dry stream beds in the foothills, sandy floors or gravelly plains in the valleys, 200 to 4250 ft.: throughout cismontane Cal.; Inyo Co.; Mohave Desert; e. to Tex. and Nev. July-Oct. Var. *MONOENSIS* Jepson n. comb. Less woody, copiously branched from the main stem; herbage bright green, glabrous; branches often long and decumbent.—Inyo and Mono Cos. (*S. monoensis* Greene.)

3. *S. lyonii* Gray. Stems branching, somewhat woody at base, 2 to 3 ft. high; herbage when young tomentose, soon glabrate except for conspicuous dense tufts of wool in the leaf axils; leaves ovate in outline,  $1\frac{1}{2}$  to 3 in. long, once or twice pinnately divided into many narrow or linear obtuse segments, the petioles  $\frac{1}{4}$  to  $\frac{3}{4}$  in. long, auricled at base or merely dilated; inflorescence loosely cymose, the peduncles with a few minute subulate bracts; involucre hemispheric, 3 to 4 lines high, their bracts linear, slightly keeled, scarious-margined, the acuminate tips densely pubescent. — Santa Catalina and San Clemente islands; s. to L. Cal.

1008. *Senecio douglasii* DC.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, fr. head  $\times \frac{1}{2}$ ; c, disk-fl.  $\times 1\frac{1}{2}$ ; d, achene and pappus  $\times 1\frac{1}{2}$ .

4. *S. fremontii* T. & G. var. *occidentalis* Gray. Stems many, branching, ascending or erect, arising from a branched root-crown,  $2\frac{1}{2}$  to 10 in. long; leaves round-obovate, elliptic or spatulate to oblong, coarsely few-toothed above the middle, thick,  $\frac{1}{2}$  to 1 in. long, gradually narrowed to a broad petiole 2 to 6 lines long, the upper often incised, sessile by a broadish base; heads 4 to 5 lines high, 2 to 8 in a loose terminal cyme, subtended by a few loose bractlets; bracts of the involucre linear, narrowly scarious-margined, shortly acuminate, penicillate at tip; rays 7 to 9, pale yellow, 3 to 5 lines long.—Alpine or subalpine, mostly granite slopes, 7800 to 13,000 ft.: Sierra Nevada from Tulare Co. to Mariposa

1009. *Senecio triangularis* Hook; a, top of flowering stem  $\times \frac{1}{4}$ ; b, leaf  $\times \frac{1}{4}$ ; c, head  $\times 1$ .

Co.; n. to Wash. July-Aug. (*S. occidentalis* Greene.)

5. *S. triangularis* Hook. Fig. 1009. Stems slender, erect, several from a very stout horizontal rootstock, 2 to 6 ft. high; rootstock compact, bearing numerous cord-like roots; herbage glabrous; leaves oblong-ovate to ovate-lanceolate, sometimes triangular-hastate, saliently serrate, serrulate or subentire, cordate or truncate at base,  $1\frac{1}{4}$  to  $5\frac{1}{2}$  in. long, the petioles  $\frac{1}{4}$  to 2 in. long; heads 4 to 5 lines high, several to many in a terminal corymbose cyme; rays 6 to 12, deep yellow,  $2\frac{1}{2}$  to  $3\frac{1}{2}$  lines long.—Stream borders and bogs in the mts., 4000 to 9000 ft.: San Jacinto Mts.; San Bernardino Mts.; San Gabriel Mts.; Sierra Nevada from Tulare Co. to Shasta Co.; n. Humboldt Co. to Del Norte and Siskiyou Cos.; n. to B. C. and Sask., e. to Col. July-Sept.

rather strict; leaves oblong-lanceolate to lanceolate, denticulate, sometimes nearly entire,  $2\frac{1}{2}$  to  $5\frac{1}{2}$  in. long, narrowed to petioles 1 to 3 in. long, the cauline mostly sessile or very shortly petioled; heads broadly turbinate-cylindric, 4 lines high; bracts of the involucre linear-lanceolate, scarious-margined, the acute tips penicillate, often dark; rays none; achenes glabrous.—Montane valleys or flats, 4700 to 6600 ft.: Sierra Co. to Modoc Co.; n. to Wash., e. to Col. Var. *INTEGRUSCULUS* Gray. Leaves very thin, entire or minutely denticulate, sessile or on petioles 2 to 3 lines long.—Montane valleys, 5000 to 6000 ft.: Sierra Valley; e. Nevada Co.; Nev. and e. Ore. to Wyo. Var. *ALTIOR* Jepson n. var. Stem simple, erect,  $3\frac{1}{2}$  to  $4\frac{1}{2}$  ft. high; herbage glabrate or minutely soft-hairy; leaves linear-lanceolate, acute, regularly serrulate, 3 to 5 in. long, narrowed at base to a winged petiole (2 lines to 2 in. long) or sessile; heads narrow-cylindric, 3 to 4 lines high; bracts of the involucre 8, linear, penicillate at the slightly spatulate tips; rays 5, 3 lines long; achenes glabrous.—Montane, 8000 ft., s. Sierra Nevada in Tulare Co. (Mineral King, Jepson 1156, type).

7. *S. multicaпитatus* Greenm. Stems several from the branched root-crown of a stout taproot, 8 to 14 in. high; herbage glabrous; leaves narrowly linear, entire, acute, often curved, spreading or even deflexed,  $1\frac{1}{2}$  to 3 in. long,  $\frac{1}{2}$  to  $1\frac{1}{2}$  lines wide; heads 3 lines high, numerous in a terminal leafy-bracteate cyme; involucre subcylindric, their bracts 8 or 9, linear, acute, scarious-margined, pubescent at tip; calyculate bracts few or none; rays 4 or 5, yellow; disk-flowers 10 to 12; achenes glabrous.—Montane, 8600 to 9600 ft., San Bernardino Mts.: Santa Ana Cañon; Mt. San Gorgonio. (*S. serra* var. *sanctus* Hall.)

8. *S. párryi* Gray. Stems erect or ascending, 1 to  $1\frac{1}{2}$  ft. high, leafy throughout or the leaves reduced above, terminating in a corymbose cyme; herbage glandular-villous; leaves oblong or elliptic, sometimes lyrate-narrowed below, denticulate to doubly dentate, auriculate-sessile by a broad base,  $1\frac{1}{2}$  to 5 in. long; heads about 6 lines high; involucre sparsely calyculate; rays about 8; achenes strigulose.—San Bernardino Mts.; e. to Ariz. July-Sept.

9. *S. astéphanus* Greene. Stem solitary, erect, 12 to 20 in. high, leafy below and at base; herbage white-tomentulose, more or less glabrate; leaves oblong-obovate, 4 to 8 in. long, denticulate or saliently subulate-toothed, gradually narrowed to a petiole  $\frac{1}{5}$  to  $\frac{2}{3}$  as long; heads hemispheric, 6 to 7 lines high, disposed in a compact cyme or corymbosely paniculate.—Montane, the known stations few and the individuals infrequent: San Luis Obispo Co.; Mt. Lowe (F. W. Peirson); Mt. Wilson. June. (*S. ilicetorum* Dav.)

10. *S. hydrophilus* Nutt. Fig. 1010. Stem simple, erect, often purplish, 2 to  $4\frac{1}{3}$  ft. high, few-leaved, ending above in an ample corymbose cyme or the cyme often condensed and as if capitate; herbage somewhat succulent, glabrous, more or less glaucous; basal and lower leaves oblong-oblongeolate, entire or rarely denticulate, fleshy-coriaceous, 8 to 13 in. long, passing gradually into margined petioles 2 to 7 in. long, the upper cauline ones sessile or clasping; heads 4 to 5 lines high; involucre campanulate, slightly calyculate, the bracts with broad scarious margins, bearing a black spot just below tip; rays none or rarely few.—Marshes and swamps, 10 to 7000 ft.: San Francisco Bay region to Siskiyou Co.; Nevada Co. to Modoc Co.; n. to B. C., e. to Col. May-Aug.

1010. *Senecio hydrophilus* Nutt.; a, infl. x  $\frac{1}{2}$ ; b, leaf x  $\frac{1}{2}$ ; c, disk-fl. x 2.

11. *S. méndocinensis* Gray. Stem simple, erect, robust, leafy below or to the middle, naked above, 2 to 3 ft. high, arising from a dense cluster of stoutish fibrous roots, ending above in a very compact or a somewhat loose cyme; herbage thinly arachnoid or somewhat floccose; lower leaves oval or ovate to oblong-lanceolate, dentate or denticulate, rarely a little saliently lacinate, somewhat succulent, acute to subcordate at base, 1 to 5 in. long, passing into winged petioles  $\frac{1}{2}$  to as long; upper leaves mostly lanceolate with a broad sessile base; heads broadly campanulate, 5 to 6 lines high; bracts of the involucre linear-subulate, the calyculate ones few or several, slender, loose; rays 5 to 12, oblong, 4 to 5 lines long.—Gravelly slopes or valleys, 2500 to 6500 ft.: Mendocino and Humboldt Cos. to Siskiyou Co.; Amador Co. to Tuolumne Co. June-July. (*S. whippleanus* Gray.)

12. *S. arónicoides* DC. Stem simple, robust, arising from a cluster of fibrous roots, 1 to  $3\frac{1}{2}$  ft. high, leafy chiefly at the base or below the middle; younger parts loosely woolly, soon glabrate; basal leaves ovate or round-ovate to oblong, irregularly and coarsely toothed, denticulate or almost entire, 3 to 8 in. long, on petioles 1 to 5 in. long; cauline leaves similar or mostly lanceolate, often more irregularly or saliently toothed than the basal ones, drawn down to a winged petiole and auricled at base, the uppermost bract-like; inflorescence a compound terminal cyme, or frequently much reduced or condensed and the heads few; heads 3 to 5 lines high; involucre bracts lanceolate, either with or without purple tips; flowers in a head 10 to 26; rays none, rarely 1 or 2; achenes  $1\frac{1}{2}$  lines long, glabrous.—Thickets or sparsely chaparral-covered country in the hills, 50 to 4000 ft.: Coast Ranges from Siskiyou Co. to San Mateo Co. Common and widely distributed in the district but the individuals usually solitary, never locally abundant. May.

13. *S. lùgens* Rich. var. *exaltatus* Gray. Stem simple, erect,  $\frac{1}{2}$  to 3 ft. high, few-leaved or naked above, arising from a dense cluster of cord-like

roots borne on very short rootstock, ending above in a rather compact or open cyme of several to many heads; herbage lightly floccose-woolly when young, soon glabrate and green; leaves broadly ovate or oblong to obovate or broadly oblanceolate, denticulate to entire, 3 to 6½ in. long, tapering into a margined petiole ⅓ to ⅔ as long; upper cauline leaves lanceolate or reduced and bract-like; heads 4 to 5 lines high; involucre campanulate, the bracts lanceolate, obtuse or acute or acuminate, the tips often blackish; rays 10 to 12, conspicuous.—Wet ground in the mts., 5400 to 9000 ft.: Sierra Nevada from Tulare Co. to Eldorado Co.; Warner Mts.; n. to B. C. Var. *MEGACEPHALUS* Jepson n. var. Heads much larger (8 to 9 lines high).—Mts. of Tulare Co. (pine forest, Colony Mill to Marble Fork, Jepson 668, type).

1011. *Senecio covillei* var. *scorzonella* Jepson; a, b, habit x ½; c, head x 1.

14. *S. covillei* Greene. Fig. 1011. Stems 1 to 3 from a horizontal rootstock, erect, simple, 10 to 14 in. (or 2 ft.) high, the leaves in a mostly basal tuft; herbage thinly tomentulose, soon becoming green and glabrate; leaves oblong-oblanceolate to linear-oblong, acute or acuminate, denticulate, saliently serrulate or sometimes subentire, narrowed downward to an entire and very broad (1 to 6 lines wide) or winged petiole or sessile by a very broad base, the whole 2 to 4½ (or 6½) in. long; head 3½ to 5 lines high, few to many in very compact or in somewhat loose cymes; bracts of the involucre black-tipped; rays 5 to 7.—High montane, 8000 to 11,000 ft.: Sierra Nevada from Tulare Co. to Mariposa Co. July-Aug. Var. *SCORZONELLA* Jepson n. comb. Fig. 1011. Herbage permanently white-lanate; leaves less serrate.—High montane, 7200 to 9500 ft.: Inyo Co. to Mariposa Co. (*S. scorzonella* Greene.)

15. *S. clevelandii* Greene. Stems simple, 1½ to 2 ft. high, corymbosely branched at summit, but the inflorescence rather strict; herbage glaucous and glabrous, except the small flocs of white tomentum in the axils of the upper leaves and bracts; leaves in a basal tuft and sparsely cauline, oblong, 2 to 3 in. long, tapering to both ends from the middle or broadest above the middle, entire, obtuse, 2 to 3 in. long, on petioles 2½ to 5 in. long; uppermost leaves similar but smaller; heads 3 lines high, numerous in a compound corymb; rays 5 or 6, deep orange, 2 lines long; achenes glabrous.—Cañon bottoms and moist beds of rivulets in the hills: Napa Co. to Lake Co. July.

16. *S. petrocallis* Greene. Stems several to many from the branched crown of a taproot, 3 to 5½ in. high, nearly naked, the leaves in a basal tuft; herbage glabrate; leaves oblong-oblanceolate, entire, apiculate, 6 to 10 lines long, gradually tapering into a petiole 1 to 3 times as long; heads 3 to 4 lines high, few in a terminal cyme; rays 10 to 12.—Alpine, on rocky slopes, 10,000 to 12,000 ft.: Mt. Dana; e. to Rocky Mts.

17. *S. müirii* Greenm. Stems erect or ascending, 1½ to 2½ or 6 in. high, arising from the branches of the root-crown, almost naked, with the leaves in basal tufts, thus forming dense mats 2 to 7 in. wide; herbage white-tomentose or becoming glabrate and green or partly so; leaves oblanceolate, entire or oblong, gradually narrowed below to a margined petiole with a broad base, the whole 1 to 2 in. long; heads 3½ to 4 lines high, terminal on the stems, solitary or in a 3 or 4-flowered cyme; involucre campanulate;

rays 9 to 13,  $2\frac{1}{2}$  lines long.—Alpine, 11,500 to 12,500 ft.: Mt. Whitney to Mt. Dana and Sonora Pass.

18. *S. grœnei* Gray. Stems erect from slender running rootstocks, 3 to 5 (or 11) in. high, bearing 1 to 3 short-peduncled heads; herbage lightly floccose-tomentose; basal leaves orbicular to roundish-ovate, obtuse or acute, cuneate to truncate at base, dentate or serrate,  $\frac{1}{2}$  to 1 or  $1\frac{1}{2}$  in. long, the petioles 1 to  $1\frac{1}{2}$  times as long; cauline leaves few, the lower similar to the basal, the upper oblong or lanceolate, often contracted downward towards the broad sessile base, entire; heads 8 lines high; bracts of involucre linear, no calyculate ones at base; rays deep orange, 7 to 10 lines long; style-tips of disk-flowers conspicuously penicillate-margined and with a central cusp; achenes glabrous.—Montane, North Coast Ranges, 1500 to 2500 ft., locally rare: Capell Cañon, Napa Range; Mt. St. Helena; mts. near the Geysers, ne. Sonoma Co.; Mt. Sanhedrin; Red Mt., n. Mendocino Co.; Bottlerock Mt., Lake Co.; Indian Valley, ne. Lake Co.; Bennett Spr., w. Glenn Co. May.

*S. ÉLEGANS* L. Purple Ragwort. Leaves pinnatifid; bracts of the involucre shallowly corrugated longitudinally; calyculate bracts not corrugated, conspicuously black-tipped; rays showy, purple; achenes ribbed.—Garden plant from S. Afr.; adv. at San Francisco.

19. *S. cœnus* Hook. Stems erect, arising from a more or less horizontal rootstock, 5 to 12 (or 15) in. high; herbage white-tomentose with a permanent felt-like tomentum, or in age sometimes flocculent, rarely glabrate; leaves orbicular or roundish-ovate to elliptic, entire,  $\frac{1}{4}$  to  $1\frac{1}{4}$  in. long, rarely serrate or sometimes a little dentate at apex, on petioles  $\frac{1}{4}$  to  $1\frac{3}{4}$  in. long or the upper ones sessile; heads 3 to 5 lines high, few to mostly many in terminal cymes; rays 5 to 8; achenes glabrous.—Montane, 5500 to 11,500 ft.: Sierra Nevada from e. Tulare Co. to Fresno Co. and Mono Co.; Warner Mts., Modoc Co.; n. to B. C., e. to Rocky Mts. June-July.

20. *S. howellii* Greene. Stems erect or nearly so, arising from a branching rootstock, 10 to 12 in. high, leafy mainly below, the leaves in basal tufts; herbage closely white-tomentose, the upper surface of the leaves becoming green and glabrate, the stems partly glabrate; leaves linear-oblancoolate, entire or rarely with a few teeth,  $\frac{3}{4}$  to  $1\frac{1}{2}$  in. long, gradually narrowed to a petiole as long; inflorescence a corymbose cyme; heads about 4 lines high; rays 6.—Montane, n. boundary Del Norte Co.; n. to Ore.

21. *S. fastigiatus* Nutt. var. *layneae* Gray. Stems few or several from the base, erect, 10 to 23 in. high, the leaves mostly in basal tufts or on lower half of stem, reduced above; herbage with scattered flocs of wool, otherwise glabrate; leaves oblanceolate, entire or somewhat saliently serrulate, acute, apiculate,  $1\frac{1}{4}$  to  $2\frac{1}{4}$  in. long, gradually narrowed to a petiole  $\frac{1}{2}$  to as long; inflorescence a corymbose cyme of few to many heads; heads 5 to 7 lines high; rays narrowly linear, 6 to 8 lines long.—Eldorado Co. foothills.

22. *S. neomexicanus* Gray. Stem simple, erect, 9 to 18 in. high, ending above in a loose or compact cyme, the leaves mostly basal; herbage white-tomentulose or partly glabrate; basal leaves elliptic, dentate, 1 to  $1\frac{1}{2}$  in. long, narrowed below to a petiole 1 to 2 times as long; cauline leaves few, narrower, sessile by a broad base, sometimes more deeply toothed; heads 4 lines high, several to many in the cyme; rays 12 to 16, 4 to 5 lines long; achenes hispidulous or glabrous.—San Bernardino Mts.; e. to N. Mex.

23. *S. ionophyllus* Greene. Stems several, erect, arising from a branched or simple root-crown, densely leafy below, mostly naked above the middle, 8 to 16 in. high; herbage floccose-woolly when young, soon glabrate; leaves orbicular, cordate or truncate at base, crenate to subentire, or sometimes with 1 or 2 small pairs of lobes at base, somewhat fleshy, 4 to 10 lines wide; petioles  $\frac{3}{4}$  to 2 in. long; heads 6 to 8 lines high, borne in a loose terminal cyme or sometimes solitary; involucre broadly campanulate,  $3\frac{1}{2}$  to  $4\frac{1}{2}$  lines high, sometimes a little calyculate and a little white-tomentose at base; bracts lanceolate; rays showy, light yellow; achenes glabrous, 10-nerved, the alternate ones much stronger.—Mts. of S. Cal., 5700 to 7000 ft.: Tehachapi Mts.; San Gabriel Mts.; San Bernardino Mts. June. Var. *BERNARDINUS* Hall. Stems several from the root-crown, 6 to 12 in. high;

herbage with subsistent tomentum; leaves crowded in basal tufts, orbicular to obovate, 3 to 5-toothed at apex, 3 to 7 lines long; petioles  $\frac{3}{4}$  to  $1\frac{3}{4}$  in. long.—San Bernardino Mts., 7000 ft. (*S. bernardinus* Greene.) Var. *SPARSILOBATUS* Hall. Stems slender, few from the root-crown, erect or ascending 6 to 11 in. high; herbage tomentose or green and glabrate; leaves mostly in basal tufts or the stems a little leafy to the middle,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long, pinnatifid into 5 obovate or roundish segments, the segments dentate at apex, the terminal one the largest; petioles about 1 to 3 times as long as the blades; sometimes with some leaves merely roundish and dentate; heads 4 to  $5\frac{1}{2}$  lines high; rays sometimes none.—San Bernardino Mts., 6000 to 10,000 ft. July-Aug. (*S. sparsilobatus* Parish.) Var. *STYGIVUS* Jepson n. comb. Related to var. *sparsilobatus*; stems 12 to 22 in. high; herbage soon very glabrous except for a few scattered persistent flocs; heads smaller (3 lines high).—New York Mts., e. Mohave Desert; e. to Ariz. (*S. stygius* Greene.)

24. *S. eurycephalus* T. & G. Stems 1 or several, arising from the crown of stout taproot, erect, 1 to  $2\frac{3}{4}$  ft. high, the leaves mostly basal or the cauline ones mostly scattered and commonly smaller; herbage floccose-woolly when young, more or less glabrate; leaves 2 to 7 in. long (on petioles  $\frac{1}{4}$  to as long), deeply pinnatifid into 2 to 4 or 5 pairs of lobes or segments, the lobes obovate or cuneate-obovate, entire, coarsely serrate or incisely cleft, or the terminal portion not segmented and usually much larger; heads 5 to 6 lines high, few to numerous in a terminal corymb; involucre broadly campanulate, somewhat contracted above, their bracts linear or linear-oblong, somewhat acute, scarious-margined; rays 7 to 12, 5 to 6 lines long.—Open woods in the hills or rocky slopes in the mts., 1500 to 5000 ft.: Coast Ranges from Sonoma, Napa and Lake Cos. to Siskiyou Co. May-June. Var. *AUSTINAE* Jepson n. comb. Leaves more finely divided and incised, especially the terminal segment.—Modoc Co. (*A. austinae* Greene.)

25. *S. breweri* Davy. Similar to *S. eurycephalus*; herbage glabrous; leaves with 1 to 9 pairs of segments, the segments often more incised, sometimes petiolulate.—South Coast Ranges from Santa Clara Co. to the San Emigdio Range; Tehachapi Mts.; Greenhorn Range.

26. *S. bolanderi* Gray. Stems slender,  $\frac{1}{2}$  to  $2\frac{1}{2}$  ft. high, arising from rootstocks; herbage glabrous; basal leaves cordate-orbicular or subcordate, crenate or crenate-incised, sometimes shallowly palmately lobed,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long, sometimes with a pair of supplementary lobes on the petiole, the petioles  $1\frac{1}{2}$  to  $3\frac{1}{2}$  in. long; cauline leaves pinnately divided into about 5 mostly distinct leaflets, the leaflets serrate or shortly incised, the terminal one much the larger; cymes terminal, loose, 2 to 6-headed; heads 4 to 5 lines high; rays 5 to 8 (or 11), elliptic or oblong, 4 to 6 lines long.—Sandstone ridges near the coast, 100 to 500 ft.: Mendocino Co. to Del Norte Co.; n. to Ore.

27. *S. pauciflorus* Pursh. Stem simple, erect, arising from the crown of a vertical root, 5 to 19 in. high, the leaves chiefly basal, those of the stem remote, mostly reduced above; herbage early glabrate; basal and lower leaves oval, crenulate or sometimes entire,  $\frac{1}{2}$  to  $1\frac{3}{4}$  in. long; petioles 1 to 3 in. long; cauline leaves 1 to 3 in. long, oblong or linear, incised or pinnatifid to the sessile base or more or less petioled, sometimes subentire; heads about 4 lines high, few in a close terminal cyme, discoid; achenes glabrous.—Alpine, 9000 to 10,300 ft.: Sierra Nevada from Tuolumne Co. to Lassen Peak; n. to Alas., e. to Lab. and Quebec. (*S. lemberti* Greene.) Var. *FALLAX* Greenm. Similar to the species; heads radiate, the rays 4 to 7, about  $3\frac{1}{2}$  lines long.—High montane, Sierra Nevada from Tulare Co. to Mt. Dana. Var. *CROCEUS* Jepson n. comb. Stem 5 to 12 in. high; stem leaves pinnatifid and often much incised at the broad sessile base; rays saffron yellow.—Mt. Goddard to Mariposa Co., 8300 to 10,000 ft. (*S. aureus* var. *croceus* Gray.) Var. *SUBNUDUS* Jepson n. comb. Stems nearly naked; basal leaves roundish to oval, the cauline less serrate or incised; rays 8 to 17.—Alpine, 8700 to 10,300 ft.: Mariposa Co. to Plumas and Lassen Cos.: n. to Wash. and Mont. (*S. aureus* var. *subnudus* Gray.) Var. *JUCUNDULUS* Jepson n. var. Stems erect, arising from a branched rootstock, ending above in a compact cyme, 2 ft.

high, nearly naked, the leaves mostly basal; herbage quite glabrate or sparsely flocculent; leaves very erect, oblong-ovate, regularly serrate, cordate or subcordate at base, obtuse,  $\frac{1}{2}$  to  $2\frac{1}{2}$  in. long, the petioles  $1\frac{1}{2}$  to  $5\frac{3}{4}$  in. long; heads  $2\frac{1}{2}$  to 3 in. high; involucre campanulate; rays 9, elliptic,  $1\frac{1}{2}$  to 2 lines long.—Montane, 8500 ft.: Tulare Co. (Volcano Creek, Jepson 4944, type).

28. *S. californicus* DC. Stem simple or branched from near the base, erect or diffuse, 7 to 17 in. high; herbage glabrous or the leaves obscurely soft-hairy; leaves linear or lanceolate, entire or pinnately (and shortly) lobed or pinnatifid, 1 to  $2\frac{1}{2}$  in. long, the upper ones strongly auriculate-clasping by a broad base; heads 4 lines high, several to many in loose terminal corymbs; involucre broadly hemispheric, nearly naked at base, the bracts brown-tipped; rays 14 to 20; achenes canescent.—Hill slopes, in chaparral, or sand dunes along the coast, 10 to 1500 ft.: Tulare Co. foothills; Santa Barbara Co. to San Diego Co.; w. side Colorado Desert; s. to L. Cal.

29. *S. mohavensis* Gray. Stem branching, 3 to 15 in. high; herbage glabrous; leaves obovate or broadly oblong to ovate,  $\frac{3}{4}$  to  $3\frac{1}{2}$  in. long, irregularly dentate or shallowly lobed, often purple beneath, broadly auriculate-clasping or the lowest on petioles 6 to 9 lines long; heads 3 to 4 lines high, loosely cymose-paniculate; bracts of the involucre 11 to 15, linear, naked at tip or penicillate, not black-tipped; calyculate bracts few, minute; rays commonly none; achenes canescent.—Desert cañons or flats, 100 to 3000 ft.: Panamint Mts.; Colorado Desert. Apr.

30. *S. vulgaris* L. COMMON GROUNDSEL. Fig. 1012. Stem simple or branching, 6 to 12 in. high; herbage glabrous or with a little loose tomentum; leaves pinnatifid with jagged margin; heads in terminal corymbs, disposed to be sessile in clusters; involucre cylindrical, 4 lines long, consisting of about 20 equal black-tipped bracts with several to many conspicuously black-tipped small ones at base; achenes slightly hairy.—Nat. weed from Eur., very common in waste places. Sometimes called "Old Man of Spring." The herbage is reputed poisonous to some animals. Feb.-Apr.

1012. *Senecio vulgaris* L.; a, fl. branchlet x 1; b, lower leaf x  $\frac{1}{2}$ .

31. *S. sylvaticus* L. Stem branching from or near the base, erect, 1 to  $3\frac{1}{4}$  ft. high; herbage pubescent; leaves linear to oblong in outline, 6 to 12 lines long, sessile or the lower with short winged petioles, pinnatifid with the lobes 1 or 2-toothed; corymbs loose, few-headed; heads cylindric; bracts of involucre not black-tipped, the small ones at base wanting or minute; rays about 5, minute, recurved, or sometimes wanting; achenes appressed-pubescent.—Woods of Mendocino and Humboldt Cos.; nat. from Eur.

32. *S. aphanactis* Greene. Very similar to no. 31; stems 4 to 7 in. high; herbage glabrous or slightly tomentulose on the heads or in the axils; involucre slightly constricted above.—Coastal region from sw. Solano Co. and the South Coast Ranges to San Diego.

33. *S. mikanioides* Otto. GERMAN IVY. Stems twining and thus climbing over shrubs and trees to a height of 5 to 20 ft.; leaves ivy-like, roundish-cordate, sharply 5 to 7-angled; petioles as long or longer; stipules reniform, present except on the uppermost leaves; corymbs more or less paniculate;

heads linear-oblong, 5 to 7 lines long, the involucre about  $\frac{1}{2}$  the length of the corollas.—Nat. from S. Afr. along streams or gullies near the coast: Berkeley; Temescal Creek; Mills College; San Luis Obispo. Jan.

### 153. *ARNICA* L.

Perennial montane herbs, somewhat glandular or aromatic. Stems bearing 1 to several large heads at the summit. Leaves all opposite or the upper alternate. Involucre broadly campanulate, not calyculate at base; bracts lanceolate, equal, somewhat in 2 ranks. Disk-flowers many, yellow; ray-flowers pistillate when present, yellow. Achenes slender and somewhat spindle-shaped, with a callus knob at base. Pappus a single row of rather rigid and strongly roughened denticulate white bristles. (Origin of name obscure.)

Rays wanting (rarely some rudiments).

Basal leaves mostly cordate at base, or merely truncatish, some of the cauline leaves usually petioled.

Involucre 4 to 5 (or 6) lines high; heads about 20 to 25-flowered; achenes glandular, not pubescent ..... 1. *A. parviflora*.

Involucre (5 or) 6 to 7 lines high; heads 30 to 50-flowered; achenes pubescent. . . 2. *A. discoidea*.

Basal leaves not cordate; cauline leaves sessile; involucre 4 lines high, 25 to 30-flowered; achenes glandular-hirsute ..... 3. *A. viscosa*.

Rays present (rarely wanting).

Basal leaves mostly cordate at base.

Lower cauline leaves deeply cordate, long-petioled; achenes more or less hirsute. . . 4. *A. cordifolia*.

Cauline leaves not cordate, sessile; achenes pubescent. . . . . 5. *A. latifolia*.

Basal leaves not cordate.

Plants leafy to the top or commonly so; cauline leaves seldom less than 4 pairs, the upper usually not conspicuously diminished.

Leaves oblong or oblong-lanceolate, the uppermost broad at base. . . . . 6. *A. mollis*.

Leaves lanceolate, tapering at both ends or at base, the lower connate at base into a sheath.

Sheaths all herbaceous or nearly so; none or few of the stem leaves tapering to petioles; herbage minutely puberulent; stems few or several in a tuft from a branched root-crown. . . . . 7. *A. longifolia*.

Sheaths membranous on each side below the point of union of the leafy bases; some of the stem leaves petioled; herbage tomentose-pubescent; stems one in a place, arising from a slender horizontal rootstock. . . . . 8. *A. foliosa*.

Plants less leafy; cauline leaves in 1 or 2 (rarely 3) pairs, the upper mostly small.

Herbage puberulent; stems 6 to 12 in. high; leaves mostly round ovate or broadly ovate. . . . . 9. *A. nevadensis*.

Herbage villous-pubescent or puberulent; stems 8 to 20 in. high; leaves mostly lanceolate. . . . . 10. *A. alpina*.

1. *A. parviflora* Gray. Stem slender, erect,  $1\frac{1}{2}$  to 2 ft. high, bearing a panicle of few to many heads, or the heads sometimes solitary; herbage puberulent, only slightly glandular; basal leaves ovate, varying to roundish or oblong, irregularly toothed, the larger obtuse or mostly truncate at base, rarely subcordate, 1 to  $3\frac{1}{2}$  in. long; petioles as long or  $1\frac{1}{2}$  times as long as the blade; cauline leaves few and reduced, usually some of them petioled; heads 20 to 30-flowered, 5 to 8 lines high; achenes minutely glandular, not pubescent or with only a few scattered hairs.—Hill slopes, 800 to 4000 ft.: w. Glenn Co. to Humboldt, Trinity and Del Norte Cos.

2. *A. discoidea* Benth. COAST *ARNICA*. Plants erect,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  ft. high; herbage glandular or viscid-pubescent especially above; leaves broadly ovate or oblong, irregularly and often coarsely dentate, rounded or truncate or cordate at base,  $2\frac{1}{2}$  to 4 in. long, on petioles nearly as long or longer; cauline leaves sessile, reduced, often with salient teeth, the upper sometimes alternate; heads 8 to 10 lines high; rays none; involucre villous-glandular; achenes sparsely hispidulous, 2 to 3 lines long.—Dry open woods, 1500 to 6000 ft.: Coast Ranges from San Luis Obispo Co. to Humboldt Co.; Mariposa Co.; n. to Wash.

3. *A. viscosa* Gray. Stems fastigiately branching, 8 to 12 in. high; herbage very viscid-pubescent; leaves small, ovate-oblong, entire, closely sessile, but not connate at base, 6 to 12 lines long; heads 25 to 30-flowered; involucre 4 lines high; corolla pale yellow; achenes glandular-hirsute with scattered hairs.—Mt. Shasta, 8000 ft.; very rare and too little known.

4. *A. cordifolia* Hook. Stem erect,  $\frac{1}{2}$  to 2 ft. high, from slender creeping rootstocks; herbage pubescent or towards the heads somewhat villous; basal and lower cauline leaves cordate (some almost reniform, some merely ovate), 1 to 3 in. long, on petioles 1 to 2 in. long; uppermost leaves smaller, broadly lanceolate, mostly sessile; heads few in a loose cyme and long-peduncled, or in the alpine plants solitary,  $\frac{3}{4}$  in. high; involucre hemispheric; rays 7 to 13,  $\frac{3}{4}$  to 1 in. long.—Montane, mostly in open woods, 4300 to 10,000 ft.: Cuyamaca Mts.; Sierra Nevada from Tulare Co. to Modoc Co.; Santa Lucia Mts.; Mt. Hamilton; Humboldt Co. to Siskiyou Co.; n. to B. C., e. to Col.

5. *A. latifolia* Bong. var. *viscidula* Gray. Stems erect, 9 to 14 in. high; herbage seemingly glabrous but minutely puberulent and sometimes a little glandular; leaves roundish ovate to ovate-oblong or ovate-lanceolate, mostly acute, denticulate or serrate, the basal on petioles  $\frac{1}{2}$  to 2 in. long, the cauline in 3 or 4 pairs on short (1 to 6 lines long) petioles, the uppermost sessile; heads 7 to 9 lines high; rays 6 to 8 lines long; achenes with short scattered slightly spreading hispid hairs.—Montane, 5000 to 6000 ft.: Mariposa Co. to Nevada Co.; Siskiyou Co. July.

6. *A. mollis* Hook. Plants erect, 7 to 22 in. high, the stems few or several from a stout rootstock; herbage villous-pubescent to nearly glabrous, the inflorescence glandular-puberulent; leaves oblong to oblong-lanceolate, denticulate or dentate, acute or obtuse,  $1\frac{1}{2}$  to  $3\frac{1}{2}$  in. long, tapering into a margined petiole about  $\frac{1}{4}$  to  $\frac{1}{2}$  as long or subsessile, or the basal with petioles as long; upper leaves broad at base, lanceolate to ovate-lanceolate, somewhat clasping; heads 5 to 6 lines high, in a loose cyme; rays 5 to 8 lines long; achenes hirsute-pubescent.—Montane flats, 8000 to 10,300 ft.: Sierra Nevada from Tulare Co. to Nevada Co.; n. to B. C., e. to Quebec and Col. Var. *SCABERRIMA* Smiley. Herbage scabrid; leaves more or less saliently toothed.—Tulare and Eldorado Cos.; w. Siskiyou Co. (A. scaberrima Greene.)

7. *A. longifolia* Eat. Stems few or several from the root-crown, erect, 1 to  $2\frac{1}{4}$  ft. high; herbage scantily puberulent; leaves elongated-lanceolate, tapering to both ends, entire or denticulate, somewhat nervose, 3 to 6 in. long, the lower connate-sheathing at base, the sheaths ( $\frac{1}{8}$  or)  $\frac{1}{2}$  to 1 in. long; heads 2 to 4 in a corymb, the peduncles 1 to  $3\frac{1}{2}$  in. long; achenes with very minute and short glandular processes, not at all hairy or obscurely so.—Montane valleys or cañons, 5000 to 7200 ft., infrequent: Kern Co. to Nevada and Modoc Cos.; e. to Utah. July.

8. *A. foliosa* Nutt. var. *incana* Gray. Stems erect, strict, usually 1 in a place, from slender running rootstocks, 10 to 28 in. high; herbage tomentose-pubescent; leaves broadly lanceolate, denticulate, nervose, 2 to  $5\frac{1}{2}$  in. long, tapering to petioles,  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. long or the upper clasping; lower leaves with sheathing bases, the sheaths  $\frac{1}{4}$  to 1 in. long; heads 3 or 4 in a cyme, rarely solitary, the peduncles 1 to  $1\frac{3}{4}$  in. long; bracts of the involucre acuminate; rays 4 to 6 lines long; achenes sparingly hairy.—Montane cañon flats or meadows, often standing in shallow water of lakes or the beds of former pools, 7800 to 9000 ft.: Sierra Nevada from Tulare Co. to Shasta and Lassen Cos.; n. to Wash. It passes into the next variety. Var. *SÖNNEI* Jepson n. comb. Stems and petioles long-villous; leaves mostly basal or sub-basal.—E. Eldorado and Nevada Cos.; n. Lake Co. (A. sonnei Greene.) Var. *BERNARDINA* Jepson n. comb. Bracts of the involucre obtuse.—San Bernardino Mts. (A. bernardina Greene.)

9. *A. nevadensis* Gray. Stems erect from slender rootstocks, 6 to 12 in. high; herbage puberulent, sometimes cinereous; leaves orbicular to broadly oval or ovate, mostly obtuse, entire, rarely denticulate, 1 to  $2\frac{1}{4}$  in. long, mostly abruptly petioled, the petiole usually margined,  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. long; heads 7 lines high; rays 6 lines long; achenes minutely pubescent with short scattered and spreading slightly glandular hairs, or glabrate.—Montane, 5000 to 7600 ft.: Inyo and Mariposa Cos. to Modoc Co. July.

10. *A. alpina* Olin. Stems erect, simple, 9 to 20 in. high, the heads terminal and solitary (rarely 2 or 3); herbage villous-pubescent or puberulent; leaves

1013. *Peucephyllum schottii* Gray; *a*, leaf  $\times 1$ ; *b*, fl. branchlet  $\times \frac{1}{2}$ ; *c*, fl.  $\times 2\frac{1}{2}$ .

narrowly oblong to lanceolate, or the basal ovate and the small uppermost ones linear, entire or denticulate, 3-nerved,  $\frac{3}{4}$  to  $2\frac{3}{4}$  in. long, narrowed at base to a petiole  $\frac{1}{2}$  to 2 in. long, the cauline often distinctly connate at base; achenes hirsute-pubescent, rarely glabrate.—Montane, 6000 to 9000 ft.: Mariposa Co. to Lassen Co.; n. Humboldt Co.; n. to Alas., e. to Lab.; n. Eur.

#### 154. *PEUCEPHYLLUM* Gray

Balsamic shrub, the numerous ultimate branchlets fastigiate and crowded with leaves up to the single discoid head. Leaves terete, resinous-punctate. Involucre broadly campanulate, its bracts numerous, linear-subulate, in about 2 series. Flowers yellowish. Corolla with very short proper tube and long cylindric throat, its short teeth erect, puberulent. Achenes turbinate-oblong, densely hirsute. Pappus shorter than the corolla, its bristles numerous, unequal, rather sordid, roughish, some of the longer with narrow hyaline margins. (Greek *peuke*, the fir, and *phyllon*, leaf, on account of the needle-like foliage.)

1. *P. schottii* Gray. Fig. 1013. **PIGMY CEDAR.** Glabrous very much branched shrub 3 to 9 ft. high; leaves 3 to 5 (or 10) lines long; heads 5 to 6 lines high; corolla-teeth purplish in age.—Washes of the foothills and gravelly sides of cañons: Inyo Co.; Mohave Desert; Colorado Desert; e. to Ariz., s. to L. Cal.

#### 155. *LÉPIDOSPÁRTUM* Gray

Ours a rigid broom-like shrub. Leaves alternate, all but the earliest reduced to scales. Bracts of the involucre regularly imbricated in 3 or 4 series, chartaceous, oblong, obtuse. Receptacle naked. Heads discoid. Flowers pale yellow. Corolla with long slender tube, the short campanulate throat exceeded by the spreading lobes. Anthers exserted. Achenes terete, faintly 8 to 10-nerved. Pappus of copious minutely scabrous capillary bristles. (Greek *lepis*, scale, and *sparton*, the broom shrub.)

1. *L. squamatum* Gray. Fig. 1014. Round-topped bush 3 to 6 ft. high; young or basal shoots white-tomentose, densely leafy with obovate entire leaves, 4 to 6 lines long; full-grown plant glabrate, or with flocs of wool in the axils, its stems ascending or virgate, with scattered ovate-acute

1014. *Lepidospartum squamatum* Gray; *a*, leafy shoot, spring growth,  $\times \frac{1}{2}$ ; *b*, fl. branchlet  $\times \frac{1}{4}$ ; *c*, head  $\times 1$ ; *d*, fl.  $\times 1\frac{1}{2}$ ; *e*, pappus-bristle  $\times 3$ .

scales  $\frac{1}{2}$  to  $1\frac{1}{2}$  lines long; heads 3 to 6 lines high, racemose or paniculate, 11 to 13-flowered; involucre campanulate; achenes glabrous or nearly so.—Sandy washes and gravelly plains, 1000 to 3000 ft.: cismontane S. Cal. and n. to southern Monterey Co., the upper San Joaquin Valley and the southern Sierra Nevada in Kern Co.; Mohave and Colorado deserts; e. to Ariz., s. to L. Cal. Var. *obtectum* Jepson n. var. Peduncles beneath the heads very densely imbricated with small scales.—Whitewater Wash (Schellenger, type).

#### 156. *TETRADYMIA* DC.

Low rigid shrubs of arid regions. Herbage whitish tomentose, sometimes almost glabrate. Leaves alternate, entire, solitary or fascicled, the primary ones often replaced by spines. Involucre cylindric to oblong, its bracts 4 to 6, firm, concave, overlapping, often enlarged and thickened at base. Heads discoid, 4 to 9-flowered. Receptacle flat, small. Flowers yellow. Achenes terete, short, faintly 5-nerved. Pappus white or whitish, of fine and soft scabrous capillary bristles. (Greek tetra, four, and dymos, together, the first-known species with four-flowered heads.)

Achenes glabrous, or with hairs much shorter than those of the pappus; pappus extremely copious.

Heads 4-flowered; branches not spiny.

Leaves permanently tomentose, 6 to 10 lines long.....1. *T. canescens*.

Axillary leaves glabrate, 3 to 5 lines long.....2. *T. glabrata*.

Heads 5-flowered; branches slender, spiny.....3. *T. stenolepis*.  
Achenes heavily and densely clothed with long ascending hairs which quite conceal the pappus; pappus bristles reduced to a single series.

Heads peduncled, scattered or loosely racemose.....4. *T. spinosa*.

Heads nearly sessile in a close terminal cyme.....5. *T. comosa*.

1. *T. canescens* DC. Fig. 1015. Stems freely branching, diffuse or decumbent, 4 to 12 in. long, unarmed; leaves and inflorescence white with a permanent close tomentum; leaves somewhat crowded but rarely at all fascicled, linear or oblanceolate, pungently acute, 6 to 10 lines long; heads short-pedunculate in cymose clusters terminating the short branchlets; involucre 4 to 5 lines high, 4-flowered, their bracts 4 or 5, oblong, carinate; achenes quite glabrous to villous; pappus sordid or yellowish.—Sandy and rocky hillsides and plains, 4000 to 7000 ft.: San Luis Obispo Co. to the San Gabriel and San Bernardino mountains; e. side of the Sierra Nevada and its easterly plateau crests; Siskiyou and Modoc Cos.; n. to B. C., e. to Wyo. and N. Mex. Var. *inermis* Gray. Leaves and involucre shorter.—San Luis Obispo; Honey Lake Valley; e. to Rocky Mts.

2. *T. glabrata* Gray. Stems branching to form a rounded bush 1 to  $2\frac{1}{2}$  ft. high; herbage white-tomentose, the leaves soon glabrate; primary leaves rigid-subulate, cuspidate, 3 to 5 lines long, early deciduous; axillary leaves 3 to 6 in a fascicle, linear-oblanceolate, soft, persistent, 3 to 5 lines long; leaves of sterile shoots linear-subulate, appressed, without fascicled ones in their axils; heads in terminal cymes, or the cymose clusters sometimes racemosely disposed; involucre  $3\frac{1}{2}$  to  $4\frac{1}{2}$  lines high, white-tomentose or glabrate and green, 4-flowered; bracts 4 or 5, oblong, carinate; achenes densely hairy; pappus sordid.—Mohave Desert and n. along the e.

1015. *Tetradymia canescens* DC.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, fl.  $\times 1\frac{1}{2}$ , showing the pappus bristles crinkled at the middle.

side of the Sierra Nevada to Ore., e. to Utah. The young buds and leaves are more or less poisonous to sheep.

3. *T. stenólepis* Greene. Shrub  $1\frac{3}{4}$  to  $2\frac{3}{4}$  ft. high; herbage permanently white-tomentose with appressed wool; lower primary leaves oblanceolate, mucronate, about 10 lines long; upper primary leaves modified into rigid spreading spines 1 to  $1\frac{1}{2}$  in. long; secondary fascicled leaves oblanceolate, 5 to 11 lines long, or entirely wanting; heads in close terminal cymes; involucre 5 lines high, 5-flowered, their bracts 5, linear-oblong, very thick and rigid, obtuse; achenes canescent but glabrate; pappus comparatively coarse, its bristles bent at tip.—Western and central Mohave Desert north to the s. Sierra Nevada and Inyo Co.

1016. *Tetradyimia spinosa* H. & A.; fl. branchlet  $\times \frac{3}{8}$ .

4. *T. spinosa* H. & A. COTTON THORN. Fig. 1016. Rigidly branched silvery-tomentose shrub 2 to 4 ft. high; primary leaves modified into rigid spines and bearing in their axils the second year a cluster of secondary leaves and 1 (rarely 2 or 3) peduncles; spines slender, often needle-like, straight or recurved, tomentose or glabrate,  $\frac{1}{4}$  to  $1\frac{1}{2}$  in. long; fascicled leaves linear-clavate, glabrous or early glabrate, 3 to 5 lines long; peduncles 1-headed; involucre about 4 lines high, usually 6 or 7-flowered; bracts 5 or 6, varying from linear-oblong (the outer) to elliptic (the inner), all obtuse; achenes with soft white hairs nearly equaling the rigid pappus-bristles.—Desert areas, 2000 to 4000 ft.: Mohave Desert and its bordering mountain slopes; Inyo Co.; n. to eastern Ore., e. to Utah and Ariz.

5. *T. comosa* Gray. Bush with many erect stems and virgate branches, 2 to 4 ft. high; herbage permanently and densely white-tomentose; leaves narrowly linear, soft, 1 to  $1\frac{1}{2}$  in. long, the uppermost ones rigid, somewhat spine-like, 7 to 9 lines long; heads in close terminal cymes; involucre 4 to 5 lines high, 6 to 9-flowered; bracts 5 or 6, oblong, obtuse; long straight but soft hairs of the achene very abundant, concealing the true pappus.—Low dry hills: cismontane S. Cal.; Mohave Desert; e. to Nev.

#### TRIBE 12. *Cynàreae*. THISTLE TRIBE

Thistles or thistle-like herbs with alternate prickly leaves. Heads large. Bracts of the involucre imbricated, usually prolonged into a spine or bristle, or provided with a membranous edge. Receptacle bristly or hairy. Flowers all perfect. Rays none. Corollas tubular, cleft into long narrow lobes. Anthers long-tailed at the base, with elongated appendages at the tip. Pappus bristly or plumose, rarely paleaceous.

#### 157. *CNICUS* L.

Annual herb. Leaves pinnatifid or mostly sinuate-dentate with spiny or prickly teeth. Heads solitary at the ends of the branches, subtended and almost concealed by the upper leaves. Bracts of the involucre imbricated in several series, the outer ovate and tipped by a simple spine, the inner lanceolate and ending in a strong pinnately branched spine. Flowers yellow. Achenes many-nerved, 10-toothed at the summit, and bearing a pappus of awns in 2 series; outer series long, naked, yellow; inner series hispidulous, white. (Latin name of the Safflower, applied to thistles.)

1. *C. benedictus* L. BLESSED THISTLE. Stem freely branching, 1 to 2 ft. high; herbage pubescent; leaves oblong or oblong-lanceolate, thin, upper clasping, lower petioled; heads 1 in. long.—Nat. from Eur. on valley floors: Petaluma; Lathrop; Buena Vista, Nevada Co.; Oroville. Mar.-June.

**CARTHÁMUS L.** Flowers yellow. Outer bracts of the involucre terminating in a foliaceous appendage; inner bracts more rigid, appressed, ending in a spinescent tip. Achenes obpyramidal, with a crenulate margin at the truncate summit. Pappus-paleae of 2 kinds, the outer unequal, ciliate, in several series, the inner in one series and much shorter; or pappus quite wanting in the outer row of achenes. **C. LANÁTUS DC.** Distaff Thistle. Annual, 10 to 25 in. high; leaves rigid, prickly pinnatifid, clasping.—Native of Mediterranean region, adv. at San Francisco and Stockton.

#### 158. **SILYBUM** Gaertn.

Annual or biennial herb. Leaves very ample, sinuate-pinnatifid, prickly, clasping, smooth and shining above and very conspicuously blotched with white along the veins. Heads very large, solitary at the ends of the branches. Flowers purple. Corollas with filiform tube conspicuously dilated below the narrowly linear lobes. Bracts of the involucre broad, appressed, bearing an abruptly spreading spine which is broadly lanceolate or ovate and ciliate-prickly toward the base. Pappus-bristles in several series, flattish, minutely barbellate. (Old Greek name applied to thistle-like plants.)

1. **S. mariánum** Gaertn. MILK THISTLE. Branching, 3 to 6 ft. high; leaves  $1\frac{1}{2}$  to  $2\frac{1}{2}$  ft. long, 6 to 12 in. wide, strongly undulate at the sinuses; heads about 2 to  $2\frac{1}{2}$  in. broad; spines of the middle involucre bracts 1 to  $1\frac{1}{2}$  in. long.—Nat. from the Mediterranean region, common in abandoned fields, old pastures and by roadsides throughout Cal. May-Aug.

#### 159. **CYNARA** Vaill.

Stout perennial herb. Leaves ample, pinnatifid or bipinnatifid. Flowers blue. Heads very large, globose, solitary on the ends of the branches. Bracts of the involucre broadly ovate, obtuse or emarginate, coriaceous. Receptacle fleshy, fimbriate. Pappus of many series of plumose bristles. Achenes obovate, somewhat 4-angled. (From the Greek *kuon*, a dog, the spines of the involucre being likened to a dog's teeth.)

1. **C. cardunculus** L. CARDOON. Stem freely and diffusely branching,  $1\frac{1}{2}$  to  $2\frac{1}{2}$  ft. high; stems and under side of leaves white-tomentulose, the upper side of leaves green, thinly arachnoid; leaves bipinnatifid, 1 to 2 ft. long, the lobes and teeth bearing long spines; involucre  $1\frac{1}{4}$  to  $1\frac{3}{4}$  in. high, the bracts spinose.—Native of s. Eur., nat. at Benicia and Cordelia; a garden escape at San Bernardino.

**C. scolymus** L. Artichoke. Leaf lobes scarcely spinose; inner bracts of involucre with scarious tips, not spinose.—Garden plant from Eur., an occasional escape.

#### 160. **CIRSÍUM** Scop. THISTLE

Stout biennial or perennial herbs. Leaves alternate, prickly or spiny, commonly toothed or pinnatifid. Heads with numerous crimson, white or yellowish flowers, perfect and all alike, or unisexual in *C. arvense*. Corolla tubular, its segments linear. Involucre spherical to campanulate, ovoid or cylindrical, its bracts imbricated in many ranks, at least the outer tipped with a spine or prickle, rarely innocuous. Receptacle thickly clothed with soft bristles or hairs. Achenes obovate or oblong, compressed, not ribbed, smooth and glabrous. Pappus of a single series of bristles, plumose or barbellate to the middle, clavellate-dilated at tip, united into a ring at the base and deciduous as a whole. (Kirsion, Greek name of a kind of thistle.)

##### A. HEADS CONSISTING WHOLLY OF PERFECT FLOWERS; BIENNIALS (EXCEPTING NOS. 9 AND 16).

##### 1. Heads leafy-bracteate (the spiny foliaceous bracts usually more than 3), commonly more or less clustered.

Stem spinose-winged by decurrent leaf-bases; upper surface of leaves strigose-setulose with harsh hairs; involucre bracts and leaves linear. . . . . 1. *C. lanceolatum*.  
Stem not spinose-winged (although leaf-bases may be somewhat decurrent); upper surface of leaves never strigose-setulose with harsh hairs.

Leaves and stem glandular; involucre bracts dilated and slightly fimbriate above the middle; heads a little nodding. . . . . 2. *C. fontinale*.

Leaves and stem not glandular.

Outer and middle series of involucre bracts pinnately spinose.

Leaves whitish, felt-like, with broad obtuse lobes and few small spines; foliaceous bracts  $\frac{3}{4}$  to 2 in. long, felt-like; seacoast...3. *C. maritimum*.

Leaves at length green, thinner (thickish in no. 5), with numerous spines; foliaceous bracts  $\frac{1}{2}$  to 1 in. long, not felt-like.

Heads mostly arachnoid-woolly; seacoast, mid. Cal....4. *C. andrewsii*.

Heads essentially glabrous; lower San Joaquin.....5. *C. crassicaule*.

Outer and middle series of involucre bracts entire; leaves and foliaceous bracts green, usually thin, with numerous weak prickles; stem hollow, weak, succulent; woods along streams.....6. *C. edule*

2. Heads naked, or if leafy-bracteate, the foliaceous bracts 1 to 3 (rarely more).

Involucre bracts, especially the outer, conspicuously spinose-fimbriate.

Involucres broadly turbinate; involucre bracts lanceolate, few, mostly thin and loose...7. *C. remotifolium*.

Involucres campanulate; involucre bracts mostly dilated above the middle, numerous, the outer ones oblong, imbricated.....8. *C. americanum*.

Involucre bracts entire or sometimes minutely spinulose.

Plants  $\frac{1}{2}$  to 1 (or 3 in var. of no. 9) ft. high; upper leaves often longer than the heads; heads solitary or in pairs, 1 to 2½ in. high; involucres essentially glabrous; bracts 3 to 12 lines long, tipped with a spine or cuspidate or blunt.

Heads peduncled; stem leafy.

Outer bracts brownish red with a yellow margin and base, coriaceous, cuspidate or not; leaves broad.....9. *C. quercetorum*.

Outer bracts without a prominent yellow margin, chartaceous, prickle-tipped; leaves narrower.....10. *C. drummondii*.

Heads sessile on the ground or very shortly peduncled; leaves mostly in a basal rosette, longer than the heads.....11. *C. acaulescens*.

Plants 1 to 6 ft. tall; upper leaves never longer than the heads; involucres floccose or woolly (sparingly in no. 17).

Heads mostly paniculately clustered, rarely solitary or in pairs.

Leaves and bracts mostly thin and glabrate; spines weak.....12. *C. vaseyi*.

Leaves mostly thick and tomentose.

Bracts abruptly tipped with a spine of equal length; heads numerous, 6 to 12 lines high; bracts 1 to 3 lines long....13. *C. breweri*.

Bracts gradually attenuate into a spine of unequal length; heads not so numerous, clustered or sometimes not, larger; bracts (2 or) 3 to 9 lines long.....14. *C. mohavense*.

Heads solitary on very long peduncles, rarely in clusters of 2.

Flowers white, lavender or pink; heads 1 to 1½ in. high; plants rather slender, 1½ to 6 ft. tall; stems grayish.

Bracts tending to reflex; spines 1 to 4 lines long; common.....15. *C. californicum*.

Bracts straight; spines 5 to 9 lines long; Mt. Whitney.....16. *C. ochrocentrum*.

Flowers bright red, crimson or purple; heads 1½ to 2½ in. high; plants 1 to 3 ft. tall.

Bracts erect, mostly glabrous, cuspidate or not; plants slender; stems reddish.....17. *C. andersonii*.

Lower bracts tending to reflex, floccose (sometimes glabrate), spine-tipped; plants mostly stout; stems grayish....18. *C. occidentale*.

B. HEADS UNISEXUAL, 4 TO 9 (OR 12) LINES HIGH; TIPS OF INNER INVOLUCRAL BRACKTS REFLEXED; PERENNIAL.....19. *C. arvense*.

1. *C. lanceolatum* (L.) Scop. BULL THISTLE. Spreading, 2 to 3½ ft. high; herbage green; leaves lanceolate, 1½ to 8 (or 14) in. long, deeply pinnatifid into lanceolate lobes, the callous midribs and veins excurrent as rigid spines, the base decurrent on the stem into interrupted prickly wings, the upper surface strigose-setulose, the lower tomentose; heads large, 1½ to 2 in. high, terminating leafy branchlets; involucre bracts lanceolate, attenuate into slender rigid prickly-pointed spreading tips, lightly arachnoid; corollas rose-purple.—Nat. from Eur., common at lower altitudes: Berkeley; Stockton; Suisun; Ione; Quincy; Prattville; Eureka; Yreka.

2. *C. fontinale* (Greene) Jepson. Plants 1 to 2 ft. high, the branches widely spreading; stems and upper surface of leaves more or less glandular-pubescent; heads  $\frac{3}{4}$  to 1 in. high, mostly clustered, a little nodding; bracts of the involucre very broad, almost 3 lines in width from the base to the abruptly acute apex, fimbriate-dilated and spreading or recurved from near the middle, prickly-pointed; corollas dull white; anther-tips acute.—Crystal Sprs., San Mateo Co. Perhaps introduced. June. (*Cnicus fontinalis* Greene.)

3. *C. maritimum* Jepson n. comb. Stems succulent, leafy to the top, branched so as to form a rounded bushy plant 1 to 3 ft. high; leaves covered

with a dense heavy felt-like tomentum, the stems merely arachnoid; basal leaves 3 in. long, elliptical in outline, sinuately and undulately pinnatifid, the lobes broad, overlapping, the spines few, short ( $\frac{1}{2}$  to 2 lines long) and for the most part borne only at the ends of the lobes; petiole margined, 2 in. long; cauline leaves more spinose, auriculate-clasping; heads  $1\frac{1}{4}$  to  $1\frac{3}{4}$  in. high, borne in a terminal leafy-bracteate cyme; bracts straight, lanceolate, tapering into a long spine, spinose-ciliate above the middle; corolla-segments about as long as the throat; anther-tips acute.—Surf, Santa Barbara Co. (*Carduus maritimus* Elmer.)

4. *C. andrewsii* (Gray) Jepson. Stems tall, striate, cymosely branching at summit, 3 to 4 ft. high; tomentum usually deciduous except from the heads and under surface of the leaves; basal leaves oblong, 5 to 16 in. long, deeply sinuate-pinnatifid into 3-cleft lobes, the lobes spinulose-bordered and terminating in a stout spine; petiole prickly-margined, about 4 in. long; upper leaves laciniate-pinnatifid, the lobes lanceolate, terminating in long spines; heads hemispherical, somewhat clustered, sessile or shortly peduncled; involucre arachnoid-woolly, becoming flocculent, 9 to 11 lines high; proper bracts with coriaceous oblong-ovate base, the short upper part greenish and abruptly contracted into an awn-like spine, often somewhat pinnately spinose; leafy bracts pinnately spinose and strongly spinose-tipped; corollas bright red, the segments longer than the throat.—Coves and marshes near the sea, Marin and Sonoma Cos. June-July.

5. *C. crassicaule* (Greene) Jepson. Stem 3 to 4 ft. high, very stout below, hollow, striate, branching above, and bearing a panicle of 6 to 9 subsessile or short-peduncled heads; herbage in the mature plant arachnoid-pubescent, the under surface of the leaves white-tomentulose; leaves similar to those of no. 7; involucre campanulate, glabrous in age, 7 to 9 lines high; proper bracts linear-lanceolate to lanceolate-acuminate, tipped with a rather long slender prickle, often pinnately spinose above the middle, the lower portion entire or finely ciliate; leafy bracts with a few strong prickles or pectinate-spinose, the inner sometimes passing into the proper bracts; corollas whitish or pinkish, the segments about as long as the throat. — Low fields of the San Joaquin River in San Joaquin Co. May. Possibly it is not a native.

6. *C. edule* Nutt. Fig. 1017. INDIAN THISTLE. Stem simple, robust but tender and succulent,  $3\frac{1}{2}$  to 6 ft. high, pubescent and leafy to the top; leaves thin, white-tomentose below, the basal narrowly oblong to oblanceolate, sinuate-pinnatifid, very prickly-ciliate, 8 to 10 in. long, the cauline similar, auriculate-clasping; heads depressed-globose, 1 in. high, few in a terminal cluster, leafy-bracted at base; involucre conspicuously arachnoid-woolly when young, sometimes tending to become glabrate in age, 9 to 14 lines high; outermost bracts foliaceous, pinnately spinose, the proper involucre bracts lanceolate-subulate, spinose-tipped; corollas dull purple, pink or whitish, the segments shorter than the throat and with callous thickening at apex; pappus fuscous.—Creeks and gulches, 50 to 1500 ft., common: coastal S. Cal.; Coast Ranges; n. to B. C.

7. *C. remotifolium* (Hook.) Jepson. Stem 2 to 5 ft. high, openly

1017. *Cirsium edule* Nutt.; a, leaf  $\times \frac{1}{2}$ ; b, stem  $\times \frac{1}{2}$ ; c, achene and pappus  $\times 1$ .

cymose-branched, the branches few, slender, terminated by usually solitary heads; herbage nearly glabrate, loosely arachnoid or minutely flocculent; leaves oblong to lanceolate, spinulose, 2 to 7 in. long, pinnately lobed to divided, the divisions of at least the lower divergently 2 or 3-lobed; under surface of the leaves white-tomentulose; heads mostly on long (2 to 7 in.) peduncles, the peduncles naked or the leaves much reduced and remote; involucre broadly turbinate to campanulate, lightly arachnoid and glabrate, 8 to 12 lines high; bracts linear or elongated-subulate, more or less fimbriolate, the inner mostly entire except at the crisped apex; corollas yellowish white, the segments shorter than the throat; pappus of coarse bristles, the strongest with club-shaped tips.—Dry mountain ridges, 3000 to 5000 ft.: Lake and Mendocino Cos. to Humboldt Co.; n. to Wash. It intergrades to no. 9. (*Carduus remotifolius* Hook.) Var. *RIVULARE* Jepson n. var. Basal leaves oblong, sinuately lobed or pinnatifid, the cauline lanceolate, entire, remotely spinulose-margined, auriculate-clasping; flowers purple.—Along streams in open woods, e. Humboldt Co., 3000 ft. (near Low Gap, J. P. Tracy 2909, type).

8. *C. americanum* Daniels. Stem simple or branched above,  $\frac{3}{4}$  to 2 $\frac{1}{2}$  ft. high; herbage glabrate and green or the leaves tomentose below; leaves oblong to oblanceolate, spinose, sinuately toothed to deeply pinnatifid, 1 $\frac{1}{2}$  to 9 in. long, the upper auriculate-clasping, the lower tapering to a spinose-margined petiole; heads campanulate or sub-globose, solitary or in

1018. *Cirsium quercetorum* Jepson; a, habit  $\times \frac{1}{2}$ ; b, bract of involucre  $\times 1$ ; c, fl.  $\times \frac{1}{4}$ .

terminal clusters of 2 or 3; involucre 9 to 10 lines high, imbricated; outer and middle bracts oblong, the margin mostly spiny-toothed and tipped with 1 to 3 curved spines; inner bracts lanceolate with barely spinose scarious tips; corolla yellowish, the lobes shorter than the throat.—Sonoma Co. to Siskiyou Co. May-July. (*Cnicus americanus* Gray.) It passes into: Var. *CALLILEPIS* Jepson n. comb. Bracts dilated at apex, the dilated portion with a fimbriate-scarious margin and a short terminal spine, the lower portion of the bracts mostly entire-margined.—San Francisco; Berkeley; Marin Co. July. (*Carduus callilepis* Greene.)

9. *C. quercetorum* (Gray) Jepson. Fig. 1018. BROWNIE THISTLE. Plants perennial by horizontal rootstocks; stem short, erect, 4 to 6 (rarely 12) in. high, its few branches each bearing a large head; herbage arachnoid-tomentose when young, especially on the under surface of the leaves, eventually glabrate;

leaves oblong in outline, 3 to 9 in. long, pinnately parted or divided, the oblong or lanceolate divisions often 3 to 5-cleft or -divided, strongly or weakly prickly, mostly narrowed below to a petiole; involucre campanulate, 1 to 1 $\frac{1}{2}$  in. high; involucre bracts thickish, coriaceous, entire or sometimes minutely fimbriate, closely imbricated in many ranks, light or dark brown and often with a straw-color border, the outermost ovate (about 3 to 5 lines long), the inner becoming lanceolate and twice or thrice as long, all with a short cusp rather less than 1 line long or sometimes blunt; innermost bracts obscurely scarious at tip; corollas purplish or whitish, 4 of the lobes united higher, the others longer than the throat.—Open hills, or valley flats, 50 to 1500 ft.: Mendocino Co. to San Benito Co. Var. *WALKERIANUM* Jepson n. comb. Plants taller (1 to 3 ft. high); heads on long (3 to 7 in.) peduncles.—Humboldt Co.; Berkeley. (*C. walkerianum* Petrak.)

10. *C. drummondii* T. & G. Stem simple, erect, 2 to 12 in. high; heads somewhat tomentose or glabrous, the leaves arachnoid-tomentose beneath; leaves oblong or oblanceolate, 3 to 12 in. long, deeply sinuate-pinnatifid, the lobes spinulose to nearly entire; heads 1 to  $1\frac{3}{4}$  in. high; involucre bracts chartaceous, the outer ovate with acute short-spinose tips, the inner lanceolate with weak scarious tips, the tips varying from entire and acute to dilated and fimbriate; corollas white or rose-purple, long-exserted, the lobes not longer than the throat; anthers very acuminate.—Montane, 2500 to 6600 ft.: mts. of S. Cal.; Mt. Pinos; Sierra Nevada; Siskiyou Co.; e. to Col. June-July.

11. *C. acaulescens* (Gray) K. Schn. Heads 2 to several in a cluster seated on the ground and subtended by the rosette of basal leaves or sometimes borne terminally on a stem 1 or 2 in. high; herbage tomentulose to glabrate, the under surface of the leaves sometimes whitish-arachnoid; leaves lanceolate or narrowly oblong, 2 to 8 in. long, toothed to pinnatifid, the margin or lobes armed with short or long prickles; heads 1 to 2 in. high; bracts oblong-lanceolate to lanceolate, tipped with a short spine, or the inner ones weak-spined; corollas similar to no. 12.—Montane, 5300 to 8500 ft.: mts. of coastal S. Cal.; Sierra Nevada from Tulare Co. to Eldorado, Sierra and Modoc Cos. June-July. (*Cnicus drummondii* var. *acaulescens* Gray.)

12. *C. vasesyi* Jepson n. comb. Stem simple or branched above, leafy, 1 to 3 ft. high; herbage thinly tomentose to glabrate; leaves lanceolate to narrowly oblong,  $2\frac{1}{2}$  to 7 in. long, pinnately cleft into remote segments, these again more or less deeply cleft, the ultimate segments with rather long stout spines; upper leaves decurrent; heads terminating rather short branches, either in pairs or paniculately clustered; involucre greenish,  $\frac{3}{4}$  to 1 in. high, the proper bracts lanceolate, with spreading short-spinose tips, and often with a viscid ridge on the back; corolla-segments shorter than throat.—Dry or woody hillsides, 2000 to 4500 ft.: Siskiyou, Modoc and Butte Cos. May-July. (*Cnicus breweri* var. *vasesyi* Gray.) Var. *HYDRÓPHILUM* Jepson n. comb. Lower leaves as much as 12 in. long and 5 in. broad; heads paniculately clustered; glandular spot on bracts more pronounced.—Wet places: Mt. Tamalpais; Suisun. (*Carduus hydrophilus* Greene.)

13. *C. breweri* Jepson. SWAMP THISTLE. Stem slender, simple below, paniculately branched above, 3 to 8 ft. high, the heads numerous and often borne in dense clusters; herbage commonly white-tomentose, sometimes nearly green; lower leaves rather narrowly oblong, 6 to 14 (or 22) in. long, spinose-dentate to sinuate-pinnatifid, with rather broad lateral segments and elongated terminal segment tipped with a long or short spine; upper leaves mostly elongated-lanceolate, conspicuously prickly,  $2\frac{1}{2}$  to 6 in. long; heads short-cylindric, markedly constricted about the middle, 8 to 12 lines high; involucre subglobose, 4 to 9 lines high, the bracts much appressed, firm-coriaceous, bearing towards the apex a dark colored area and a glandular or viscid spot or ridge; outer and middle bracts ovate to oblong-lanceolate, abruptly tipped with a spreading weak prickly; inner bracts lanceolate, mostly with a soft or crisped tip; corollas pale purple, pink or whitish, the lobes shorter than the throat; anther-tips deltoid, merely acute.—Swamps or wet places, 2500 to 5000 ft.: North Coast Ranges; Butte Co. to Modoc Co.; n. to Ore. July-Aug.

14. *C. mohavense* Petrak. DESERT THISTLE. Stem rather stout, 2 to 4 ft. high, ending above in a panicle bearing clustered heads or the heads in a loose cyme on long peduncles; herbage white-tomentose or the tomentum deciduous above; lower leaves oblong in outline, 6 to 14 in. long, sinuate-pinnatifid, the lobes tipped with long yellow spines; petioles very short or long; upper leaves shorter, decurrent, all densely prickly; heads  $\frac{1}{2}$  to  $1\frac{1}{4}$  in. high; involucre glabrate; bracts straw-color, the spines yellow, as long as the body of the bracts, often spreading or reflexed; corollas pinkish or reddish.—Alkaline meadows about springs, 2000 to 6000 ft.: Colorado and Mohave deserts; Inyo Co. June-July. (*Carduus mohavensis* Greene.)

15. *C. californicum* Gray. Fig. 1019. SIERRA THISTLE. Stem slender, 2 (or 3) to 6 ft. high, leafy toward the base, cymosely branched above, the heads

1019. *Cirsium californicum* Gray; a, basal leaf  $\times \frac{1}{4}$ ; b, fl. branchlet  $\times \frac{1}{4}$ ; c, bract of involucre  $\times 1$ .

bosely branched above, the peduncles mostly thinly tomentose to glabrate; in. long, pinnately cleft or parted into rather remote segments, these again cleft into triangular lobes armed with long stout yellow spines, at base tapering into a spinose-margined petiole; cauline leaves shorter with a spinose-auriculate-clasping base; heads campanulate,  $1\frac{1}{2}$  to  $1\frac{3}{4}$  in. high; involucre  $1\frac{1}{4}$  in. high, with foliaceous bracts pinnately spinose at base, the proper bracts ovate to lanceolate, entire, with or without a viscid line on the back, tipped with a stout somewhat spreading spine often twice as long as the body; innermost bracts attenuate to a short weak spine; corollas purple, the lobes much longer than the throat.—Mt. Whitney, 10,000 to 11,500 ft. Aug.

17. *C. andersónii* Petrak. Stem slender, reddish, simple or sparsely branched, nearly naked above, 1 to 3 ft. high, the heads 1 or few, corymbose or racemose, on peduncles  $1\frac{1}{2}$  to 9 in. long; herbage loosely woolly to glabrate; leaves oblong to lanceolate, 4 to  $8\frac{1}{4}$  in. long, spinose-toothed to deeply pinnatifid with spinulose, toothed or cleft lobes,

solitary on long (5 to 13 in. long) peduncles; herbage white-woolly, the wool more or less deciduous; leaves linear, narrowly oblong or lanceolate, 1 to 8 in. long, sinuately toothed to deeply and angularly pinnatifid, moderately prickly; heads 1 to  $1\frac{1}{4}$  in. high; involucre hemispherical, glabrate to somewhat woolly, 4 to 12 lines high; bracts narrowly lanceolate, coriaceous at base, the upper portion spreading and often incurved, the terminal prickle short; corollas cream-color, white or rarely purple, the lobes equaling or shorter than the throat; anther-tips deltoid. — Chaparral or openly wooded slopes, 1500 to 7500 ft.: Sierra Nevada from Placer Co. to Tulare Co.; South Coast Ranges; mts. of coastal S. Cal.; n. to Santa Lucia Mts. (*Cnicus lilacinus* Greene.) Var. *BERNARDINUM* (Gray) Petrak. Not so tall; leaves often sparsely spiny; involucre globose-depressed, spines of bracts weak and inconspicuous.—Hill-sides, S. Cal., 1000 to 4000 ft. Apr.-June. (*Carduus bernardinus* Greene.)

16. *C. ochrocéntrum* Gray. Stem leafy, branched, 1 to 2 (or 6) ft. high, arising from a perennial root, corymbose and heads usually solitary; herbage basal leaves narrowly oblong, 5 to 12

1020. *Cirsium occidentale* var. *coulteri* Jepson; a, fl. branch  $\times \frac{1}{2}$ ; b, basal leaf  $\times \frac{1}{2}$ .

the base broad or narrow and more or less spinose-auriculate; heads broadly turbinate,  $1\frac{1}{2}$  to 2 in. high; involucre broadly turbinate, glabrous,  $1\frac{1}{4}$  to  $1\frac{3}{4}$  in. high; outermost bracts foliaceous, pinnately spinose; proper bracts lanceolate-subulate, acuminate, tipped with a short spine, or the innermost merely long-acuminate; corollas rose-purple, the segments nearly as long as the throat; styles long-exserted.—Montane, 4000 to 9000 ft.: Sierra Nevada from Tulare Co. to Butte Co.; e. to Nev., n. to Ida. June-Aug. (*Cnicus andersonii* Gray.)

18. *C. occidentale* (Nutt.) Jepson. Stem stout, branched,  $1\frac{1}{2}$  to 3 ft. high; herbage mostly white with a coating of cottony wool, the upper side of the leaves greenish and merely thin-tomentulose; leaves lanceolate to oblong, 2 to 10 in. long, sinuate-dentate to pinnatifid, prickly, or sometimes the prickles few and weak; heads subglobose,  $1\frac{1}{2}$  to 2 in. high; involucre bracts subulate-lanceolate, straight, with short spines, not widely spreading, densely festooned with cobwebby hairs; corollas reddish or purple, the segments longer than the throat; anther-tips narrow and acuminate; pappus rather scanty.—Sand dunes or sandy hills along the coast from Mendocino Co. and San Francisco to San Diego; also interior valleys and hills of Coast Ranges and coastal S. Cal. Apr.-July. This seacoast species passes by intergrades into the first variety. Var. *C. COULTERI* Jepson n. comb. Fig. 1020. Stem stout, erect, 2 to 4 ft. high, ending above in a few long cymose branches bearing single long heads; heads mostly subglobose; involucre arachnoid-woolly to glabrate, their bracts gradually narrowed into a slender spine; outer bracts appressed at base, then spreading, the upper portion either incurved or straight or deflexed; innermost bracts erect; corollas red, white or lavender.—Dry warm montane slopes, 2500 to 8000 ft.: n. Los Angeles Co.; Coast Ranges; Sierra Nevada; e. to Nev. May-July. (*C. coulteri* Harv. & Gray.) Var. *C. VENUSTUM* Jepson n. comb. Fig. 1021. Similar to var. *coulteri* but the heads campanulate or even tending slightly to cylindrical and noticeably constricted at the middle; involucre not woolly, merely thinly tomentulose or arachnoid; corolla bright crimson.—Dry hill and mountain slopes, 500 to 2000 ft.: middle and inner North Coast Ranges. (*Carduus venustus* Greene.) Var.

1021. *Cirsium occidentale* var. *venustum* Jepson; *a*, basal leaf  $\times \frac{1}{2}$ ; *b*, fl. branchlet  $\times \frac{1}{2}$ .

*CANDIDISSIMUM* Mebr. Stem very stout; herbage almost snowy white with a commonly persistent felt-like tomentum; outer and middle involucre bracts rigid, at length squarrose-spreading or reflexed, heavily festooned with wool; corollas crimson.—Dry slopes, 400 to 5300 ft.: Mendocino, Siskiyou and Modoc Cos.; e. to Nev. (*Carduus candidissimus* Greene.)

19. *C. arvense* Scop. CANADA THISTLE. Stem slender, 1 to 3 ft. high, arising from creeping perennial rootstocks and thus forming patches, above paniculately branched and bearing mostly close clusters of heads at the ends of the branches; herbage arachnoid-pubescent to glabrate; leaves lanceolate or oblong in outline, 1 to 5 in. long, pinnatifid and with spinose-toothed segments; heads numerous, 6 to 11 lines high, unisexual, the staminate and pistillate usually on different plants; staminate heads ovate-globular, the flowers well exserted; pistillate heads oblong-campanulate, the flowers less exserted, with only abortive anthers; corollas rose-purple; involucre

bracts appressed, the outer  $\frac{1}{2}$  to 2 lines long, the inner longer, all with small weak prickles.—Nat. from Eur.: lower Eel River at Ferndale; Yreka; Quincy; Truckee; Los Angeles, San Bernardino and Orange Cos.

### 161. *ARCTIUM* L. BURDOCK

Coarse biennial herbs. Leaves very large, broad, petioled. Flowers purple, rarely white, in rather large solitary or clustered heads. Involucre globular, its bracts numerous, imbricated, rigid, lanceolate, appressed at base but attenuate into long spreading spines hooked at tip. Receptacle densely bristly. Achenes oblong or narrowly ovate, flattened, ribbed, transversely wrinkled. Pappus short, of many serrulate bristles, deciduous. (Greek arktos, a bear, from the rough involucre.)

Heads somewhat racemose, arachnoid; involucre 6 to 9 lines broad. . . . . 1. *A. minus*.  
Heads somewhat corymbose, glabrous; involucre 11 to 13 lines broad. . . . . 2. *A. lappa*.

1. *A. minus* Benth. COMMON BURDOCK. Coarse biennial weed; herbage more or less scurfy or thinly tomentulose; stems erect, leafy, several ft. high; leaves broadly ovate to cordate-reniform, somewhat toothed or sinuate, the lower 1 to  $1\frac{1}{2}$  ft. long, the upper 2 to  $4\frac{1}{2}$  in. long; heads broadly ovate or globose,  $\frac{3}{4}$  in. high; involucre bracts hooked at the tip, cobwebby-tomentose; flowers purple; pappus short, of numerous rough bristles.—Bottom lands of the Eel River near Humboldt Bay; introduced from Eur.

2. *A. lappa* L. GREAT BURDOCK. Plants 3 to 5 ft. high; leaves as in *A. minus*, tomentulose below, glabrous above; heads somewhat corymbose; involucre bracts glabrous.—Native of Eur., sparingly introduced near the coast: Livermore; Niles; Aromas, San Benito Co.; Carmel Valley.

### 162. *CENTAURÆA* L. STAR THISTLE

Erect or diffuse usually rigid herbs. Leaves alternate, not prickly. Heads medium-sized. Involucre ovoid, globose or campanulate, the bracts imbricated and ending in a needle-like prickle, or at least a fringed or toothed (rarely entire) appendage. Receptacle densely bristly, the bristles persistent. Flowers yellow, purple or blue, all tubular, the marginal much larger and neutral. Pappus of 2 or 3 rows of bristles or short scales or none.

(Named for one of the Centaurs who used it in healing.)

Achenes notched just above the base, indicating the oblique or lateral attachment.

Flowers yellow; leaves decurrent on the stem; bracts of the involucre spiny; achenes light gray; pappus present.

Plants erect, branching mostly above the base; spines 2 to 4 lines long.

1. *C. melitensis*.

Plants diffuse, branching from the base; spines  $\frac{1}{2}$  to 1 in. long. . . . .

2. *C. solstitialis*.

Flowers purple or blue; leaves not decurrent. Middle bracts ending in a very stout spine; achenes brown; pappus none. . . . . 3. *C. calcitrapa*.

Bracts fimbriate, devoid of spine; pappus red. . . . . 4. *C. cyanus*.

Achenes not notched, attached basally; flowers blue; bracts of the involucre not spiny; pappus-bristles many. . . . . 5. *C. repens*.

1. *C. melitensis* L. NAPA THISTLE.

TICALOTE. Fig. 1022. Erect commonly much-branched annual 1 to 2 ft. high, with a roughish indument, the stems winged by the decurrent leaves; lowest leaves pinnatifid, the upper narrow and mostly entire; heads mostly terminal and solitary, or 2 or 3 together,  $\frac{1}{2}$  in. high; bracts rigid, the outer with palmatifid spine, the intermediate and inner ones with a rigid spine 2 to 4 lines long, which

1022. *Centaurea melitensis* L.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, leaf  $\times \frac{1}{2}$ ; c, achene and pappus  $\times 3\frac{1}{2}$ .

is either simple or with divaricate short spines at base; flowers yellow; pappus-bristles in about 3 rows, the middle row long, the outer and inner very short.—Nat. from Eur., abundant everywhere in agricultural lands and pastured hills. First introduced at Napa and diffused over the state in seed grain, hence commonly known as Napa Thistle. It is one of our most widespread and objectionable grain-field weeds. May-June.

2. *C. solstitialis* L. YELLOW STAR THISTLE. BARNABY'S THISTLE. Fig. 1023. Diffuse annual branching from the base, 1 ft. high, cottony-pubescent; basal leaves pinnatifid, the cauline linear, entire, rather closely ascending, decurrent into long narrow wings; heads solitary at the ends of the branches, ovoid-globular; spines of the intermediate bracts 6 to 10 lines long; innermost bracts ending in a small shining appendage; flowers very bright yellow; achenes with pappus.—Cultivated fields, roadsides and waste lands, nat. from Eur.: Sacramento Valley; North Coast Ranges; Alameda Co.; San Diego. An objectionable alien, its aggressive spread continued steadily since 1885.

1023. *Centaurea solstitialis* L.; a, fl. branchlet  $\times \frac{1}{2}$ ; b, achene and pappus  $\times 3$ ; c, fl.  $\times 1$ .

3. *C. calcitrapa* L. PURPLE STAR THISTLE. Coarse and rigid perennial, forming dense bushy plants 2 to 4 ft. high, nearly glabrous; leaves pinnately divided into few linear or lanceolate lobes, or the uppermost undivided, all serrulate, not decurrent; heads large, 9 to 10 lines high, on short peduncles scattered along the branches, or in the forks, or terminal; involucrial spines very stout,  $\frac{1}{2}$  to 1 in. long; flowers purple; achenes brownish, over 1 line long, destitute of pappus.—Nat. from Eur. in uncultivated lands: plains of Solano Co.; San Mateo.

*C. salmantica* L. Escobilla. Leaves sinuately divided into triangular lobes below the large terminal ovate- or oblong-lanceolate lobe, not decurrent; heads on long slender peduncles; involucrial bracts ovate, obtuse, not spine-tipped, the innermost with lanceolate scarious appendage; flowers purple; achenes brown; pappus white.—Native of Eur., adv. at Healdsburg.

4. *C. cyanus* L. BLUEBOTTLE. Erect annual 1 to 2 ft. high, lightly flocculent-tomentose when young; leaves linear, entire or the lower rarely dentate or pinnatifid; heads 1 in. high, terminating naked peduncles; involucries campanulate, 7 lines high, their bracts with a scarious fimbriate border; flowers deep blue; marginal corollas much enlarged, ray-like; pappus-bristles unequal.—Nat. from Eur.: Scott Valley, Siskiyou Co.; Holmes Flat, Eel River; Oakland; Los Angeles; Orange Co.

5. *C. repens* L. TURKESTAN THISTLE. Stems 1 to 3 ft. high from creeping perennial rootstocks; herbage arachnoid or at base white-tomentose; basal leaves oblong, sinuately lobed or pinnatifid,  $1\frac{1}{4}$  to 3 in. long, gradually narrowed to a petiole about  $\frac{1}{2}$  as long; cauline leaves linear, entire,  $\frac{3}{4}$  to  $1\frac{1}{4}$  in. long; heads solitary on the ends of the leafy branchlets, oblong or short-cylindric, 6 to  $6\frac{1}{2}$  lines high; bracts of the involucre orbicular, strongly scarious-margined on upper third, shortly acute, the innermost with acuminate hairy tips; pappus-bristles many in a single series, barbellulate.—Native of Asia, introduced about 1918: Greenville, Orange Co.; Arlington, w. Riverside Co.; Artesia, Los Angeles Co.; Helm, Fresno Co.; Tuttle, Merced Co.; Norman, Glenn Co. Also called Russian Knapweed.

## SUPPLEMENT

P. 68. *Triglochin palustris* L. Scapes very slender,  $\frac{3}{4}$  to  $1\frac{1}{2}$  ft. high; sepals 6; fruit linear or clavate, composed of 3 carpels.—Montane: Rattlesnake Creek, Kern Cañon, 8500 ft. (F. W. Peirson).

P. 330. *Euròtia lanàta* (Pursh) Moq. Also called Lamb's Tail.

P. 380. *Aconitum howèllii* Nels. & Mcbr. Stem slender, weak, 2 to 3 ft. long; leaves  $1\frac{1}{2}$  to  $2\frac{1}{2}$  in. wide, deeply parted into 4 or 5 lobes, the lobes laciniately cleft or toothed; axils of the leaves bearing bulblets; flowers pale blue; follicles 5 to  $5\frac{1}{2}$  lines long.—Siskiyou Co. (Etna Mills, J. P. Young); n. to Ore.

P. 457. *Peltiphyllum peltàtum* (Torr.) Engler. Indian Rhubarb.

P. 583. *Lathyrus littoràlis* (Nutt.) Endl. Monterey.

P. 594. *Euphorbiaceae*. *Tràgia* L. Perennial herbs. Stems slender, wiry, beset with stinging hairs. Leaves small, coarsely toothed, short-petioled. Flowers monoecious, in small clusters at the ends of the branches. Staminate flower: sepals 3 to 5; stamens 3 to 5. Pistillate flower: sepals 5; ovary with one ovule in each cell. *T. ramòsa* Torr. Stems hirsute; stamens 4 or 5.—Providence Mts. (P. E. Munz); e. to Mo. and Tex.

P. 626. *Malvaceae*. *Abùtilon* Gaertn. Perennial herbs with cordate leaves and axillary flowers. Calyx without bracts. Stigmas capitate. Carpels 5 to 10, leathery, dehiscent, 2 to several-seeded. *A. párvulum* Gray. Stems slender, prostrate or ascending.—Providence Mts. (P. E. Munz); e. to Tex., s. to Mex.

P. 647. *Viòla langsdórffii* Fisch. This species does not occur in Cal. The plants so referred above belong to *V. palustris* L. (acc. M. S. Baker).

P. 892. *Solànum villòsum* Lam. Stem erect, branching, 8 to 15 in. high, short-villous; calyx glandular-pubescent; corolla yellowish,  $1\frac{1}{2}$  lines long; filaments triangular-dilated, slightly joined at base; ovary glabrous; style slightly puberulent.—Naturalized near Los Angeles: Arcadia; Bellflower. The herbage is poisonous to chickens when fed with alfalfa greens.

P. 901. 2. *Linària vulgàris* Mill. BUTTER-AND-EGGS. Perennial; stem erect, 1 to  $2\frac{1}{2}$  ft. high; leaves linear, very numerous; flowers yellow in a terminal dense raceme; corolla (including the slender spur) 1 in. long.—Nat. from e. U. S.: Pt. Reyes; Valley Ford; Wawona (Thos. Howell); Emerald Bay, Lake Tahoe.

P. 1079. *Wyéthia ovàta* T. & G. var. *funérea* Jepson n. var. Herbage not tomentose, rather densely covered with short gland-tipped hairs; leaves shorter and broader than in the species, 4 to 10 in. long, 2 to 5 in. wide, mostly rather coarsely few-toothed.—Funeral Mts., Death Valley (Jepson 6903, type).

Jepson, Manual, pp. 961-1170, Nov. 24, 1925.

# MAJOR GEOGRAPHIC TERMS<sup>1</sup>

*Cismontane California*, all the area west of the main sierran crest.

*Cismontane Southern California*, the area west of the main sierran crest.

*Coast Ranges*, the complex of ranges west of the Great Valley. See North Coast Ranges, etc.

*Colorado Desert* in California, includes the desert area between the San Jacinto and Cuyamaca mountains on the west, the Colorado River on the east and the Mohave Desert on the north.

*Conchilla Desert*, the northwest arm of the Colorado Desert.

*Conchilla Mts.*, the range extending from Morongo Pass to Pleasant Valley, bounding the Conchilla Desert on the north.

*Great Valley*, the great central valley of California, lying between the Sierra Nevada and Coast Ranges.

*Hoods Peak Range*, the mountains west of Napa Valley.

*Inner Coast Range*, the range next to the Great Valley; it is composed of a number of distinct ranges with specific geographical names.

*Inner North Coast Range*, the range bounding the Sacramento Valley on the west (including the Vaca Mountains north to the Trinity Mountains).

*Inner South Coast Range*, the range bounding the San Joaquin Valley on the west (from Mt. Diablo south to Mt. San Emigdio).

*Mayacamas Range*, east of Ukiah Valley from Cobb Mt. and Geyser Peak northward to Cow Mt.

*Mohave Desert* in California, includes the desert area bounded by the Tehachapi Mountains and Inyo County on the north, the San Gabriel and San Bernardino mountains and Riverside County on the south and the Colorado River on the east.

*North Coast Ranges*, the ranges north of San Francisco Bay as far as the Siskiyou.

*Sacramento Valley*, north arm of the Great Valley.

*San Carlos Range*, the inner South Coast Range from Panoche Pass south to Waltham Creek.

*San Joaquin Valley*, south arm of the Great Valley.

*Santa Barbara Islands*, including all the islands off the Southern California coast.

*Seaward or Outer Coast Range*, the range next the ocean; applied more frequently to the seaward North Coast Range.

*Sierra Nevada*, the main mountain axis on the eastern side of the Great Valley, south to Tehachapi Pass and north to Pit River.

*South Coast Ranges*, the ranges south of San Francisco Bay as far as Santa Barbara County (Santa Maria River).

*Southern California*, a definitely defined portion of California, including the eight counties south of Tehachapi, namely, Santa Barbara, Ventura, San Bernardino, Los Angeles, Orange, Riverside, San Diego and Imperial; coastal Southern California, that portion west of the crest of the main sierran axis.

<sup>1</sup> Includes also some special designations not found on maps.

# GLOSSARY OF BOTANIC TERMS

*Acaulescent*, apparently stemless, the leaves all borne at the surface of the ground and the flowers sessile or borne on a scape. (See *Caulescent*.)

*Accessory*, something additional.

*Accrescent*, increasing in size or length with age, as the calyx or pedicel after flowering.

*Accumbent*, said of cotyledons with edges lying against the caulicle.

*Acerose*, with a sharp slender point like a needle.

*Achene*, a dry indehiscent 1-seeded fruit.

*Acorn*, fruit of the Oak.

*Acuminate*, tapering gradually to the apex; taper-pointed.

*Acute*, with a sharp point.

*Adherent*, growing fast to or united with another body or organ of a different kind.

*Adnate*, growing fast to; literally, born united to another body.

*Alternate leaves or branches*, only one from each node.

*Amplexicaul*, said of a leaf with the base clasping the stem.

*Anastomosing*, the union of veins so as to form a network.

*Anatropous*, with the ovule inverted on its stalk.

*Ancipital*, two-edged.

*Andro-dioecious*, with staminate and with perfect flowers on different individuals.

*Androgynous*, having both staminate and pistillate flowers in the same cluster.

*Andro-monoecious*, with staminate and with perfect flowers on the same individual.

*Annual*, a plant flowering and fruiting in the first year or season and then dying.

*Annular*, having the form of a ring, ring-like.

*Anterior*, the side in front; in an axillary flower, the side away from the stem; lower; inferior.

*Anther*, the sac or sacs containing the pollen, the essential part of the stamen.

*Anthesis*, the period during which a flower is expanded, the stigma re-

ceptive and the anthers shedding pollen.

*Antrorsely*, directed forward.

*Apetalous*, without petals.

*Aphyllipodic*, without a leafy base.

*Apiculate*, ending in a short-pointed tip.

*Appendage*, any supplementary or superadded part.

*Appressed*, flattened or pressed against another body but not united with it; hairs lying flat on leaves are appressed.

*Approximate*, standing or borne close or near together.

*Aquatic*, living or growing in water; an "aquatic plant" may be wholly submersed or with only the base in water.

*Arcuate*, moderately curved.

*Areola*, an area with a distinct or raised boundary; the spaces between the reticulations or veins: in *Compositae* the disk or circle at the summit of the achene where sat the corolla; *areolate*, having areolae.

*Areole*, same as *Areola*.

*Aril*, an appendage of a seed growing at or about the hilum or summit of the funiculus; *arillate*, furnished with an aril.

*Aristate*, furnished with an arista or awn, like the beard or bristle of Barley.

*Articulation*, a joint; *articulated*, jointed or furnished with joints; where the stem or organ separates or is inclined to do so.

*Ascending*, rising gradually upwards.

*Assurgent*, rising or curving upwards from the base.

*Attenuate*, gradually narrowed or prolonged.

*Auricled*, with ear-like lobes at base; *auriculate*.

*Awn*, a bristle, like the beard of Barley.

*Awned*, provided with a bristle.

*Axil*, the angle between a leaf and stem.

*Axile*, referring to or borne on the axis.

*Axillary*, borne or occurring in an axil.

- Aris*, the stem or longitudinal or central support on which parts or organs are arranged; a central line.
- Baccate*, of the nature of a berry, berry-like or pulpy.
- Banner*, the upper petal in a papilionaceous, or pea, flower.
- Barbate*, bearded, the hairs directed upward.
- Barbed*, furnished with sharp rigid reflexed points, like the barbs of a fish-hook.
- Barbellate*, beset with short stiff hairs; *barbellulate*, the diminutive.
- Berry*, a fleshy indehiscent fruit, formed from a single superior or inferior ovary.
- Bi-*, a prefix to Latin words, two or twice.
- Bifid*, 2-cleft to the middle or thereabouts.
- Bilabiate*, a synsepalous calyx or sympetalous corolla cleft into two divisions, with an upper (superior or posterior) lip and a lower (inferior or anterior) lip; 2-lipped as the corolla of Sage or of Mimulus.
- Bilamellate*, of two plates or lamellae.
- Bipinnate*, twice pinnate.
- Blade*, the flat expanded portion of a leaf; said also of the broad portion of a petal, especially when it possesses a petiole-like base or claw.
- Bloom*, said when leaves and fruit are whitened with a fine powder or dust. (See *Glaucous*.)
- Bract*, the modified or much reduced leaf of a flower-cluster; in Gramineae, the modified leaf subtending a spikelet; leafy-bracted, in Compositae, with accessory or foliose bracts to the head outside the involucre.
- Bracteate*, possessing or bearing bracts.
- Bractlet*, the small modified leaf subtending a flower or inserted on the pedicel.
- Bud*, the youngest or formative portion at the end of a stem.
- Bulb*, cluster of fleshy storage leaves set closely on a short stem axis and forming an underground organ.
- Bur*, a fruit covered with prominent spines.
- Caducous*, dropping off very early as compared with other parts; the calyx in the California Poppy falls when the flower opens.
- Caespitose* (or *cespitose*), said of stems and leaves when borne on the same stock in a close tuft.
- Callous*, hardened, indurated.
- Callus*, hardened and often smooth tissue or protuberances; the tough often hairy swelling at base of the lemma and palea in grasses.
- Calyculate*, said of the short bracts which occur at the base of the involucre proper in some Compositae and so imitate an exterior involucre.
- Calyx*, the outer, usually green, whorl of the flower.
- Campanulate*, bell-shaped.
- Canescent*, grayish white or hoary, the surface covered with fine white hairs.
- Capillary*, like a hair.
- Capitate*, gathered or collected into a head, or head-like.
- Capsule*, a dry dehiscent seed-vessel composed of more than one carpel.
- Carinate*, having a keel, sharp ridge, or carina.
- Carpel*, a simple pistil (which is typically 1-celled, with one placenta, one style, and one stigma), or one of the elements of a compound pistil; also applied to a simple pistil when mature or to one of the parts of a compound pistil which splits up when it is ripe. The number of carpels composing a compound pistil may be determined from the number of styles or stigmas, or, if these are blended, by the number of cells in the ovary, or, if but one cell, by the number of placentae.
- Cartilaginous*, firm and tough like cartilage.
- Caruncle*, an excrescence or process at the hilum in certain seeds.
- Catkin*, a scaly spike or ament, as in the Willow or Oak; in the Conifers applied to the staminate and ovulate clusters.
- Caudate*, bearing a slender tail-like body or appendage.
- Caudex*, a short stem or trunk, more commonly the persistent woody base of a perennial herb.
- Caulescent*, having a distinct leafy stem above ground; plants with radical leaves and flowers on a scape are called *acaulescent*.

*Caulicle*, the stem in an embryo.

*Cauline*, pertaining to or borne on a stem, as cauline leaves.

*Chamisal*, the formation composed of Chamise; see p. 503.

*Chaparral*, collective term referring to the colonies of thorny or rigid shrubs growing on mountain slopes. It is a xerophytic formation, composed of such species as *Ceanothus cuneatus*, *sorediatus*, *spinosus* and *divaricatus*, *Pickeringia montana*, *Arctostaphylos viscida* and *glauca* and *Quercus dumosa*.

*Chartaceous*, having the thickness or texture of writing paper; most leaves are chartaceous.

*Choripetalous*, petals distinct and free from each other; not united even at base.

*Chorisepalous*, sepals distinct and free from each other.

*Ciliate*, having the margin bordered with a row or rows of hairs; *ciliolate*, the diminutive.

*Cinereous*, of ashy hue.

*Circinate*, rolled into a coil from the tip.

*Circumscissile*, splitting at the middle with the upper part falling away like a lid.

*Cismontane*, this side of the mountains, that is west of the main sierran crests; a term used in opposition to or contrast with the deserts.

*Clavate*, narrow but widening gradually and regularly upward like a club, *clavellate*, the diminutive.

*Claw*, the narrow or petiole-like base of a petal.

*Cleft*, with sharp lobes, usually about to the middle.

*Coalescent*, said of united organs in one circle.

*Cochleate*, shell-shaped.

*Coherent*, united with another body or organ of the same kind.

*Coma*, a tuft of hairs; *comose*, furnished with a coma.

*Commissure*, the plane by which the flattened faces of the two carpels in Umbelliferae cohere.

*Complete*, said of a flower which has all the four circles, sepals, petals, stamens, and pistils.

*Complicate*, folded upon itself.

*Compressed*, flattened on the sides or laterally: compressed pod in Cruci-

ferae, flattened parallel to the partition; compressed achenes in Compositae, flattened contrary to the plane of the bract; compressed fruit in Umbelliferae, flattened parallel to the plane of the commissure. (See Obcompressed.)

*Concolorous*, of one color.

*Conduplicate*, folded flat so that the folds or sides lie face to face.

*Connate*, united from the beginning (born united).

*Connective*, the portion of a stamen connecting the two cells of an anther.

*Connivent*, lightly joined or sticking.

*Contorted*, bent or twisted on itself or out of the usual position.

*Convolute*, rolled inwards from one side to the other.

*Cordate*, heart-shaped with the notch at the base.

*Coriaceous*, leathery in texture and stiffness.

*Corm*, a thickened or globose fleshy stem base, underground and sometimes called a solid bulb.

*Corolla*, the circle of petals in a flower, found outside the stamens and within the calyx.

*Corymb*, pedicels of unequal length, the lower longer so as to form a flat-topped cluster; *corymbose*, in corymbs.

*Costate*, ribbed.

*Crenate*, with rounded or blunt teeth; *crenulate*, the diminutive.

*Crested*, bearing a ridge or elevation on the summit of an organ.

*Cruciferous*, with the petals spreading in the form of a cross.

*Crustaceous*, shell-like.

*Cucullate*, hood-shaped, cowled.

*Culm*, the hollow stem of grasses.

*Cuneate*, widening gradually and regularly upwards from a pointed base; wedge-shaped.

*Cuspidate*, tipped with a cusp or short hard point.

*Cyme*, a flower cluster in which the terminal or central flower blooms first; *cymose*, after the manner of a cyme.

*Deciduous*, falling when ripe or after the function has been performed; a corolla is deciduous when it falls after anthesis; deciduous trees shed their leaves in autumn.

- Declined*, curved downward or forward.
- Decompound*, several times compounded.
- Decumbent*, lying on the ground but tending to rise at the end.
- Decurrent*, where the edge of the leaf runs down on the stem forming lines or wings.
- Decussate*, opposite but each pair placed at right angles or over the intervals of the pair above or below.
- Deflexed*, bent abruptly downward.
- Deltoid*, triangular with equal sides.
- Dentate*, toothed with the teeth standing directly outward.
- Denticulate*, dentate with fine teeth.
- Dextrorse*, turned towards the right hand.
- Di-*, a prefix to Greek words, two or twice.
- Diadelphous*, stamens united into two sets.
- Dichotomous*, branching or forking with the two divisions nearly equal.
- Didymous*, twin, found in pairs.
- Didynamous*, said of stamens in 2 pairs with one pair shorter than the other.
- Digitate*, parted or divided like the fingers of a hand.
- Dilated*, widened or broadened, applied to flattened or wing-like structures; *dilatation*, that which is dilated.
- Dimorphic*, having two unlike forms.
- Dioecious*, with stamens and pistils in different flowers on different plants.
- Discoid*, disk-like; without ray-flowers.
- Discrete*, separate, said of organs which are neither crowded nor remote.
- Disk*, a development of the receptacle at or around the base of the ovary; In *Compositae*, the tubular corollas of the receptacle as distinct from the ray.
- Dissected*, several times cleft into small segments.
- Distichous*, in 2 ranks or rows.
- Distinct*, parts in the same circle not united; as "stamens distinct," separate from each other.
- Divaricate*, widely divergent.
- Divided*, cleft about to the base, or to midrib.
- Dorsal*, relating to or borne along the back; lower; outer; posterior.
- Drupe*, a fruit with a fleshy or soft outside (or exocarp) and a hard or stony inside (or endocarp).
- Elliptic*, about  $1\frac{1}{2}$  times as long as broad; elliptical.
- Emarginate*, with a sharp notch at apex.
- Emersed*, growing up out of or raised above the water.
- Endosperm*, starch or other reserve food stored with the embryo in the seed.
- Entire*, margin not toothed or indented.
- Epigynous*, with the flower parts as if inserted on the summit of the ovary, that is the ovary wholly inferior.
- Equilateral*, equal sided, or with the same number of parts on a side; a pinnate leaf is equilateral when it has the same number of leaflets on each side of the rachis.
- Equitant*, astride, as if riding, like the leaves of Iris.
- Erose*, gnawed on the edge; *erosulate*, the diminutive.
- Explanate*, spreading out flat.
- Exserted*, protruding beyond the surrounding organ; exserted stamens protrude beyond the corolla; an exserted corolla protrudes beyond the calyx.
- Exstipulate*, without stipules.
- Extrorse*, turned outward.
- Falcate*, sickle-shaped.
- Fascicle*, a close cluster or bundle of roots, stems, leaves or flowers.
- Fastigiate*, with clustered parallel branches.
- Favose*, with honey-combed surface; *faveolate*, the diminutive.
- Felt-like*, with very densely and closely woven wool.
- Fenestrate*, with transparent areas or window-like openings.
- Fertile flower*, one containing a pistil capable of producing fruit with good seed; *fertile stamen*, the anther containing pollen.
- fid or -fidus*, terminations meaning cleft or lobed; 3-fid means 3-cleft.
- Filament*, a thread, in case of a stamen the stalk supporting the anther.
- Filiform*, thread-like.
- Fimbriate*, fringed; *fimbriate*, the diminutive.

- Fistulous*, hollow.
- Flabellate*, fan-shaped.
- Flaccid*, flabby or limp.
- Flexuous*, more or less zigzag.
- Floccose*, bearing locks or tufts of hair or wool.
- Floret*, a small flower, one of a cluster.
- Foliaceous*, leaf-like.
- Foliolate*, having leaflets; 3-foliolate, with 3 leaflets, etc.
- Follicle*, a dehiscent seed-vessel derived from a single carpel, as a pod of the Larkspur.
- Foveate*, pitted; *foveolate*, the diminutive.
- Free*, not united to another organ, especially when one circle of the flower is not united to another circle.
- Fruit*, the matured or ripened ovary with all its appendages or accessory parts as well as contents.
- Fruticose*, relating to a shrub; shrubby.
- Fruticulose*, diminutive of fruticose; relating to a little shrub, as *Phyllodoce breweri*.
- Fugacious*, very promptly falling off or lasting but a short time.
- Fulvous*, tawny.
- Funicle*, the stalk on which the ovule is borne in the ovary.
- Fusiform*, thickest at or above or below the middle and tapering more or less to each end.
- Galea*, the long or helmet-like upper lip in the Mint and Figwort families; *galeate*, having a galea.
- Geminate*, twin, in pairs, two side by side.
- Geniculate*, bent abruptly, like a knee.
- Gibbous*, swollen or distended on one side.
- Glabrate*, somewhat glabrous or becoming glabrous.
- Glabrous*, bald, not hairy. Some agriculturists and some botanists wrongly use the term smooth as opposite to hairy; bald or glabrous is the opposite of hairy; smooth is the opposite of rough. No word would be left as an antonym of rough, if smooth be perverted in this way from its right etymological use. Cf. Smooth.
- Glandular*, bearing glands, or having a surface which exudes a sticky or viscid liquid.
- Glaucous*, somewhat glaucous or becoming so.
- Glaucous*, whitened with a bloom.
- Globose*, rounded, more or less spherical.
- Glomerate*, compacted into a close cluster.
- Glomerule*, a compacted or condensed head-like cyme.
- Glumaceous*, like the glume (bract) of grasses, thin but firm.
- Glume*, one of the two lowest bracts on the spikelet in grasses.
- Glutinous*, with a sticky exudation.
- Granulate*, bearing granules or grain-like bodies; *granuliferous*.
- Gynaecandrous*, having the pistillate and staminate flowers in the same spikelet, the former above the latter.
- Gynobase*, an elevation or process of the receptacle bearing the carpels or nutlets.
- Gyno-dioecious*, having flowers on one plant pistillate, on another perfect.
- Gyno-monoecious*, having perfect and pistillate flowers on the same plant.
- Habit*, mode of growth, general aspect or hue of a plant.
- Halophyte*, a plant growing in salty soils or alkaline soils, mostly succulent plants with thick or small leaves; the Pickleweed, *Atriplex* and Kern Greasewood are typical halophytes.
- Hastate*, with a pair of lobes at base turned outward.
- Head*, said of flowers in a globose cluster, being sessile and collected at the same point on the peduncle.
- Herb*, a plant without woody stem or parts, at least above ground.
- Herbaceous*, like an herb in appearance or habit, or in texture or color, as *herbaceous sepals*, meaning green or leaf-like.
- Herbage*, the vegetative parts (stems and leaves) produced in the season, not including the flowers or fruit.
- Heteromorphic*, having several different forms.
- Hirsute*, with long firm hairs; *hirsutulose*, *hirsutulous*, the diminutives.
- Hispid*, with stiff or rigid hairs.
- Hispidulous*, *hispidulose*, minutely hispid.

*Hooded*, said of an organ which is curved or concave at the top like a hood.

*Hyaline*, transparent, translucent.

*Hydrophyte*, a plant adapted to live in water or very wet soil, chiefly characterized by a thin epidermis, reduction or absence of roots and reduction of the vascular system as in the Pond Lilies, Pond Weeds and Duck Weeds, or by succulence as in Arrow Head, or by tall unbranched stems with narrowly linear leaves, or leafless as in the Bulrushes and Sedges.

*Hypogynous*, inserted on the receptacle, with the parts of the flower under or free from the pistil.

*Imbricate*, overlapping like the shingles on a roof so as to cover or break joints.

*Immersed*, growing wholly under water.

*Incised*, cleft or cut irregularly and sharply.

*Included*, not protruding beyond the surrounding organ; included stamens do not protrude beyond the corolla.

*Incomplete*, said of a flower which has not all of the four circles.

*Incumbent*, said of cotyledons when the back of one of them lies against the caulicle.

*Indefinite*, variable or uncertain in number, numerous.

*Indehiscent*, said of fruits or pods which do not split open.

*Indigenous*, native to the region.

*Indument*, with a close pubescence or coat of hairs.

*Induplicate*, with the tips turned in.

*Indurated*, hardened or becoming tough.

*Inequilateral*, not equilateral, which see.

*Inferior*, growing or placed below; inferior ovary, one more or less attached to or united with the calyx; inferior stamens or lip of corolla, that is with the stamens or lip on the lower side of the flower; see *Superior*.

*Inflated*, distended or bladderly.

*Inflexed*, bent or turned abruptly inward.

*Inflorescence*, a flower-cluster, or in particular the mode of arrangement of the flowers in a cluster.

*Innate*, borne on the apex.

*Innovations*, in Gramineae, barren shoots.

*Inserted*, attached to or growing upon.

*Internode*, the portion of the stem between two nodes.

*Interrupted*, not continuous and regular.

*Introrse*, turned inward.

*Involucel*, a secondary involucre, as that of an umbellet; a circle of bractlets.

*Involucre*, a circle of bracts subtending a flower cluster; *involucrate*, provided with an involucre.

*Involute*, rolled inwards from both sides.

*Irregular*, the parts not of the same size and shape.

*Keel*, a longitudinal central ridge on the back of an organ, like the keel of a boat; the two lower petals of a pea-like flower which are joined into a keel-like body.

*Lacerate*, irregularly but not necessarily deeply cleft or torn.

*Laciniate*, cut or slashed into narrow divisions.

*Lamellate*, composed of thin plates.

*Lanate*, densely and very closely woolly.

*Lanceolate*, 4 to 6 times as long as broad and tapering from slightly above base to apex.

*Lax*, loose.

*Leaflet*, one of the divisions of a compound leaf.

*Legume*, a 1-celled seed vessel, composed of a single carpel, which dehisces by both the ventral and the dorsal sutures into two valves.

*Lemma*, the lowest bract of the floret in grasses; see p. 72.

*Lenticular*, shaped like a lens.

*Ligneous*, hard and woody.

*Ligule*, like a short ribbon or strap, such as the ray in the Sunflower Family; in Gramineae the exerted portion of the hyaline membrane lining the sheath; *ligulate*, provided with a ligule.

*Limb*, a border, the blade of a petal or the spreading part of a sympetalous corolla.

*Line*,  $\frac{1}{2}$  of an inch.

*Linear*, very narrow, with parallel sides; 4 or 5 or more times as long as wide.

- Lip*, one of the two divisions of a 2-lipped corolla or calyx. (See *Bilabiate*.)
- Littoral*, growing near or under the influence of the sea.
- Lobe*, a division of an organ, especially one which is rounded; leaf lobes are usually not deep; leaves may be lobed, parted or divided depending upon the depth of division. (See *Parted* and *Divided*.)
- Loculicidal*, a capsule splitting longitudinally into the backs of the cells.
- Lodicule*, in Gramineae, one of 2 or 3 minute hyaline scale-like organs at the base of the stamens, whose function is the opening of the floral envelope at anthesis.
- Lunate*, crescent-shaped.
- Lyrate*, shaped like a lyre, the terminal lobe of the leaf large and rounded with the lower pairs smaller.
- Mammaeform*, breast-shaped or bearing breast-shaped prominences.
- Marcescent*, withering but persistent, not falling off.
- Maritime*, growing on the sea-coast.
- Membranous*, or *membranaceous*, thin, soft, and more or less pliable like an animal membrane.
- Meniscoidal*, thin and concavo-convex.
- merous*, parts or members; used in compounds, as 5-merous, having 5 parts.
- Mesophyte*, a common type of plant growing under the most favorable conditions of soil and moisture, characterized as a whole by a lack of special adaptations and by a great and diverse development of the leaf surface; Maples, Alders, and Mustards are typical mesophytes.
- Monadelphous*, stamens united into one set.
- Moniliform*, like a necklace or string of beads.
- Monocephalous*, bearing a single head.
- Monocious*, with stamens and pistils in separate flowers on the same plant.
- Montane*, of or growing in the mountains.
- Mucronate*, tipped with a mucro or sharp but rather soft point; *mucronulate*, the diminutive.
- Muricate*, bearing rough and rather sharp excrescences.
- Muriculate*, diminutive of *muricate*.
- Naked*, destitute of covering or appendages; naked head, without foliaceous or other bracts surrounding or concealing the involucre or head; naked stem, scape or inflorescence, leafless; naked flower, one without perianth.
- nate*, termination meaning divided, as 2-nate, 3-nate.
- Nerve*, simple or unbranched vein, a slender or secondary rib.
- Neutral*, a flower having neither stamens nor pistils.
- Nigrescent*, becoming blackened.
- Node*, the place on a stem where a leaf is borne.
- Nut*, an indehiscent fruit with a hard firm wall, resulting from a compound ovary.
- Nutlet*, a diminutive nut, applied to a fruit derived from a simple ovary, or to a compound ovary which splits up at maturity.
- Ob-*, prefix, meaning reversed or lower side up.
- Obcompressed*, flattened on the anterior and posterior sides or fore and aft, instead of laterally or side-wise; obcompressed pod in Cruciferae, flattened contrary to the partition; obcompressed fruit in Umbelliferae, flattened contrary to the commissure; obcompressed achene in Compositae, flattened parallel to the bract.
- Obconic*, inversely conic.
- Obcordate*, inverted heart-shaped, with the notch at the apex.
- Oblanceolate*, inversely lanceolate.
- Oblique*, unequal-sided, as in leaves which are larger on one side than the other.
- Oblong*, two or three times longer than broad and with nearly parallel sides, or somewhat tapering to each end from the middle.
- Obovate*, inversely ovate.
- Obovoid*, inversely ovoid.
- Obsolete*, imperfectly or scarcely at all developed, or abortive; for example, the lower lip of a calyx is obsolete when it is obscure or not very distinctly developed.
- Obtuse*, blunt or rounded.

- Opposite leaves or branches*, two from each node, proceeding from opposite sides of the stem; "stamens opposite petals," when the stamen is set before the petal; etc.
- Orbicular*, round or roundish.
- Ovary*, the part of the pistil containing the ovule or ovules.
- Oval*, broadly elliptic and a little contracted upward.
- Orate or ovoid*, egg-shaped.
- Ovule*, the body in the ovary which becomes a seed; *ovulate*, bearing ovules.
- Palate*, the lower side of the throat in a 2-lipped corolla.
- Palea*, chaff-like pappus borne on the achenes of the Sunflower Family; in the Grass Family the upper of the two modified bracts subtending an individual flower; chaff or chaffy bracts.
- Paleaceous*, in Compositae, chaff-like.
- Palmate*, with the divisions or sinuses of the leaf pointing to the petiole; palmately compound, with the leaflets all borne at the apex of the common petiole.
- Palmatifid*, cleft so as to resemble the outstretched fingers of the hand.
- Paludose, palustrine*, living in a marsh or swamp.
- Panicle*, a compound flower cluster, a raceme, spike or corymb which is compounded by branching.
- Papilionaceous*, applied to an irregular corolla with an upper petal or banner, 2 lateral petals or wings and 2 lower petals joined to form a keel.
- Papillate*, bearing minute nipple-shaped protuberances.
- Pappus*, the modified calyx-limb borne on the achenes of the Sunflower Family, usually occurring as bristles, naked or plumose hairs, scales or chaff.
- Parietal*, referring to or borne on the wall or sides of an organ.
- Parted*, cleft to below the middle.
- Pectinate*, cleft into closely set divisions like the teeth of a comb.
- Pedate*, palmately divided with the lateral divisions 2-cleft, thus resembling a bird's foot; *pedately*, in a pedate manner.
- Pedicel*, stalk or stem of a flower in a flower cluster; *pediceled*, having a pedicel.
- Pedicellate*, having or possessing a small or short pedicel.
- Peduncle*, stalk or stem of a flower or flower cluster; *pedunculate*, having a peduncle.
- Pellucid*, clear, transparent.
- Peltate*, round, with stalk or petiole attached on the under side at the middle.
- Penicillate*, with a tip or cluster of fine hairs or bristles.
- Perfect*, having both stamens and pistils in the same flower.
- Perfoliate*, where a stem seems to pass through or pierce a leaf.
- Perianth*, the floral envelopes, including both calyx and corolla when both are present; applied here chiefly to those flowers in which there is no marked differentiation into calyx and corolla.
- Pericarp*, the wall of a mature ovary or fruit.
- Perigynous*, inserted on the calyx.
- Persistent*, falling away very tardily or not at all.
- Petal*, one of the parts or divisions of a corolla, usually colored; *petaloid*, colored like the corolla or perianth.
- Petiolate*, having a petiole.
- Petiole*, the stalk of a leaf.
- Petiolule*, the stalk of a leaflet.
- Phyllopodic*, having a leafy base.
- Pilose*, with long soft spreading hairs.
- Pinna*, a leaflet or division of a compound leaf.
- Pinnate*, with the leaflets arranged along each side of a common petiole.
- Pinnatifid*, cleft in a pinnate manner.
- Pistil*, the female organ of a flower.
- Pistillate*, provided with or containing a pistil or pistils, but no stamens; fertile; said of a flower or a plant.
- Placenta*, that particular portion of the ovary wall which bears the ovules; it is sometimes strongly differentiated; axile placentae are borne on the axis of the ovary or fruit; parietal placentae on the walls of the ovary or fruit.
- Plaited*. See *Plicate*.
- Plane*, flat and even, without elevations or depressions; opposed to concave, convex, revolute, etc.
- Plicate*, folded into lengthwise plaits or folds.

*Plumose*, finely and abundantly branched, like a plume.

*Pod*, general term for any dry fruit which splits open; strictly a legume or follicle.

*Polygamous*, having perfect, pistillate and staminate flowers on the same individual (polygamo-monoecious) or on different individuals (polygamo-dioecious).

*Pome*, an inferior fleshy fruit with more than one carpel.

*Posterior*, the side behind, in an axillary flower the side next to the axis; superior; upper.

*Prickly*, armed with prickles or short sharp hard outgrowths of the epiderms of leaves or stems.

*Prismatic*, shaped like a prism, with flat faces separated by angles.

*Procumbent*, lying along the ground with ascending tips.

*Produced*, lengthened or extended.

*Proliferous*, bearing supplementary flowering branches or shoots from or near the summit or from the inflorescence, which surpass the stem or inflorescence.

*Prostrate*, lying close along the ground.

*Proterandrous*, the anthers of a perfect flower dehiscing before the stigma is receptive; *proterogynous*, the reverse condition.

*Puberulent*, minutely pubescent.

*Pubescent*, clothed with hairs, especially soft or downy hairs.

*Punctate*, dotted with point-like depressions.

*Pungent*, terminating in a rigid, sharp or prickly point.

*Pustulate*, dilated like a blister.

*Quinate*, borne in or divided into fives.

*Raceme*, a flower cluster in which the flowers are borne along the peduncle on pedicels of nearly equal length.

*Racemose*, like a raceme.

*Rachilla*, in Gramineae, the axis of a spikelet on which the florets are borne.

*Rachis*, the axis of a spike or raceme, the prolongation of the peduncle through the flower cluster; the axis or midrib of a compound leaf or prolongation of the petiole; in Gramineae the main axis and branches of an inflorescence, on which the spikelets are borne.

*Radiate*, arranged around or spreading from a common center; bearing rays.

*Rameal*, borne on the branches.

*Ranks*, successive rows.

*Ray*, in the Parsley Family, one of the primary branches of an umbel; in the Sunflower Family the ligule of a ray-flower, the ray-flowers or ray-achenes being marginal on the head.

*Receptacle*, in a flower, that portion of the stem on which the sepals, petals, stamens and pistils are borne; in an inflorescence it is the axis or abbreviated stem on which the flowers are borne, as the axis of the head in the Sunflower Family.

*Reflexed*, turned downward or backward.

*Refracted*, turned abruptly downward.

*Regular*, the parts in a circle having the same size and shape.

*Remote*, as in the case of flowers, leaves or fruits distantly spaced on an axis.

*Reniform*, kidney-shaped.

*Repend*, with slightly uneven margin.

*Reticulate*, with a network; netted.

*Retrocurved*, curving backward.

*Retorse*, turned or pressed backward.

*Retuse*, with a broad shallow notch.

*Revolute*, rolled backward from each side.

*Rhombic*, quadrangular but the lateral angles obtuse; *rhomboidal*, more or less rhombic.

*Rib*, a primary vein of a leaf.

*Rootcrown*, the more or less short stem or axis crowning the root, often woody, simple or branched and persistent; frequently called a caudex.

*Rootstock*, prostrate or underground root-like stem, sending up from season to season herbaceous shoots and bearing roots on the under side.

*Rostrate*, with a beak or spur; narrowed into a slender process; *rostellate*, the diminutive.

*Rosulate*, said of basal leaves spreading in a circle or rosette on the ground.

*Rotate*, wheel-shaped; spreading flat or horizontally and circular in outline.

*Rudiment*, an imperfectly developed organ, a vestige.

*Rugose*, having wrinkles or rugae; *rugulose*, finely wrinkled; *rugulae* fine wrinkles.

- Runcinate*, sharply incised with the teeth or incisions turned downward.
- Rumex*, a slender prostrate stem rooting, more or less, at the nodes.
- Saccate*, bearing distensions or sac-like bodies.
- Sagittate*, shaped like an arrowhead.
- Salient*, projecting prominently, in an isolated manner, beyond the main body or series.
- Salverform*, having a border or limb spreading at right angles to a slender tube.
- Samara*, an indehiscent winged fruit like the key of a maple.
- Saprophyte*, living upon dead organic matter and thus destitute of chlorophyll.
- Scabrid*, slightly scabrous.
- Scabrous*, rough to the touch; *scabroulose*, *scaberulous*, minutely scabrous.
- Scale*, a small thin body, not at all or little green, commonly glabrous.
- Scape*, a leafless flower-bearing stem arising from the ground.
- Scarious*, thin, dry and not green.
- Scobiculate*, bearing fine or sawdust-like particles.
- Scorpid*, said of a 1-sided inflorescence which is circinately coiled in the bud.
- Scrobiculate*, marked with numerous small depressions.
- Scurf*, small bran-like scales on the stem or leaves.
- Secund*, inserted on (or turned to) one side of the stem.
- Sepal*, a leaf or division of the calyx.
- Septal*, relating to a septum; *septate*, bearing a septum.
- Septicidal*, a capsule splitting between the partitions of the cells.
- Septum*, a partition in an ovary or fruit.
- Sericeous*, silky with straight soft hairs.
- Series*, successive rows.
- Serrate*, toothed or saw-like, with the teeth turned forward or upward; *serrulate*, the diminutive.
- Sessile* leaf, leaf without a petiole and the blade seated directly on the stem; sessile ovary, one without a stipe.
- Set*, a cluster or collection of organs of the same kind.
- Setaceous*, bristle-like.
- Setose*, beset with bristles; *setulose*, the diminutive.
- Sheath*, where the base of the blade or expanded petiole completely encloses or sheathes the stem for some distance above the node.
- Shrub*, a branching woody plant, commonly without distinct trunk, usually about 2 to 12 ft. high. There are no rigid limits between shrubs and trees, or between shrubs and herbs.
- Silicle*, a short silique not much longer than wide; sometimes indehiscent.
- Silique*, a 2-celled capsule, several times longer than wide, the valves splitting from the bottom and leaving the placentae with the false partition stretched between.
- Simple*, unbranched or without branches; simple leaf, the blade composed of one piece; simple pistil, of one carpel.
- Sinistrorse*, turned toward the left.
- Sinuate*, with a recessed margin.
- Sinus*, with a recess or indentation; literally a bay.
- Smooth*, not rough; opposed to scabrous, echinate, etc. Cf. Glabrous.
- Sordid*, of a dull white or dirty hue.
- Spadix*, a spike with a fleshy axis.
- Spathe*, a bract enclosing a flower cluster; *spathaceous*, of the nature of a spathe.
- Spatulate*, rounded above and contracted below to a narrow or slender base.
- Spicate*, in the form of a spike; spike-like, especially when flower clusters are arranged spicately.
- Spike*, a flower cluster in which the flowers are sessile and more or less densely arranged along a common peduncle.
- Spikelet*, a secondary spike; the flower-cluster of Grasses.
- Spine*, a sharp-pointed hard woody organ; homologous with a leaf; *Spinescent*, ending in a spine or sharp rigid point; *spinose*, furnished with spines or of a spiny character; *spinulose*, the diminutive.
- Spur*, a slender and hollow extension or prolongation of some part of a flower, as the petal of a Columbine or calyx of a Larkspur.

- Squama*, a scale; *squamate*, scale-like; *squamella*, a diminutive scale; *squamellate*, like a little scale.
- Squarrose*, with stiff spreading processes, as the tips of bracts.
- Stamen*, one of the male organs of the flower.
- Staminate*, bearing or containing stamens but no pistils; sterile or not seed-bearing; said of a flower, flower cluster or plant.
- Staminodium*, a sterile stamen, usually one in which the anther is wholly obsolete and the filament much developed or dilated.
- Stellate*, with rays like those of a star, star-shaped.
- Sterile*, barren; a stamen without anther or an anther without pollen; a flower without a pistil or with infertile ones; ovary without good ovules.
- Stigma*, the receptive part of the style which secretes a sticky or viscid substance.
- Stipe*, stalk by which the ovary or fruit is raised above the receptacle.
- Stipels*, stipules of the leaflet.
- Stipitate*, having a stipe.
- Stipules*, small supplementary organs or appendages of the leaf, borne in pairs at the base of the petiole.
- Stolon*, a stem or branch bending or curving down at tip and there rooting. Cf. Runner.
- Stoloniferous*, bearing stolons.
- Striate*, marked with longitudinal lines, grooves or ridges.
- Strict*, close or narrow, closely upright and straight, not spreading.
- Strigose*, with straight appressed hairs or bristles.
- Strophiole*, an appendage near the hilum of seeds.
- Style*, the contracted or slender portion of a pistil between the ovary and stigma.
- Stylopodium*, the enlargement or disk-like expansion at the base of the style, as in Umbelliferae.
- Sub-*, prefix, meaning somewhat, nearly, or below, depending upon the context.
- Submerged* or *submersed*, growing under water.
- Subulate*, awl-shaped.
- Succulent*, juicy or fleshy.
- Suffrutescent*, woody at base, with a persistent woody portion above ground, but no implication of diminutiveness. Cf. Fruticulose.
- Sulcus*, a groove or furrow; *sulcate*, grooved or furrowed.
- Superior*, growing or placed above; superior ovary, one free from the calyx; superior stamens or superior lip of corolla, the stamens or lip on the upper side.
- Symmetrical*, with the same number of parts in each circle throughout the flower.
- Sympetalous*, petals more or less united into one piece, so that one can not be taken away from the rest without tearing.
- Synsepalous*, sepals more or less united.
- Taproot*, a single and often strong root descending perpendicularly into the earth.
- Terete*, round in the sense of cylindric.
- Ternate*, occurring or divided into threes.
- Thorn*, a sharp-pointed hard woody organ, homologous with a stem.
- Throat*, the upper expanded portion or orifice of the corolla-tube.
- Thyrse*, a close or contracted ovate panicle; *thyrsoid*, resembling a thyrse.
- Tomentose*, covered with soft or woolly hairs or tomentum.
- Torulose*, cylindrical but bulging irregularly at intervals.
- Tri-*, a prefix to Latin words, three or thrice.
- Trichotomous*, forking, with the three divisions from the same point and nearly equal.
- Trifid*, 3-cleft to the middle or somewhat more or less.
- Trigonus*, 3-angled, with plane faces.
- Tripinnate*, thrice pinnate.
- Triquetrous*, 3-sided.
- Triternate*, thrice ternate.
- Truncate*, cut off squarely at the end.
- Tuber*, a thickened fleshy and more or less rounded underground stem or root.
- Tubular*, shaped like a tube or hollow cylinder.
- Tufted*, short, close, and several or many together from the same stock. (See Caespitose.)

- Tunicated*, having several closely fitting coats.
- Turbinate*, top-shaped.
- Turgid*, distended or inflated.
- Two-lipped*, said of a sympetalous corolla or a synsepalous calyx with an upper and a lower lobe or division. See *Bilabiate*.
- Umbel*, branches nearly equal and proceeding from the same point, so as to form a flat-topped flower cluster.
- Umbellet*, one of the secondary umbels of a compound umbel.
- Umbilicate*, depressed in the center.
- Undulate*, wavy or wavy-margined.
- Unisexual*, flowers containing pistils only, or stamens only.
- Urnshaped*, globular and contracted at the mouth like an urn or pitcher.
- Utricle*, a 1-seeded carpel with loose coat; *utricular*, of the nature of a utricle.
- Valvate*, opening by doors or valves; said of flower-buds when the parts meet exactly without overlapping.
- Vein*, in a leaf, a branch of a secondary rib or nerve.
- Ventral*, relating to or borne on the face; upper; inner; anterior.
- Ventricose*, distended or swollen on one side and not on another.
- Venulose*, having veins.
- Versatile*, swinging, turning freely on its support.
- Verticil*, with the organs in a whorl or circle; *verticillate*, having the nature of a verticil.
- Villous*, bearing long soft hairs, often shaggy.
- Virgate*, long, slender and straight, like a virga or rod.
- Viscid*, sticky.
- Vitifform*, grape-like.
- Whorl*, with the organs borne in a circle.
- Wing*, any thin expansion attached to an organ; the lateral petals in a papilionaceous flower.
- Xerophyte*, a plant adapted to live in dry soil, on the desert, in sand or on rocky ridges, chiefly characterized by great thickening of the epidermis, condensation of the plant body, or reduction of the leaf surface. Cactus, Buck-brush, Manzanita and Pickeringia are typical xerophytes.

# GENERAL INDEX OF PLANT NAMES

- Abies* 52  
     *concolor* 53  
     *grandis* 53  
     *magnifica* 53  
         var. *shastensis* 54  
     *venusta* 54  
*Abronia* 337  
     *alba* 338  
         var. *platyphylla* 338  
         var. *variabilis* 338  
     *alpina* 339  
     *exalata* 339  
     *latifolia* 337  
     *maritima* 337  
     *nana* 339  
     *pinetorum* 338  
     *pogonantha* 338  
     *turbinata* 338  
     *umbellata* 338  
     *villosa* 338  
         var. *aurita* 338  
         var. *pinetorum* 338  
*Abutilon* 1170  
     *parvulum* 1170  
*Acacia* 514  
     *greggii* 514  
*Acaena* 500  
     *californica* 501  
     *pinnatifida* var. *californica* 501  
*Acalypha* 597  
     *californica* 597  
*Acamptopappus* 1022  
     *microcephalus* 1025  
     *shockleyi* 1022  
     *sphaerocephalus* 1022  
*Acanthaceae* 954  
*Acanthomintha* 872  
     *ilicifolia* 872  
     *lanceolata* 872  
     *obovata* 873  
*Acanthus* Family 954  
*Acer* 611  
     *circinatum* 611
